Multi-factor authentication	Select which multi-factor authentication method to use to authenticate the user: **Default** - use the method set as default in MFA configuration; this option is selected by default for new user groups if MFA is enabled; **<Method name>** - use selected method (for example, "Zabbix TOTP"); **Disabled** - MFA is disabled for this group; this option is selected by default for new user groups if MFA is disabled. Note that if a user belongs to multiple user groups with MFA enabled (or at least one group has MFA enabled), the following authentication rules apply: if any group uses the "Default" MFA method, it will authenticate the user; otherwise, the first method (ordered alphabetically) will be used for authentication.
Enabled	Status of user group and group members. *Checked* - user group and users are enabled *Unchecked* - user group and users are disabled
Debug mode	Mark this checkbox to activate debug mode for the users.

The **Template permissions** tab allows you to specify user group access to template groups and, through them, to template data:

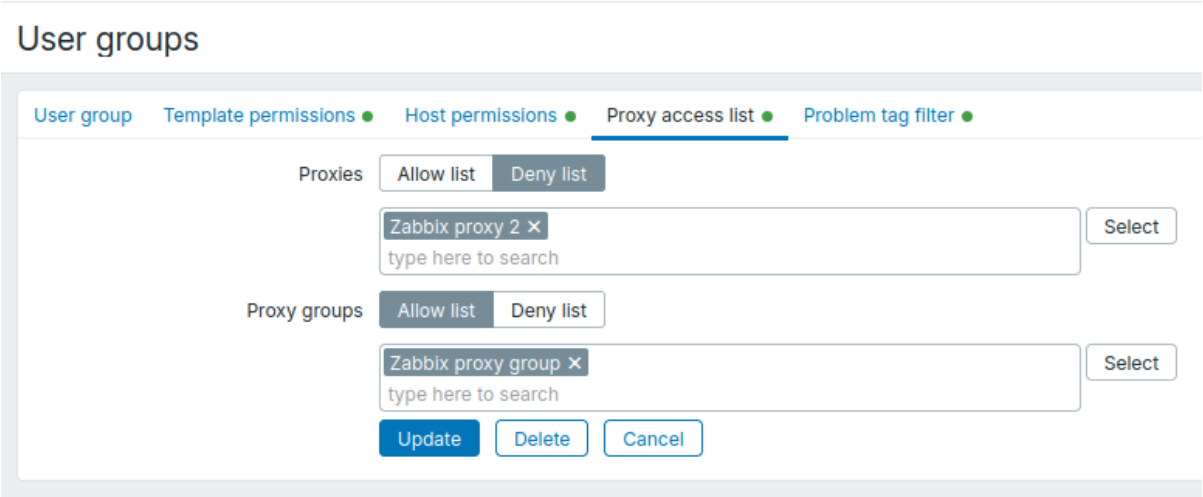
The **Host permissions** tab allows you to specify user group access to host groups and, through them, to host data:

Click Add to choose the template/host groups (be it a parent or a nested group) and assign permissions to those. Start typing the group name (a dropdown of matching groups will appear) or click *Select* for a popup window listing all groups to be opened.

Then use the option buttons to assign permissions to the chosen groups. Possible permissions are the following:

- **Read-write** - read-write access to a group
- **Read** - read-only access to a group
- **Deny** - access to a group denied

If the same template/host group is added in several rows with different permissions set, the strictest permission will be applied.



Note that a *Super admin* user can enforce nested groups to have the same level of permissions as the parent group; this can be done in the host/template group configuration form.

The **Template permissions** and **Host permissions** tabs support the same set of parameters.

Current permissions to groups are displayed in the *Permissions* block, and those can be modified or removed.

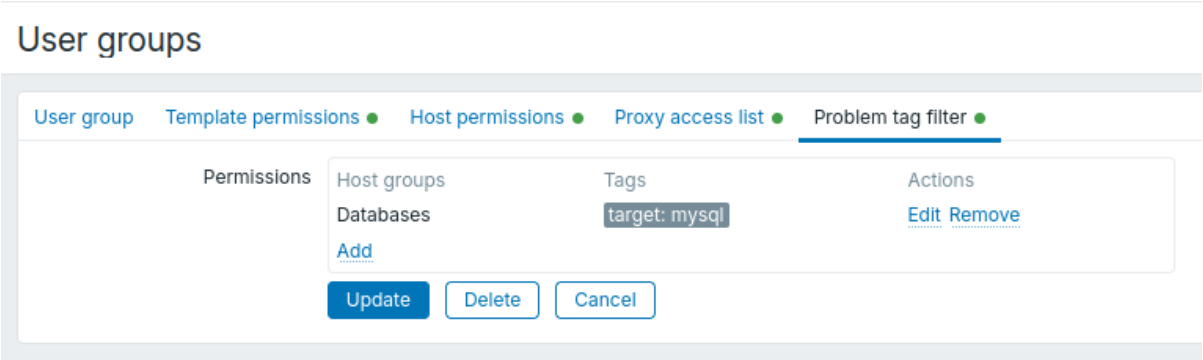
Note:
If a user group has **Read-write** permissions to a host and **Deny** or no permissions to a template linked to this host, the users of such group will not be able to edit templated items on the host, and template name will be displayed as *Inaccessible template*.

The **Proxy access list** tab allows you to specify user group access to proxies, either individually or through proxy groups:

Use the *Proxy groups* field to apply the permission to the selected groups. A proxy that belongs to a group can only be allowed or denied through that group. Use the *Proxies* field to add individual proxies that do not belong to any proxy group.

Proxies and *Proxy groups* support the same set of parameters.

Click the *Select* button next to the *Proxies* or *Proxy groups* field to select proxies or proxy groups, respectively. Alternatively, start typing the name of a proxy or proxy group in the corresponding field. A dropdown list of matching proxies or proxy groups appears.



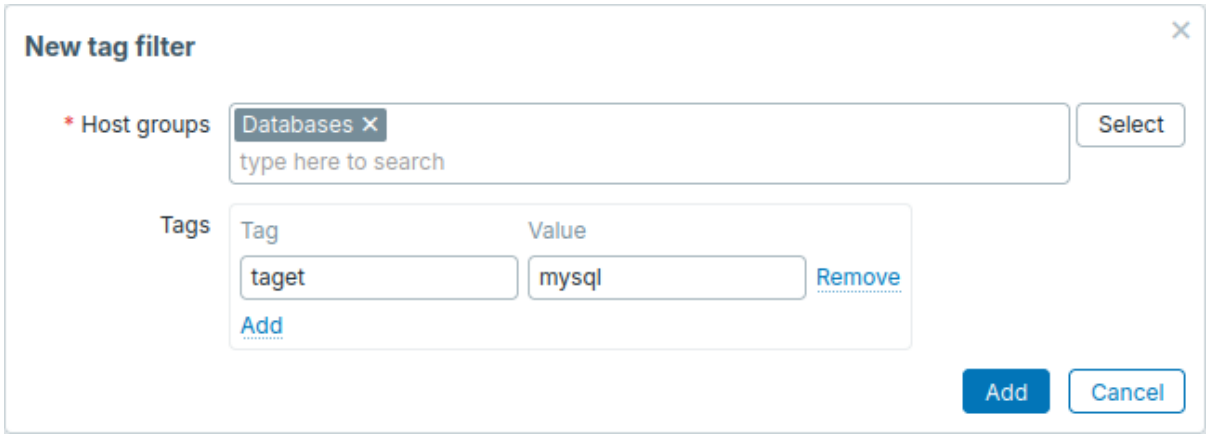
Select *Allow list* to allow the user group to access only the selected proxies and proxy groups.
 If the *Proxies* selection is empty for the *Allow list*, the user group has no access to any proxy that does not belong to a proxy group. If the *Proxy groups* selection is empty for the *Allow list*, the user group has no access to any proxy group.

Select *Deny list* to deny the user group access to the selected proxies and proxy groups. Access to all other proxies and proxy groups is allowed.
 If the *Proxies* selection is empty for the *Deny list*, the user group has full access to all proxies that does not belong to a proxy group. If the *Proxy groups* selection is empty for the *Deny list*, the user group has full access to all proxy groups.

Permission precedence rules for users who belong to multiple user groups:

- *Deny list* overrides *Allow list*. If any group denies access to a proxy/proxy group, the user cannot access it.
- *Allow list* permissions are cumulative. If multiple groups allow access, the user can access all proxies allowed by those groups.

The **Problem tag filter** tab allows setting tag-based permissions for user groups to see problems filtered by tag name and value:



Click Add to choose the host groups. To select a host group to apply a tag filter for, click *Select* to get the complete list of existing host groups or start typing the name of a host group to get a dropdown of matching groups. Only host groups will be displayed, because problem tag filter cannot be applied to template groups.

Tag names without values can be added, but values without names cannot. Only the first three tags (with values, if any) are displayed in the *Permissions* block; if there are more, those can be seen by clicking or hovering over the ••• icon.

Tag filter allows separating the access to host group from the possibility to see problems.

For example, if a database administrator needs to see only "MySQL" database problems, it is required to create a user group for database administrators first, then specify "target" tag name and "mysql" value.

If "target" tag name is specified and value field is left blank, the user group will see all problems with tag name "target" for the selected host group.

Make sure tag name and tag value are correctly specified, otherwise, the user group will not see any problems.

Let's review an example when a user is a member of several user groups selected. Filtering in this case will use OR condition for tags.

User group A			**User group B**			**Visible result for a user (member) of both groups**
Tag filter						
Host group	*Tag name*	*Tag value*	*Host group*	*Tag name*	*Tag value*	
Databases	target	mysql	Databases	target	oracle	target:mysql or target:oracle problems visible
Not configured in the **Problem tag filter**			Databases	target	oracle	target:oracle problems visible

Access from several user groups

A user may belong to any number of user groups. These groups may have different access permissions to hosts or templates.

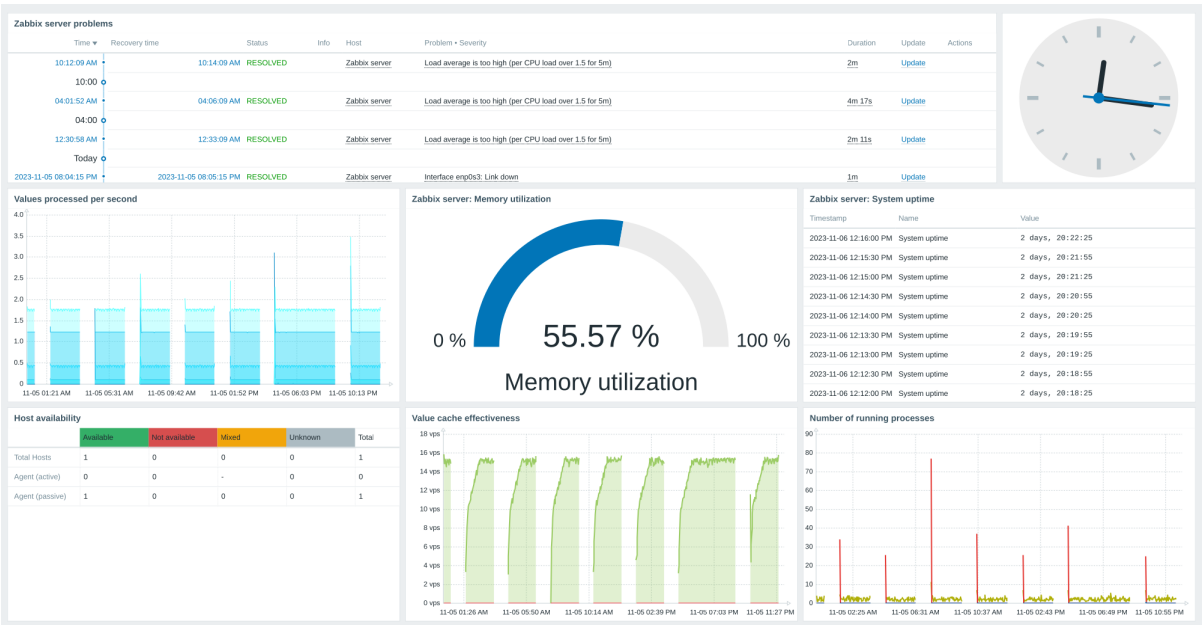
Therefore, it is important to know what entities an unprivileged user will be able to access as a result. In the following example, consider how access to host **X** (in Hostgroup 1) will be affected in various situations for a user who is in user groups A and B.

- If Group A has only *Read* access to Hostgroup 1, but Group B *Read-write* access to Hostgroup 1, the user will get **Read-write** access to 'X'.

Attention:
"Read-write" permissions have precedence over "Read" permissions.

- In the same scenario as above, if 'X' is simultaneously also in Hostgroup 2 that is **denied** to Group A or B, access to 'X' will be **unavailable**, despite a *Read-write* access to Hostgroup 1.
- If Group A has no permissions defined and Group B has a *Read-write* access to Hostgroup 1, the user will get **Read-write** access to 'X'.
- If Group A has *Deny* access to Hostgroup 1 and Group B has a *Read-write* access to Hostgroup 1, the user will get access to 'X' **denied**.

Other details



- An Admin level user with *Read-write* access to a host will not be able to link/unlink templates, if he has no access to the template group they belong to. With *Read* access to the template group he will be able to link/unlink templates to the host, however, will not see any templates in the template list and will not be able to operate with templates in other places.

- An Admin level user with *Read* access to a host will not see the host in the configuration section host list; however, the host triggers will be accessible in IT service configuration.
- Any non-Super Admin user (including 'guest') can see network maps as long as the map is empty or has only images. When hosts, host groups or triggers are added to the map, permissions are respected.
- Zabbix server will not send notifications to users defined as action operation recipients if access to the concerned host is explicitly "denied".

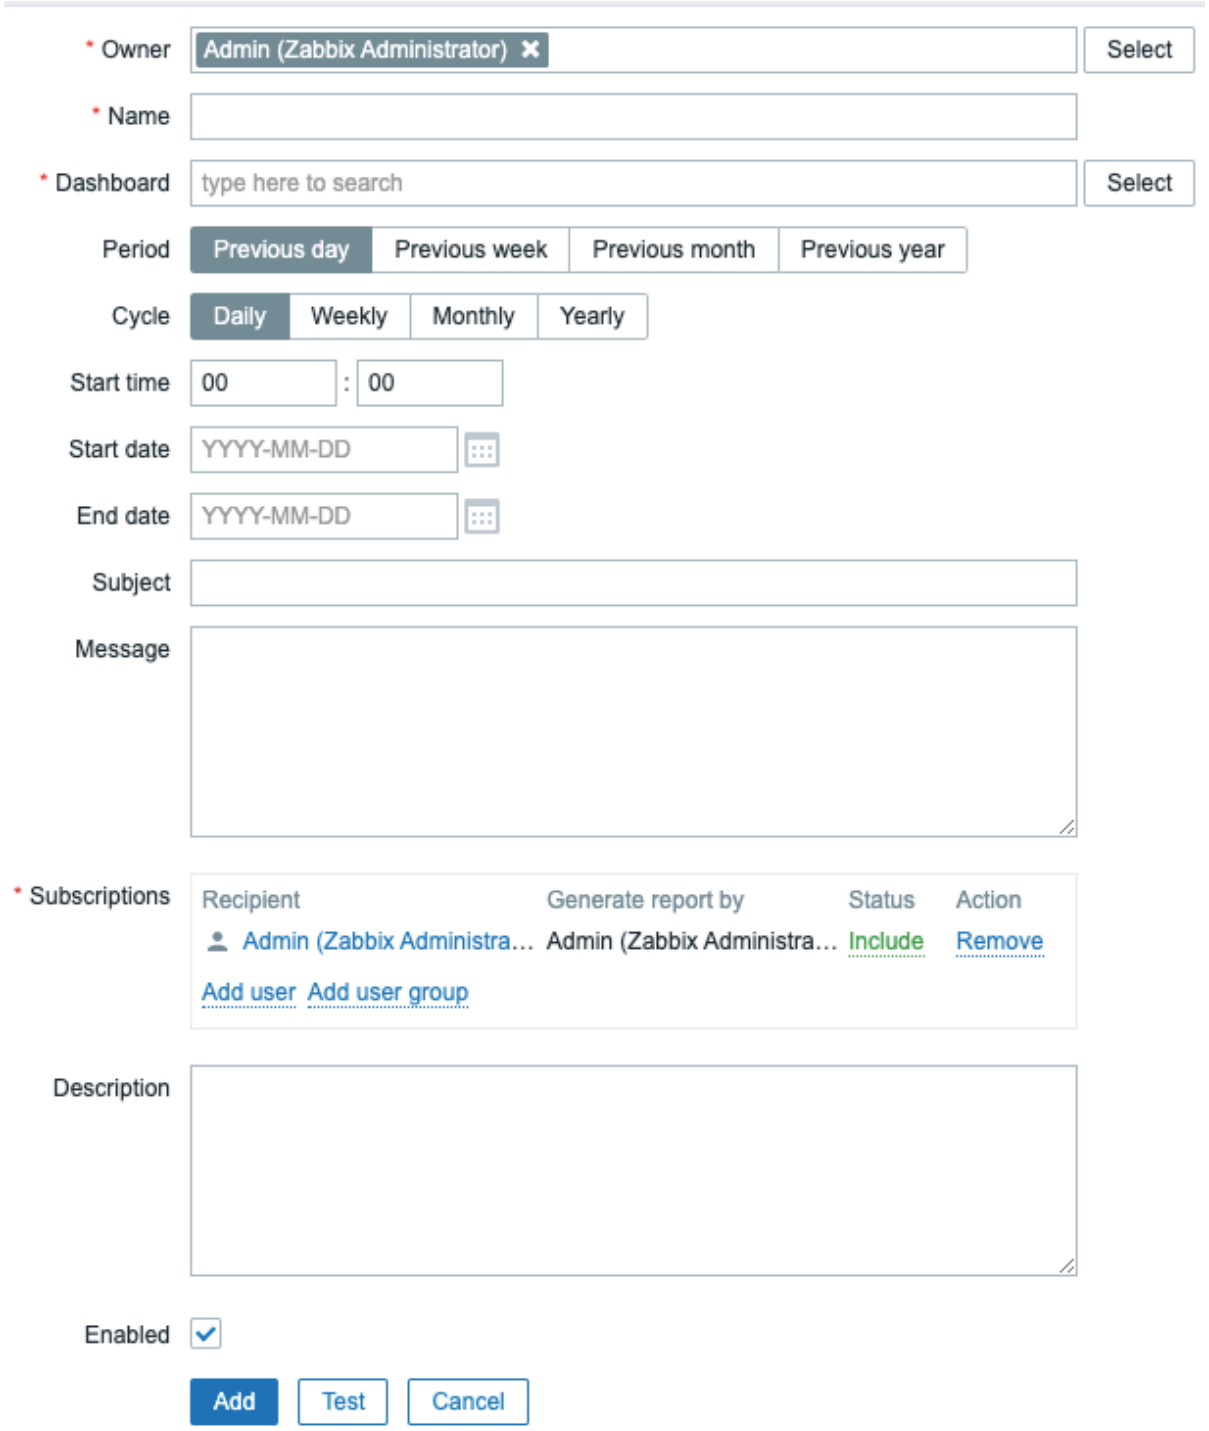
Scheduled reports

Overview

With the *Scheduled reports* feature, you can set up a PDF version of a given dashboard to be sent to specified recipients at recurring intervals.

Pre-requisites:

- Zabbix web service must be installed and configured correctly to enable scheduled report generation - see Setting up scheduled reports for instructions.
- A user must have a user role of type *Admin* or *Super admin* with the following permissions:
  - *Scheduled reports* in the *Access to UI elements* block (to view report settings)
  - *Manage scheduled reports* in the *Access to actions* block (to create/edit reports)



To create a scheduled report in Zabbix frontend, do the following:

1. Go to *Reports* > *Scheduled reports*.
2. Click *Create report* in the upper-right corner of the screen.
3. Enter parameters of the report in the form.

Alternatively, you can create a report by opening an existing one, clicking the *Clone* button, and saving it under a different name.

Configuration

The *Scheduled reports* tab contains general report attributes.

All mandatory input fields are marked with a red asterisk.

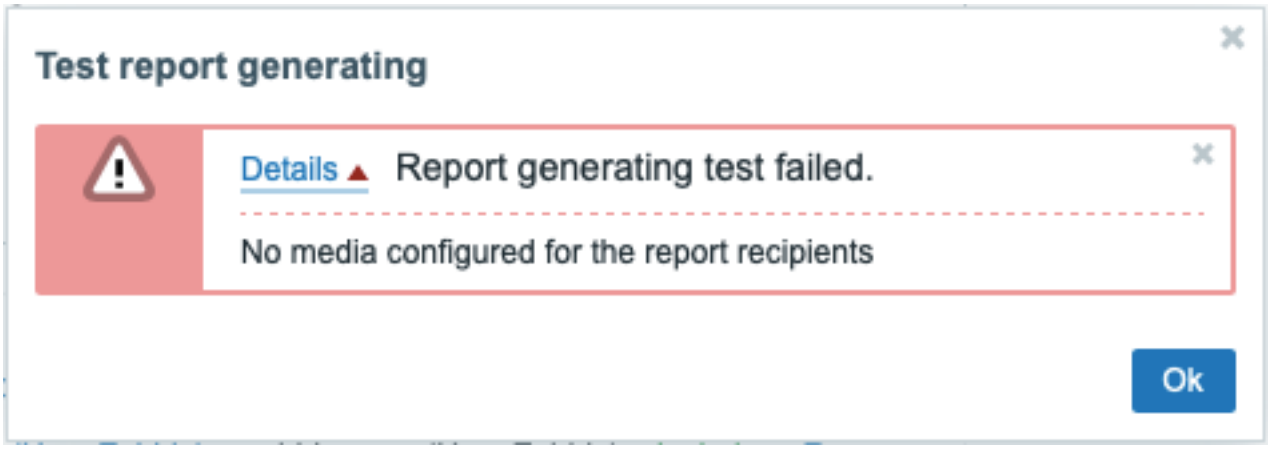
Parameter	Description
Owner	User that creates a report. *Super admin* level users are allowed to change the owner. For *Admin* level users, this field is read-only.
Name	Name of the report; must be unique.
Dashboard	Dashboard on which the report is based; only one dashboard can be selected at a time. To select a dashboard, start typing the name - a list of matching dashboards will appear; scroll down to select. Alternatively, you may click *Select* next to the field and select a dashboard from the displayed list.
Period	Time period for which the report will be prepared. Select the previous day, week, month, or year.
Cycle	Report generation frequency. The reports can be sent daily, weekly, monthly, or yearly. ”Weekly” mode allows you to select days of the week when the report will be sent.
Start time	Time of the day in the format hh:mm when the report will be prepared. Note that Zabbix server time zone will be used.
Repeat on	Days of the week when the report will be sent. This field is available only if *Cycle* is set to ”Weekly”.

Parameter	Description
Start date	Date when regular report generation should be started.
End date	Date when regular report generation should be stopped.
Subject	Subject of the report email. Supported macros: {TIME}, {TIMESTAMP}.
Message	Body of the report email. Supported macros: {TIME}, {TIMESTAMP}.
Subscriptions	List of report recipients. By default, includes only the report owner. Any Zabbix user with configured email media may be specified as a report recipient. Click *Add user* or *Add user group* to add more recipients. Click the username to edit settings: *Generate report by* - whether the report data should be generated based on the dashboard permissions of the current user or the recipient. *Status* - select ”Include” to send the report to the user or ”Exclude” to prevent sending the report to this user. At least one user must have the ”Include” status. The ”Exclude” status can be used to exclude specific users from a user group that is included. Note that users with insufficient permissions (that is, users with a role based on the *Admin* user type who are not members of the same user group as the recipient or report owner) will see ”Inaccessible user” or ”Inaccessible user group” instead of the actual names in the fields *Recipient* and *Generate report by*; the fields *Status* and *Action* will be displayed as read-only.
Enabled	Report status. Clearing this checkbox will disable the report.
Description	An optional description of the report. This description is for internal use and will not be sent to report recipients.

Form buttons

Buttons at the bottom of the form allow you to perform several operations.

Add	Add a report. This button is only available for new reports.
Update	Update the properties of a report.
Clone	Create another report based on the properties of the current report.
Test	Test if report configuration is correct by sending a report to the current user.
Delete	Delete the report.
Cancel	Cancel the editing of report properties.

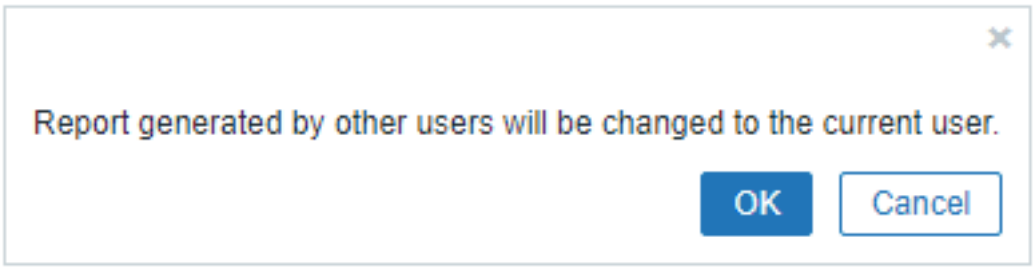


Testing

To test a report, click the *Test* button at the bottom of the report configuration form.

Note:
The *Test* button is not available if the report configuration form has been opened from the dashboard action menu.

If the configuration is correct, the test report is sent immediately to the current user. For test reports, subscribers and *Generate report by* user settings are ignored.



If the configuration is incorrect, an error message is displayed describing the possible cause.

Updating a report

To update an existing report, click the report name, make the required configuration changes, and then click the *Update* button.

If an existing report is updated by another user and this user changes the Dashboard, upon clicking the *Update* button, a warning message ”Report generated by other users will be changed to the current user” will be displayed.

Clicking *OK* at this step will lead to the following changes:

- *Generate report by* settings will be updated to display the user who edited the report last (unless *Generate report by* is set to the recipient).
- Users that have been displayed as ”Inaccessible user” or ”Inaccessible user group” will be deleted from the list of report subscribers.

Clicking *Cancel* will close the configuration form and cancel the report update.

Cloning a report

To quickly clone an existing report, click the *Clone* button at the bottom of an existing report configuration form. When cloning a report created by another user, the current user becomes the owner of the new report.

Report settings will be copied to the new report configuration form with respect to user permissions:

- If the user who clones a report has no permissions to a dashboard, the *Dashboard* field will be cleared.
- If the user who clones a report has no permissions to some users or user groups in the *Subscriptions* list, inaccessible recipients will not be cloned.
- *Generate report by* settings will be updated to display the current user (unless *Generate report by* is set to the recipient).

Change the required settings and the report name, then click *Add*.

Data export

Overview

Zabbix supports data export in real-time in two ways:

- export to files
- streaming to external systems

The following entities can be exported:

- trigger events
- item values
- trends (export to files only)

Export to files

Overview

It is possible to configure real-time exporting of trigger events, item values and trends in a newline-delimited JSON format.

Exporting is done into files, where each line of the export file is a JSON object. Value mappings are not applied.

In case of errors (data cannot be written to the export file or the export file cannot be renamed or a new one cannot be created after renaming it), the data item is dropped and never written to the export file. It is written only in the Zabbix database. Writing data to the export file is resumed when the writing problem is resolved.

The export file is created with read-write permissions for the file owner only. Additionally the file is readable by the owner group. All other permissions are denied.

Note that host/item can have no metadata (host groups, host name, item name) if the host/item was removed after the data was received, but before server exported data.

Configuration

Real-time export of trigger events, item values and trends is configured by specifying a directory for the export files - see the ExportDir parameter in server configuration.

Two other parameters are available:

- `ExportFileSize` may be used to set the maximum allowed size of an individual export file. When a process needs to write to a file it checks the size of the file first. If it exceeds the configured size limit, the file is renamed by appending .old to its name and a new file with the original name is created.

Attention:
A file will be created per each process that will write data (i.e. approximately 4-30 files). As the default size per export file is 1G, keeping large export files may drain the disk space fast.

- `ExportType` allows you to specify which entity types (events, history, trends) will be exported.

Newline-delimited JSON export protocol

This section presents details of the export protocol in a newline-delimited JSON format, used in:

- data export to files
- streaming to external systems

All files have an `.ndjson` extension. Each line of the export file is a JSON object.

Trigger event export

The following information is exported for a problem event:

Field		Type	Description
clock		number	Number of seconds since Epoch to the moment when problem was detected (integer part).
ns		number	Number of nanoseconds to be added to `clock` to get a precise problem detection time.
value		number	1 (always).
eventid		number	Problem event ID.
name		string	Problem event name.
severity		number	Problem event severity (0 - Not classified, 1 - Information, 2 - Warning, 3 - Average, 4 - High, 5 - Disaster).
hosts		array	List of hosts involved in the trigger expression; there should be at least one element in array.
-		object	
	host	string	Host name.
	name	string	Visible host name.
groups		array	List of host groups of all hosts involved in the trigger expression; there should be at least one element in array.
-		string	Host group name.
tags		array	List of problem tags (can be empty).
-		object	
	tag	string	Tag name.
	value	string	Tag value (can be empty).

The following information is exported for a recovery event:

Field	Type	Description
clock	number	Number of seconds since Epoch to the moment when problem was resolved (integer part).
ns	number	Number of nanoseconds to be added to `clock` to get a precise problem resolution time.
value	number	0 (always).
eventid	number	Recovery event ID.
p_eventid	number	Problem event ID.

Trigger event export examples

Problem:

```
{"clock":1519304285,"ns":123456789,"value":1,"name":"Either Zabbix agent is unreachable on Host B or polle
```

Recovery:

```
{"clock":1519304345,"ns":987654321,"value":0,"eventid":43,"p_eventid":42}
```

Problem (multiple problem event generation):

```
{"clock":1519304286,"ns":123456789,"value":1,"eventid":43,"name":"Either Zabbix agent is unreachable on Ho
```

```
{"clock":1519304286,"ns":123456789,"value":1,"eventid":43,"name":"Either Zabbix agent is unreachable on Ho
```

Recovery:

```
{"clock":1519304346,"ns":987654321,"value":0,"eventid":44,"p_eventid":43}
```

```
{"clock":1519304346,"ns":987654321,"value":0,"eventid":44,"p_eventid":42}
```

Item value export

The following information is exported for a collected item value:

Field	Type	Description
host	object	Host name of the item host.
host	string	Host name.
name	string	Visible host name.
groups	array	List of host groups of the item host; there should be at least one element in array.
-	string	Host group name.
item_tags	array	List of item tags (can be empty).
-	object	
tag	string	Tag name.
value	string	Tag value (can be empty).
itemid	number	Item ID.
name	string	Visible item name.
clock	number	Number of seconds since Epoch to the moment when value was collected (integer part).
ns	number	Number of nanoseconds to be added to `clock` to get a precise value collection time.
timestamp (*Log* only)	number	0 if not available.
source (*Log* only)	string	Empty string if not available.
severity (*Log* only)	number	0 if not available.
eventid (*Log* only)	number	0 if not available.
value	number (for numeric items) or string (for text items)	Collected item value.
type	number	Collected value type: 0 - numeric float, 1 - character, 2 - log, 3 - numeric unsigned, 4 - text, 5 - binary, 6 - JSON

Item value export example

Numeric (unsigned) value:

```
{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"
```

Numeric (float) value:

{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"

Character, text value:

{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"

Log value:

{"host":{"host":"Host A","name":"Host A visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"

Trends export

The following information is exported for a calculated trend value:

Field	Type	Description
host	object	Host name of the item host.
host	string	Host name.
name	string	Visible host name.
groups	array	List of host groups of the item host; there should be at least one element in array.
-	string	Host group name.
item_tags	array	List of item tags (can be empty).
-	object	
tag	string	Tag name.
value	string	Tag value (can be empty).
itemid	number	Item ID.
name	string	Visible item name.
clock	number	Number of seconds since Epoch to the moment when value was collected (integer part).
count	number	Number of values collected for a given hour.
min	number	Minimum item value for a given hour.
avg	number	Average item value for a given hour.
max	number	Maximum item value for a given hour.
type	number	Value type: 0 - numeric float, 3 - numeric unsigned

Trends export examples

Numeric (unsigned) value:

{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"

Numeric (float) value:

{"host":{"host":"Host B","name":"Host B visible"},"groups":["Group X","Group Y","Group Z"],"item_tags":[{"

Streaming to external systems

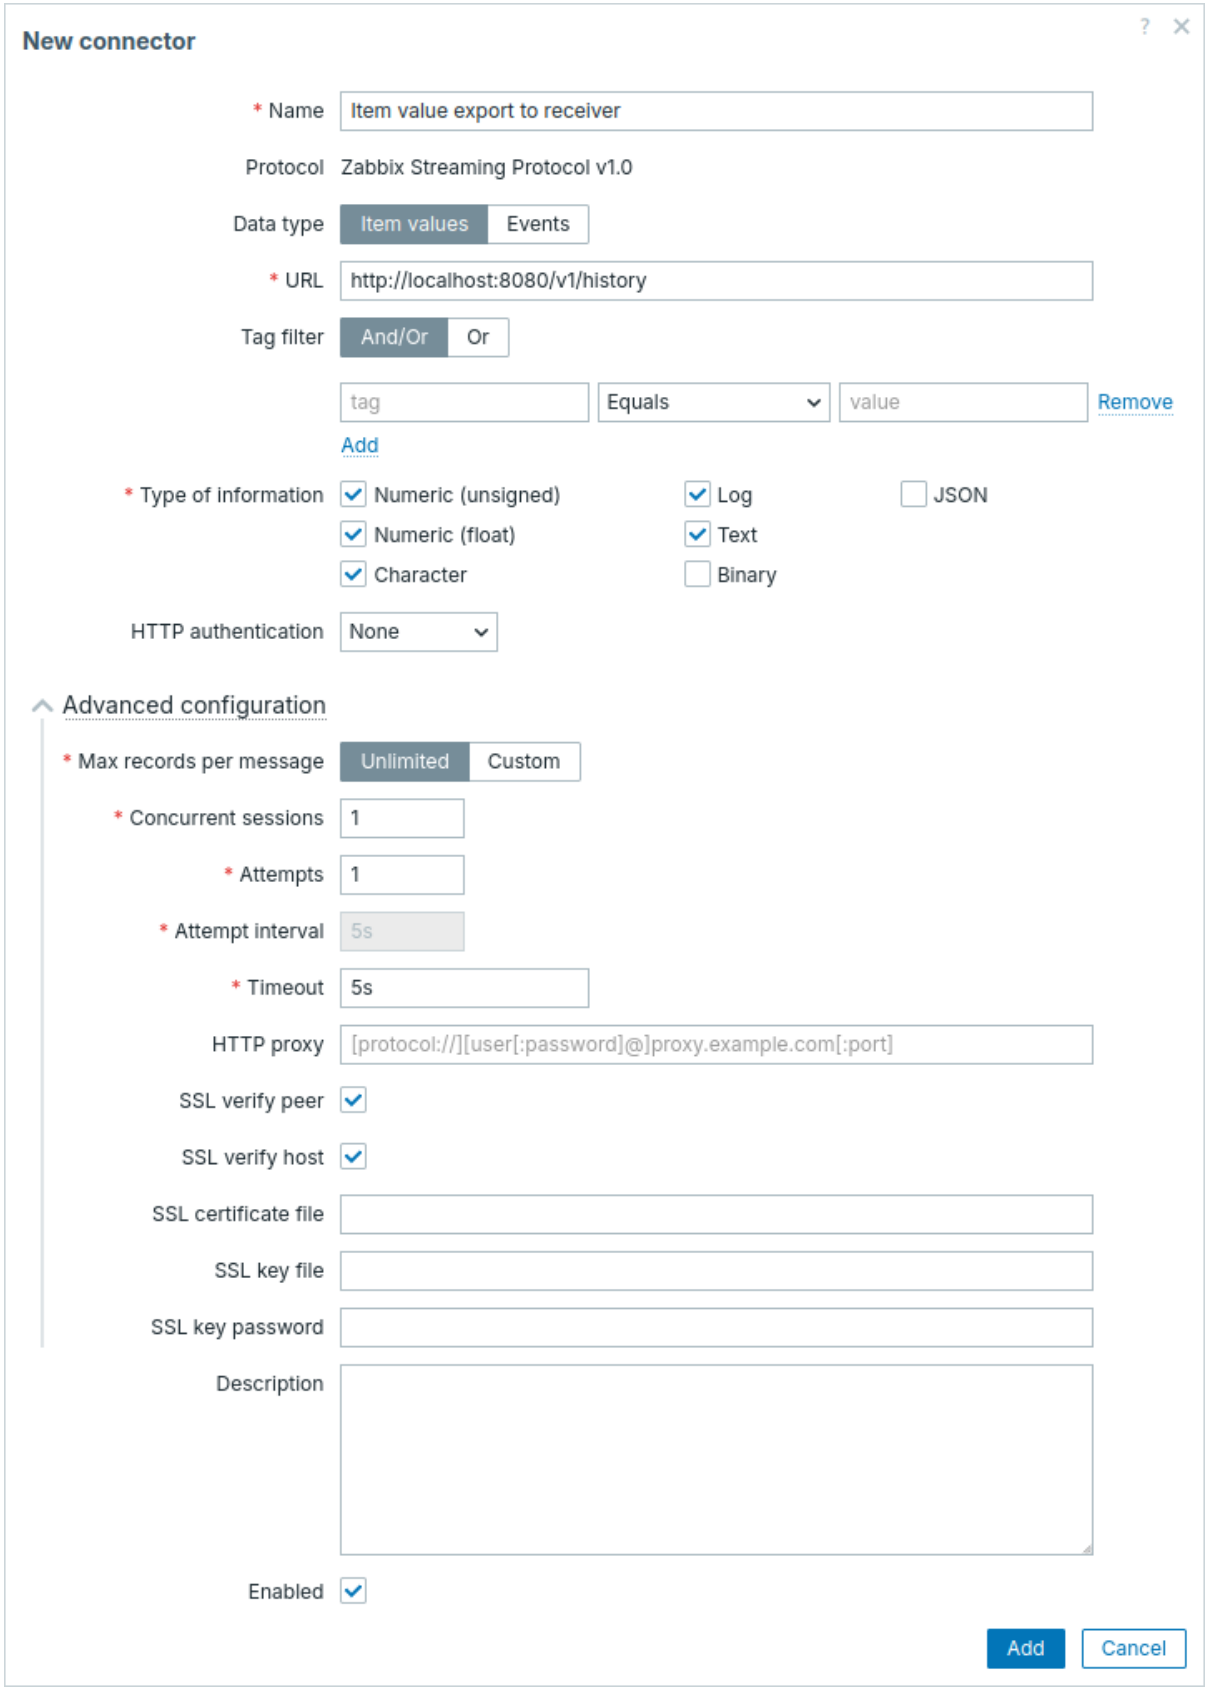
Overview

It is possible to stream item values and events from Zabbix to external systems over HTTP (see protocol details).

The tag filter can be used to stream subsets of item values or events.

Two Zabbix server process types are responsible for data streaming: `connector manager` and `connector worker`. A Zabbix internal item `zabbix[connector_queue]` allows you to monitor the count of values enqueued in the connector queue.

Configuration



The following steps are required to configure data streaming to an external system:

1. Have a remote system set up for receiving data from Zabbix. For this purpose, the following tools are available:

- An example of a simple receiver that logs the received information in `events.ndjson` and `history.ndjson` files.
- Kafka connector for Zabbix server - a lightweight server written in Go, designed to forward item values and events from a Zabbix server to a Kafka broker.

2. Set the required number of connector workers in Zabbix by adjusting the `StartConnectors` parameter in `zabbix_server.conf`. The number of connector workers should match (or exceed if concurrent sessions are more than 1) the configured connector count in Zabbix frontend. Then, restart Zabbix server.

3. Configure a new connector in Zabbix frontend (*Administration* > *General* > *Connectors*) and reload the server cache with the `zabbix_server -R config_cache_reload` command.

Mandatory fields are marked by an asterisk.

Parameter	Description
Name	Enter the connector name.
Data type	Select the data type to stream: **Item values** - stream item values from Zabbix to external systems; **Events** - stream events from Zabbix to external systems.

Parameter	Description
URL	Enter the receiver URL. User macros are supported.
Tag filter	Export only item values or events matching the tag filter. If not set, then export everything. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met.
Type of information	Select the type of information (numeric (unsigned), numeric (float), character, etc.), by which to filter the item values that the connector should stream. This field is available if *Data type* is set to ”Item values”.
HTTP authentication	Select the authentication option: **None** - no authentication used; **Basic** - basic authentication is used; **NTLM** - NTLM (Windows NT LAN Manager) authentication is used; **Kerberos** - Kerberos authentication is used (see also: Configuring Kerberos with Zabbix); **Digest** - Digest authentication is used; **Bearer** - Bearer authentication is used.
Username	Enter the user name (up to 255 characters). User macros are supported. This field is available if *HTTP authentication* is set to ”Basic”, ”NTLM”, ”Kerberos”, or ”Digest”.
Password	Enter the user password (up to 255 characters). User macros are supported. This field is available if *HTTP authentication* is set to ”Basic”, ”NTLM”, ”Kerberos”, or ”Digest”.
Bearer token	Enter the Bearer token. User macros are supported. This field is available and required if *HTTP authentication* is set to ”Bearer”.
Advanced configuration	Click the *Advanced configuration* header to display advanced configuration options (see below).
Max records per message	Specify the maximum number of values or events that can be streamed within one message.
Concurrent sessions	Select the number of sender processes to run for this connector. Up to 100 sessions can be specified; the default value is ”1”.
Attempts	Number of attempts for streaming data. Up to 5 attempts can be specified; the default value is ”1”.
Attempt interval	Specify how long the connector should wait after an unsuccessful attempt to stream data. Up to 10s can be specified; the default value is ”5s”. This field is available if *Attempts* is set to ”2” or more. Unsuccessful attempts are those where establishing a connection has failed, or where the HTTP response code is not 200, 201, 202, 203, 204. Retries are **triggered** in case of communication errors or when the HTTP response code is not 200, 201, 202, 203, 204, 400, 401, 403, 404, 405, 415, 422. Redirects are followed, so 302 -> 200 is a positive response; whereas 302 -> 503 will trigger a retry.
Timeout	Specify the message timeout (1-60 seconds, default - 5 seconds). Time suffixes are supported (e.g., 30s, 1m). User macros are supported.

Parameter	Description
HTTP proxy	You can specify an HTTP proxy to use in the following format: `[protocol://][username[:password]@]proxy.example.com[:port]` User macros are supported. The optional `protocol://` prefix may be used to specify alternative proxy protocols (the protocol prefix support was added in cURL 7.21.7). With no protocol specified, the proxy will be treated as an HTTP proxy. By default, 1080 port will be used. If *HTTP proxy* is specified, the proxy will overwrite proxy related environment variables like `http_proxy`, `HTTPS_PROXY`. If not specified, the proxy will not overwrite proxy-related environment variables. The entered value is passed on as is, no sanity checking takes place. You may also enter a SOCKS proxy address. If you specify the wrong protocol, the connector will fail to stream item values or events from Zabbix. Note that only simple authentication is supported with HTTP proxy.
SSL verify peer	Mark the checkbox to verify the SSL certificate of the web server. The server certificate is verified against the trusted certificate authority (CA) certificates from the system-wide CA location. You can override the location of CA files using Zabbix server or proxy configuration parameter SSLCALocation.
SSL verify host	Mark the checkbox to verify that the *Common Name* field or the *Subject Alternate Name* field of the web server certificate matches. This sets the CURLOPT_SSL_VERIFYHOST cURL option.
SSL certificate file	Name of the SSL certificate file used for client authentication. The certificate file must be in PEM[1] format. User macros are supported. If the certificate file also contains the private key, leave the *SSL key file* field empty. If the key is encrypted, specify the password in the *SSL key password* field. The directory containing this file is specified by Zabbix server or proxy configuration parameter SSLCertLocation.
SSL key file	Name of the SSL private key file used for client authentication. The private key file must be in PEM[1] format. User macros are supported. The directory containing this file is specified by Zabbix server or proxy configuration parameter SSLKeyLocation.
SSL key password	SSL private key file password. User macros are supported.
Description	Enter the connector description.
Enabled	Mark the checkbox to enable the connector.

When the Kafka connector is configured with a comma-separated list of bootstrap broker addresses (for example, `Kafka.URL=kafka1.exampl`) the Kafka client connects to the broker(s) that respond first and uses their cluster metadata. If the list contains addresses from different Kafka clusters, only the fastest-responding cluster will be used and other addresses will be logged as unavailable; as a result, startup warnings such as the following may appear even though the connector is connected:

```
kafka cluster connected, but broker(s) "kafka1.example.com:9093, kafka2.example.com:9093" unavailable; wil
```

In some environments (private networks, container networks or non-standard DNS/hosts setups) hostnames or IPs may resolve to loopback addresses (for example, `127.0.0.1/localhost`) or be normalized by the client, which can make such warnings misleading. To reduce confusion, ensure all `Kafka.URL` addresses belong to the same Kafka cluster, verify DNS resolution from the connector host and the brokers' `advertised.listeners`, and prefer addresses that resolve to the broker's advertised address.

Protocol

Communication between the server and the receiver is done over HTTP using REST API, NDJSON, "Content-Type: application/x-ndjson".

For more details, see Newline-delimited JSON export protocol.

Server request

Example of streaming item values:

```
POST /v1/history HTTP/1.1
Host: localhost:8080
Accept: */*
Accept-Encoding: deflate, gzip, br, zstd
Content-Length: 628
Content-Type: application/x-ndjson
```

```
{"host":{"host":"Zabbix server","name":"Zabbix server"},"groups":["Zabbix servers"],"item_tags":[{"tag":"f
{"host":{"host":"Zabbix server","name":"Zabbix server"},"groups":["Zabbix servers"],"item_tags":[{"tag":"f
{"host":{"host":"Zabbix server","name":"Zabbix server"},"groups":["Zabbix servers"],"item_tags":[{"tag":"b
```

Example of streaming events:

```
POST /v1/events HTTP/1.1
Host: localhost:8080
Accept: */*
Accept-Encoding: deflate, gzip, br, zstd
Content-Length: 333
Content-Type: application/x-ndjson

{"clock":1673454303,"ns":800155804,"value":1,"eventid":5,"name":"trigger for foo being 0","severity":0,"ho
{"clock":1673454303,"ns":832290669,"value":0,"eventid":6,"p_eventid":5}
```

Receiver response

The response consists of the HTTP response status code and the JSON payload. The HTTP response status code must be "200", "201", "202", "203", or "204" for requests that were handled successfully, other for failed requests.

Example of success:

```
HTTP/1.1 200 OK
Content-Type: application/json
X-Content-Type-Options: nosniff
Date: Tue, 21 Apr 2026 10:13:04 GMT
Content-Length: 23

{"response":"success"}
```

Example with errors:

```
HTTP/1.1 422 Unprocessable Entity
Content-Type: application/json
X-Content-Type-Options: nosniff
Date: Tue, 21 Apr 2026 12:15:01 GMT
Content-Length: 55

{"error":"invalid character '{' after top-level value"}
```

SNMP gateway

Overview

Zabbix SNMP gateway is an AgentX-extension for snmpd supporting both SNMP polling and trapping.

With Zabbix SNMP gateway it is possible to use the SNMP protocol to retrieve:

- trigger data;
- problem trigger data;
- host group status (count of triggers by trigger state per group)

The data is retrieved by the OID, which is a combination of a common base and a specific suffix. The common **base** is set in the configuration file of SNMP gateway, for example:

- `BaseOID=1.3.6.1.4.1.3043.7.55` - for any trigger data;
- `ProblemBaseOID=1.3.6.1.4.1.3047.7.55` - for problem trigger data;
- `BaseOID=1.3.6.1.4.1.3046.7.55` - for host group status.

The OID **suffix** is set in the configuration on host triggers as a **tag** (for example, `OIDSuffix:3`) in the frontend.

In this case all information for the trigger will be available under `OID=1.3.6.1.4.1.3043.7.55.X.3`. "X" here will be the number of trigger data fields (i.e. 1 - suffix, 2 - ID, 3 - expression, 4 - description, etc.).

For a more detailed description and the configuration file example, see the SNMP gateway readme file.

Installation and setup

See the readme file of SNMP gateway for instructions on:

- installing and configuring snmpd;
- enabling AgentX support;
- configuring Zabbix SNMP gateway;
- configuring SNMP traps for trigger state changes.

Retrieving data

With everything set up properly, you may use `snmpwalk` and `snmpget` commands to retrieve data:

```
[user@localhost ~]# snmpget -v2c -c public 127.0.0.1 1.3.6.1.4.1.3043.7.55.2.3
SNMPv2-SMI::enterprises.3043.7.55.2.3 = INTEGER: 15247
```

```
[user@localhost ~]# snmpwalk -v2c -c public 127.0.0.1 1.3.6.1.4.1.3043.7.55
SNMPv2-SMI::enterprises.3043.7.55.1.1 = INTEGER: 1
SNMPv2-SMI::enterprises.3043.7.55.1.3 = INTEGER: 3
SNMPv2-SMI::enterprises.3043.7.55.1.4 = INTEGER: 4
SNMPv2-SMI::enterprises.3043.7.55.1.5 = INTEGER: 5
SNMPv2-SMI::enterprises.3043.7.55.1.6 = INTEGER: 6
SNMPv2-SMI::enterprises.3043.7.55.1.10 = INTEGER: 10
SNMPv2-SMI::enterprises.3043.7.55.2.1 = INTEGER: 15367
SNMPv2-SMI::enterprises.3043.7.55.2.3 = INTEGER: 15247
SNMPv2-SMI::enterprises.3043.7.55.2.4 = INTEGER: 15365
SNMPv2-SMI::enterprises.3043.7.55.2.5 = INTEGER: 15366
SNMPv2-SMI::enterprises.3043.7.55.2.6 = INTEGER: 13493
SNMPv2-SMI::enterprises.3043.7.55.2.10 = INTEGER: 13503
...
```

Filtering options

You may limit the problem trigger information in SNMP gateway configuration:

- by severity (by default `ProblemMinSeverity=-1`)
- by hiding acknowledged problems (by default `ProblemHideAck=false`)

You may limit the problem count per host group in SNMP gateway configuration:

- by unknown state triggers (by default `CountUnknown=false`)
- by triggers with acknowledged/unacknowledged/all problems (by default `CountAcknowledgeStatus=all`)

Configuration export/import

Overview

Zabbix export/import functionality makes it possible to exchange various configuration entities between one Zabbix system and another.

Typical use cases for this functionality:

- share templates or network maps - Zabbix users may share their configuration parameters
- upload a template to Zabbix Community templates. Then others can download the template and import the file into Zabbix.
- integrate with third-party tools - universal YAML, XML and JSON formats make integration and data import/export possible with third-party tools and applications

What can be exported/imported

Objects that can be exported/imported are:

- Host groups (*through Zabbix API only*)
- Template groups (*through Zabbix API only*)
- Templates
- Hosts
- Network maps
- Media types
- Images
- Dashboards
- Regular expressions

Export format

Data can be exported using the Zabbix web frontend or Zabbix API. Supported export formats are YAML, XML and JSON.

Details about export

- All supported elements are exported in one file.
- Host and template entities (items, triggers, graphs, discovery rules) that are inherited from linked templates are not exported. Any changes made to those entities on a host level (such as changed item interval, modified regular expression or added prototypes to the low-level discovery rule) will be lost when exporting; when importing, all entities from linked templates are re-created as on the original linked template.
- Entities created by low-level discovery and any entities depending on them are not exported. For example, a trigger created for an LLD-rule generated item will not be exported.
- When the exported host/template contains entities supporting timeouts, the timeout values will be exported if these entities have their own timeouts configured.

Details about import

- Import stops at the first error.
- When updating existing images during image import, "imagetype" field is ignored, i.e., it is impossible to change image type via import.
- When importing hosts/templates using the "Delete missing" option, host/template macros not present in the import file will be deleted from
the host/template after the import.
- Empty tags for items, triggers, graphs, discoveryRules, itemPrototypes, triggerPrototypes, graphPrototypes are meaningless, i.e., it's the same as if it was missing.
- If entities of the imported host/template have their own timeouts configured, they will be applied; otherwise, proxy/global timeouts will be applied.
- Import supports YAML, XML and JSON, the import file must have a correct file extension: .yaml and .yml for YAML, .xml for XML and .json for JSON. See compatibility information about supported XML versions.
- Import supports configuration files only in UTF-8 encoding (with or without BOM); other encodings (UTF16LE, UTF16BE, UTF32LE, UTF32BE, etc.) will result in an import conversion error.

YAML base format

The YAML export format contains the following nodes:

- Root node for Zabbix YAML export
- Export version

```
zabbix_export:
  version: '8.0'
```

Other nodes are dependent on exported objects.

XML format

The XML export format contains the following tags:

- Default header for XML documents
- Root tag for Zabbix XML export
- Export version

```
<?xml version="1.0" encoding="UTF-8"?>
<zabbix_export>
    <version>8.0</version>
</zabbix_export>
```

Other tags are dependent on exported objects.

JSON format

The JSON export format contains the following objects:

- Root object for Zabbix JSON export
- Export version

```
{
    "zabbix_export": {
        "version": "8.0"
    }
}
```

Other objects are dependent on exported objects.

Template groups

Overview

In the frontend, template groups can be exported only with template export. When a template is exported, all groups it belongs to are exported with it automatically.

API allows exporting template groups independently of templates.

Export format

```
template_groups:
  - uuid: 36bff6c29af64692839d077febfc7079
    name: 'Network devices'
```

Exported elements

Element	Type	Description
uuid	string	Unique identifier for this template group.
name	string	Group name.

Host groups

Overview

In the frontend, host groups can be exported only with host export. When a host is exported, all groups it belongs to are exported with it automatically.

API allows exporting host groups independently of hosts.

Export format

```
host_groups:
  - uuid: 6f6799aa69e844b4b3918f779f2abf08
    name: 'Zabbix servers'
```

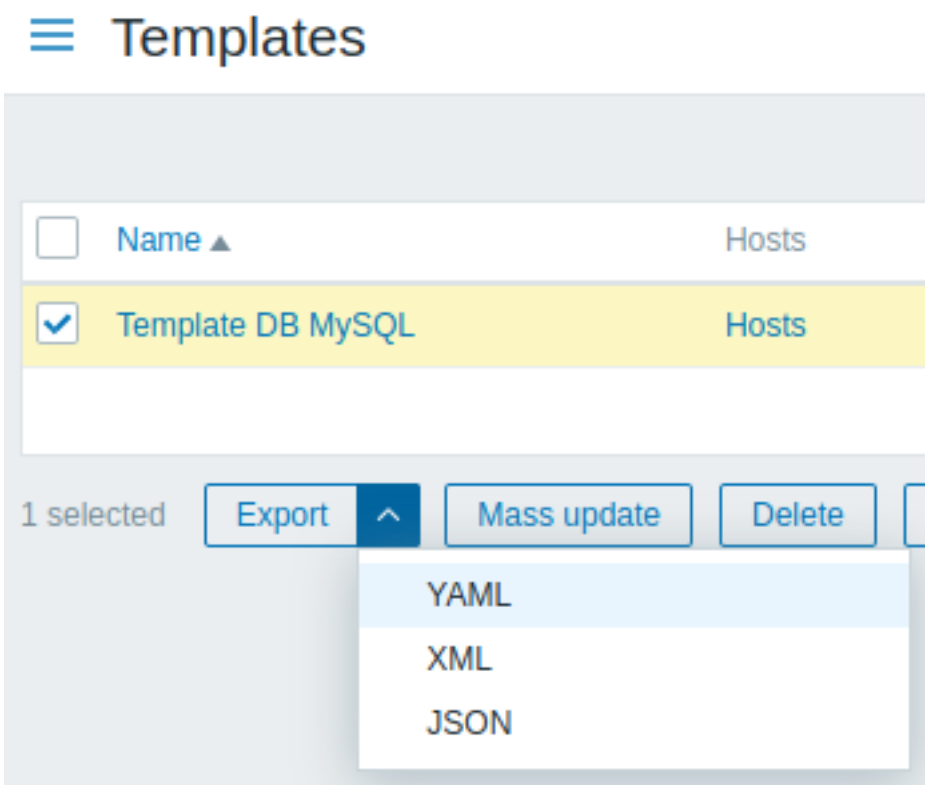
Exported elements

Element	Type	Description
uuid	string	Unique identifier for this host group.
name	string	Group name.

Templates

Overview

Templates are exported with many related objects and object relations.



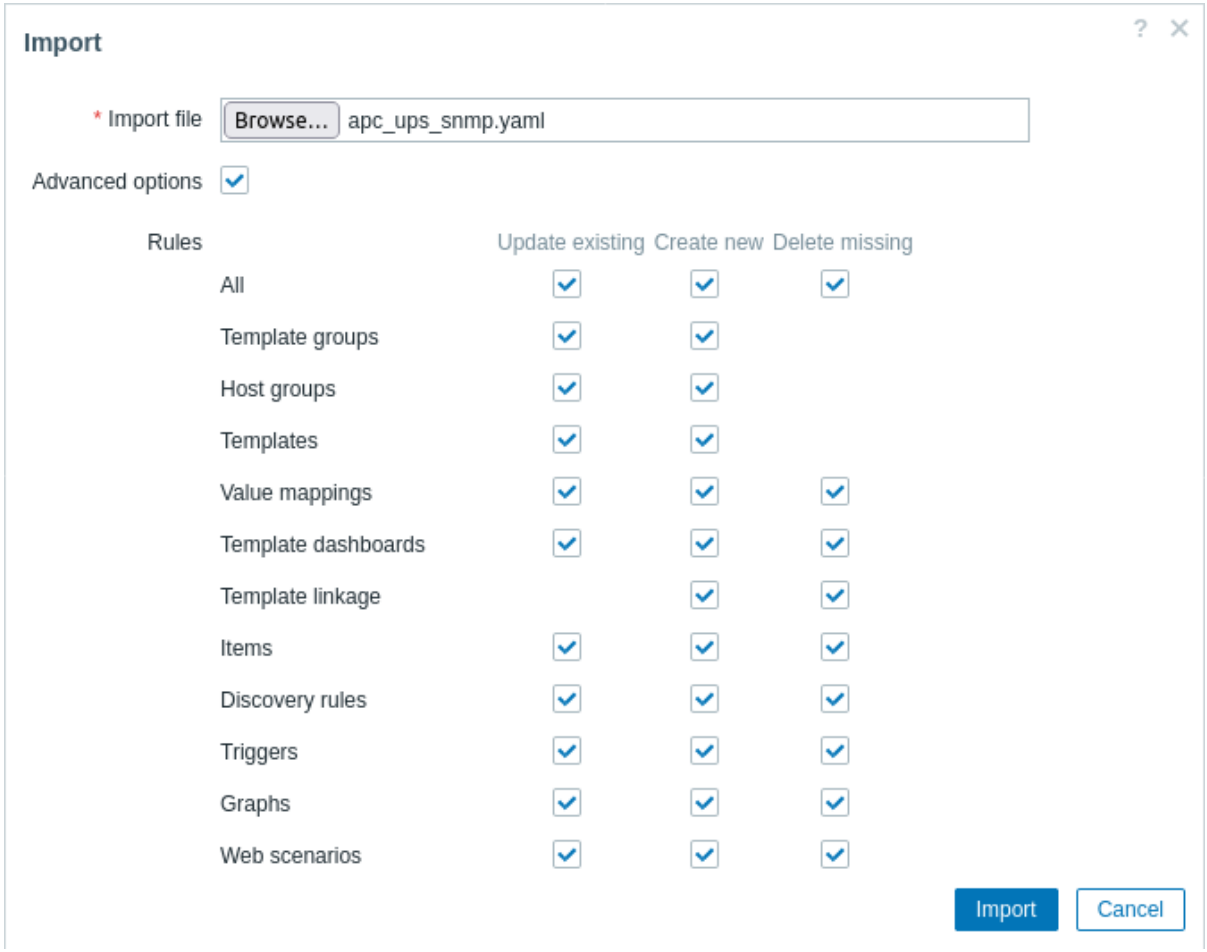
Template export contains:

- Linked template groups
- Linked host groups (if used in host prototype configuration)
- Template data
- Linkage to other templates
- Linkage to template groups
- Directly linked items
- Directly linked triggers
- Directly linked graphs
- Directly linked dashboards
- Directly linked discovery rules with all prototypes
- Directly linked web scenarios
- Value maps

Exporting

To export templates, do the following:

1. Go to *Data collection* > *Templates*.
2. Mark the checkboxes of the templates to export.
3. Click *Export* below the list to export in the default YAML format, or click the arrow to select a different export format.



Depending on the selected format, templates are exported to a local file with a default name:

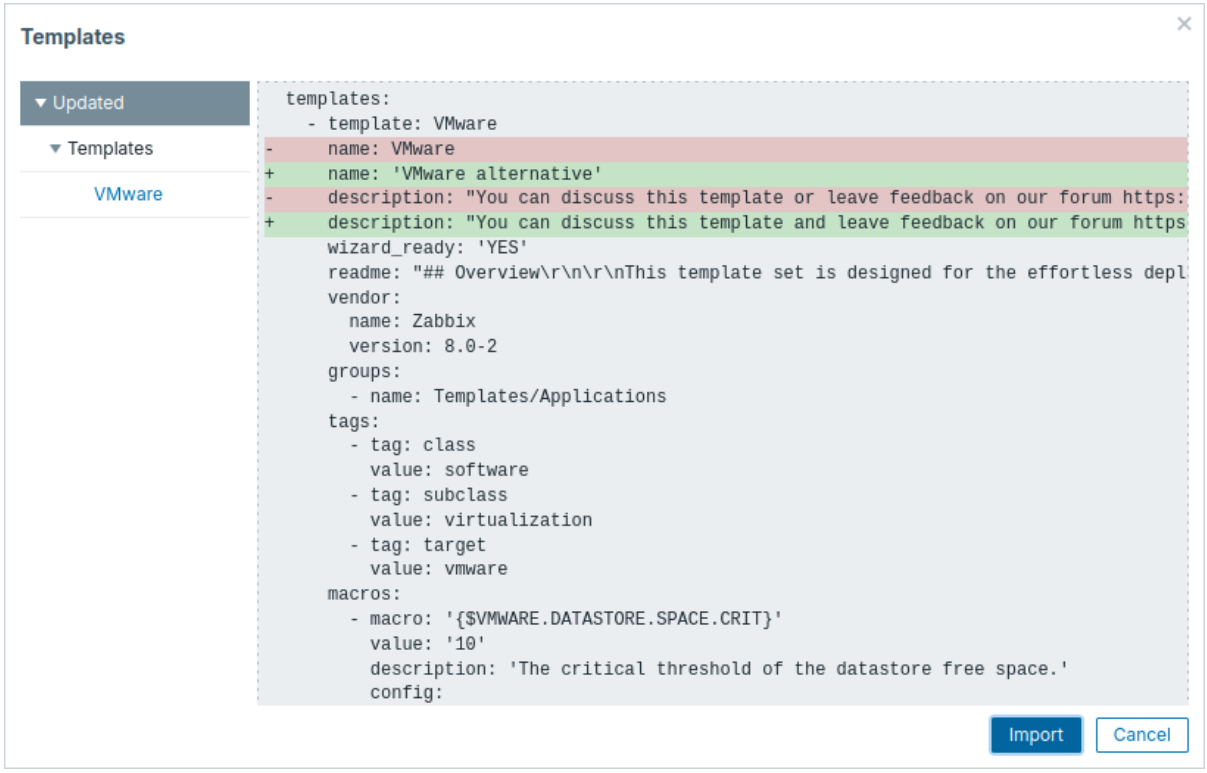
- `zabbix_export_templates.yaml` - in YAML export;
- `zabbix_export_templates.xml` - in XML export;
- `zabbix_export_templates.json` - in JSON export.

Importing

To import templates, do the following:

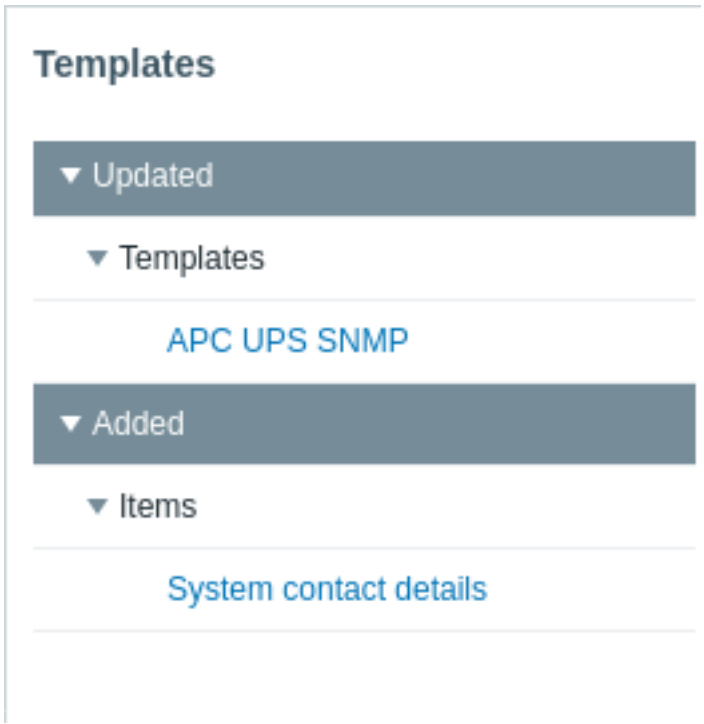
1. Go to *Data collection* > *Templates*.
2. Click *Import* in the upper-right corner.
3. Select the import file.
4. Mark the checkboxes of the import rules you want to apply (see below).
5. Click *Import* in the lower-right corner of the configuration form.

If you mark the *Advanced options* checkbox, a detailed list of all importable elements will be displayed - mark or unmark each import rule as required.



If you click the checkbox in the *All* row, all elements below it will be marked/unmarked.

Import rules:



Rule	Description
Update existing	Existing elements will be updated using data from the import file. Otherwise, they will not be updated.
Create new	New elements will be created using data from the import file. Otherwise, they will not be created.
Delete missing	Existing elements not present in the import file will be removed. Otherwise, they will not be removed. If *Delete missing* is marked for *Template linkage*, current template linkage not present in the import file will be unlinked. Entities (items, triggers, graphs, etc.) inherited from the unlinked templates will not be removed (unless the *Delete missing* option is selected for each entity as well).

Attention:
If templates with the same names already exist, the *Delete missing* options should be checked when importing to achieve a clean import. This way, the old items that are no longer in the updated template will be removed (note that it will mean losing history of these old items).

On the next screen, you will be able to view the content of a template being imported. If this is a new template, all elements will be listed in green. If updating an existing template, new template elements will be highlighted in green; removed template elements will be highlighted in red; elements that have not changed will be listed on a gray background.

The menu on the left can be used to navigate through the list of changes. The *Updated* section highlights all changes made to existing template elements. The *Added* section lists new template elements. The elements in each section are grouped by element type; click the gray arrow to expand or collapse the group of elements.

Review template changes and then click *Import* to perform the template import. A success or failure message of the import will be displayed in the frontend.

Export format When a template is exported, Zabbix generates a structured YAML, JSON, or XML format. The export includes template elements, such as template metadata, items, macros, triggers, dashboards, and more.

Each element serves a specific purpose and may contain nested elements.

The following sections describe each element in the export format. The examples use the Linux by Zabbix agent template.

An ellipsis (`...`) indicates elements omitted for brevity. The note (`see table below`) is used when the element is explained in more detail in later sections.

```
zabbix_export:
  version: '8.0'
  template_groups:
    - uuid: 846977d1dfed4968bc5f8bdb363285bc
      name: 'Templates/Operating systems'
  templates: (see table below)
  triggers: (see table below)
  graphs: (see table below)
```

Template metadata

Element	Type	Description
version	string	(required) Export version.
template_groups		(required) Root element for template groups.
uuid	string	(required) Unique identifier for this template group.
name	string	(required) Template group name.
host_groups		Root element for host groups that are used by host prototypes.
uuid	string	(required) Unique identifier for this host group.
name	string	(required) Host group name.
templates		Root element for templates.
triggers		Root element for template trigger elements, which are the same as for template item triggers.
graphs		Root element for template graph elements, which are the same as for host graphs.

Templates

```
zabbix_export:
  (...)
  templates:
    - uuid: f8f7908280354f2abeed07dc788c3747
      template: 'Linux by Zabbix agent'
      name: 'Linux by Zabbix agent'
      description: |
        This is an official Linux template. It requires Zabbix agent 8.0 or newer. (...)
      wizard_ready: 'YES'
      readme: |
        ## Overview

        This is an official Linux template. It requires Zabbix agent 8.0 or newer. (...)
      vendor:
        name: Zabbix
        version: 8.0-2
      groups:
        - name: 'Templates/Operating systems'
      items: (see table below)
      discovery_rules: (see table below)
      tags:
        - tag: class
          value: os
        - tag: target
          value: linux
      macros:
        - macro: '{$AGENT.TIMEOUT}'
          value: 3m
          description: 'Timeout after which agent is considered unavailable. Works only for agents reachab
          config: (see table below)
        - macro: '{$CPU.UTIL.CRIT}'
          value: '90'
          description: 'Critical threshold of CPU utilization expressed in %.'
          config: (see table below)
        (...)
```

```
      dashboards: (see table below)
      valuemaps: (see table below)
    (...)
```

Element	Type	Description
uuid	string	(required) Unique identifier for this template.
template	string	(required) Unique template name.
name	string	Visible template name.
description	text	Template description.
wizard_ready	text	Whether the template is available for selection in the Host Wizard. Possible values:[1] NO (0, default), YES (1). See also: Template object (`wizard_ready`).
readme	text	Template-specific configuration instructions to display in the Host Wizard. Supports Markdown formatting.
vendor		Root element for template vendor (present if the exported template contains vendor data).
name	string	(required) Template vendor name.
version	string	(required) Template version. For out-of-the-box templates, version is displayed as follows: major version of Zabbix, delimiter ("-"), revision number (increased with each new version of the template, and reset with each major version of Zabbix). For example, 7.0-0, 7.0-3, 8.0-0, 8.0-3.
templates		Root element for linked templates.
name	string	(required) Template name.
groups		Root element for template groups.
name	string	(required) Template group name.
items		Root element for template items.
discovery_rules		Root element for template low-level discovery rules.
httptests		Root element for template web scenarios.
tags		Root element for template tags.
tag	string	(required) Tag name.
value	string	Tag value.
macros		Root element for template user macros.
macro	string	(required) User macro name.
type	string	User macro type. Possible values:[1] TEXT (0, default), SECRET_TEXT (1), VAULT (2). See also: User macro object (`type`).
value	string	User macro value.
description	string	User macro description.
config		Root element for template macro configuration responsible for how the macro is displayed in the Host Wizard.
dashboards		Root element for template dashboards.
valuemaps		Root element for template value maps.

Template items

```
zabbix_export:
  (...)
  templates:
    (...)
      items:
        - uuid: f94f9f4699e94c369e6c98b2a2f485ce
          name: 'Zabbix agent ping'
          key: agent.ping
          description: 'The agent always returns "1" for this item. May be used in combination with `nodat
          valuemap:
            name: 'Zabbix agent ping status'
          tags:
            - tag: component
              value: system
        (...)
        - uuid: 58818005e76d46dda14d6592f601ab00
          name: 'Number of installed packages'
```

```
      key: system.sw.packages.get
      delay: 1h
      preprocessing: (see table below)
      tags:
        - tag: component
          value: os
      triggers: (see table below)
    - uuid: 403cebed115441369e94d35d070ca7b8
      name: 'Memory utilization'
      type: DEPENDENT
      key: vm.memory.utilization
      value_type: FLOAT
      units: '%'
      description: 'The percentage of used memory is calculated as `100-pavailable`.'
      preprocessing: (see table below)
      master_item:
        key: 'vm.memory.size[pavailable]'
      tags:
        - tag: component
          value: memory
      triggers: (see table below)
    (...)
```

Element	Type	Description
uuid	string	(required) Unique identifier for this item.
name	string	(required) Item name.
type	string	Item type. Possible values:[1] ZABBIX_PASSIVE (0, default), TRAP (2), SIMPLE (3), INTERNAL (5), ZABBIX_ACTIVE (7), EXTERNAL (10), ODBC (11), IPMI (12), SSH (13), TELNET (14), CALCULATED (15), JMX (16), SNMP_TRAP (17), DEPENDENT (18), HTTP_AGENT (19), SNMP_AGENT (20), ITEM_TYPE_SCRIPT (21), ITEM_TYPE_BROWSER (22), TELEMETRY_QUERY (24).
snmp_oid	string	(required for SNMP_AGENT items) SNMP object ID.
key	string	(required) Item key.
delay	string	Update interval of the item. Default: 1m. The value will always be 0 for TRAP items.
history	string	Time period (using time suffix, user macro or LLD macro) of how long the history data should be stored. Default: 31d.
trends	string	Time period (using time suffix, user macro or LLD macro) of how long the trends data should be stored. Default: 365d.
status	string	Item status. Possible values:[1] ENABLED (0, default), DISABLED (1).
value_type	string	Received value type. Possible values:[1] FLOAT (0), CHAR (1), LOG (2), UNSIGNED (3, default), TEXT (4), BINARY (5), JSON (6).
allowed_hosts	string	List of comma-delimited IP addresses of hosts allowed to send data for the item. Supported for TRAP and HTTP_AGENT items.
units	string	Received value units (bps, B, etc.).
params	text	Additional parameters depending on the type of the item (executed script for SSH and TELNET items; SQL query for ODBC items; formula for CALCULATED items; the script for ITEM_TYPE_SCRIPT and ITEM_TYPE_BROWSER items).
ipmi_sensor	string	IPMI sensor. Supported for IPMI items.
authtype	string	Authentication type. Supported for SSH and HTTP_AGENT items. Possible values for SSH items:[1] PASSWORD (0, default), PUBLIC_KEY (1). Possible values for HTTP_AGENT items:[1] NONE (0, default), BASIC (1), NTLM (2), Kerberos (3), or Digest (4).

Element	Type	Description
username	string	(required for SSH and TELNET items) Username for authentication. Supported for SIMPLE, ODBC, JMX and HTTP_AGENT items. When used for JMX items, `password` (see below) should also be specified or both elements should be left blank.
password	string	(required for SSH and TELNET items) Password for authentication. Supported for SIMPLE, ODBC, JMX and HTTP_AGENT items. When used for JMX items, `username` (see above) should also be specified or both elements should be left blank.
publickey	string	(required for SSH items) Name of the public key file.
privatekey	string	(required for SSH items) Name of the private key file.
description	text	Item description.
inventory_link	string	Host inventory field that is populated by the item. Possible values:[1] NONE (0), ALIAS (4), etc. (see Host inventory for supported fields).
valuemap		Root element for item value maps.
name	string	(required) Name of the value map to use for the item.
logtimefmt	string	Format of the time in log entries. Supported for items of LOG value type.
preprocessing		Root element for item value preprocessing.
step		Root element for template item value preprocessing steps.
jmx_endpoint	string	JMX endpoint. Supported for JMX items.
master_item		(required for DEPENDENT items) Root element for dependent item's master item.
key	string	(required) Dependent item's master item key.
timeout	string	Item data polling request timeout. Supported for Timeouts list of item types.
url	string	(required for HTTP_AGENT items) URL string.
query_fields		Root element for query parameters. Supported for HTTP_AGENT items.
name	string	(required for HTTP_AGENT items) Query parameter name.
value	string	Query parameter value. Supported for HTTP_AGENT items.
parameters		Root element for user-defined parameters. Supported for ITEM_TYPE_SCRIPT and ITEM_TYPE_BROWSER items.
name	string	(required for ITEM_TYPE_SCRIPT and ITEM_TYPE_BROWSER items) User-defined parameter name.
value	string	User-defined parameter value. Supported for ITEM_TYPE_SCRIPT and ITEM_TYPE_BROWSER items.
posts	string	HTTP(S) request body data. Supported for HTTP_AGENT items.
status_codes	string	Ranges of required HTTP status codes, separated by commas. Supported for HTTP_AGENT items.
follow_redirects	string	Follow response redirects while polling data. Supported for HTTP_AGENT items. Possible values:[1] NO (0), YES (1, default).
post_type	string	Type of post data body. Supported for HTTP_AGENT items. Possible values:[1] RAW (0, default), JSON (2), XML (3).
http_proxy	string	HTTP(S) proxy connection string. Supported for HTTP_AGENT items.
headers		Root element for HTTP(S) request headers. Supported for HTTP_AGENT items.
name	string	(required for HTTP_AGENT items) Header name.
value	string	(required for HTTP_AGENT items) Header value.
retrieve_mode	string	What part of response should be stored. Supported for HTTP_AGENT items. Possible values:[1] BODY (0, default), HEADERS (1), BOTH (2).
request_method	string	Request method type. Supported for HTTP_AGENT items. Possible values:[1] GET (0, default), POST (1), PUT (2), HEAD (3).
output_format	string	How to process response. Supported for HTTP_AGENT items. Possible values:[1] RAW (0, default), JSON (1).

Element	Type	Description
allow_traps	string	Allow the value to be populated similarly to the trapper item. Supported for HTTP_AGENT items. Possible values:[1] NO (0, default), YES (1).
ssl_cert_file	string	Public SSL Key file path. Supported for HTTP_AGENT items.
ssl_key_file	string	Private SSL Key file path. Supported for HTTP_AGENT items.
ssl_key_password	string	Password for SSL Key file. Supported for HTTP_AGENT items.
verify_peer	string	Whether to validate that the host's certificate is authentic. Supported for HTTP_AGENT items. Possible values:[1] NO (0, default), YES (1).
verify_host	string	Whether to validate that the host name for the connection matches the one in the host's certificate. Supported for HTTP_AGENT items. Possible values:[1] NO (0, default), YES (1).
time_shift	string	How far back (before the current time) ends the time range that the item queries. Supported for TELEMETRY_QUERY items.
lookback_limit	string	How far back (before the current time) the item queries for data when there is no previous query to continue from (e.g., on the item's first run), or when the previous query is older than `delay` (e.g., because Zabbix server was down). Supported for TELEMETRY_QUERY items.
granularity	string	The length of a piece that the query's full time range is split into. Supported for TELEMETRY_QUERY items.
query		(required for TELEMETRY_QUERY items) Root element for the telemetry query. Defines what the item queries from the data source, how it filters the data, and how it aggregates the result.
signal_type	string	(required) Signal type that the item queries. Supported for TELEMETRY_QUERY items. Possible values:[1] TRACES (0), METRICS (1), LOGS (2).
metric_point_type	string	(required for METRICS signal type) Metric point type that the item queries. Supported for TELEMETRY_QUERY items. Possible values:[1] SUM (0), GAUGE (1), HISTOGRAM (2), EXPONENTIAL_HISTOGRAM (3).
columns		(required) Root element for telemetry data columns that the item queries. This element has the following elements: `column (string)` - (required) Name of the telemetry data column that the item queries. `attribute_key (string)` - (required for columns that hold key-value pairs) Name of the key that the item queries, within the column that holds key-value pairs.
aggregated_columns		(required) Root element for telemetry data aggregated columns that the item queries. This element has the following elements: `column (string)` - (required for MIN, MAX, AVG, SUM, and PERCENTILE functions) Name of the telemetry data column that the item queries. `function (string)` - (required) Function that the item applies to the column records. Possible values:[1] MIN (1), MAX (2), AVG (3), COUNT (4), SUM (5), PERCENTILE (8). `parameters (array)` - (required for PERCENTILE functions) Percentile that the item calculates from the column records. `alias (string)` - (required) Unique name for the calculated value, used to identify it in the item value.

Element	Type	Description
filter		(required) Root element for telemetry query filter for column records in the query. This element has the following elements: `evaltype` (`string`) - (required) Filter condition evaluation method. Possible values:[1] AND_OR (0), AND (1), OR (2), FORMULA (3). `formula` (`string`) - (required for FORMULA evaluation methods) User-defined expression to be used for evaluating conditions of filters with a custom expression. `conditions` (`string`) - (required) Root element for telemetry data filter conditions a record in a telemetry data column must meet. The `conditions` element has the following elements: `column` (`string`) - (required) Name of the telemetry data column that the filter conditions apply to. `attribute_key` (`string`) - (required for columns that hold key-value pairs) Name of the key that the condition applies to, within the column that holds key-value pairs. `operator` (`string`) - (required) Filter condition operator. Possible values for single-value columns:[1] EQUAL (0), NOT_EQUAL (1), LIKE (2), NOT_LIKE (3). Possible values for columns that hold key-value pairs:[1] EQUAL (0), NOT_EQUAL (1), EXISTS (12). `formulaid` (`string`) - (required for FORMULA evaluation methods) Arbitrary unique ID that is used to reference the condition from a custom expression. `value` (`string`) - (required for EQUAL, NOT_EQUAL, LIKE, and NOT LIKE operations) Value to compare with.
tags		Root element for item tags.
tag	string	(required) Tag name.
value	string	Tag value.
triggers		Root element for template item triggers.

Note:
See also: Item object (refer to the relevant property with a matching name).

Template item value preprocessing steps

```
zabbix_export:
  (...)
  templates:
    (...)
      items:
        (...)
        - uuid: 58818005e76d46dda14d6592f601ab00
          (...)
          preprocessing:
            - type: JSONPATH
              parameters:
                - $.length()
            - type: DISCARD_UNCHANGED_HEARTBEAT
              parameters:
                - 12h
          (...)
```

Element	Type	Description
type	string	(required) The item value preprocessing step type. Possible values:[1] MULTIPLIER (1), RTRIM (2), LTRIM (3), TRIM (4), REGEX (5), BOOL_TO_DECIMAL (6), OCTAL_TO_DECIMAL (7), HEX_TO_DECIMAL (8), SIMPLE_CHANGE (9, calculated: received value - previous value), CHANGE_PER_SECOND (10, calculated: (received value - previous value)/(time now - time of last check)), XMLPATH (11), JSONPATH (12), IN_RANGE (13), MATCHES_REGEX (14), NOT_MATCHES_REGEX (15), CHECK_JSON_ERROR (16), CHECK_XML_ERROR (17), CHECK_REGEX_ERROR (18), DISCARD_UNCHANGED (19), DISCARD_UNCHANGED_HEARTBEAT (20), JAVASCRIPT (21), PROMETHEUS_PATTERN (22), PROMETHEUS_TO_JSON (23), CSV_TO_JSON (24), STR_REPLACE (25), CHECK_NOT_SUPPORTED (26), XML_TO_JSON (27), SNMP_WALK_VALUE (28), SNMP_WALK_TO_JSON (29), SNMP_GET_VALUE (30).
parameters		(required) Root element for parameters of the item value preprocessing step.
parameter	string	Individual parameter of the item value preprocessing step.
error_handler	string	Action type used in case of preprocessing step failure. Possible values:[1] ORIGINAL_ERROR (0, default), DISCARD_VALUE (1), CUSTOM_VALUE (2), CUSTOM_ERROR (3).
error_handler_params	string	Error handler parameters.

Note:
See also: Item preprocessing object (refer to the relevant property with a matching name).

Template item triggers

```
zabbix_export:
  (...)
  templates:
    (...)
      items:
        (...)
        - uuid: 58818005e76d46dda14d6592f601ab00
          (...)
          triggers:
            - uuid: b950c306394f4b3c902060a8273cbcde
              expression: 'change(/Linux by Zabbix agent/system.sw.packages.get)<>0'
              name: 'Linux: Number of installed packages has been changed'
              priority: WARNING
              manual_close: 'YES'
              tags:
                - tag: scope
                  value: notice
        (...)
        - uuid: 403cebed115441369e94d35d070ca7b8
          (...)
          triggers:
            - uuid: cfd395b1cde74ef18a5e5f840bd5142a
              expression: 'min(/Linux by Zabbix agent/vm.memory.utilization,5m)>{$MEMORY.UTIL.MAX}'
              name: 'Linux: High memory utilization'
              event_name: 'Linux: High memory utilization (>{$MEMORY.UTIL.MAX}% for 5m)'
              priority: AVERAGE
              description: 'The system is running out of free memory.'
              dependencies:
                - name: 'Linux: Lack of available memory'
                  expression: 'max(/Linux by Zabbix agent/vm.memory.size[available],5m)<{$MEMORY.AVAILABLE
              tags:
                - tag: scope
                  value: capacity
                - tag: scope
                  value: performance
        (...)
```

Element	Type	Description
uuid	string	(required) Unique identifier for this trigger.
expression	string	(required) Trigger expression.
recovery_mode	string	Basis for generating OK events. Possible values:[1] EXPRESSION (0, default), RECOVERY_EXPRESSION (1), NONE (2).
recovery_expression	string	Trigger recovery expression.
correlation_mode	string	Correlation mode (no event correlation or event correlation by tag). Possible values:[1] DISABLED (0, default), TAG_VALUE (1).
correlation_tag	string	The tag name to be used for event correlation.
name	string	(required) Trigger name.
event_name	string	Event name.
opdata	string	Operational data.
url_name	string	Label for the URL associated with the trigger.
url	string	URL associated with the trigger.
status	string	Trigger status. Possible values:[1] ENABLED (0, default), DISABLED (1).
priority	string	Trigger severity. Possible values:[1] NOT_CLASSIFIED (0, default), INFO (1), WARNING (2), AVERAGE (3), HIGH (4), DISASTER (5).
description	text	Trigger description.
type	string	Event generation type (single problem event or multiple problem events). Possible values:[1] SINGLE (0, default), MULTIPLE (1).
manual_close	string	Manual closing of problem events. Possible values:[1] NO (0, default), YES (1).
dependencies		Root element for dependencies.
name	string	(required) Dependency trigger name.
expression	string	(required) Dependency trigger expression.
recovery_expression	string	Dependency trigger recovery expression.
tags		Root element for trigger tags.
tag	string	(required) Tag name.
value	string	Tag value.

Note:
See also: Trigger object (refer to the relevant property with a matching name).

Template low-level discovery rules

```
zabbix_export:
  (...)
  templates:
    (...)
      discovery_rules:
        - uuid: acfdea9c46ef48c68e6636f43b8f96a2
          name: 'Network interface discovery'
          key: net.if.discovery
          delay: 1h
          filter: (see table below)
          description: 'The discovery of network interfaces.'
          item_prototypes: (see table below)
          trigger_prototypes: (see table below)
          graph_prototypes: (see table below)
        (...)
```

Attention:
Most template low-level discovery rule elements are the same as for template items. The table below describes those elements that differ from template items.

Element	Type	Description
type	string	Item type. Possible values:[1] ZABBIX_PASSIVE (0, default), TRAP (2), SIMPLE (3), INTERNAL (5), ZABBIX_ACTIVE (7), EXTERNAL (10), ODBC (11), IPMI (12), SSH (13), TELNET (14), JMX (16), DEPENDENT (18), HTTP_AGENT (19), SNMP_AGENT (20), ITEM_TYPE_SCRIPT (21), ITEM_TYPE_BROWSER (22).
key	string	(required) The low-level discovery rule key.
filter		Root element for template low-level discovery rule filters.
lifetime	string	Time period (using seconds, time suffix, or user macro), after which no longer discovered resources will be deleted. Default: 7d.
lifetime_type	string	Scenario for deleting lost LLD resources. Possible values: DELETE_NEVER, DELETE_IMMEDIATELY, DELETE_AFTER.
enabled_lifetime	string	Time period (using seconds, time suffix, or user macro), after which no longer discovered resources will be disabled.
enabled_lifetime_type	string	Scenario for disabling lost LLD resources. Possible values: DISABLE_NEVER, DISABLE_IMMEDIATELY, DISABLE_AFTER.
item_prototypes		Root element for template item prototype elements, which are the same as for template items.
trigger_prototypes		Root element for template trigger prototype elements, which are the same as for template item triggers.
graph_prototypes		Root element for template graph prototype elements, which are the same as for host graphs.
host_prototypes		Root element for template host prototype elements, which are the same as for hosts.
parent_discovery_rule		Root element for the parent low-level discovery rule (or rule prototype) of the low-level discovery rule prototype. This property denotes that it is an LLD rule prototype, direct child of the referenced rule/rule prototype.
key	string	(required) The parent low-level discovery rule (or rule prototype) key.
master_item	string	(required for DEPENDENT rules) Root element for the dependent rule's master item.
lld_macro_paths		Root element for low-level discovery rule macro paths.
lld_macro	string	(required) Low-level discovery rule macro name.
path	string	(required) Selector for value, which will be assigned to the corresponding macro.
preprocessing		Root element for low-level discovery rule value preprocessing.
step		Root element for low-level discovery rule value preprocessing step elements, which are the same as for template item value preprocessing steps, except with fewer possible values. See also: LLD rule preprocessing object.
overrides		Root element for low-level discovery rule override rules.
name	string	(required) Unique override name.
step	string	(required) Unique order number of the override.
stop	string	Stop processing next overrides if matches.
filter		Root element for template low-level discovery rule override rule filter elements, which are the same as for template low-level discovery rule filters.
operations		Root element for template low-level discovery rule override operations.

Note:
See also: LLD rule object (refer to the relevant property with a matching name).

Template low-level discovery rule filters

```
zabbix_export:
  (...)
  templates:
    (...)
      discovery_rules:
        - uuid: acfdea9c46ef48c68e6636f43b8f96a2
          (...)
          filter:
            evaltype: AND
            conditions:
              - macro: '{#IFNAME}'
                value: '{$NET.IF.IFNAME.MATCHES}'
              - macro: '{#IFNAME}'
```

```
            value: '{$NET.IF.IFNAME.NOT_MATCHES}'
            operator: NOT_MATCHES_REGEX
      (...)
    - uuid: 2bbdc79f082d4c618e01bec625e9c90a
      (...)
      filter:
        evaltype: AND
        conditions:
          - macro: '{#DEVNAME}'
            value: '{$VFS.DEV.DEVNAME.MATCHES}'
          - macro: '{#DEVNAME}'
            value: '{$VFS.DEV.DEVNAME.NOT_MATCHES}'
            operator: NOT_MATCHES_REGEX
          - macro: '{#DEVTYPE}'
            value: disk
      (...)
```

Element	Type	Description
evaltype	string	Override filter condition evaluation method. Possible values:[1] AND_OR (0, default), AND (1), OR (2), FORMULA (3).
formula	string	Custom calculation formula for filter conditions.
conditions		Root element for filter conditions.
macro	string	(required) The name of the low-level discovery macro to perform the check on.
value	string	Value to compare with.
operator	string	Condition operator. Possible values:[1] MATCHES_REGEX (8, default), NOT_MATCHES_REGEX (9).
formulaid	string	(required) Arbitrary unique ID that is used to reference a condition from the custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward.

Note:
See also: LLD rule filter object (refer to the relevant property with a matching name).

Template low-level discovery rule override operations

Element	Type	Description
operationobject	string	Object to which the operation is applied. Possible values:[1] ITEM_PROTOTYPE (0), TRIGGER_PROTOTYPE (1), GRAPH_PROTOTYPE (2), HOST_PROTOTYPE (3).
operator	string	Override condition operator. Possible values:[1] EQUAL (1), NOT_EQUAL (2), LIKE (3), NOT_LIKE (4), REGEXP (5), NOT_REGEXP (6).
value	string	A regular expression or a string for the override condition operator.
status	string	Status of the object upon the override operation.
discover	string	Whether the object is added as a result of the discovery.
delay	string	Update interval set for the item prototype upon the override operation.
history	string	History storage period set for the item prototype upon the override operation.
trends	string	Trend storage period set for the item prototype upon the override operation.
severity	string	Trigger prototype severity set upon the override operation.
tags		Root element for the tags set for the object upon the override operation.
tag	string	(required) Tag name.
value	string	Tag value.
templates		Root element for the templates linked to the host prototype upon the override operation.
name	string	(required) Template name.
inventory_mode	string	Host prototype inventory mode set upon the override operation.

Note:
See also: LLD rule override operation object (refer to the relevant property with a matching name).

Template web scenarios

Element	Type	Description
uuid	string	(required) Unique identifier for this web scenario.
name	string	(required) Web scenario name.
delay	string	Frequency (using seconds, time suffix, or user macro) of executing web scenario. Default: 1m.
attempts	integer	The number of attempts for executing web scenario steps. Possible values:[1] 1-10 (default: 1).
agent	string	Client agent. Zabbix will pretend to be the selected browser. This is useful when a website returns different content for different browsers. Default: Zabbix.
http_proxy	string	Proxy that will be used by the web scenario given as: `http://[username[:password]@]proxy.example.com[:port]`
variables		Root element for web scenario variables that may be used in scenario steps.
name	string	(required) Variable name.
value	text	(required) Variable value.
headers		Root element for HTTP headers to be sent when performing a request. Headers should be listed using the same syntax as they would appear in the HTTP protocol.
name	string	(required) Header name.
value	text	(required) Header value.
status	string	Web scenario status. Possible values:[1] ENABLED (0, default), DISABLED (1).
authentication	string	Authentication method. Possible values:[1] NONE (0, default), BASIC (1), NTLM (2), Kerberos (3), or Digest (4).
http_user	string	User name used for BASIC (HTTP), NTLM, Kerberos, or Digest authentication.
http_password	string	Password used for BASIC (HTTP), NTLM, Kerberos, or Digest authentication.
verify_peer	string	Verify the SSL certificate of the web server. Possible values:[1] NO (0, default), YES (1).
verify_host	string	Verify that the *Common Name* field or the *Subject Alternate Name* field of the web server certificate matches. Possible values:[1] NO (0, default), YES (1).
ssl_cert_file	string	Name of the SSL certificate file used for client authentication (must be in PEM format).
ssl_key_file	string	Name of the SSL private key file used for client authentication (must be in PEM format).
ssl_key_password	string	SSL private key file password.
steps		(required) Root element for template web scenario steps.
tags		Root element for web scenario tags.
tag	string	(required) Tag name.
value	string	Tag value.

Note:
See also: Web scenario object (refer to the relevant property with a matching name).

Template web scenario steps

Element	Type	Description
name	string	(required) Web scenario step name.
url	string	(required) URL for monitoring.
query_fields		Root element for query parameters (an array of HTTP fields to be added to the URL when performing a request).
name	string	(required) Query parameter name.
value	string	Query parameter value.
posts		Root element for HTTP POST variables (a string (raw post data) or an array of HTTP fields (form field data)).
name	string	(required) Post field name.
value	string	(required) Post field value.

Element	Type	Description
variables		Root element of step-level variables (macros) that should be applied after this step. If the variable value has a 'regex:' prefix, then its value is extracted from the data returned by this step according to the regular expression pattern following the 'regex:' prefix
name	string	(required) Variable name.
value	text	(required) Variable value.
headers		Root element for HTTP headers to be sent when performing a request.
name	string	(required) Header name.
value	text	(required) Header value.
follow_redirects	string	Follow HTTP redirects. Possible values:[1] NO (0), YES (1, default).
retrieve_mode	string	HTTP response retrieve mode. Possible values:[1] BODY (0, default), HEADERS (1), BOTH (2).
timeout	string	Timeout (using seconds, time suffix, or user macro) of step execution. Default: 15s.
required	string	Text that must be present in the response (ignored if empty).
status_codes	string	A comma-delimited list of accepted HTTP status codes (e.g., 200-201,210-299; ignored if empty).

Note:
See also: Web scenario step object (refer to the relevant property with a matching name).

Template macro configuration

```
zabbix_export:
  (...)
  templates:
    - uuid: f8f7908280354f2abeed07dc788c3747
      (...)
      macros:
        - macro: '{$AGENT.TIMEOUT}'
          (...)
          config:
            type: TEXT
            priority: '1'
            label: 'Seconds since the last Zabbix agent seen'
            description: 'Timeout after which agent is considered unavailable.'
        - macro: '{$CPU.UTIL.CRIT}'
          (...)
          config:
            type: TEXT
            priority: '2'
            section_name: Thresholds
            label: 'Threshold of CPU utilization expressed'
            description: 'Critical threshold of CPU utilization expressed in %. In the range from 0 to 100
            regex: '^-?([0-9]+|(([0-9]+)\.([0-9]+)))$'
        (...)
        - macro: '{$IFCONTROL}'
          (...)
          config:
            type: CHECKBOX
            priority: '19'
            label: 'Interfaces control'
            description: 'Fire a trigger when the interface operational status changes to "Link down".'
            options:
              - checked: '1'
                unchecked: '0'
        (...)
```

Element	Type	Description
type	string	(required) Type of macro input field. Possible values:[1] NOCONF (0), TEXT (1), LIST (2), CHECKBOX (3).
priority	string	Macro position in the macro list.
section_name	string	Label of the collapsible section where the macro is grouped.
label	string	(required for TEXT, LIST, CHECKBOX macros) Macro label.
description	text	Macro help text. Supports Markdown formatting.
required	string	Marks the macro as mandatory. Possible values:[1] NO (0), YES (1). Supported for TEXT and LIST macros.
regex	string	Regular expression to validate user input in a textbox field. Supported for TEXT macros.
options		Root element for LIST items or CHECKBOX values.
value	string	(required for LIST macros) LIST item value.
text	string	(required for LIST macros) LIST item text.
checked	string	(required for CHECKBOX macros) Value representing a checked state. Possible values:[1] 0 (false), 1 (true). Supported for CHECKBOX macros.
unchecked	string	(required for CHECKBOX macros) Value representing an unchecked state. Possible values:[1] 0 (false), 1 (true). Supported for CHECKBOX macros.

Note:
See also: Macro configuration object (refer to the relevant property with a matching name).

Template dashboards

```
zabbix_export:
  (...)
  templates:
    (...)
      dashboards:
        - uuid: c689ad3115fd46a4b927d1f70ee2e5a4
          name: Filesystems
          pages:
            - name: Overview
              widgets: (see table below)
        (...)
```

Element	Type	Description
uuid	string	(required) Unique identifier for this dashboard.
name	string	(required) Template dashboard name.
display pe-riod	integer	Display period of dashboard pages.
auto_start	string	Slideshow auto start. Possible values:[1] NO (0), YES (1, default).
pages		Root element for template dashboard pages.
name	string	Page name.
display period	integer	Slideshow interval.
sortorder	integer	Page sorting order.
widgets		Root element for template dashboard widgets.

Note:
See also: Template dashboard object (refer to the relevant property with a matching name).

Template dashboard widgets

```
zabbix_export:
  (...)
  templates:
    (...)
      dashboards:
        - uuid: c689ad3115fd46a4b927d1f70ee2e5a4
          name: Filesystems
          pages:
            - name: Overview
              widgets:
                - type: graphprototype
                  width: '72'
                  height: '5'
                  fields:
                    - type: INTEGER
                      name: columns
                      value: '3'
                    - type: GRAPH_PROTOTYPE
                      name: graphid.0
                      value:
                        host: 'Linux by Zabbix agent'
                        name: 'FS [{#FSTYPE}({#FSNAME})]: Space utilization chart (relative to total)'
                    - type: STRING
                      name: reference
                      value: AAAEB
                - type: graphprototype
                  'y': '5'
                  width: '72'
                  height: '5'
                  fields:
                    - type: INTEGER
                      name: columns
                      value: '1'
                    - type: GRAPH_PROTOTYPE
                      name: graphid.0
                      value:
                        host: 'Linux by Zabbix agent'
                        name: 'FS [{#FSTYPE}({#FSNAME})]: Space usage graph, in % (relative to max availab
                    - type: STRING
                      name: reference
                      value: AAAEC
        (...)
```

Element	Type	Description
type	string	(required) Widget type.
name	string	Widget name.
x	integer	Horizontal position from the left side of the template dashboard. Possible values:[1] 0-71.
y	integer	Vertical position from the top of the template dashboard. Possible values:[1] 0-63.
width	integer	Widget width. Possible values:[1] 1-72.
height	integer	Widget height. Possible values:[1] 1-64.
hide_header	string	Hide widget header. Possible values:[1] NO (0, default), YES (1).
fields		Root element for the template dashboard widget fields.
type	string	(required) Widget field type. Possible values:[1] INTEGER (0), STRING (1), ITEM (4), ITEM_PROTOTYPE (5), GRAPH (6), GRAPH_PROTOTYPE (7), MAP (8), SERVICE (9), SLA (10), USER (11), ACTION (12), MEDIA_TYPE (13).
name	string	(required) Widget field name.

Element	Type	Description
value	mixed	(required) Widget field value, depending on the field type.

Note:
See also: Template dashboard widget object (refer to the relevant property with a matching name).

Template value maps

```
zabbix_export:
  (...)
  templates:
    (...)
      valuemaps:
        - uuid: 8c048c6cca8248f2860c208e8db0f59e
          name: ifOperStatus
          mappings:
            - value: '0'
              newvalue: unknown
            - value: '1'
              newvalue: notpresent
            - value: '2'
              newvalue: down
            - value: '3'
              newvalue: lowerlayerdown
            - value: '4'
              newvalue: testing
            - value: '5'
              newvalue: dormant
            - value: '6'
              newvalue: up
        (...)
```

Element	Type	Description
uuid	string	(required) Unique identifier for this value map.
name	string	(required) Value map name.
mapping		Root element for mappings.
type	string	Mapping match type. Possible values:[1] EQUAL (0, default), GREATER_OR_EQUAL (2), LESS_OR_EQUAL (3), IN_RANGE (4), REGEXP (5), DEFAULT (6).
value	string	Original value.
newvalue	string	(required) Value to which the original value is mapped to.

Note:
See also: Value map object (refer to the relevant property with a matching name).

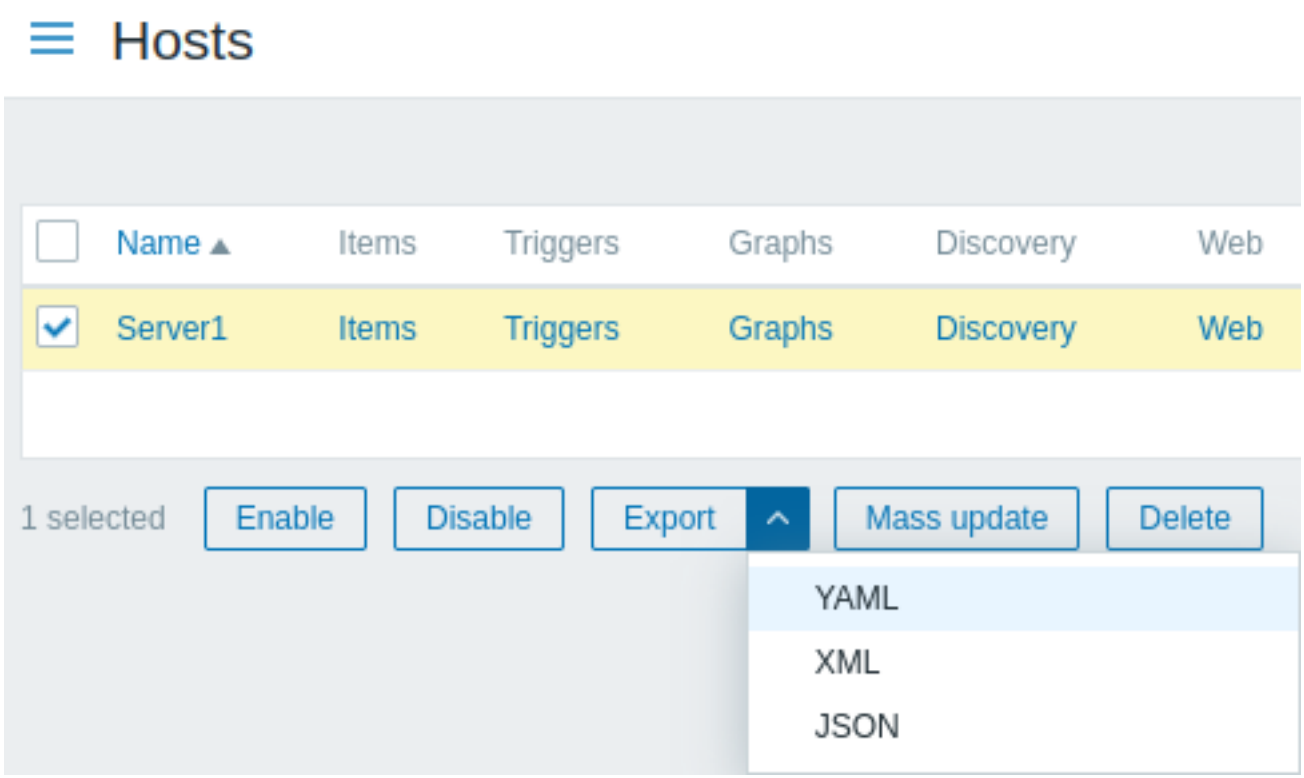
Footnotes [1] API integer values in brackets, for example, ENABLED (0), are mentioned only for reference. For more information, see the linked API object page in the table entry or at the end of each section.

Hosts

Overview

Hosts are exported with many related objects and object relations.

Host export contains:



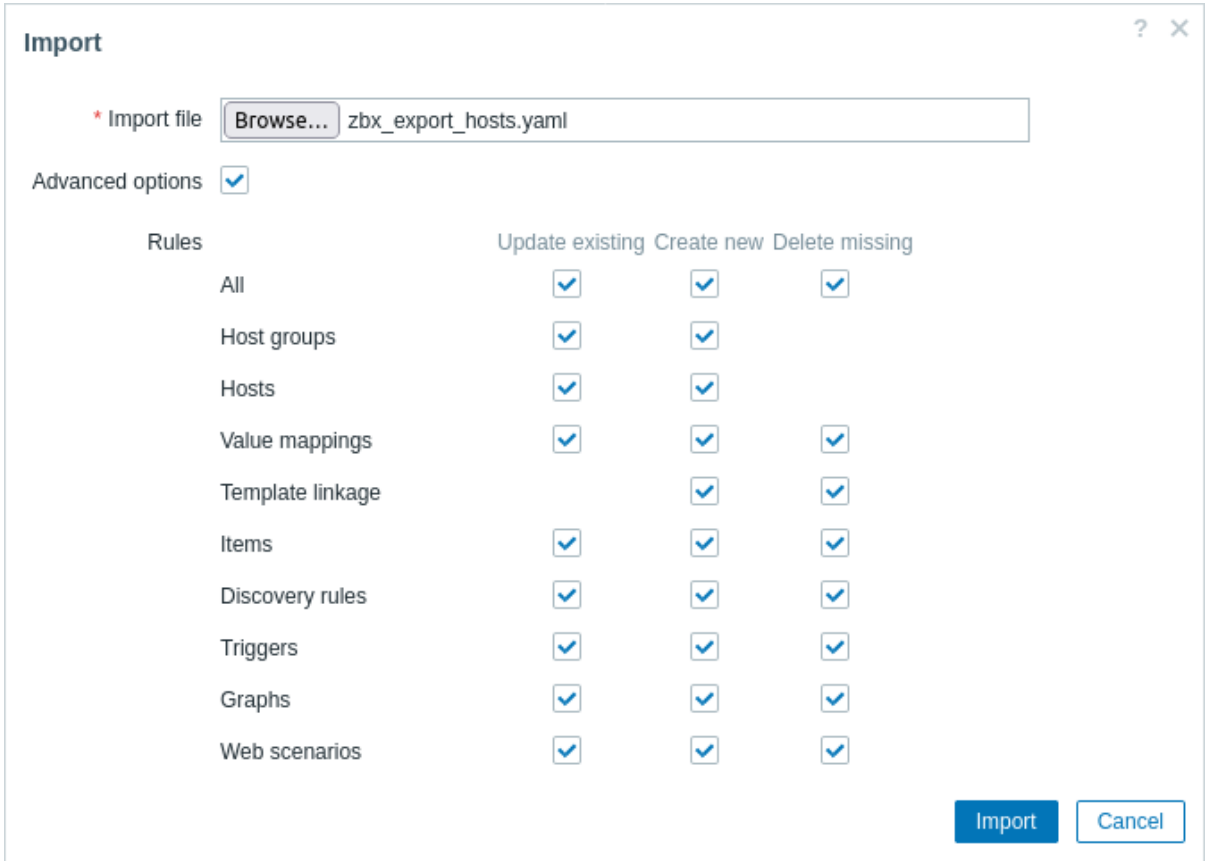
- Linked host groups
- Host data
- Template linkage
- Host group linkage

- Host interfaces
- Directly linked items
- Directly linked triggers
- Directly linked discovery rules with all prototypes
- Directly linked web scenarios
- Host macros
- Host inventory data
- Value maps
- Linked graphs

Exporting

To export hosts, do the following:

1. Go to *Data collection* > *Hosts*.
2. Mark the checkboxes of the hosts to export.
3. Click *Export* below the list to export in the default YAML format, or click the arrow to select a different export format.



Depending on the selected format, hosts are exported to a local file with a default name:

- `zabbix_export_hosts.yaml` - in YAML export;
- `zabbix_export_hosts.xml` - in XML export;
- `zabbix_export_hosts.json` - in JSON export.

Importing

To import hosts, do the following:

1. Go to *Data collection* > *Hosts*.
2. Click *Import* in the upper-right corner.
3. Select the import file.
4. Mark the checkboxes of the import rules you want to apply (see below).
5. Click *Import* in the lower-right corner of the configuration form.

If you mark the *Advanced options* checkbox, a detailed list of all importable elements will be displayed - mark or unmark each import rule as required.

If you click the checkbox in the *All* row, all elements below it will be marked/unmarked.

Import rules:

Rule	Description
Update existing	Existing elements will be updated using data from the import file. Otherwise, they will not be updated.
Create new	New elements will be created using data from the import file. Otherwise, they will not be created.
Delete missing	Existing elements not present in the import file will be removed. Otherwise, they will not be removed. If *Delete missing* is marked for *Template linkage*, current template linkage not present in the import file will be unlinked. Entities (items, triggers, graphs, etc.) inherited from the unlinked templates will not be removed (unless the *Delete missing* option is selected for each entity as well).

You cannot review changes to hosts during the import. A success or failure message of the import will be displayed in the frontend.

Export format

When a host is exported, Zabbix generates a structured YAML, JSON, or XML format. The export includes host elements, such as host metadata, items, macros, triggers, and more.

Each element serves a specific purpose and may contain nested elements.

The following sections describe each element in the export format. The examples use a host with the MySQL by Zabbix agent 2 template. For element demonstration purposes, the template is unlinked after the host is created. Unlinking keeps all elements in the configuration (unlike unlinking and clearing, which removes them).

An ellipsis (`...`) indicates elements omitted for brevity. The note (`see table below`) is used when the element is explained in more detail in later sections.

```
zabbix_export:
  version: '8.0'
```

```
  host_groups:
    - uuid: 748ad4d098d447d492bb935c907f652f
      name: Databases
  hosts: (see table below)
  graphs: (see table below)
```

Host metadata

Element		Type	Description
version		string	(required) Zabbix version.
host_groups			(required) Root element for host groups.
	uuid	string	(required) Unique identifier for this host group.
	name	string	(required) Host group name.
hosts			Root element for hosts.
graphs			Root element for host graphs.

Hosts

```
zabbix_export:
  (...)
  hosts:
    - host: 'MySQL server'
      name: 'MySQL server'
      groups:
        - name: Databases
      interfaces: (see table below)
      items: (see table below)
      discovery_rules: (see table below)
      tags:
        - tag: location
          value: Riga
      macros:
        (...)
        - macro: '{$MYSQL.DSN}'
          value: 192.0.2.1
        (...)
        - macro: '{$MYSQL.PASSWORD}'
          type: SECRET_TEXT
          description: 'MySQL user password.'
        (...)
      valuemaps: (see table below)
  (...)
```

Element	Type	Description
host	string	(required) Unique host name.
name	string	Visible host name.
description	text	Host description.
monitored_by	string	How the host is monitored. Possible values:[1] SERVER (0, default), PROXY (1), or PROXY_GROUP (2).
proxy		Root element for proxy.
name	string	(required) Name of the proxy (if any) that monitors the host.
proxy_group		Root element for proxy group.
name	string	(required) Name of the proxy group (if any) that is used to monitor the host.
status	string	Host status. Possible values:[1] ENABLED (0, default), DISABLED (1).
ipmi_authtype	string	IPMI session authentication type. Possible values:[1] DEFAULT (-1, default), NONE (0), MD2 (1), MD5 (2), STRAIGHT (4), OEM (5), RMCP_PLUS (6).
ipmi_privilege	string	IPMI session privilege level. Possible values:[1] CALLBACK (1), USER (2, default), OPERATOR (3), ADMIN (4), OEM (5).
ipmi_username	string	Username for IPMI checks.

Element	Type	Description
ipmi_password	string	Password for IPMI checks.
templates		Root element for linked templates.
name	string	(required) Template name.
groups		Root element for host groups to which the host belongs.
name	string	(required) Host group name.
interfaces		Root element for host interfaces.
items		Root element for host items.
discovery_rules		Root element for host low-level discovery rules.
http_tests		Root element for host web scenarios.
tags		Root element for host tags.
tag	string	(required) Tag name.
value	string	Tag value.
macros		Root element for host macros.
macro	string	(required) User macro name.
type	string	User macro type. Possible values:[1] TEXT (0, default), SECRET_TEXT (1), VAULT (2).
value	string	User macro value.
description	string	User macro description.
inventory		Root element for host inventory.
<inventory_property>	string	Inventory property. All properties have their respective element (`type`, `name`, `os`, etc.; for example, see Export format).
inventory_mode	string	Inventory mode. Possible values:[1] DISABLED (-1), MANUAL (0, default), AUTOMATIC (1).
valuemaps		Root element for host value maps.

Note:
See also: Host object (refer to the relevant property with a matching name).

Host interfaces

```
zabbix_export:
  (...)
  hosts:
    - host: 'MySQL server'
      (...)
      interfaces:
        - ip: 192.0.2.1
          interface_ref: if1
      (...)
```

Element	Type	Description
default	string	Whether this is the primary host interface. Note that there can be only one primary interface of one type on a host. Possible values:[1] NO (0), YES (1, default).
type	string	Interface type. Possible values:[1] ZABBIX (1, default), SNMP (2), IPMI (3), JMX (4).
useip	string	Whether to use IP as the interface for connecting to the host (otherwise, DNS will be used). Possible values:[1] NO (0), YES (1, default).
ip	string	(required for IP connections) IP address (IPv4 or IPv6).
dns	string	(required for DNS connections) DNS name.
port	string	Port number.
details		Root element for interface details.
version	string	Use this SNMP version. Possible values:[1] SNMPV1 (1), SNMP_V2C (2, default), SNMP_V3 (3).
community	string	(required for SNMPv1 and SNMPv2 items) SNMP community.
max_repetitions	string	Max repetition value for native SNMP bulk requests (GetBulkRequest-PDUs). Supported for SNMPv2 and SNMPv3 items (`discovery[]` and `walk[]` items). Default: 10.

Element	Type	Description
contextname	string	SNMPv3 context name. Supported for SNMPv3 items.
securityname	string	SNMPv3 security name. Supported for SNMPv3 items.
securitylevel	string	SNMPv3 security level. Supported for SNMPv3 items. Possible values:[1] NOAUTHNOPRIV (0, default), AUTHNOPRIV (1), AUTHPRIV (2).
authprotocol	string	SNMPv3 authentication protocol. Supported for SNMPv3 items. Possible values:[1] MD5 (0, default), SHA1 (1), SHA224 (2), SHA256 (3), SHA384 (4), SHA512 (5).
authpassphrase	string	SNMPv3 authentication passphrase. Supported for SNMPv3 items.
privprotocol	string	SNMPv3 privacy protocol. Supported for SNMPv3 items. Possible values:[1] DES (0, default), AES128 (1), AES192 (2), AES256 (3), AES192C (4), AES256C (5).
privpassphrase	string	SNMPv3 privacy passphrase. Supported for SNMPv3 items.
bulk	string	Use bulk requests for SNMP. Possible values:[1] NO (0), YES (1, default).
interface_ref	string	Interface reference name to be used in items (format: `if<N>`).

Note:
See also: Host interface object (refer to the relevant property with a matching name).

Host items

```
zabbix_export:
  (...)
  hosts:
    - host: 'MySQL server'
      (...)
      items:
        (...)
        - name: 'Binlog cache disk use'
          type: DEPENDENT
          key: mysql.binlog_cache_disk_use
          value_type: FLOAT
          description: 'Number of transactions that used a temporary disk cache because they could not fit
          preprocessing: (see table below)
          master_item:
            key: 'mysql.get_status_variables["{$MYSQL.DSN}","{$MYSQL.USER}","{$MYSQL.PASSWORD}"]'
          tags:
            - tag: component
              value: cache
        (...)
        - name: 'Buffer pool utilization'
          type: CALCULATED
          key: mysql.buffer_pool_utilization
          value_type: FLOAT
          units: '%'
          params: |
            ( last(//mysql.innodb_buffer_pool_pages_total) -
            last(//mysql.innodb_buffer_pool_pages_free) ) /
            ( last(//mysql.innodb_buffer_pool_pages_total) +
            ( last(//mysql.innodb_buffer_pool_pages_total) = 0 ) ) * 100 *
            ( last(//mysql.innodb_buffer_pool_pages_total) > 0 )
          description: 'Ratio of used to total pages in the buffer pool.'
          tags:
            - tag: component
```

```
            value: memory
        triggers: (see table below)
      (...)
      - name: Uptime
        type: DEPENDENT
        key: mysql.uptime
        units: uptime
        description: 'Number of seconds that the server has been up.'
        preprocessing: (see table below)
        master_item:
          key: 'mysql.get_status_variables["{$MYSQL.DSN}","{$MYSQL.USER}","{$MYSQL.PASSWORD}"]'
        tags:
          - tag: component
            value: application
        triggers: (see table below)
      (...)
```

Element	Type	Description
name	string	(required) Item name.
type	string	Item type. Possible values:[1] ZABBIX_PASSIVE (0, default), TRAP (2), SIMPLE (3), INTERNAL (5), ZABBIX_ACTIVE (7), EXTERNAL (10), ODBC (11), IPMI (12), SSH (13), TELNET (14), CALCULATED (15), JMX (16), SNMP_TRAP (17), DEPENDENT (18), HTTP_AGENT (19), SNMP_AGENT (20), ITEM_TYPE_SCRIPT (21), ITEM_TYPE_BROWSER (22), ITEM_TYPE_NESTED (23), TELEMETRY_QUERY (24).
snmp_oid	string	(required for SNMP_AGENT items) SNMP object ID.
key	string	(required) Item key.
delay	string	Update interval of the item. Default: 1m. The value will always be 0 for TRAP items.
history	string	Time period (using time suffix, user macro or LLD macro) of how long the history data should be stored. Default: 31d.
trends	string	Time period (using time suffix, user macro or LLD macro) of how long the trends data should be stored. Default: 365d.
status	string	Item status. Possible values:[1] ENABLED (0, default), DISABLED (1).
value_type	string	Received value type. Possible values:[1] FLOAT (0), CHAR (1), LOG (2), UNSIGNED (3, default), TEXT (4), BINARY (5), JSON (6).
allowed_hosts	string	List of comma-delimited IP addresses of hosts allowed to send data for the item. Supported for TRAP and HTTP_AGENT items.
units	string	Received value units (bps, B, etc.).
params	text	Additional parameters depending on the type of the item (executed script for SSH and TELNET items; SQL query for ODBC items; formula for CALCULATED items; the script for ITEM_TYPE_SCRIPT and ITEM_TYPE_BROWSER items).
ipmi_sensor	string	IPMI sensor. Supported for IPMI items.
authtype	string	Authentication type. Supported for SSH and HTTP_AGENT items. Possible values for SSH items:[1] PASSWORD (0, default), PUBLIC_KEY (1). Possible values for HTTP_AGENT items:[1] NONE (0, default), BASIC (1), NTLM (2), Kerberos (3), or Digest (4).
username	string	(required for SSH and TELNET items) Username for authentication. Supported for SIMPLE, ODBC, JMX and HTTP_AGENT items. When used for JMX items, `password` (see below) should also be specified or both elements should be left blank.
password	string	(required for SSH and TELNET items) Password for authentication. Supported for SIMPLE, ODBC, JMX and HTTP_AGENT items. When used for JMX items, `username` (see above) should also be specified or both elements should be left blank.
publickey	string	(required for SSH items) Name of the public key file.

Element	Type	Description
privatekey	string	(required for SSH items) Name of the private key file.
description	text	Item description.
inventory_link	string	Host inventory field that is populated by the item. Possible values:[1] NONE (0), ALIAS (4), etc. (see Host inventory for supported fields).
valuemap		Root element for item value maps.
name	string	(required) Name of the value map to use for the item.
logtimefmt	string	Format of the time in log entries. Supported for items of LOG value type.
preprocessing		Root element for item value preprocessing.
step		Root element for host item value preprocessing steps.
interface_ref	string	Reference to the host interface (format: `if<N>`).
jmx_endpoint	string	JMX endpoint. Supported for JMX items.
master_item		(required for DEPENDENT items) Root element for dependent item's master item.
key	string	(required) Dependent item's master item key.
timeout	string	Item data polling request timeout. Supported for the Timeouts list of item types.
url	string	(required for HTTP_AGENT items) URL string.
query_fields		Root element for query parameters. Supported for HTTP_AGENT items.
name	string	(required for HTTP_AGENT items) Query parameter name.
value	string	Query parameter value. Supported for HTTP_AGENT items.
parameters		Root element for user-defined parameters. Supported for ITEM_TYPE_SCRIPT and ITEM_TYPE_BROWSER items.
name	string	(required for ITEM_TYPE_SCRIPT and ITEM_TYPE_BROWSER items) User-defined parameter name.
value	string	User-defined parameter value. Supported for ITEM_TYPE_SCRIPT and ITEM_TYPE_BROWSER items.
posts	string	HTTP(S) request body data. Supported for HTTP_AGENT items.
status_codes	string	Ranges of required HTTP status codes, separated by commas. Supported for HTTP_AGENT items.
follow_redirects	string	Follow response redirects while polling data. Supported for HTTP_AGENT items. Possible values:[1] NO (0), YES (1, default).
post_type	string	Type of post data body. Supported for HTTP_AGENT items. Possible values:[1] RAW (0, default), JSON (2), XML (3).
http_proxy	string	HTTP(S) proxy connection string. Supported for HTTP_AGENT items.
headers		Root element for HTTP(S) request headers. Supported for HTTP_AGENT items.
name	string	(required for HTTP_AGENT items) Header name.
value	string	(required for HTTP_AGENT items) Header value.
retrieve_mode	string	What part of response should be stored. Supported for HTTP_AGENT items. Possible values:[1] BODY (0, default), HEADERS (1), BOTH (2).
request_method	string	Request method type. Supported for HTTP_AGENT items. Possible values:[1] GET (0, default), POST (1), PUT (2), HEAD (3).
output_format	string	How to process response. Supported for HTTP_AGENT items. Possible values:[1] RAW (0, default), JSON (1).
allow_traps	string	Allow the value to be populated in the same way as for a trapper item. Supported for HTTP_AGENT items. Possible values:[1] NO (0, default), YES (1).
ssl_cert_file	string	Public SSL Key file path. Supported for HTTP_AGENT items.
ssl_key_file	string	Private SSL Key file path. Supported for HTTP_AGENT items.

Element	Type	Description
ssl_key_password	string	Password for SSL Key file. Supported for HTTP_AGENT items.
verify_peer	string	Whether to validate that the host's certificate is authentic. Supported for HTTP_AGENT items. Possible values:[1] NO (0, default), YES (1).
verify_host	string	Whether to validate that the host name for the connection matches the one in the host's certificate. Supported for HTTP_AGENT items. Possible values:[1] NO (0, default), YES (1).
time_shift	string	How far back (before the current time) ends the time range that the item queries. Supported for TELEMETRY_QUERY items.
lookback_limit	string	How far back (before the current time) the item queries for data when there is no previous query to continue from (e.g., on the item's first run), or when the previous query is older than `delay` (e.g., because Zabbix server was down). Supported for TELEMETRY_QUERY items.
granularity	string	The length of a piece that the query's full time range is split into. Supported for TELEMETRY_QUERY items.
query		(required for TELEMETRY_QUERY items) Root element for the telemetry query. Defines what the item queries from the data source, how it filters the data, and how it aggregates the result.
signal_type	string	(required) Signal type that the item queries. Supported for TELEMETRY_QUERY items. Possible values:[1] TRACES (0), METRICS (1), LOGS (2).
metric_point_type	string	(required for METRICS signal type) Metric point type that the item queries. Supported for TELEMETRY_QUERY items. Possible values:[1] SUM (0), GAUGE (1), HISTOGRAM (2), EXPONENTIAL_HISTOGRAM (3).
columns		(required) Root element for telemetry data columns that the item queries. This element has the following elements: `column (string)` - (required) Name of the telemetry data column that the item queries. `attribute_key (string)` - (required for columns that hold key-value pairs) Name of the key that the item queries, within the column that holds key-value pairs.
aggregated_columns		(required) Root element for telemetry data aggregated columns that the item queries. This element has the following elements: `column (string)` - (required for MIN, MAX, AVG, SUM, and PERCENTILE functions) Name of the telemetry data column that the item queries. `function (string)` - (required) Function that the item applies to the column records. Possible values:[1] MIN (1), MAX (2), AVG (3), COUNT (4), SUM (5), PERCENTILE (8). `parameters (array)` - (required for PERCENTILE functions) Percentile that the item calculates from the column records. `alias (string)` - (required) Unique name for the calculated value, used to identify it in the item value.

Element	Type	Description
filter		(required) Root element for telemetry query filter for column records in the query. This element has the following elements: `evaltype` (`string`) - (required) Filter condition evaluation method. Possible values:[1] AND_OR (0), AND (1), OR (2), FORMULA (3). `formula` (`string`) - (required for FORMULA evaluation methods) User-defined expression to be used for evaluating conditions of filters with a custom expression. `conditions` (`string`) - (required) Root element for telemetry data filter conditions a record in a telemetry data column must meet. The `conditions` element has the following elements: `column` (`string`) - (required) Name of the telemetry data column that the filter conditions apply to. `attribute_key` (`string`) - (required for columns that hold key-value pairs) Name of the key that the condition applies to, within the column that holds key-value pairs. `operator` (`string`) - (required) Filter condition operator. Possible values for single-value columns:[1] EQUAL (0), NOT_EQUAL (1), LIKE (2), NOT_LIKE (3). Possible values for columns that hold key-value pairs:[1] EQUAL (0), NOT_EQUAL (1), EXISTS (12). `formulaid` (`string`) - (required for FORMULA evaluation methods) Arbitrary unique ID that is used to reference the condition from a custom expression. `value` (`string`) - (required for EQUAL, NOT_EQUAL, LIKE, and NOT LIKE operations) Value to compare with.
tags		Root element for item tags.
tag	string	(required) Tag name.
value	string	Tag value.
triggers		Root element for host item triggers.

Note:
See also: Item object (refer to the relevant property with a matching name).

Host item value preprocessing steps

```
zabbix_export:
  (...)
  hosts:
    - host: 'MySQL server'
      (...)
      items:
        (...)
        - name: 'Binlog cache disk use'
          (...)
          preprocessing:
            - type: JSONPATH
              parameters:
                - $.Binlog_cache_disk_use
            - type: DISCARD_UNCHANGED_HEARTBEAT
              parameters:
                - 6h
          (...)
```

Element	Type	Description
type	string	(required) The item value preprocessing step type. Possible values:[1] MULTIPLIER (1), RTRIM (2), LTRIM (3), TRIM (4), REGEX (5), BOOL_TO_DECIMAL (6), OCTAL_TO_DECIMAL (7), HEX_TO_DECIMAL (8), SIMPLE_CHANGE (9, calculated: received value - previous value), CHANGE_PER_SECOND (10, calculated: (received value - previous value)/(time now - time of last check)), XMLPATH (11), JSONPATH (12), IN_RANGE (13), MATCHES_REGEX (14), NOT_MATCHES_REGEX (15), CHECK_JSON_ERROR (16), CHECK_XML_ERROR (17), CHECK_REGEX_ERROR (18), DISCARD_UNCHANGED (19), DISCARD_UNCHANGED_HEARTBEAT (20), JAVASCRIPT (21), PROMETHEUS_PATTERN (22), PROMETHEUS_TO_JSON (23), CSV_TO_JSON (24), STR_REPLACE (25), CHECK_NOT_SUPPORTED (26), XML_TO_JSON (27), SNMP_WALK_VALUE (28), SNMP_WALK_TO_JSON (29), SNMP_GET_VALUE (30).
parameters		(required) Root element for parameters of the item value preprocessing step.
parameter	string	Individual parameter of the item value preprocessing step.
error_handler	string	Action type used in case of preprocessing step failure. Possible values:[1] ORIGINAL_ERROR (0, default), DISCARD_VALUE (1), CUSTOM_VALUE (2), CUSTOM_ERROR (3).
error_handler_params	string	Error handler parameters.

Note:
See also: Item preprocessing object (refer to the relevant property with a matching name).

Host item triggers

```
zabbix_export:
  (...)
  hosts:
    - host: 'MySQL server'
      (...)
      items:
        (...)
        - name: Uptime
          (...)
          triggers:
            - expression: 'nodata(/MySQL server/mysql.uptime,30m)=1'
              name: 'MySQL: Failed to fetch info data'
              event_name: 'MySQL: Failed to fetch info data (or no data for 30m)'
              priority: INFO
              description: 'Zabbix has not received any data for items for the last 30 minutes.'
              dependencies:
                - name: 'MySQL: Service is down'
                  expression: 'last(/MySQL server/mysql.ping["{$MYSQL.DSN}","{$MYSQL.USER}","{$MYSQL.PASSW
              tags:
                - tag: scope
                  value: availability
            - expression: 'last(/MySQL server/mysql.uptime)<10m'
              name: 'MySQL: Service has been restarted'
              event_name: 'MySQL: Service has been restarted (uptime < 10m)'
              priority: INFO
              description: 'MySQL uptime is less than 10 minutes.'
              tags:
                - tag: scope
                  value: notice
        (...)
```

Element	Type	Description
uuid	string	(required) Unique identifier for this trigger.
expression	string	(required) Trigger expression.
recovery_mode	string	Basis for generating OK events. Possible values:[1] EXPRESSION (0, default), RECOVERY_EXPRESSION (1), NONE (2).
recovery_expression	string	Trigger recovery expression.

Element	Type	Description
correlation_mode	string	Correlation mode (no event correlation or event correlation by tag). Possible values:[1] DISABLED (0, default), TAG_VALUE (1).
correlation_tag	string	The tag name to be used for event correlation.
name	string	(required) Trigger name.
event_name	string	Event name.
opdata	string	Operational data.
url_name	string	Label for the URL associated with the trigger.
url	string	URL associated with the trigger.
status	string	Trigger status. Possible values:[1] ENABLED (0, default), DISABLED (1).
priority	string	Trigger severity. Possible values:[1] NOT_CLASSIFIED (0, default), INFO (1), WARNING (2), AVERAGE (3), HIGH (4), DISASTER (5).
description	text	Trigger description.
type	string	Event generation type (single problem event or multiple problem events). Possible values:[1] SINGLE (0, default), MULTIPLE (1).
manual_close	string	Manual closing of problem events. Possible values:[1] NO (0, default), YES (1).
dependencies		Root element for dependencies.
name	string	(required) Dependency trigger name.
expression	string	(required) Dependency trigger expression.
recovery_expression	string	Dependency trigger recovery expression.
tags		Root element for trigger tags.
tag	string	(required) Tag name.
value	string	Tag value.

Note:
See also: Trigger object (refer to the relevant property with a matching name).

Host low-level discovery rules

```
zabbix_export:
  (...)
  hosts:
    - host: 'MySQL server'
      (...)
      discovery_rules:
        - name: 'Database discovery'
          key: 'mysql.db.discovery["{$MYSQL.DSN}","{$MYSQL.USER}","{$MYSQL.PASSWORD}"]'
          delay: 1h
          filter: (see table below)
          description: 'Scanning databases in DBMS.'
          interface_ref: if1
          item_prototypes:
            - name: 'Size of database {#DATABASE}'
              key: 'mysql.db.size["{$MYSQL.DSN}","{$MYSQL.USER}","{$MYSQL.PASSWORD}","{#DATABASE}"]'
              delay: 5m
              units: B
              description: 'Database size.'
              preprocessing:
                - type: DISCARD_UNCHANGED_HEARTBEAT
                  parameters:
                    - 1h
              interface_ref: if1
              tags:
                - tag: component
                  value: storage
                - tag: database
                  value: '{#DATABASE}'
          lld_macro_paths:
            - lld_macro: '{#DATABASE}'
```

```
            path: $.Database
          preprocessing:
            - type: DISCARD_UNCHANGED_HEARTBEAT
              parameters:
                - 1d
        (...)
```

Attention:
Most host low-level discovery rule elements are the same as for host items. The table below describes those elements that differ from host items.

Element	Type	Description
type	string	Item type. Possible values:[1] ZABBIX_PASSIVE (0, default), TRAP (2), SIMPLE (3), INTERNAL (5), ZABBIX_ACTIVE (7), EXTERNAL (10), ODBC (11), IPMI (12), SSH (13), TELNET (14), JMX (16), DEPENDENT (18), HTTP_AGENT (19), SNMP_AGENT (20), ITEM_TYPE_SCRIPT (21), ITEM_TYPE_BROWSER (22).
key	string	(required) The low-level discovery rule key.
filter		Root element for host low-level discovery rule filters.
lifetime	string	Time period (using seconds, time suffix, or user macro), after which no longer discovered resources will be deleted. Default: 7d.
lifetime_type	string	Scenario for deleting lost LLD resources. Possible values: DELETE_NEVER, DELETE_IMMEDIATELY, DELETE_AFTER.
enabled_lifetime	string	Time period (using seconds, time suffix, or user macro), after which no longer discovered resources will be disabled.
enabled_lifetime_type	string	Scenario for disabling lost LLD resources. Possible values: DISABLE_NEVER, DISABLE_IMMEDIATELY, DISABLE_AFTER.
item_prototypes		Root element for host item prototype elements, which are the same as for host items.
trigger_prototypes		Root element for host trigger prototype elements, which are the same as for host item triggers.
graph_prototypes		Root element for host graph prototypes, which are the same as for host graphs.
host_prototypes		Root element for host prototypes, which are the same as for hosts.
parent_discovery_rule		Root element for the parent low-level discovery rule (or rule prototype) of the low-level discovery rule prototype. This property denotes that it is an LLD rule prototype, direct child of the referenced rule/rule prototype.
key	string	(required) The parent low-level discovery rule (or rule prototype) key.
master_item	string	(required for DEPENDENT rules) Root element for the dependent rule's master item.
lld_macro_paths		Root element for low-level discovery rule macro paths.
lld_macro	string	(required) Low-level discovery rule macro name.
path	string	(required) Selector for value, which will be assigned to the corresponding macro.
preprocessing		Root element for low-level discovery rule value preprocessing.
step		Root element for low-level discovery rule value preprocessing step elements, which are the same as for host item value preprocessing steps, except with fewer possible values. See also: LLD rule preprocessing object.
overrides		Root element for low-level discovery rule override rules.
name	string	(required) Unique override name.
step	string	(required) Unique order number of the override.
stop	string	Stop processing next overrides if matches.
filter		Root element for low-level discovery rule override rule filter elements, which are the same as for host low-level discovery rule filters.
operations		Root element for host low-level discovery rule override operations.

Note:
See also: LLD rule object (refer to the relevant property with a matching name).

Host low-level discovery rule filters

```
zabbix_export:
  (...)
  hosts:
```

```
  - host: 'MySQL server'
    (...)
    discovery_rules:
      - name: 'Database discovery'
        (...)
        filter:
          evaltype: AND
          conditions:
            - macro: '{#DATABASE}'
              value: '{$MYSQL.DBNAME.MATCHES}'
            - macro: '{#DATABASE}'
              value: '{$MYSQL.DBNAME.NOT_MATCHES}'
              operator: NOT_MATCHES_REGEX
        (...)
```

Element	Type	Description
evaltype	string	Override filter condition evaluation method. Possible values:[1] AND_OR (0, default), AND (1), OR (2), FORMULA (3).
formula	string	Custom calculation formula for filter conditions.
conditions		Root element for filter conditions.
macro	string	(required) The name of the low-level discovery macro to perform the check on.
value	string	Value to compare with.
operator	string	Condition operator. Possible values:[1] MATCHES_REGEX (8, default), NOT_MATCHES_REGEX (9).
formulaid	string	(required) Arbitrary unique ID that is used to reference a condition from the custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward.

Note:
See also: LLD rule filter object (refer to the relevant property with a matching name).

Host low-level discovery rule override operations

Element	Type	Description
operationobject	string	Object to which the operation is applied. Possible values:[1] ITEM_PROTOTYPE (0), TRIGGER_PROTOTYPE (1), GRAPH_PROTOTYPE (2), HOST_PROTOTYPE (3), DISCOVERY_PROTOTYPE (4).
operator	string	Override condition operator. Possible values:[1] EQUAL (1), NOT_EQUAL (2), LIKE (3), NOT_LIKE (4), REGEXP (5), NOT_REGEXP (6).
value	string	A regular expression or a string for the override condition operator.
status	string	Status of the object upon the override operation.
discover	string	Whether the object is added as a result of the discovery.
delay	string	Update interval set for the item prototype upon the override operation.
history	string	History storage period set for the item prototype upon the override operation.
trends	string	Trend storage period set for the item prototype upon the override operation.
severity	string	Trigger prototype severity set upon the override operation.
tags		Root element for the tags set for the object upon the override operation.
tag	string	(required) Tag name.
value	string	Tag value.
templates		Root element for the templates linked to the host prototype upon the override operation.
name	string	(required) Template name.
inventory_mode	string	Host prototype inventory mode set upon the override operation.

Note:
See also: LLD rule override operation object (refer to the relevant property with a matching name).

Host web scenarios

Element	Type	Description
uuid	string	(required) Unique identifier for this web scenario.
name	string	(required) Web scenario name.
delay	string	Frequency (using seconds, time suffix, or user macro) of executing web scenario. Default: 1m.
attempts	integer	The number of attempts for executing web scenario steps. Possible values: 1-10 (default: 1).
agent	string	Client agent. Zabbix will pretend to be the selected browser. This is useful when a website returns different content for different browsers. Default: Zabbix.
http_proxy	string	Proxy that will be used by the web scenario given as: `http://[username[:password]@]proxy.example.com[:port]`
variables		Root element for web scenario variables that may be used in scenario steps.
name	string	(required) Variable name.
value	text	(required) Variable value.
headers		Root element for HTTP headers to be sent when performing a request. Headers should be listed using the same syntax as they would appear in the HTTP protocol.
name	string	(required) Header name.
value	text	(required) Header value.
status	string	Web scenario status. Possible values:[1] ENABLED (0, default), DISABLED (1).
authentication	string	Authentication method. Possible values:[1] NONE (0, default), BASIC (1), NTLM (2), Kerberos (3), or Digest (4).
http_user	string	User name used for BASIC (HTTP), NTLM, Kerberos, or Digest authentication.
http_password	string	Password used for BASIC (HTTP), NTLM, Kerberos, or Digest authentication.
verify_peer	string	Verify the SSL certificate of the web server. Possible values:[1] NO (0, default), YES (1).
verify_host	string	Verify that the *Common Name* field or the *Subject Alternate Name* field of the web server certificate matches. Possible values:[1] NO (0, default), YES (1).
ssl_cert_file	string	Name of the SSL certificate file used for client authentication (must be in PEM format).
ssl_key_file	string	Name of the SSL private key file used for client authentication (must be in PEM format).
ssl_key_password	string	SSL private key file password.
steps		(required) Root element for host web scenario steps.
tags		Root element for web scenario tags.
tag	string	(required) Tag name.
value	string	Tag value.

Note:
See also: Web scenario object (refer to the relevant property with a matching name).

Host web scenario steps

Element	Type	Description
name	string	(required) Web scenario step name.
url	string	(required) URL for monitoring.
query_fields		Root element for query parameters (an array of HTTP fields to be added to the URL when performing a request).
name	string	(required) Query parameter name.
value	string	Query parameter value.
posts		Root element for HTTP POST variables (a string (raw post data) or an array of HTTP fields (form field data)).
name	string	(required) Post field name.
value	string	(required) Post field value.
variables		Root element of step-level variables (macros) that should be applied after this step. If the variable value has a 'regex:' prefix, then its value is extracted from the data returned by this step according to the regular expression pattern following the 'regex:' prefix
name	string	(required) Variable name.

Element	Type	Description
value	text	(required) Variable value.
headers		Root element for HTTP headers to be sent when performing a request.
name	string	(required) Header name.
value	text	(required) Header value.
follow_redirects	string	Follow HTTP redirects. Possible values:[1] NO (0), YES (1, default).
retrieve_mode	string	HTTP response retrieve mode. Possible values:[1] BODY (0, default), HEADERS (1), BOTH (2).
timeout	string	Timeout (using seconds, time suffix, or user macro) of step execution. Default: 15s.
required	string	Text that must be present in the response (ignored if empty).
status_codes	string	A comma-delimited list of accepted HTTP status codes (e.g., 200-201,210-299; ignored if empty).

Note:
See also: Web scenario step object (refer to the relevant property with a matching name).

Host graphs

```
zabbix_export:
  (...)
  graphs:
    - name: 'MySQL: Bandwidth'
      graph_items: (see table below)
    (...)
```

Element	Type	Description
uuid	string	Unique identifier of the graph.
name	string	(required) Graph name.
width	integer	Graph width, in pixels. Used for preview and for pie/exploded graphs. Possible values:[1] 20-65535 (default: 900).
height	integer	Graph height, in pixels. Used for preview and for pie/exploded graphs. Possible values:[1] 20-65535 (default: 900).
yaxismin	double	Value of Y axis minimum. Supported for FIXED minimum value of Y axis. Default: 0.
yaxismax	double	Value of Y axis maximum. Supported for FIXED minimum value of X axis. Default: 0.
show_work_period	string	Highlight non-working hours. Supported for NORMAL and STACKED graphs. Possible values:[1] NO (0), YES (1, default).
show_triggers	string	Display simple trigger values as a line. Supported for NORMAL and STACKED graphs. Possible values:[1] NO (0), YES (1, default).
type	string	Graph type. Possible values:[1] NORMAL (0, default), STACKED (1), PIE (2), EXPLODED (3).
show_legend	string	Display graph legend. Possible values:[1] NO (0), YES (1, default).
show_3d	string	Enable 3D style. Supported for NORMAL and STACKED graphs. Possible values:[1] NO (0, default), YES (1).
percent_left	double	Show the percentile line for left axis. Supported for NORMAL graphs. Default: 0.
percent_right	double	Show the percentile line for right axis. Supported for NORMAL graphs. Default: 0.

Element	Type	Description
ymin_type_1	string	Minimum value of Y axis. Supported for NORMAL and STACKED graphs. Possible values:[1] CALCULATED (0, default), FIXED (1), ITEM (2).
ymin_item_1		(required if `ymin_type_1` is set to `ITEM`) Root element for individual item details.
host	string	(required) Item host.
key	string	(required) Item key.
ymax_type_1	string	Maximum value of Y axis. Supported for NORMAL and STACKED graphs. Possible values:[1] CALCULATED (0, default), FIXED (1), ITEM (2).
ymax_item_1		(required if `ymax_type_1` is set to `ITEM`) Root element for individual item details.
host	string	(required) Item host.
key	string	(required) Item key.
graph_items		(required) Root element for host graph items.

Note:
See also: Graph object (refer to the relevant property with a matching name).

Host graph items

```
zabbix_export:
  (...)
  graphs:
    - name: 'MySQL: Bandwidth'
      graph_items:
        - drawtype: GRADIENT_LINE
          color: 199C0D
          item:
            host: 'MySQL server'
            key: mysql.bytes_received.rate
        - sortorder: '1'
          drawtype: GRADIENT_LINE
          color: F63100
          item:
            host: 'MySQL server'
            key: mysql.bytes_sent.rate
    (...)
```

Element	Type	Description
sortorder	integer	Draw order. The smaller value is drawn first. Can be used to draw lines or regions behind (or in front of) another.
drawtype	string	Draw style of the graph item. Supported for NORMAL graphs. Possible values:[1] SINGLE_LINE (0, default), FILLED_REGION (1), BOLD_LINE (2), DOTTED_LINE (3), DASHED_LINE (4), GRADIENT_LINE (5).
color	string	Element color (6 symbols, hex).
yaxisside	string	Side of the graph where the graph item's Y scale will be drawn. Supported for NORMAL and STACKED graphs. Possible values:[1] LEFT (0, default), RIGHT (1).
calc_fnc	string	Data to draw if more than one value exists for an item. Possible values:[1] MIN (1), AVG (2, default), MAX (4), ALL (7; minimum, average, and maximum; supported for simple graphs), LAST (9, supported for pie/exploded graphs).
type	string	Graph item type. Possible values:[1] SIMPLE (0, default), GRAPH_SUM (2; value of the item represents the whole pie; supported for pie/exploded graphs).
item		(required) Individual item.
host	string	(required) Item host.
key	string	(required) Item key.

Note:
See also: Graph item object (refer to the relevant property with a matching name).

Host value maps

```
zabbix_export:
  (...)
  hosts:
    - host: 'MySQL server'
      (...)
      valuemaps:
        - name: Example value map
          mappings:
            - value: '1'
              newvalue: Example value
  (...)
```

Element	Type	Description
uuid	string	(required) Unique identifier for this value map.
name	string	(required) Value map name.
mapping		Root element for mappings.
type	string	Mapping match type. Possible values:[1] EQUAL (0, default), GREATER_OR_EQUAL (2), LESS_OR_EQUAL (3), IN_RANGE (4), REGEXP (5), DEFAULT (6).
value	string	Original value.
newvalue	string	(required) Value to which the original value is mapped to.

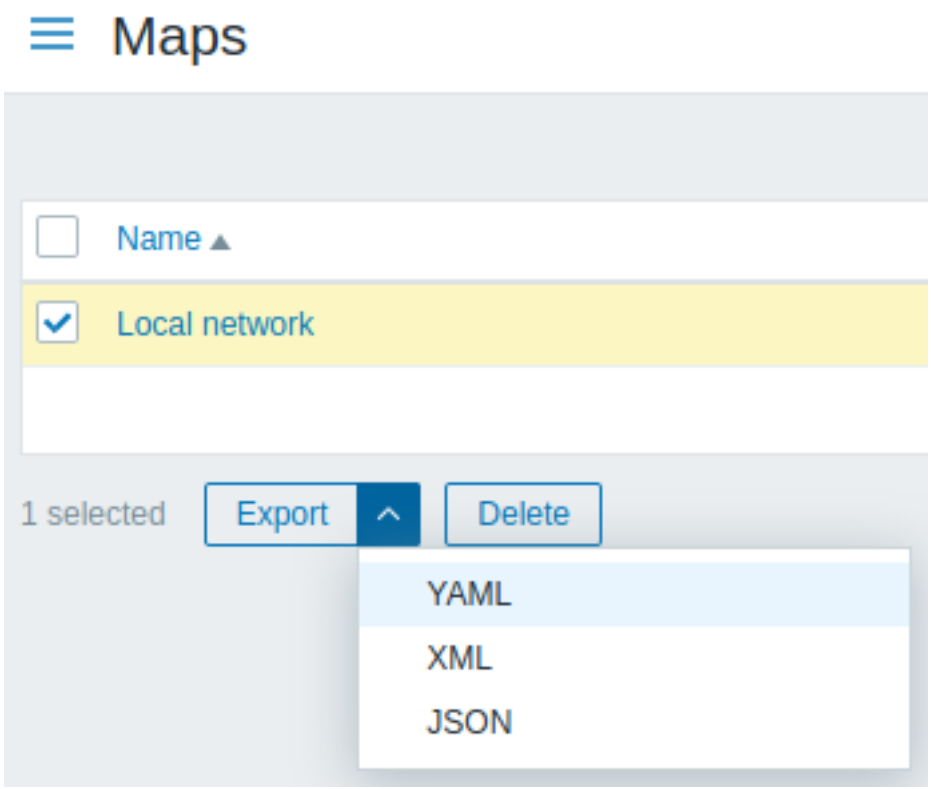
Note:
See also: Value map object (refer to the relevant property with a matching name).

Footnotes [1] API integer values in brackets, for example, ENABLED (0), are mentioned only for reference. For more information, see the linked API object page in the table entry or at the end of each section.

Network maps

Overview

Network map export contains:



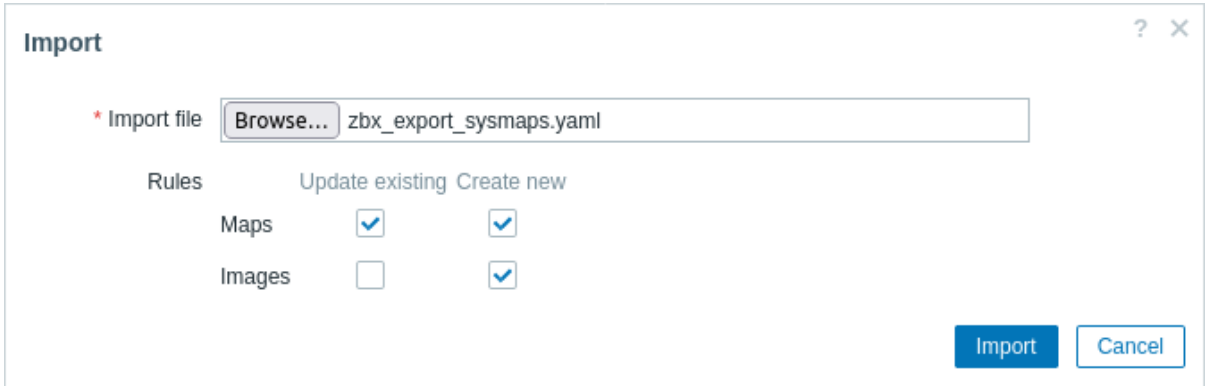
- All related images
- Map structure (all map settings, all contained elements with their settings, map links and map link status indicators)

Warning:
Any host groups, hosts, triggers, other maps or other elements that may be related to the exported map are not exported. Thus, if at least one of the elements the map refers to is missing, importing it will fail.

Exporting

To export network maps, do the following:

1. Go to *Monitoring* > *Maps*.
2. Mark the checkboxes of the network maps to export.
3. Click *Export* below the list to export in the default YAML format, or click the arrow to select a different export format.



Depending on the selected format, maps are exported to a local file with a default name:

- `zabbix_export_maps.yaml` - in YAML export;
- `zabbix_export_maps.xml` - in XML export;
- `zabbix_export_maps.json` - in JSON export.

Importing

To import network maps, do the following:

1. Go to *Monitoring* > *Maps*.
2. Click *Import* in the upper-right corner.
3. Select the import file.
4. Mark the checkboxes of the import rules you want to apply (see below).
5. Click *Import* in the lower-right corner of the configuration form.

Import rules:

Rule	Description
Update existing	Existing maps will be updated using data from the import file. Otherwise, they will not be updated.
Create new	New maps will be created using data from the import file. Otherwise, they will not be created.

If you uncheck both map options and check the respective options for images, images only will be imported. Image importing is only available to *Super admin* users.

You cannot review changes to network maps during the import. A success or failure message of the import will be displayed in the frontend.

Warning:
If replacing an existing image, it will affect all maps that are using this image.

Export format

Export to YAML:

```yaml
zabbix_export:
  version: '8.0'
  images:
    - name: Zabbix_server_3D_(128)
      imagetype: '1'
      encodedImage: iVBOR...5CYII=
  maps:
    - name: 'Local network'
      width: '680'
      height: '200'
      label_type: '0'
      label_location: '0'
      highlight: '1'
      expandproblem: '1'
      markelements: '1'
      show_unack: '0'
      severity_min: '0'
      show_suppressed: '0'
      grid_size: '50'
      grid_show: '1'
      grid_align: '1'
      label_format: '0'
      label_type_host: '2'
      label_type_hostgroup: '2'
      label_type_trigger: '2'
      label_type_map: '2'
      label_type_image: '2'
      label_string_host: ''
      label_string_hostgroup: ''
      label_string_trigger: ''
      label_string_map: ''
      label_string_image: ''
      expand_macros: '1'
      background: {  }
      iconmap: {  }
      urls: {  }
      selements:
        - elementtype: '0'
          elements:
            - host: 'Zabbix server'
          label: |
            {HOST.NAME}
            {HOST.CONN}
          label_location: '0'
          x: '111'
          'y': '61'
          elementsubtype: '0'
          areatype: '0'
          width: '200'

          border_width: '0'
          border_color: '000000'
          background_color: ''
          zindex: '0'
      lines: {  }
      links: {  }
```

Exported elements

Exported elements are explained in the table below.

Element	Type	Description
images		Root element for images.
name	string	Unique image name.
imagetype	integer	Image type. Possible values: 1 - Image; 2 - Background.
encodedImage	string	Base64 encoded image.
maps		Root element for maps.

Maps

Element	Type	Description
name	string	Unique map name.
width	integer	Map width, in pixels.
height	integer	Map height, in pixels.
label_type	integer	Map element label type. Possible values: 0 - Label; 1 - Host IP address; 2 - Element name; 3 - Status only; 4 - Nothing.
label_location	integer	Map element label location by default. Possible values: 0 - Bottom; 1 - Left; 2 - Right; 3 - Top.

Element	Type	Description
highlight	integer	Enable icon highlighting for active triggers and host statuses. Possible values: 0 - No; 1 - Yes.
expandproblem	integer	Display problem trigger for elements with a single problem. Possible values: 0 - No; 1 - Yes.
markelements	integer	Highlight map elements that have recently changed their status. Possible values: 0 - No; 1 - Yes.
show_unack	integer	Problem display. Possible values: 0 - Count of all problems; 1 - Count of unacknowledged problems; 2 - Count of acknowledged and unacknowledged problems separately.
severity_min	integer	Minimum trigger severity to show on the map by default. Possible values: 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster.
show_suppressed	integer	Display problems, which would otherwise be suppressed (not shown) because of host maintenance. Possible values: 0 - No; 1 - Yes.
grid_size	integer	Cell size of a map grid in pixels. Supported if `grid_show` is set to 0. Possible values: 20, 40, 50, 75 or 100.
grid_show	integer	Display a grid in map configuration. Possible values: 0 - Yes; 1 - No.
grid_align	integer	Automatically align icons in map configuration. Possible values: 0 - Yes; 1 - No.
label_format	integer	Use advanced label configuration. Possible values: 0 - No; 1 - Yes.
label_type_host	integer	Display label as host label. Supported if `label_format` is set to 1. Possible values: 0 - Label; 1 - Host IP address; 2 - Element name; 3 - Status only; 4 - Nothing; 5 - Custom label.
label_type_hostgroup	integer	Display label as host group label. Supported if `label_format` is set to 1. Possible values: 0 - Label; 2 - Element name; 3 - Status only; 4 - Nothing; 5 - Custom label.

Element	Type	Description
label_type_trigger	integer	Display label as trigger label. Supported if `label_format` is set to 1. Possible values: 0 - Label; 2 - Element name; 3 - Status only; 4 - Nothing; 5 - Custom label.
label_type_map	integer	Display label as map label. Supported if `label_format` is set to 1. Possible values: 0 - Label; 2 - Element name; 3 - Status only; 4 - Nothing; 5 - Custom label.
label_type_image	integer	Display label as image label. Supported if `label_format` is set to 1. Possible values: 0 - Label; 2 - Element name; 4 - Nothing; 5 - Custom label.
label_string_host	string	Custom label for host elements. Supported if `label_type_host` is set to 5.
label_string_hostgroup	string	Custom label for host group elements. Supported if `label_type_hostgroup` is set to 5.
label_string_trigger	string	Custom label for trigger elements. Supported if `label_type_trigger` is set to 5.
label_string_map	string	Custom label for map elements. Supported if `label_type_map` is set to 5.
label_string_image	string	Custom label for image elements. Supported if `label_type_image` is set to 5.
expand_macros	integer	Expand macros in labels in map configuration. Possible values: 0 - No; 1 - Yes.
background		Root element for background image (if any). Supported if `imagetype` is set to 2.
name	string	Background image name.
iconmap		Root element for icon mapping (if any).
name	string	Icon mapping name.
urls		Root element for URLs used by maps or each map element.
name	string	Link name.
url	string	Link URL.
elementtype	integer	Map item type the link belongs to. Possible values: 0 - Host; 1 - Map; 2 - Trigger; 3 - Host group; 4 - Image.
selements		Root element for map selements.
shapes		Root element for map shapes.
type	integer	Shape type. Possible values: 0 - Rectangle; 1 - Ellipse.
x	integer	X coordinates of the shape in pixels.
y	integer	Y coordinates of the shape in pixels.
width	integer	Shape width.

Element		Type	Description
	height	integer	Shape height.
	text	string	Text inside of shape.
	font	integer	Text font style. Possible values: 0 - Georgia, serif; 1 - ”Palatino Linotype”, ”Book Antiqua”, Palatino, serif; 2 - ”Times New Roman”, Times, serif; 3 - Arial, Helvetica, sans-serif; 4 - ”Arial Black”, Gadget, sans-serif; 5 - ”Comic Sans MS”, cursive, sans-serif; 6 - Impact, Charcoal, sans-serif; 7 - ”Lucida Sans Unicode”, ”Lucida Grande”, sans-serif; 8 - Tahoma, Geneva, sans-serif; 9 - ”Trebuchet MS”, Helvetica, sans-serif; 10 - Verdana, Geneva, sans-serif; 11 - ”Courier New”, Courier, monospace; 12 - ”Lucida Console”, Monaco, monospace.
	font_size	integer	Font size in pixels.
	font_color	string	Font color represented in hexadecimal code.
	text_halign	integer	Horizontal alignment of text. Possible values: 0 - Center; 1 - Left; 2 - Right.
	text_valign	integer	Vertical alignment of text. Possible values: 0 - Middle; 1 - Top; 2 - Bottom.
	border_type	integer	Type of the border for the shape. Possible values: 0 - None; 1 - Bold line; 2 - Dotted line; 3 - Dashed line.
	border_width	integer	Width of the border in pixels.
	border_color	string	Border color represented in hexadecimal code.
	background_color	string	Background (fill) color represented in hexadecimal code.
	zindex	integer	Value for ordering all shapes and lines (z-index).
lines			Root element for map lines.
	x1	integer	X coordinates of the line point 1 in pixels.
	y1	integer	Y coordinates of the line point 1 in pixels.
	x2	integer	X coordinates of the line point 2 in pixels.
	y2	integer	Y coordinates of the line point 2 in pixels.
	line_type	integer	Line type. Possible values: 0 - None; 1 - Bold line; 2 - Dotted line; 3 - Dashed line.
	line_width	integer	Line width in pixels.
	line_color	string	Line color represented in hexadecimal code.
	zindex	integer	Value for ordering all shapes and lines (z-index).
links			Root element for links between map elements.
	drawtype	integer	Link style. Possible values: 0 - Line; 2 - Bold line; 3 - Dotted line; 4 - Dashed line.
	color	string	Link color (6 symbols, hex).

Element	Type	Description
label	string	Link label.
selementid1	id	ID of one element to connect.
selementid2	id	ID of the other element to connect.
linktriggers		Root element for link status indicators.

Note:
See also: Map object (refer to the relevant property with a matching name).

Maps elements

Element	Type	Description
elementtype	integer	Map element type. Possible values: 0 - Host; 1 - Map; 2 - Trigger; 3 - Host group; 4 - Image.
elements		Root element for Zabbix entities (host, host group, map, etc.) that are represented on the map. All entities have their respective element (`host`, etc.; see, for example, Export format).
label	string	Icon label.
label_location	integer	Label location. Possible values: -1 - Use map default; 0 - Bottom; 1 - Left; 2 - Right; 3 - Top.
x	integer	Location on the X axis.
y	integer	Location on the Y axis.
elementsubtype	integer	Element subtype. Supported if `elementtype` is set to 3. Possible values: 0 - Single host group; 1 - All host groups.
areatype	integer	Area size. Supported if `elementtype` is set to 1. Possible values: 0 - Same as whole map; 1 - Custom size.
width	integer	Width of area. Supported if `areatype` is set to 1.
height	integer	Height of area. Supported if `areatype` is set to 1.
viewtype	integer	Area placement algorithm. Supported if `elementsubtype` is set to 1. Possible values: 0 - Place evenly in the area.
use_iconmap	integer	Use icon mapping for this element. Relevant only if icon mapping is activated on map level. Possible values: 0 - No; 1 - Yes.
selementid	id	Unique element record ID.
icon_off		Root element for image to use when element is in `OK` state.
name	string	Unique image name.
icon_on		Root element for image to use when element is in `Problem` state.
name	string	Unique image name.

Element	Type	Description
icon_disabled		Root element for image to use when element is disabled.
name	string	Unique image name.
icon_maintenance		Root element for image to use when element is in maintenance.
name	string	Unique image name.
urls		Root element for URLs used by maps or each map element.
name	string	Link name.
url	string	Link URL.
evaltype	integer	Evaluation type for tags.
tags		Root element for problem tags (for host and host group elements). If tags are given, only problems with these tags will be displayed on the map.
tag	string	Tag name.
value	string	Tag value.
operator	integer	Operator.

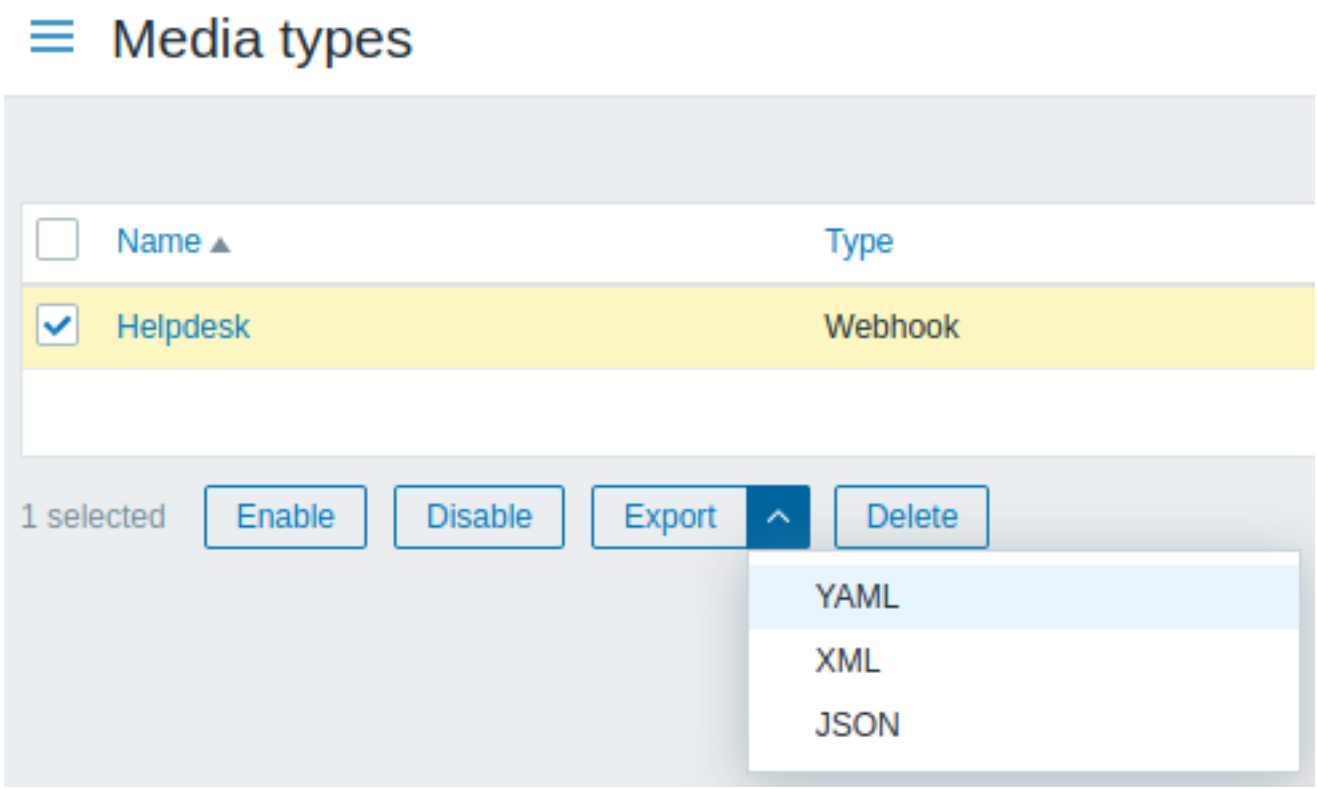
Note:
See also: Map element object (refer to the relevant property with a matching name).

Map link status indicators

Element	Type	Description
drawtype	integer	Link style when trigger is in the 'Problem' state. Possible values: 0 - Line; 2 - Bold line; 3 - Dotted line; 4 - Dashed line.
color	string	Link color (6 symbols, hex) when trigger is in the 'Problem' state.
trigger		Root element for trigger used to indicate link status.
description	string	Trigger name.
expression	string	Trigger expression.
recovery_expression	string	Trigger recovery expression.

Note:
See also: Map link trigger object (refer to the relevant property with a matching name).

Media types



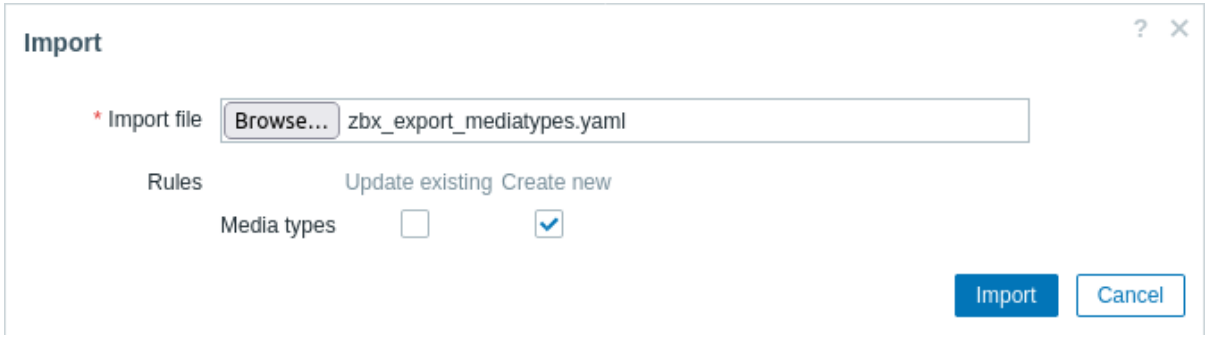
Overview

Media types are exported with all related objects and object relations.

Exporting

To export media types, do the following:

1. Go to *Alerts* > *Media types*.
2. Mark the checkboxes of the media types to export.
3. Click *Export* below the list to export in the default YAML format, or click the arrow to select a different export format.



Depending on the selected format, media types are exported to a local file with a default name:

- `zabbix_export_mediatypes.yaml` - in YAML export;
- `zabbix_export_mediatypes.xml` - in XML export;
- `zabbix_export_mediatypes.json` - in JSON export.

Importing

To import media types, do the following:

1. Go to *Alerts* > *Media types*.
2. Click *Import* in the upper-right corner.
3. Select the import file.
4. Mark the checkboxes of the import rules you want to apply (see below).
5. Click *Import* in the lower-right corner of the configuration form.

Import rules:

Rule	Description
Update existing	Mark this checkbox to update existing media types using data from the import file.
Create new	Mark this checkbox to create new media types using data from the import file. If the import file contains a media type that already exists (e.g., *Email*), a new one will not be created, and the existing media type will also not be updated.

You cannot review changes to media types during the import. A success or failure message of the import will be displayed in the frontend.

Export format

Export to YAML:

```yaml
zabbix_export:
  version: '8.0'
  media_types:
    - name: Pushover
      type: WEBHOOK
      parameters:
        - name: endpoint
          value: 'https://api.pushover.net/1/messages.json'
        - name: eventid
          value: '{EVENT.ID}'
        - name: event_nseverity
          value: '{EVENT.NSEVERITY}'
        - name: event_source
          value: '{EVENT.SOURCE}'
        - name: event_value
          value: '{EVENT.VALUE}'
        - name: expire
          value: '1200'
        - name: message
          value: '{ALERT.MESSAGE}'
        - name: priority_average
          value: '0'
        - name: priority_default
          value: '0'
        - name: priority_disaster
          value: '0'
        - name: priority_high
          value: '0'
        - name: priority_information
          value: '0'
        - name: priority_not_classified
          value: '0'
        - name: priority_warning
          value: '0'
        - name: retry
          value: '60'
        - name: title
          value: '{ALERT.SUBJECT}'
        - name: token
          value: '<PUSHOVER TOKEN HERE>'
        - name: triggerid
          value: '{TRIGGER.ID}'
        - name: url
          value: '{$ZABBIX.URL}'
        - name: url_title
          value: Zabbix
        - name: user
          value: '{ALERT.SENDTO}'
      status: DISABLED
      max_sessions: '0'
      script: |
        try {

Exported elements

Exported elements are explained in the table below.

Element	Type	Description
name	string	(required) Media type name.
type	string	(required) Transport used by the media type. Possible values:[1] EMAIL (0), SMS (1), SCRIPT (2), WEBHOOK (4).
status	string	Whether the media type is enabled. Possible values:[1] ENABLED (0, default), DISABLED (1)
max_sessions	integer	The maximum number of alerts that can be processed in parallel. Possible values for SMS:[1] 1 (default). Possible values for other media types:[1] 0-100 (where 0 - unlimited).
attempts	integer	The maximum number of attempts to send an alert. Possible values:[1] 1-10 (default: 3).
attempt_interval	string	The interval (using seconds or time suffix) between retry attempts. Possible values:[1] 0-60s (default: 10s).
description	string	Media type description.
message_templates		Root element for media type message templates.
event_source	string	(required) Event source. Possible values:[1] TRIGGERS (0), DISCOVERY (1), AUTOREGISTRATION (2), INTERNAL (3), SERVICE (4).
operation_mode	string	Operation mode. Possible values:[1] PROBLEM (0), RECOVERY (1), UPDATE (2).

Element	Type	Description
subject	string	Message subject.
message	string	Message body.

Note:
See also: Media type object (refer to the relevant property with a matching name).

Email

The following additional elements are exported only for the *Email* media type.

Element	Type	Description
provider	string	Email provider.
smtp_server	string	SMTP server.
smtp_port	integer	SMTP server port to connect to. Default: 25.
smtp_helo	string	SMTP helo.
smtp_email	string	Email address from which notifications will be sent.
smtp_security	string	SMTP connection security level to use. Possible values:[1] NONE (0, default), STARTTLS (1), SSL_OR_TLS (2).
smtp_verify_host	string	SSL verify host for SMTP. Possible values:[1] NO (0, default), YES (1).
smtp_verify_peer	string	SSL verify peer for SMTP. Possible values:[1] NO (0, default), YES (1).
smtp_authentication	string	SMTP authentication method to use. Possible values:[1] NONE (0, default), PASSWORD (1), OAUTH (2).
username	string	Username.
password	string	Authentication password.
redirection_url	string	Zabbix frontend URL to redirect back OAuth authorization.
client_id	string	The client identifier registered within the OAuth authorization server.
authorization_url	string	OAuth URL, with parameters, to get access and refresh tokens.
token_url	string	OAuth URL to exchange authorization token to access and refresh tokens.
message_format	string	Message format. Possible values:[1] TEXT (0), HTML (1, default).

Note:
See also: Media type object (refer to the relevant property with a matching name).

SMS

The following additional elements are exported only for the *SMS* media type.

Element	Type	Description
gsm_modem	string	(required) Serial device name of the GSM modem.

Note:
See also: Media type object (refer to the relevant property with a matching name).

Script

The following additional elements are exported only for the *Script* media type.

Element	Type	Description
script name	string	(required) Script name.
parameters		Root element for script parameters.

Element	Type	Description
sortorder	string	(required) Order of the script parameters passed to the script as command-line arguments.
value	string	Script parameter value.

Note:
See also: Media type object (refer to the relevant property with a matching name).

Webhook

The following additional elements are exported only for the *Webhook* media type.

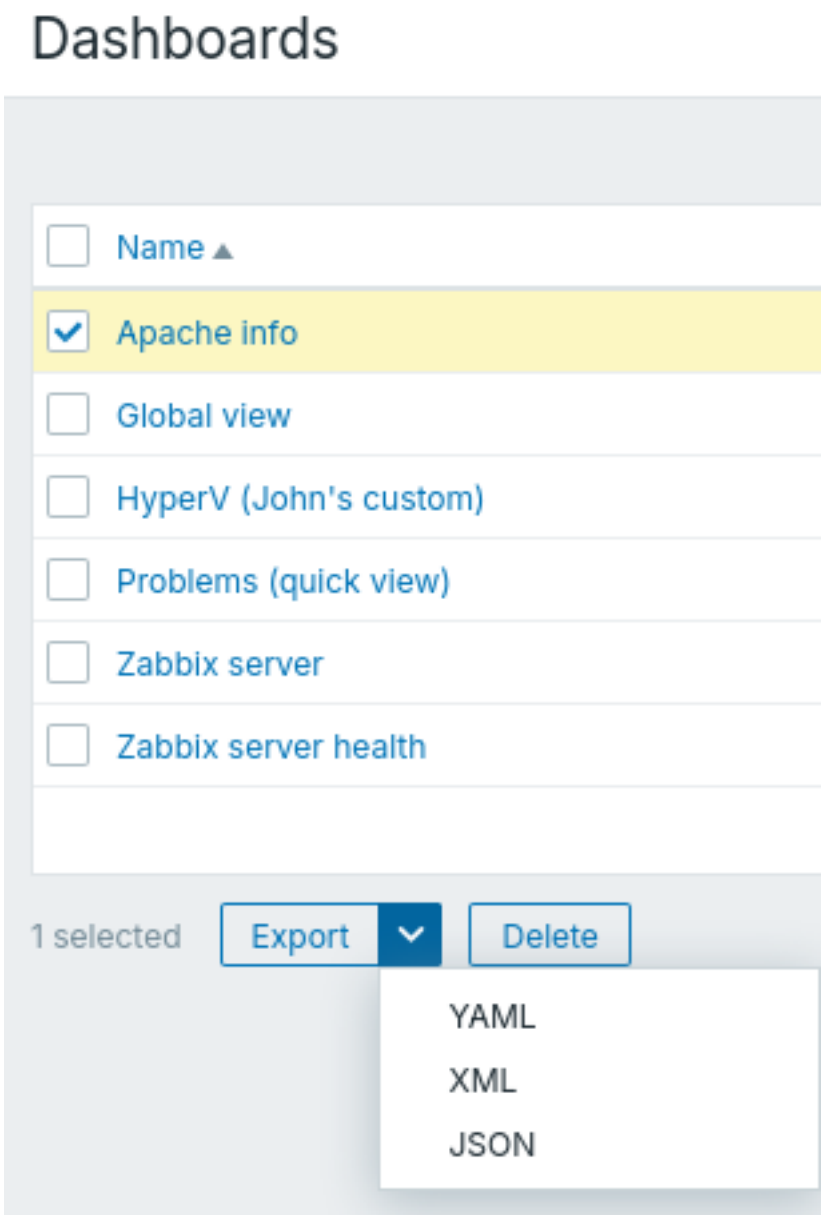
Element	Type	Description
script	string	Script.
timeout	string	Javascript script HTTP request timeout interval. Possible values:[1] 1-60s (default: 30s).
process_tags	string	Whether to process returned tags. Possible values:[1] NO (0, default), YES (1).
show_event_menu	string	Indicates the presence of an entry in the event menu if the {EVENT.TAGS.*} macro was successfully resolved in `event_menu_url` and `event_menu_name` fields. Possible values:[1] NO (0, default), YES (1).
event_menu_url	string	URL of the event menu entry. Supports {EVENT.TAGS.*} macro.
event_menu_name	string	Name of the event menu entry. Supports {EVENT.TAGS.*} macro.
parameters		Root element for webhook media type parameters.
name	string	(required) Webhook parameter name.
value	string	Webhook parameter value.

Note:
See also: Media type object (refer to the relevant property with a matching name).

Footnotes

[1] API integer values in brackets, for example, ENABLED (0), are mentioned only for reference. For more information, see the linked API object page in the table entry or at the end of each section.

Dashboards



Overview

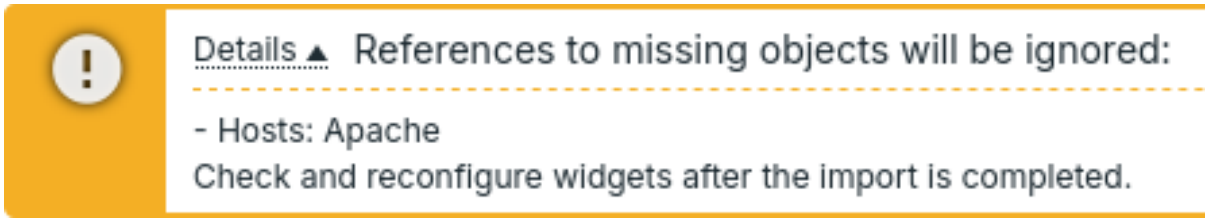
Dashboards are exported with all related objects and object relations.

Exporting

To export dashboards, do the following:

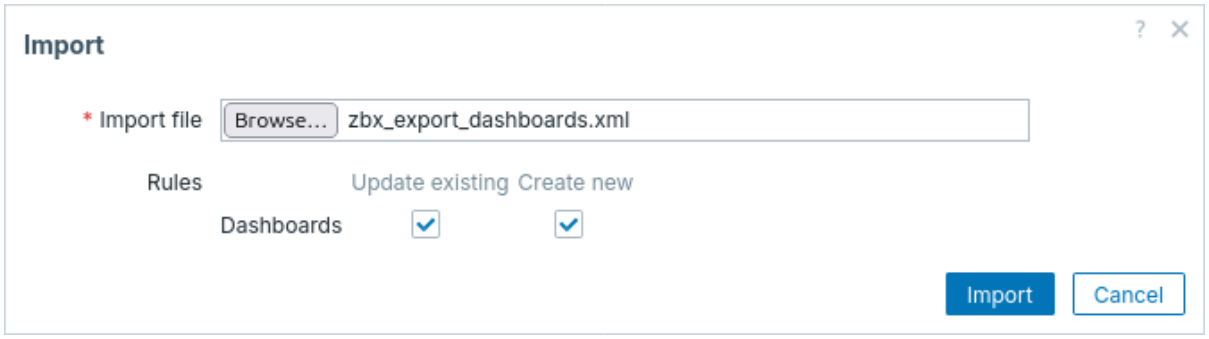
1. Go to *Dashboards* > *All dashboards*.
2. Mark the checkboxes of the dashboards to export.
3. Click *Export* below the list to export in the default YAML format, or click the arrow to select a different export format.

Depending on the selected format, dashboards are exported to a local file with a default name:



- `zbx_export_dashboards.yaml` - in YAML export;
- `zbx_export_dashboards.xml` - in XML export;
- `zbx_export_dashboards.json` - in JSON export.

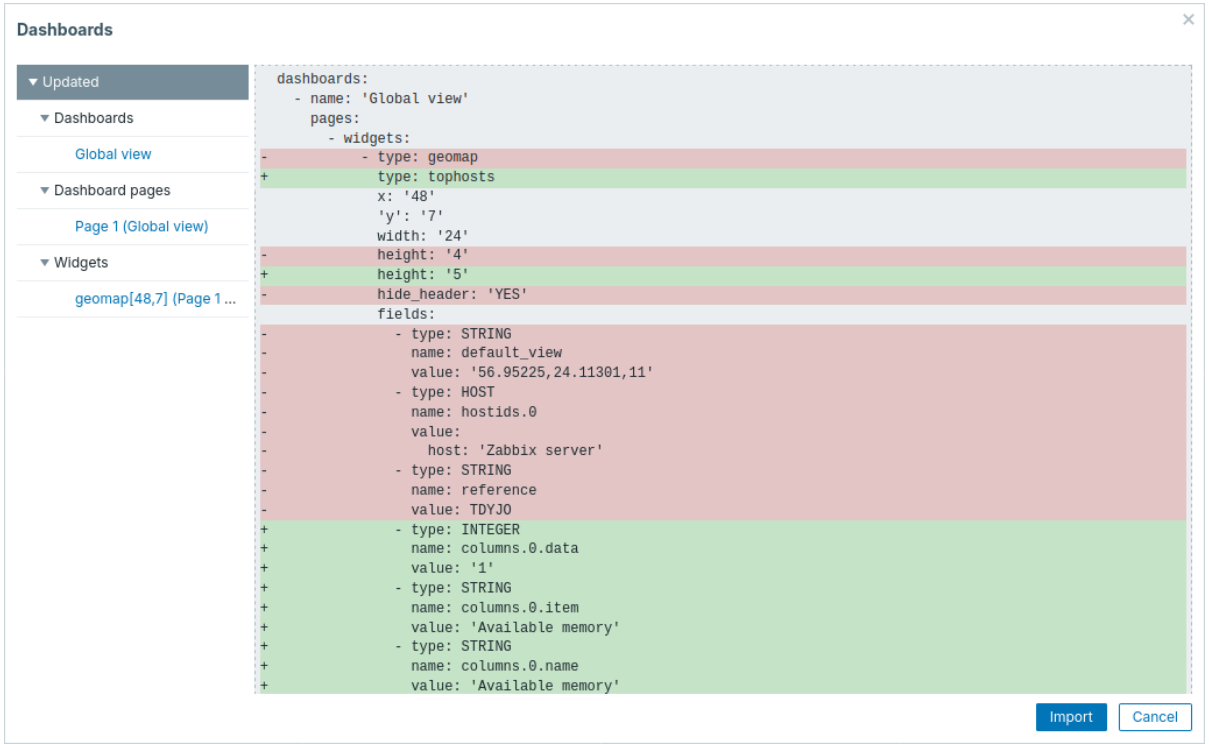
Importing



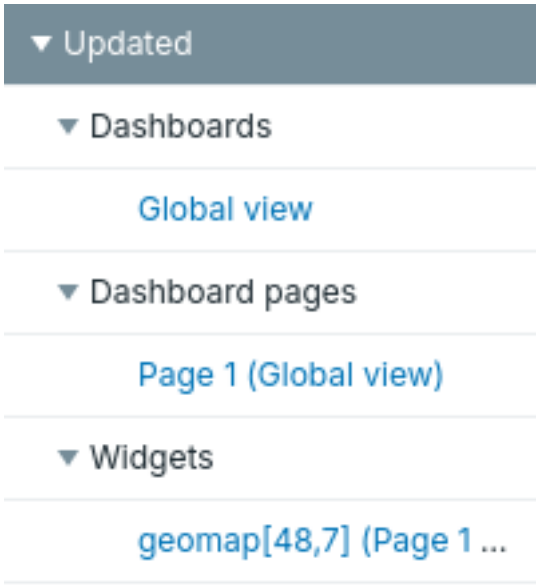
To import dashboards, do the following:

1. Go to *Dashboards* > *All dashboards*.
2. Click *Import* in the upper-right corner. Disabled if the user does not have permission to *Create and edit dashboards*.
3. Select the import file.
4. Mark the checkboxes of the import rules you want to apply (see below).
5. Click *Import* in the lower-right corner of the configuration form.

If the import file references objects that do not exist on the target system, an alert message appears. This is expected for widgets that refer to specific hosts, items, or other objects. In such cases, Zabbix allows the dashboard to be imported, clears the missing references, and either marks the widget as not fully configured when the data is mandatory or drops the filtering criteria when the fields are used only for filtering.



Clicking the *Import* button again will add and/or update the dashboard.



Import rules:

Rule	Description
Update existing	Existing elements will be updated using data from the import file. Otherwise, they will not be updated.
Create new	New elements will be created using data from the import file. Otherwise, they will not be created.

On the next screen, you will be able to view the content of dashboards being imported. If this is a new dashboard, all elements will be listed in green. If updating an existing dashboard, new dashboard elements will be highlighted in green; removed dashboard elements will be highlighted in red; elements that have not changed will be listed on a gray background.

The menu on the left can be used to navigate through the list of changes. The *Updated* section highlights all changes made to existing dashboard elements. The *Added* section lists new dashboard elements. The elements in each section are grouped by element type; click the gray arrow to expand or collapse the group of elements.

Review dashboard changes and then click *Import* to perform the dashboard import. A success or failure message of the import will be displayed in the frontend.

Export format

Export to YAML:

```yaml
zabbix_export:
  version: '8.0'
  dashboards:
    - name: 'Global view'
      pages:
        - widgets:
            - type: tophosts
              name: 'Top hosts by CPU utilization'
              width: '25'
              height: '4'
              fields:
                - type: INTEGER
                  name: column
                  value: '1'
                - type: INTEGER
                  name: columns.0.data
                  value: '2'
                - type: STRING
                  name: columns.0.item
                  value: 'System name'
                - type: STRING
                  name: columns.0.name
                  value: 'Host name'
                - type: STRING
                  name: columns.1.base_color
                  value: 4CAF50
                - type: INTEGER
                  name: columns.1.data
                  value: '1'
                - type: INTEGER
                  name: columns.1.display
                  value: '3'
                - type: STRING
                  name: columns.1.item
                  value: 'CPU utilization'
```

```
      - type: STRING
        name: columns.1.max
        value: '100'
      - type: STRING
        name: columns.1.min
        value: '0'
      - type: STRING
        name: columns.1.name
        value: Utilization
      - type: INTEGER
        name: columns.2.data
        value: '1'
      - type: STRING
        name: columns.2.item
        value: 'Load average (1m avg)'
      - type: STRING
        name: columns.2.name
        value: '1m avg'
      - type: INTEGER
        name: columns.3.data
        value: '1'
      - type: STRING
        name: columns.3.item
        value: 'Load average (5m avg)'
      - type: STRING
        name: columns.3.name
        value: '5m avg'
      - type: INTEGER
        name: columns.4.data
        value: '1'
      - type: STRING

Exported elements

Exported elements are explained in the table below.

Element	Type	Description
name	string	(required) Dashboard name.
pages		Root element for dashboard pages
widgets		Root element for dashboard pages

Note:
See also: Dashboard object (refer to the relevant property with a matching name).

Dashboard widget

Element	Type	Description
type	string	(required) Type of the dashboard widget. Possible values: actionlog - Action log; clock - Clock; discovery - Discovery status; favgraphs - Favorite graphs; favmaps - Favorite maps; gauge - Gauge; geomap - Geomap; graph - Graph (classic); graphprototype - Graph prototype; honeycomb - Honeycomb; hostavail - Host availability; hostcard - Host card; hostnavigator - Host navigator; itemcard - Item card; itemhistory - Item history; itemnavigator - Item navigator; item - Item value; map - Map; navtree - Map Navigation Tree; piechart - Pie chart; problemhosts - Problem hosts; problems - Problems; problemsbysv - Problems by severity; scatterplot - Scatter plot; slareport - SLA report; svggraph - Graph; systeminfo - System information; tophosts - Top hosts; topitems - Top items; toptriggers - Top triggers; trigover - Trigger overview; url - URL; web - Web monitoring.
x	integer	A horizontal position from the left side of the dashboard. Possible values:[1] 0-71.
y	integer	A vertical position from the top of the dashboard. Possible values:[1] 0-63.
name	string	Custom widget name.
width	integer	The widget width. Possible values:[1] 1-72.

Element	Type	Description
height	integer	The widget height. Possible values:[1] 1-64.
hide_header	string	Hide widget header. Possible values:[1] NO (0, default), YES (1).
fields		Root element for the dashboard widget fields.

Note:
See also: Dashboard widget (refer to the relevant property with a matching name).

Dashboard widget field

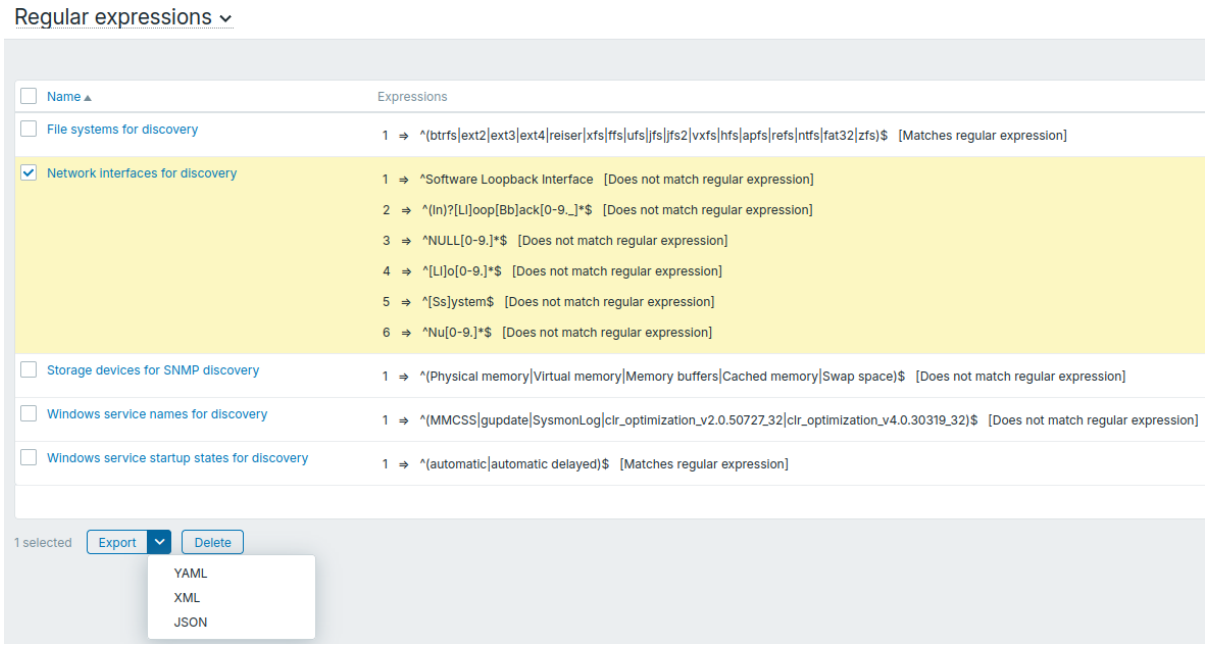
Element	Type	Description
type	string	(required) Widget field type. Possible values:[1] INTEGER (0), STRING (1), HOST_GROUP (2), HOST (3), ITEM (4), ITEM_PROTOTYPE (5), GRAPH (6), GRAPH_PROTOTYPE (7), MAP (8), SERVICE (9), SLA (10), USER (11), ACTION (12), MEDIA_TYPE (13).
name	string	(required) Widget field name.
value	mixed	(required) Widget field value, depending on the field type.
host	string	Item host.
key	string	Item key.

Note:
See also: Dashboard widget field (refer to the relevant property with a matching name).

Footnotes

[1] API integer values in brackets, for example, ENABLED (0), are mentioned only for reference. For more information, see the linked API object page in the table entry or at the end of each section.

Regular expressions



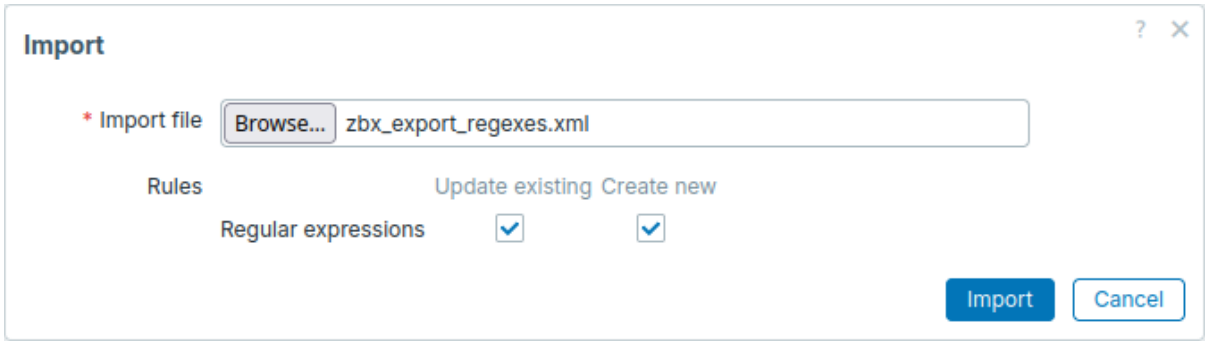
Overview

Regular expressions are exported with all related objects and object relations.

Exporting

To export regular expressions, do the following:

1. Go to *Administration* > *General* > *Regular expressions*.
2. Mark the checkboxes of the regular expressions to export.
3. Click *Export* below the list to export in the default YAML format, or click the arrow to select a different export format.

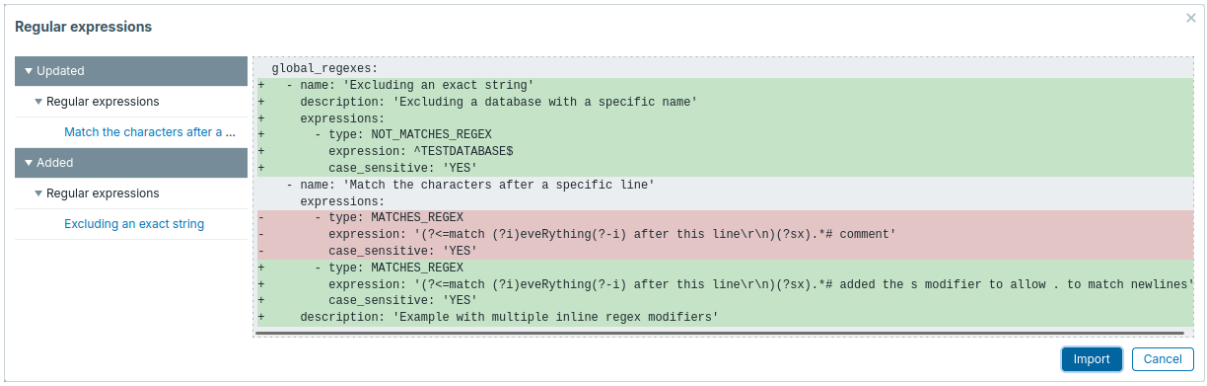


Depending on the selected format, regular expressions are exported to a local file with a default name:

- `zbx_export_regexes.yaml` - in YAML export;
- `zbx_export_regexes.xml` - in XML export;
- `zbx_export_regexes.json` - in JSON export.

Importing

To import regular expressions, do the following:



1. Go to *Administration* > *General* > *Regular expressions*.
2. Click *Import* in the upper-right corner.
3. Select the import file.
4. Mark the checkboxes of the import rules you want to apply (see below).
5. Click *Import* in the lower-right corner of the configuration form.

Import rules:

Rule	Description
Update existing	Existing regular expressions will be updated using data from the import file, fully overwriting existing expressions with the same name. Otherwise, they will not be updated.
Create new	New regular expressions will be created using data from the import file. Otherwise, they will not be created.

On the next screen, you will be able to view the content of the regular expressions being imported. If this is a new regular expression, all data will be listed in green. If updating an existing regular expression, new regular expression data will be highlighted in green; removed data will be highlighted in red; unchanged data will be displayed on a gray background.

The menu on the left can be used to navigate through the list of changes. The *Updated* section highlights all changes made to existing regular expressions. The *Added* section lists new regular expressions. Click the arrow to expand or collapse a group of regular expressions.

Review regular expression changes and then click *Import* to perform the regular expressions import. A success or failure message of the import will be displayed in the frontend.

Export format

Export to YAML:

```yaml
zabbix_export:
  version: '8.0'
  global_regexes:
    - name: 'File systems for discovery'
      description: 'Global regular expression used to discover and identify file systems on the monitored
      expressions:
        - type: MATCHES_REGEX
          expression: ^(btrfs|ext2|ext3|ext4|reiser|xfs|ffs|ufs|jfs|jfs2|vxfs|hfs|apfs|refs|ntfs|fat32|zfs
    - name: 'Storage devices for SNMP discovery'
      expressions:
        - type: NOT_MATCHES_REGEX
          expression: '^(Physical memory|Virtual memory|Memory buffers|Cached memory|Swap space)$'
          case_sensitive: 'YES'
```

Exported elements

Exported elements of regular expressions:

Element	Type	Description
global_regexes	object	Root element for regular expressions.
name	string	(required) Name of the regular expression.
description	text	Description of the regular expression.
expressions	object	Root element for regular expressions.
type	string	Type of the regular expression.
expression	string	Regular expression.
exp_delimiter	string	Regular expression delimiter; present when the type is *Contains any substring from list*.
case_sensitive	string	Case-sensitivity option for the regular expression.

Note:
See also: Regular expression object (refer to the relevant property with a matching name).

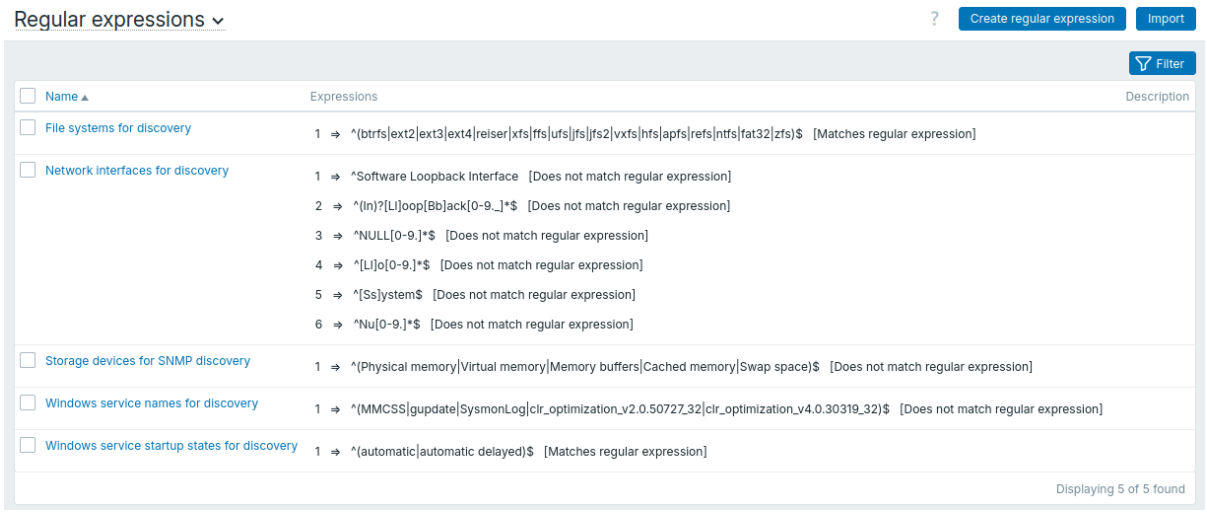
Regular expressions

Overview Perl Compatible Regular Expressions (PCRE, PCRE2) are supported in Zabbix.

There are two ways of using regular expressions in Zabbix:

- Manually entering a regular expression

- Using a global regular expression created in Zabbix



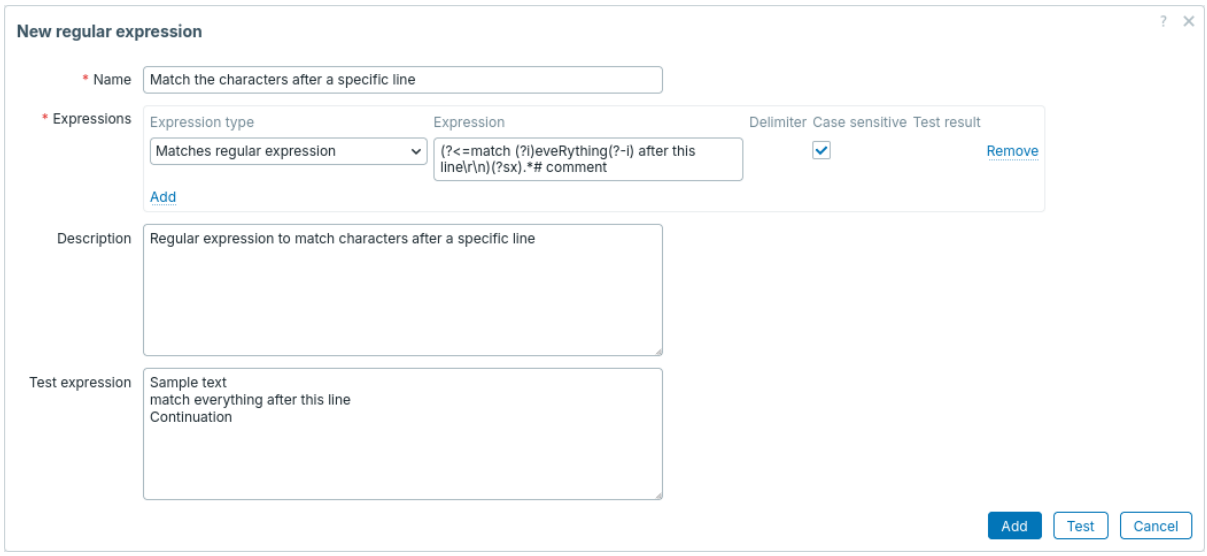
Regular expressions You may manually enter a regular expression in supported places.
 Note that the expression must not start with @, as this symbol is used in Zabbix to reference global regular expressions.

Attention:
It's possible to run out of stack memory when using regular expressions. See the PCRE PERFORMANCE for more information.

Note that in multiline matching, the ^ and $ anchors match at the beginning and end of each line respectively, instead of the beginning and end of the entire string.

See also examples for correct escaping in various contexts.

Global regular expressions Zabbix provides an advanced editor in the frontend for creating and testing complex regular expressions.
 To access it, go to *Administration* > *General* > *Regular expressions*.
 Zabbix includes a number of predefined global regular expressions in its default dataset.



You can filter the regular expressions list by name and description to find the expressions you need.

Configuration

To create a global regular expression:

1. Click *Create regular expression*.
2. Enter the regular expression parameters in the form.

All mandatory input fields are marked with a red asterisk.

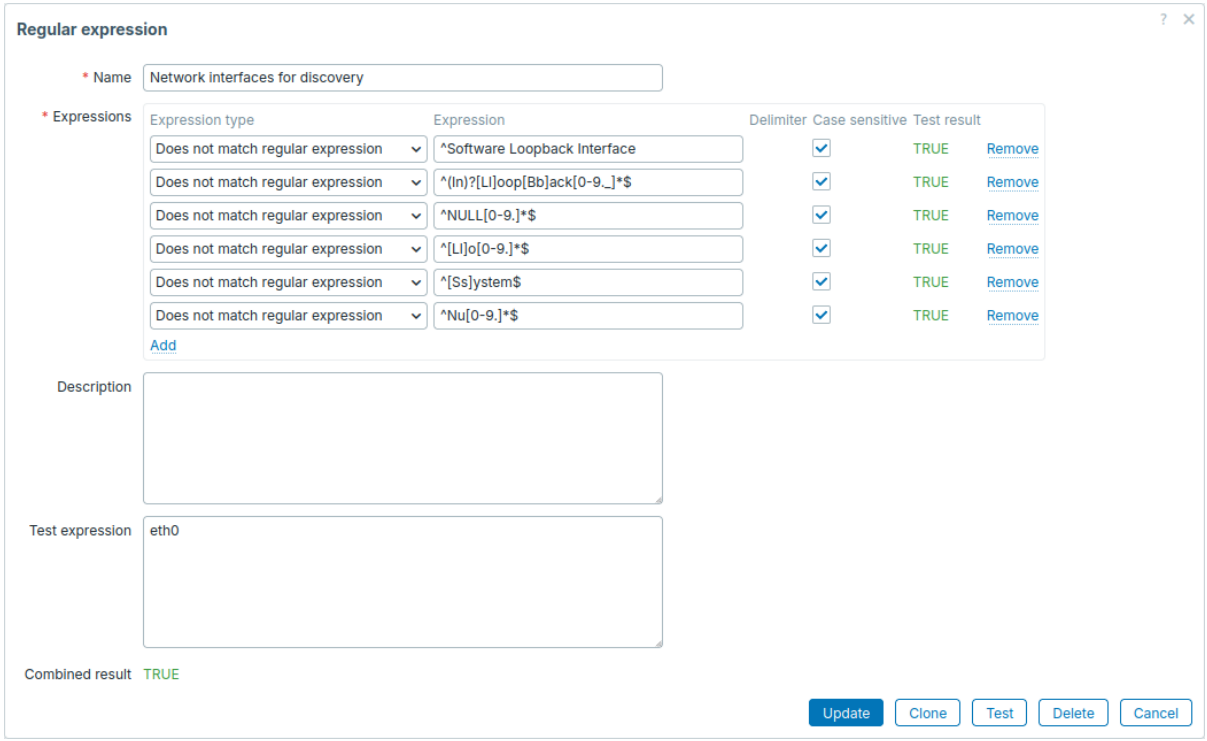
Parameter	Description
Name	Set the regular expression name. Any Unicode characters are allowed.

Parameter	Description
Expressions	Click *Add* in the *Expressions* section to add a new subexpression.
Expression type	Select expression type: **Contains string** - matches the substring. **Contains any substring from list** - matches any substring from a delimited list. The delimited list includes a comma `,`, a dot `.` or a forward slash `/`. **Does not contain string** - matches any string except the substring. **Matches regular expression** - matches the regular expression. **Does not match regular expression** - does not match the regular expression.
Expression	Enter substring/regular expression. Maximum length: 2048 characters.
Delimiter	A comma `,`, a dot `.`, or a forward slash `/` to separate text strings in a regular expression. This parameter is active only when *Contains any substring from list* expression type is selected.
Case sensitive	A checkbox to specify whether a regular expression is sensitive to capitalization of letters.
Description	Enter a description for the regular expression.
Test expression	A value to use for testing the regular expression.

A forward slash `/` in the expression is treated literally rather than as a delimiter. This makes it possible to save expressions containing a slash without errors.

Attention:
A custom regular expression name in Zabbix may contain commas, spaces, etc. In cases where this may lead to misinterpretation when referencing (for example, a comma in the parameter of an item key), the entire reference may be enclosed in quotes, like this: *"@My custom regexp for purpose1, purpose2"*.
 Regular expression names must not be quoted in other locations (for example, in LLD rule properties).

Once a regular expression has been created, it can be used in several places in the frontend by referring to its name, prefixed with `@`, for example, `@mycustomregexp`.



Form buttons

Buttons at the bottom of the form allow you to perform various operations:

Button	Description
Add	Add a regular expression. This button is only available for new regular expressions.
Update	Update the properties of a regular expression.
Clone	Create another regular expression based on the properties of the current regular expression.
Test	Test a regular expression and its subexpressions against a provided value.
Delete	Delete the regular expression.
Cancel	Cancel editing the regular expression properties.

Testing a regular expression

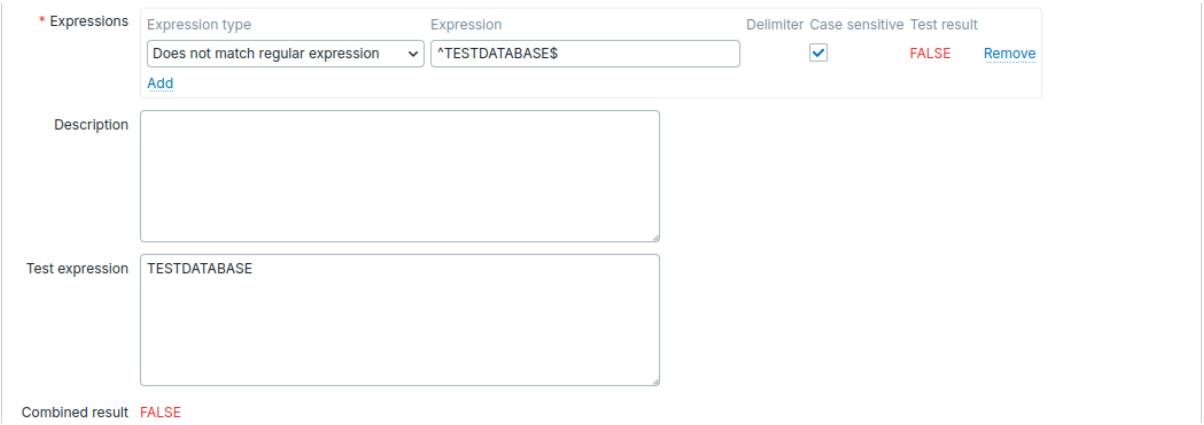
You may test the regular expression and its subexpressions by entering a value in the *Test expression* field and clicking the *Test* button.

In the *Test result* column, the status of each subexpression is displayed. The *Combined result* field displays the overall status of the regular expression. If multiple subexpressions are defined, Zabbix uses the logical AND operator to calculate the *Combined result*; that is, if at least one result is `False`, the *Combined result* is also `False`.

Default global regular expressions

The default dataset includes the following predefined global regular expressions:

Name	Expression	Matches
File systems for discovery	`^(btrfs|ext2|ext3|ext4|reiser|xfs|ffs|ufs|jfs|jfs2|vxfs|hfs|apfs|refs|ntfs|fat32|zfs)$`	"btrfs" or "ext2" or "ext3" or "ext4" or "reiser" or "xfs" or "ffs" or "ufs" or "jfs" or "jfs2" or "vxfs" or "hfs" or "apfs" or "refs" or "ntfs" or "fat32" or "zfs".
Network interfaces for discovery	`^Software Loopback Interface`	Strings starting with "Software Loopback Interface".
	`^lo$`	"lo".
	`^(In)?[Ll]oop[Bb]ack[0-9._]*$`	Strings optionally starting with "In", followed by "L" or "l", followed by "oop", followed by "B" or "b", followed by "ack", and optionally followed by any number of digits, dots, or underscores.
	`^NULL[0-9.]*$`	Strings starting with "NULL" optionally followed by any number of digits or dots.
	`^[Ll]o[0-9.]*$`	Strings starting with "Lo" or "lo" and optionally followed by any number of digits or dots.
	`^[Ss]ystem$`	"System" or "system".
	`^Nu[0-9.]*$`	Strings starting with "Nu" optionally followed by any number of digits or dots.
Storage devices for SNMP discovery	`^(Physical memory|Virtual memory|Memory buffers|Cached memory|Swap space)$`	"Physical memory" or "Virtual memory" or "Memory buffers" or "Cached memory" or "Swap space".
Windows service names for discovery	`^(MMCSS|gupdate|SysmonLog|clr_optimization_v2.0.50727_32|clr_optimization_v4.0.30319_32)$`	"MMCSS" or "gupdate" or "SysmonLog" or strings matching "clr_optimization_v2.0.50727_32" or "clr_optimization_v4.0.30319_32", where each dot can be replaced by any character except a newline.
Windows service startup states for discovery	`^(automatic|automatic delayed)$`	"automatic" or "automatic delayed".



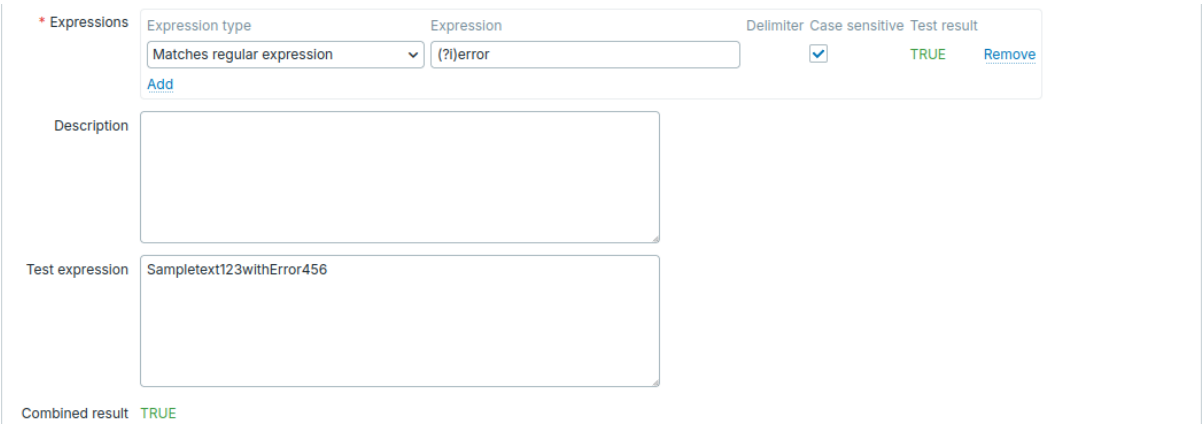
Importing/exporting a regular expression

You can import or export global regular expressions as described on the Regular expressions export/import configuration page.

Examples Example of excluding an exact string

Use the following expression in low-level discovery to discover databases except for a database with a specific name:

```
^TESTDATABASE$
```



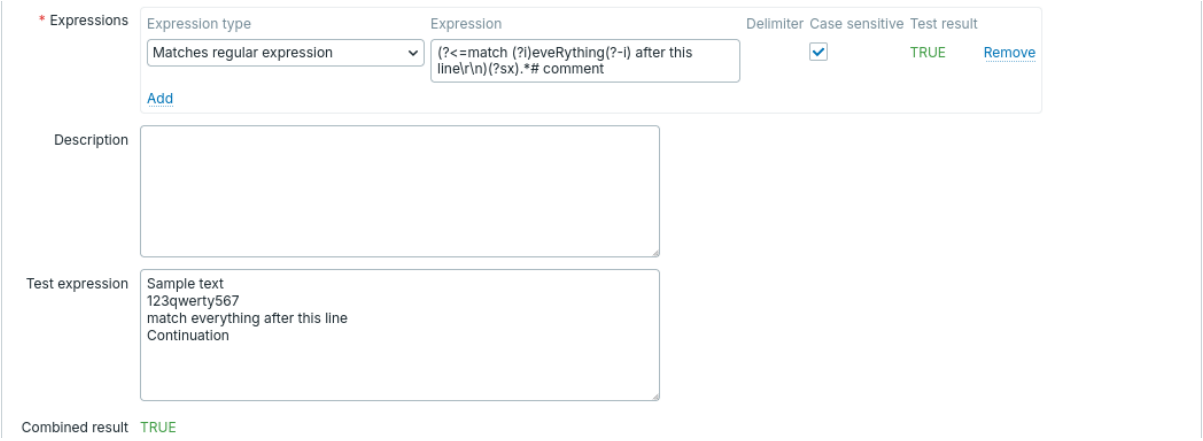
Both *Test result* and *Combined result* display `FALSE`: the name matches "TESTDATABASE", so the *Does not match regular expression* condition is not satisfied.

Example with an inline regex modifier for a case-insensitive match

Use the following regular expression, which includes the inline modifier `(?i)` to perform a case-insensitive match of the characters "error":

```
(?i)error
```

Both *Test result* and *Combined result* display `TRUE`: the characters "error" are matched even with *Case sensitive* selected, because the inline modifier `(?i)` makes the match case-insensitive.



Example with multiple inline regex modifiers

Use the following regular expression, which includes multiple inline modifiers, to match the characters after a specific line:

```
(?<=match (?i)eveRything(?-i) after this line\r\n)(?sx).*# comment
```

where:

- `(?i)` - turns case-insensitive matching on;
- `(?-i)` - turns case-insensitive matching off;
- `(?s)` - enables dotall mode, allowing `.` to match newline characters;
- `(?x)` - enables extended mode, allowing whitespace and comments in the regular expression to be ignored.

Both *Test result* and *Combined result* display TRUE: the characters following the specific line are matched.

Attention:
The g modifier cannot be specified inline. The list of available modifiers can be found in pcresyntax man page. For more information about PCRE syntax, please refer to PCRE HTML documentation.

Regular expression support by location

Location		Regular expression	Global regular expression	Multiline matching	Comments
Agent items					
	eventlog[]	Yes	Yes	Yes	`regexp`, `severity`, `source`, `eventid` parameters
	eventlog.count[]				`regexp`, `severity`, `source`, `eventid` parameters
	log[]				`regexp` parameter
	log.count[]				
	logrt[]		Yes/No		`regexp` parameter supports both, `file_regexp` parameter supports non-global expressions only
	logrt.count[]				
	proc.cpu.util[]		No	No	`cmdline` parameter
	proc.get[]				
	proc.mem[]				
	proc.num[]				
	sensor[]				`device` and `sensor` parameters on Linux 2.4
	system.hw.macaddr[]				`interface` parameter
	system.sw.packages[]				`regexp` parameter
	system.sw.packages.get[]				`regexp` parameter
	vfs.dir.count[]				`regex_incl`, `regex_excl`, `regex_excl_dir` parameters
	vfs.dir.get[]				`regex_incl`, `regex_excl`, `regex_excl_dir` parameters
	vfs.dir.size[]				`regex_incl`, `regex_excl`, `regex_excl_dir` parameters
	vfs.file.regexp[]			Yes	`regexp` parameter
	vfs.file.regmatch[]				
	web.page.regexp[]				
SNMP traps					
	snmptrap[]	Yes	Yes	No	`regexp` parameter

Location		Regular expression	Global regular expression	Multiline matching	Comments
Item value preprocessing		Yes	No	No	`pattern` parameter
Functions for triggers/calculated items					
	count()	Yes	Yes	Yes	`pattern` parameter if `operator` parameter is *regexp* or *iregexp*
	countunique()	Yes	Yes		
	find()	Yes	Yes		
	logeventid()	Yes	Yes	No	`pattern` parameter
	logsource()				
Low-level discovery					
	Filters	Yes	Yes	No	*Regular expression* field
	Overrides	Yes	No		In *matches*, *does not match* options for *Operation* conditions
Action conditions		Yes	No	No	In *matches*, *does not match* options for *Host name* and *Host metadata* autoregistration conditions
Scripts		Yes	Yes	No	*Input validation rule* field
Web monitoring		Yes	No	Yes	*Variables* with a **regex:** prefix *Required string* field
User macro context		Yes	No	No	In macro context with a **regex:** prefix
Macro functions					
	regsub() iregsub()	Yes	No	No	`pattern` parameter
Link indicators in maps		Yes	No	No	*Pattern* field (for text items)
Icon mapping		Yes	Yes	No	*Expression* field
Value mapping		Yes	No	No	*Value* field if mapping type is `regexp`
Agent configuration parameters					
	AllowKeyRegexp DenyKeyRegexp	Yes	No	No	Pattern

Events and resolution

Overview There are several types of events generated in Zabbix:

- trigger events - whenever a trigger changes its status (*OK→PROBLEM→OK*)
- service events - whenever a service changes its status (*OK→PROBLEM→OK*)
- discovery events - when hosts or services are detected
- autoregistration events - when active agents are auto-registered by server
- internal events - when an item/low-level discovery rule becomes unsupported or a trigger goes into an unknown state

Events are time-stamped and can be the basis of actions such as sending notification email, creating tickets, or executing remote commands.

To view event details in the frontend, go to *Monitoring* > *Problems*. There you can click the event date and time to open the event details page, where you can see additional information about the event, including whether it was suppressed because of maintenance or suppressed manually by a user.

Problem resolution Problem events created by triggers are resolved automatically, if the condition that caused the problem no longer exists.

To add flexibility and convenience to problem event management, the following options exist:

- Event correlation
- Event acknowledgment and suppression
- Manual closing of problems
- Maintenance periods - define periods when problems are suppressed
- Tagging - tag problems by common feature

Trigger events Change of trigger state is the most frequent and most important source of events. Each time the trigger changes its state, an event is generated. The event contains details of the trigger state's change - when it happened and what the new state is.

Two types of events are created by triggers - `Problem` and `OK`.

Problem events

A problem event is created:

- when a trigger expression evaluates to TRUE if the trigger is in OK state;
- each time a trigger expression evaluates to TRUE if multiple problem event generation is enabled for the trigger.

OK events

An OK event closes the related problem event(s) and may be created by 3 components:

- triggers - based on 'OK event generation' and 'OK event closes' settings;
- event correlation
- task manager - when an event is manually closed

Triggers have an 'OK event generation' setting that controls how OK events are generated:

- *Expression* - an OK event is generated for a trigger in problem state when its expression evaluates to FALSE. This is the simplest setting, enabled by default.
- *Recovery expression* - an OK event is generated for a trigger in problem state when its expression evaluates to FALSE and the recovery expression evaluates to TRUE. This can be used if trigger recovery criteria is different from problem criteria.
- *None* - an OK event is never generated. This can be used in conjunction with multiple problem event generation to simply send a notification when something happens.

Additionally triggers have an 'OK event closes' setting that controls which problem events are closed:

- *All problems* - an OK event will close all open problems created by the trigger
- *All problems if tag values match* - an OK event will close open problems created by the trigger and having at least one matching tag value. The tag is defined by 'Tag for matching' trigger setting. If there are no problem events to close then OK event is not generated. This is often called trigger level event correlation.

Event correlation

Event correlation (also called global event correlation) is a way to set up custom event closing (resulting in OK event generation) rules.

The rules define how the new problem events are paired with existing problem events allow the new event or the matched events to be closed by generating corresponding OK events.

However, event correlation must be configured very carefully, as it can negatively affect event processing performance or, if misconfigured, close more events than intended (in the worst case even all problem events could be closed). A few configuration tips:

1. always reduce the correlation scope by setting a unique tag for the control event (the event that is paired with old events) and use the 'new event tag' correlation condition
2. don't forget to add a condition based on the old event when using 'close old event' operation, or all existing problems could be closed
3. avoid using common tag names used by different correlation configurations

Task manager

If the 'Allow manual close' setting is enabled for trigger, then it's possible to manually close problem events generated by the trigger. This is done in the frontend when updating a problem. The event is not closed directly - instead a 'close event' task is created, which is handled by the task manager shortly. The task manager will generate a corresponding OK event and the problem event will be closed.

Service events Service events are generated only if service actions for these events are enabled. In this case, each change of service state creates a new event:

- Problem event - when service state is changed from `OK` to `Problem`
- OK event - when service state is changed from `Problem` to `OK`

The event contains details of the service state change - when it happened and what the new state is.

Discovery events Zabbix periodically scans the IP ranges defined in network discovery rules. Frequency of the check is configurable for each rule individually. Once a host or a service is discovered, a discovery event (or several events) are generated.

Zabbix generates the following events:

Event	When generated
Service Up	Every time Zabbix detects active service.
Service Down	Every time Zabbix cannot detect service.
Host Up	If at least one of the services is UP for the IP.
Host Down	If all services are not responding.
Service Discovered	If the service is back after downtime or discovered for the first time.
Service Lost	If the service is lost after being up.
Host Discovered	If host is back after downtime or discovered for the first time.
Host Lost	If host is lost after being up.

Active agent autoregistration events Active agent autoregistration creates events in Zabbix.

If configured, active agent autoregistration event is created when a previously unknown active agent asks for checks or if the host metadata has changed. The server adds a new auto-registered host, using the received IP address and port of the agent.

For more information, see the active agent autoregistration page.

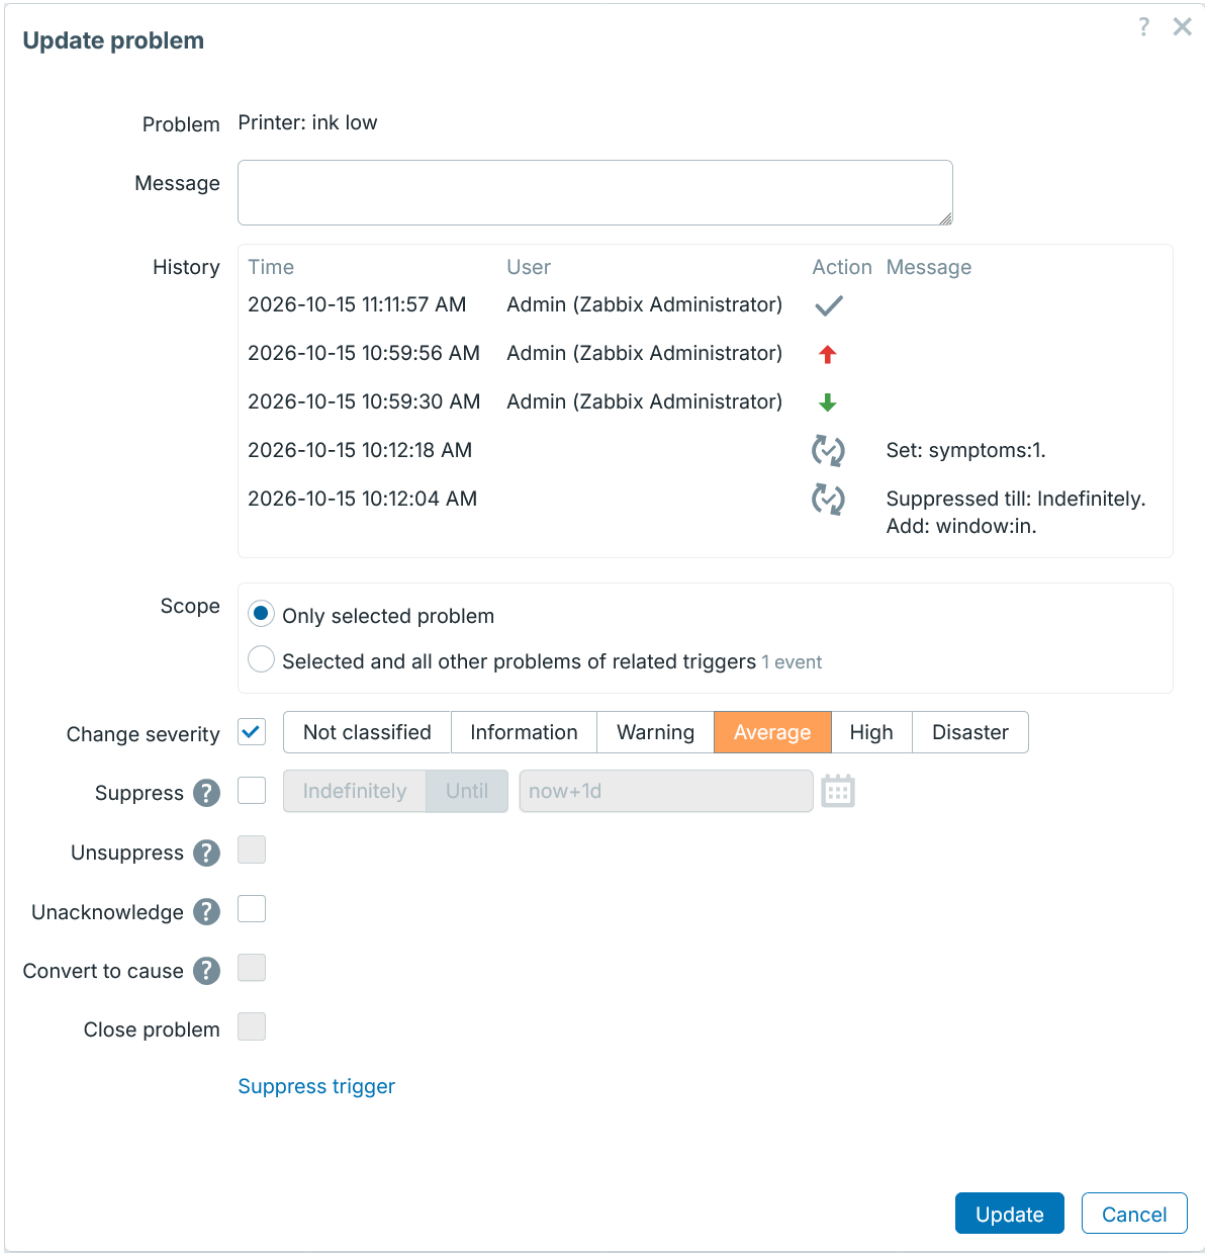
Internal events Internal events happen when:

- an item changes state from 'normal' to 'unsupported'
- an item changes state from 'unsupported' to 'normal'
- a low-level discovery rule changes state from 'normal' to 'unsupported'
- a low-level discovery rule changes state from 'unsupported' to 'normal'
- a trigger changes state from 'normal' to 'unknown'
- a trigger changes state from 'unknown' to 'normal'

The aim of introducing internal events is to allow users to be notified when any internal event takes place, for example, an item becomes unsupported and stops gathering data.

Internal events are only created when internal actions for these events are enabled. To stop generation of internal events (for example, for items becoming unsupported), disable all actions for internal events in *Alerts* > *Actions* > *Internal actions*.

Note:
If internal actions are disabled, while an object is in the 'unsupported' state, recovery event for this object will still be created.
If internal actions are enabled, while an object is in the 'unsupported' state, recovery event for this object will be created, even though 'problem event' has not been created for the object.



See also: Receiving notification on unsupported items

Problem acknowledgment and suppression

Problem events in Zabbix can be acknowledged or suppressed by users.

Updating problems The problem update popup allows you to:

- Comment on the problem.
- View comments and actions so far.
- Change problem severity.
- Suppress/unsuppress problem.
- Acknowledge/unacknowledge problem.
- Change symptom problem to cause problem.
- Manually close problem.
- Create an ad-hoc maintenance for the trigger.

All mandatory input fields are marked with a red asterisk.

Parameter	Description
Problem	If only one problem is selected, the problem name is displayed. If several problems are selected, *N problems selected* is displayed.
Message	Enter text to comment on the problem (maximum 2048 characters).
History	Previous activities and comments on the problem are listed, along with the time and user details. For the meaning of icons used to denote user actions see the event detail page. Note that history is displayed if only one problem is selected for the update.
Scope	Define the scope of such actions as changing severity, acknowledging or manually closing problems: **Only selected problem** - will affect this event only **Selected and all other problems of related triggers** - in case of acknowledgment/closing problem, will affect this event and all other problems that are not acknowledged/closed so far. If the scope contains problems already acknowledged or closed, these problems will not be acknowledged/closed repeatedly. On the other hand, the number of message and severity change operations are not limited.
Change severity	Mark the checkbox and click the severity button to update problem severity. The checkbox for changing severity is available if read-write permissions exist for at least one of the selected problems. Only those problems that are read-writable will be updated when clicking *Update*. If read-write permissions exist for none of the selected triggers, the checkbox is disabled.
Suppress	Mark the checkbox to suppress the problem: **Indefinitely** - suppress indefinitely **Until** - suppress until a given time. Both absolute and relative time formats are supported, for example: `now+1d` - for one day from now (default) `now/w` - until the end of the current week `2022-05-28 12:00:00` - until absolute date/time Note that a simple period (e. g., `1d`, `1w`) is not supported. Availability of this option depends on the "Suppress problems" user role settings. See also: Problem suppression
Unsuppress	Mark the checkbox to unsuppress the problem. This checkbox is active only if at least one of the selected problems is suppressed. Availability of this option depends on the "Suppress problems" user role settings.
Acknowledge	Mark the checkbox to acknowledge the problem. This checkbox is available if there is at least one unacknowledged problem among the selected. It is not possible to add another acknowledgment for an already acknowledged problem (it is possible to add another comment though).
Unacknowledge	Mark the checkbox to unacknowledge the problem. This checkbox is available if there is at least one acknowledged problem among the selected.
Convert to cause	Mark the checkbox to convert the symptom problem(s) to cause problem(s).
Close problem	Mark the checkbox to manually close the selected problem(s). The checkbox for closing a problem is available if the *Allow manual close* option is checked in trigger configuration for at least one of the selected problems. Only those problems that are allowed to be closed will be closed when you click *Update*. If no problem is manually closeable, the checkbox is disabled. Already closed problems will not be closed repeatedly.
Suppress trigger	Click to start ad-hoc maintenance for the trigger. A maintenance period configuration form will open. In it, a one-time maintenance period of `1h` (configurable in user settings and profile) starting from now will be pre-selected. The respective trigger will be preselected, too. The maintenance name will be pre-filled, in the format `Ad-hoc: <event name>`.

Problem acknowledgment If a user gets notified about a problem event, they can go to Zabbix frontend, open the problem update popup window of that problem using one of the ways listed below and acknowledge the problem. When acknowledging, they can enter their comment for it, saying that they are working on it or whatever else they may feel like saying about it.

This way, if another system user spots the same problem, they immediately see if it has been acknowledged and the comments so far.

This way the workflow of resolving problems with more than one system user can take place in a coordinated way.

Acknowledgment status is also used when defining action operations. You can define, for example, that a notification is sent to a higher level manager only if an event is not acknowledged for some time.

To acknowledge events and comment on them, a user must have at least read permissions to the corresponding triggers. To change problem severity or close problem, a user must have read-write permissions to the corresponding triggers.

There are **several** ways to access the problem update popup window, which allows acknowledging a problem.

- You may select problems in *Monitoring* > *Problems* and then click on *Mass update* below the list
- You can click *Update* in the *Update* column of a problem in:
  - *Dashboards* (*Problems* and *Problems by severity* widgets)
  - *Monitoring* > *Problems*
  - *Monitoring* > *Problems* > *Event details*
- You can click an unresolved problem cell in:
  - *Dashboards* (*Trigger overview* widget)

The popup menu contains an *Update* option that will take you to the problem update window.

Based on acknowledgment information it is possible to configure how the problem count is displayed in the dashboard or maps. To do that, you have to make selections in the *Problem display* option, available in both map configuration and the *Problems by severity* dashboard widget. It is possible to display all problem count, unacknowledged problem count as separated from the total or unacknowledged problem count only.

Based on problem update information (acknowledgment, etc.), it is possible to configure update operations - send a message or execute remote commands.

Problem suppression Problem suppression offers a way of temporarily hiding a problem that can be dealt with later. This is useful for cleaning up the problem list in order to give the highest priority to the most urgent issues. For example, sometimes an issue may arise on the weekend that is not urgent enough to be dealt with immediately, so it can be ”snoozed” until Monday morning.

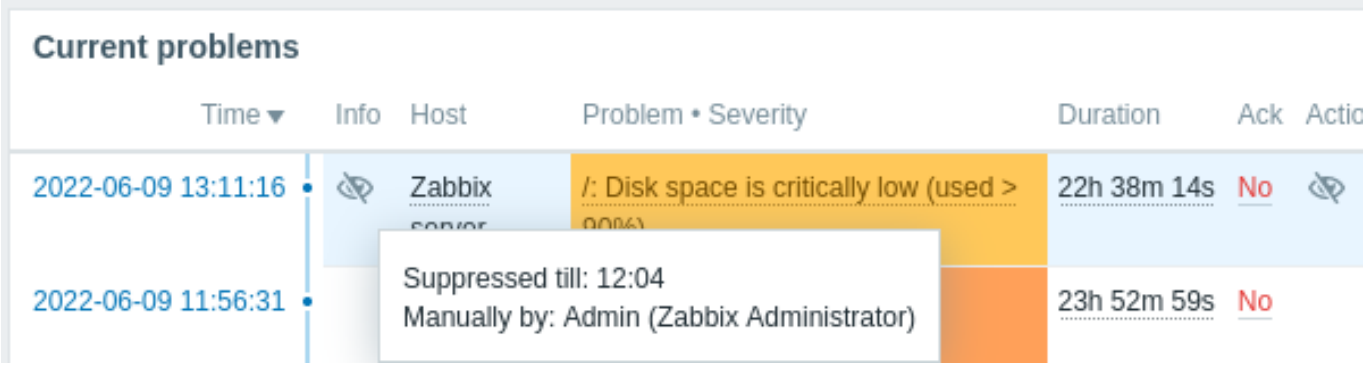
Problem suppression allows a *single* problem to be hidden, in contrast to suppression through host maintenance, when all problems of the maintenance host are hidden.

Operations for trigger actions will be paused for suppressed problems the same way as it is done with host maintenance.

A problem can be suppressed through the **problem update** window, where suppression is one of the problem update options along with commenting, changing severity, acknowledging, etc.

A problem may also be unsuppressed through the same problem update window.

Display



Once suppressed the problem is marked by a blinking  suppression icon in the *Info* column, before being hidden.

If suppression is due to host maintenance, the suppression icon in the *Info* column is shown in orange. If both maintenance and manual suppression apply, manual suppression takes priority in the icon color.

The suppression icon is blinking while the suppression task is in the waiting list. Once the task manager has suppressed the problem, the icon will stop blinking. If the suppression icon keeps blinking for a long time, this may indicate a server problem, for example, if the server is down and the task manager cannot complete the task. The same logic applies to unsuppression. In the short period after the task is submitted and the server has not completed it, the unsuppression icon is blinking.

A suppressed problem may be both hidden or shown, depending on the problem filter/widget settings.

When shown in the problem list, a suppressed problem is marked by the suppression icon and suppression details are shown on mouseover:

Suppression details are also displayed in a popup when positioning the mouse on the suppression icon in the *Actions* column.

Manual closing of problems

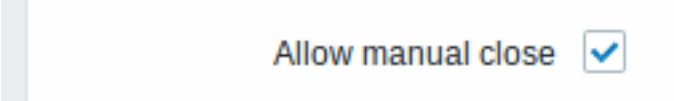
Overview While generally problem events are resolved automatically when trigger state goes from `Problem` to `OK`, there may be cases when it is difficult to determine if a problem has been resolved by means of a trigger expression. In such cases, the problem needs to be resolved manually.

For example, *syslog* may report that some kernel parameters need to be tuned for optimal performance. In this case the issue is reported to Linux administrators, they fix it and then close the problem manually.

Problems can be closed manually only for triggers with the *Allow manual close* option enabled.

When a problem is "manually closed", Zabbix generates a new internal task for Zabbix server. Then the *task manager* process executes this task and generates an OK event, therefore closing problem event.

The generated *OK* event includes the full set of event tags resolved for that event (including tags inherited from templates, hosts and triggers). These tags are available in notifications and in macros such as `{EVENT.RECOVERY.TAGS}` and `{EVENT.RECOVERY.TAGSJSON}`.

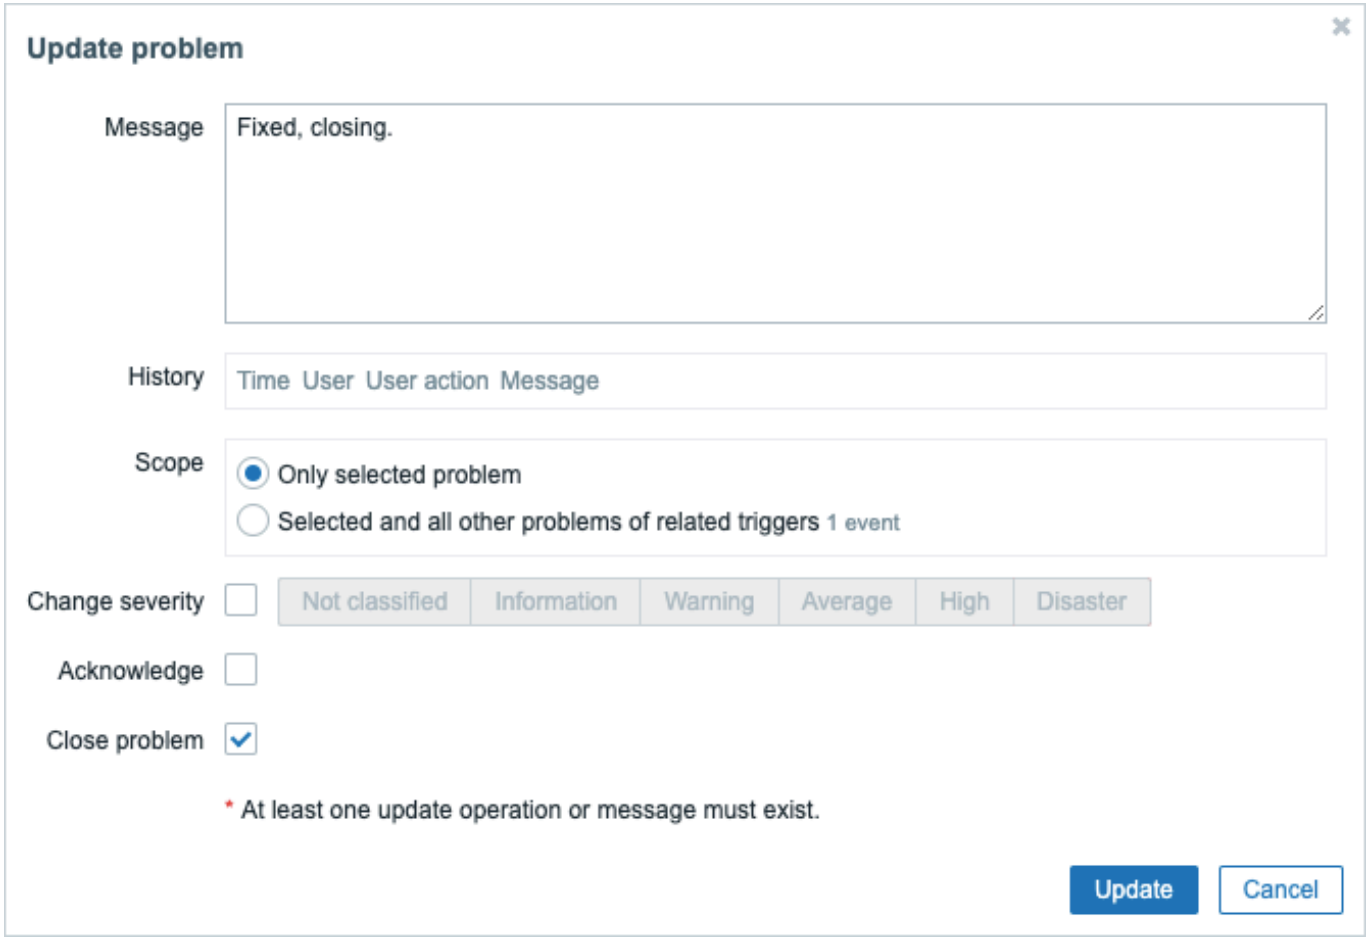


A manually closed problem does not mean that the underlying trigger will never go into a *Problem* state again. The trigger expression is re-evaluated and may result in a problem:

- When new data arrive for any item included in the trigger expression (note that the values discarded by a throttling preprocessing step are not considered as received and will not cause trigger expression to be re-evaluated);
- When date and time and/or nodata() functions are used in the expression.

Configuration Two steps are required to close a problem manually.

Trigger configuration



In trigger configuration, enable the *Allow manual close* option.

Problem update window

If a problem arises for a trigger with the *Manual close* flag, you can open the problem update popup window of that problem and close the problem manually.

To close the problem, check the *Close problem* option in the form and click *Update*.

All mandatory input fields are marked with a red asterisk.

The request is processed by Zabbix server. Normally it will take a few seconds to close the problem. During that process *CLOSING* is displayed in *Monitoring* > *Problems* as the status of the problem.

Verification It can be verified that a problem has been closed manually:

- in event details, available through *Monitoring* > *Problems*;
- by using the `{EVENT.UPDATE.HISTORY}` macro in notification messages that will provide this information.

Maintenance periods

Overview

Maintenance is used to suppress problems during predefined time periods.

You can define maintenance periods for these entities:

- Host groups
- Hosts
- Triggers
- Event names
- Tags

If maintenance is defined for specific tags or event names then maintenance will be activated only for the corresponding triggers; all other triggers of the host or host group will not be in maintenance.

There are two maintenance types: *With data collection* and *No data collection*.

During *With data collection* maintenance, triggers are processed as usual and events are created when required. However, if the *Pause operations for suppressed problems* option is checked in action configuration, problem escalations are paused for entities in maintenance. In this case, escalation steps that may include sending notifications or remote commands will be ignored for as long as the maintenance period lasts. Note that problem recovery and update operations are not suppressed during maintenance, only escalations. Recovery notifications are not sent if the problem started during maintenance.

For example, if escalation steps are scheduled at 0, 30 and 60 minutes after a problem start, and there is a half-hour long maintenance lasting from 10 minutes to 40 minutes after a real problem arises, steps two and three will be executed a half-hour later, or at 60 minutes and 90 minutes (providing the problem still exists). Similarly, if a problem arises during the maintenance, the escalation will start after the maintenance.

To receive problem notifications during the maintenance normally (without delay), you have to uncheck the *Pause operations for suppressed problems* option in action configuration.

Note:
If at least one host (used in the trigger expression) is not in maintenance mode, Zabbix will send a problem notification.

Zabbix server must be running during maintenance. Maintenances are recalculated every minute or as soon as the configuration cache is reloaded if there are changes to the maintenance period.

Timer processes check if host status must be changed to/from maintenance at 0 seconds of every minute. Additionally, every second the timer process checks if any maintenances must be started/stopped based on whether there are changes to the maintenance periods after the configuration update. Thus the speed of starting/stopping maintenance periods depends on the configuration update interval (10 seconds by default). Note that maintenance period changes do not include *Active since/Active till* settings. Also, if an entity (host group/host/trigger/etc) is added to an existing active maintenance period, the changes will only be activated by the timer process at the start of next minute.

Note that when a host enters maintenance, Zabbix server timer processes will read all open problems to check if it is required to suppress those. This may have a performance impact if there are many open problems. Zabbix server will also read all open problems upon startup, even if there are no maintenances configured at the time.

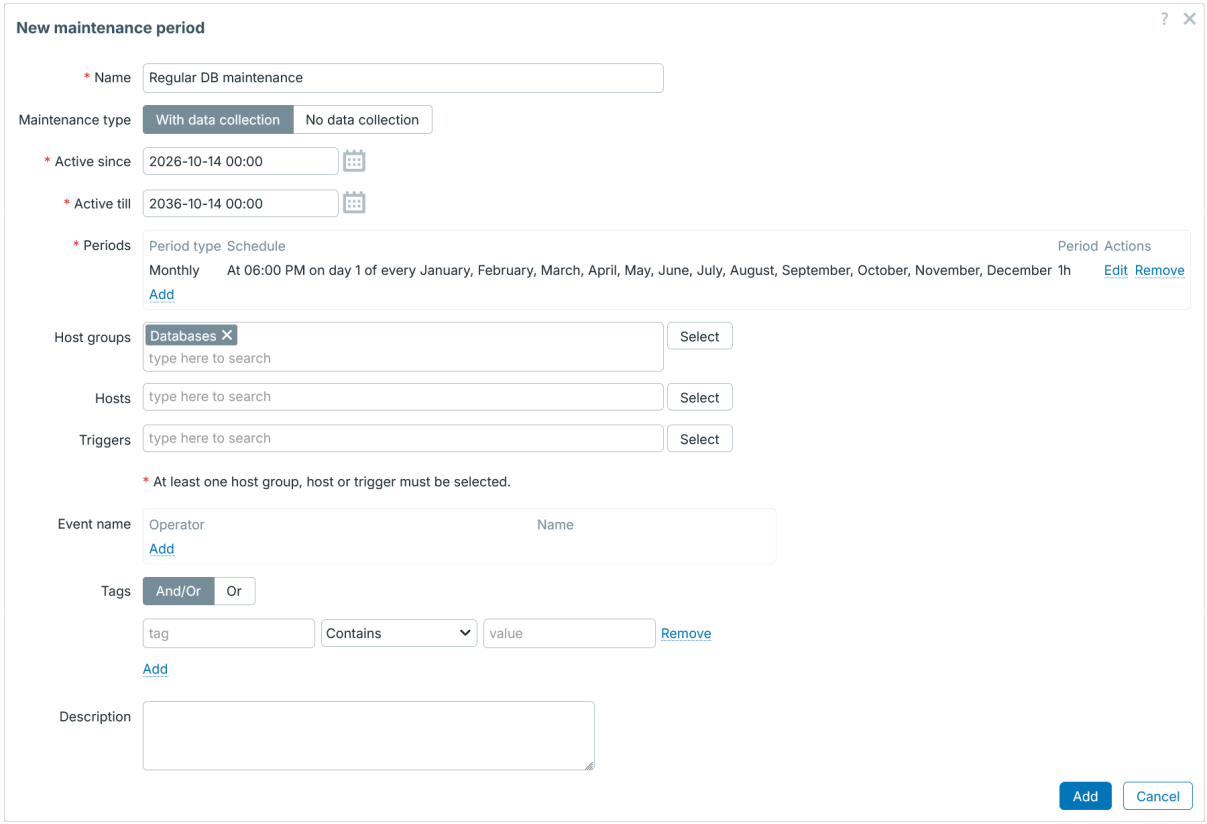
Note that the Zabbix server (or proxy) always collects data regardless of the maintenance type (including *No data collection* maintenance). The data is later ignored by the server if *No data collection* is set.

When *No data collection* maintenance ends, triggers using `nodata()` function will not fire before the next check during the period they are checking.

If a log item is added while a host is in maintenance and the maintenance ends, only new logfile entries since the end of the maintenance will be gathered.

If a timestamped value is sent for a host that is in *No data collection* maintenance (e.g., using Zabbix sender), then this value will be dropped; however it is possible to send a timestamped value in for an expired maintenance period, and it will be accepted.

If maintenance period or maintenance option (host group, host, trigger, etc) are changed by the user, the changes will only take effect after configuration cache synchronization.



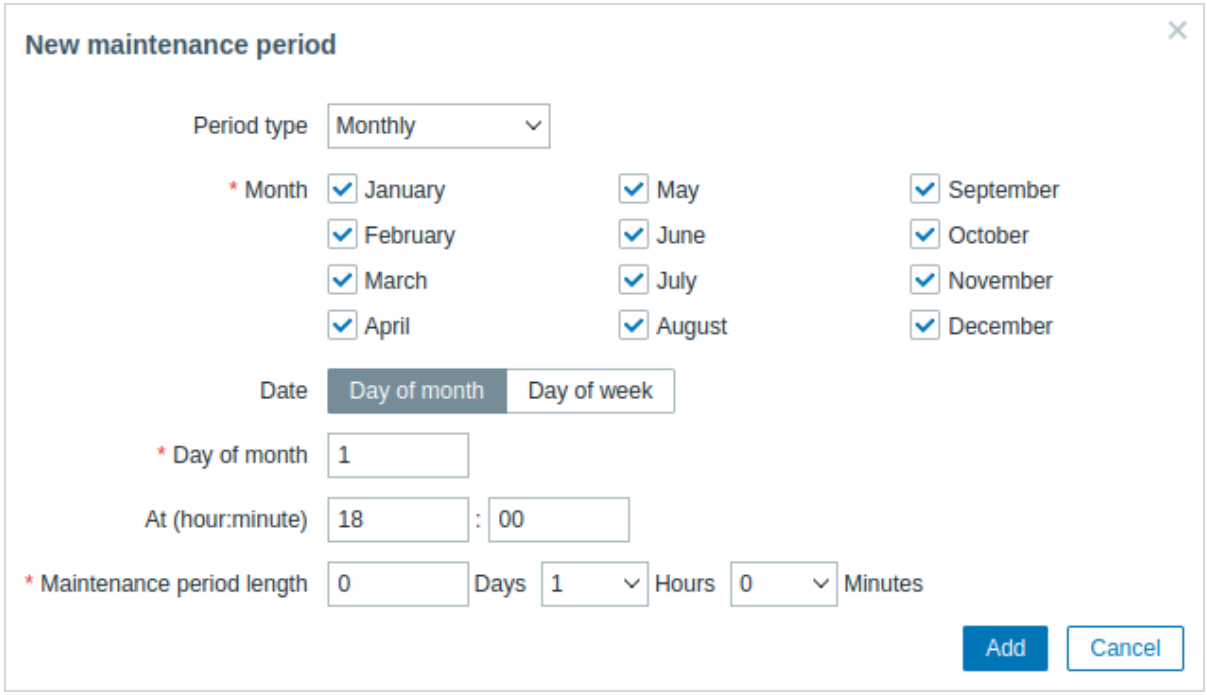
Configuration

To start a maintenance period immediately:

1. Go to *Monitoring* > *Problems*.
2. Click on the problem name.
3. Select maintenance option from the event menu (host, trigger, event name, tags).
4. Modify maintenance parameters in the form.

To configure a planned maintenance period:

1. Go to *Data collection* > *Maintenance*.
2. Click *Create maintenance period* (or the name of an existing maintenance period).
3. Enter maintenance parameters in the form.



All mandatory input fields are marked with a red asterisk.

Parameter	Description
Name	Name of the maintenance period.
Maintenance type	Two types of maintenance can be set: **With data collection** - data is collected by the server during maintenance, and triggers are processed; **No data collection** - data may still be collected, but it is not saved to the database during maintenance, and triggers (including the `nodata()` function) do not fire. See Effect of maintenance periods for how each type affects the availability report.
Active since	The date and time when executing maintenance periods becomes active. *Note:* Setting this time alone does not activate a maintenance period; maintenance periods must be configured in *Periods* (see below).
Active till	The date and time when executing maintenance periods stops being active.
Periods	This block allows you to define the exact days and hours when the maintenance takes place. Clicking Add opens a popup window with a flexible *Maintenance period* form where you can define maintenance schedule. See Maintenance periods for a detailed description.
Host groups	Select host groups that the maintenance will be activated for. The maintenance will be activated for all hosts from the specified host group(s). This field is auto-complete, so starting to type in it will display a dropdown of all available host groups. Specifying a parent host group implicitly selects all nested host groups. Thus the maintenance will also be activated on hosts from nested groups.
Hosts	Select hosts that the maintenance will be activated for. This field is auto-complete, so starting to type in it will display a dropdown of all available hosts.
Triggers	Select triggers that the maintenance will be activated for. This field is auto-complete, so starting to type in it will display a dropdown of all available triggers.
Event name	Specify event names that the maintenance will be activated for. Several conditions can be set. There are two operators available for each condition: **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive)

Parameter	Description
Tags	Specify tags that the maintenance will be activated for. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-sensitive); **Equals** - include the specified tag names and values (case-sensitive). **Does not equal** - exclude the specified tag names and values (case-sensitive) **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met. Tags can be specified only if the *With data collection* maintenance type is selected.
Description	Description of maintenance period.

Maintenance periods

The maintenance period window is for scheduling time for a recurring or a one-time maintenance. The form is dynamic with available fields changing based on the *Period type* selected.

Period type	Description
One time only	Configure a one time only maintenance period: *Date* - date and time of the maintenance period; *Maintenance period length* - for how long the maintenance will be active.

Period type	Description
Daily	Configure a daily maintenance period: *Every day(s)* - maintenance frequency (1 - *(default)* every day, 2 - every two days, etc.); *At (hour:minute)* - time of the day when maintenance starts; *Maintenance period length* - for how long the maintenance will be active. When *Every day(s)* parameter is greater than ”1”, the starting day is the day that the *Active since* time falls on. Examples: - if *Active since* is set to ”2021-01-01 12:00”, *Every day(s)* is set to ”2”, and *At (hour:minute)* is set to ”23:00”, then the first maintenance period will start on January 1 at 23:00, while the second maintenance period will start on January 3 at 23:00; - if *Active since* is set to ”2021-01-01 12:00”, *Every day(s)* is set to ”2”, and *At (hour:minute)* is set to ”01:00”, then the first maintenance period will start on January 3 at 01:00, while the second maintenance period will start on January 5 at 01:00.
Weekly	Configure a weekly maintenance period: *Every week(s)* - maintenance frequency (1 - *(default)* every week, 2 - every two weeks, etc.); *Day of week* - on which day the maintenance should take place; *At (hour:minute)* - time of the day when maintenance starts; *Maintenance period length* - for how long the maintenance will be active. When *Every week(s)* parameter is greater than ”1”, the starting week is the week that the *Active since* time falls on. For examples, see parameter *Daily* description above.
Monthly	Configure a monthly maintenance period: *Month* - select all months during which the regular maintenance is carried out; *Date:* ***Day of month*** - select this option if the maintenance should take place on the same date each month (for example, every 1st day of the month), and then select the required day in the field *Day of month* that appears; *Date:* ***Day of week*** - select this option if the maintenance should take place only on certain days (for example, every first Monday of the month), then select (in the drop-down) the required week of the month (first, second, third, fourth, or last), and then mark the checkboxes for maintenance day(s); *At (hour:minute)* - time of the day when maintenance starts; *Maintenance period length* - for how long the maintenance will be active.

Attention:
When creating a maintenance period, the time zone of the user who creates it is used. However, when recurring maintenance periods (*Daily*, *Weekly*, *Monthly*) are scheduled, the time zone of the Zabbix server is used. To ensure predictable behavior of recurring maintenance periods, it is required to use a common time zone for all parts of Zabbix.

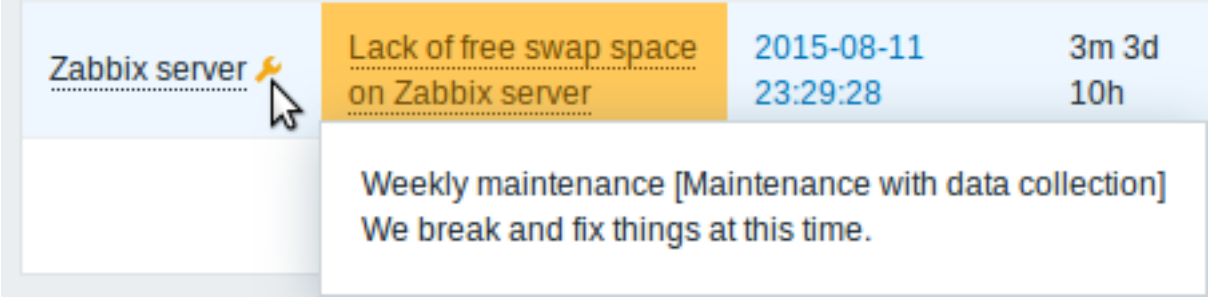
When done, click *Add* to add the maintenance period to the *Periods* section.

Note that Daylight Saving Time (DST) changes do not affect how long the maintenance will be. For example, let’s say that we have a two-hour maintenance configured that usually starts at 01:00 and finishes at 03:00:

- if after one hour of maintenance (at 02:00) a DST change happens and current time changes from 02:00 to 03:00, the maintenance will continue for one more hour (till 04:00);
- if after two hours of maintenance (at 03:00) a DST change happens and current time changes from 03:00 to 02:00, the maintenance will stop, because two hours have passed;
- if a maintenance period starts during the hour that is skipped by a DST change, then the maintenance will not start.

If a maintenance period is set to ”1 day” (the actual period of the maintenance is 24 hours, since Zabbix calculates days in hours), starts at 00:00 and finishes at 00:00 the next day:

- the maintenance will stop at 01:00 the next day if current time changes forward one hour;
- the maintenance will stop at 23:00 that day if current time changes back one hour.



Display

Displaying hosts in maintenance

An orange wrench icon  next to the host name indicates that this host is in maintenance in:

- *Dashboards*
- *Monitoring > Problems*

- *Inventory* > *Hosts* > *Host inventory details*
- *Data collection* > *Hosts* (See *Status* column)

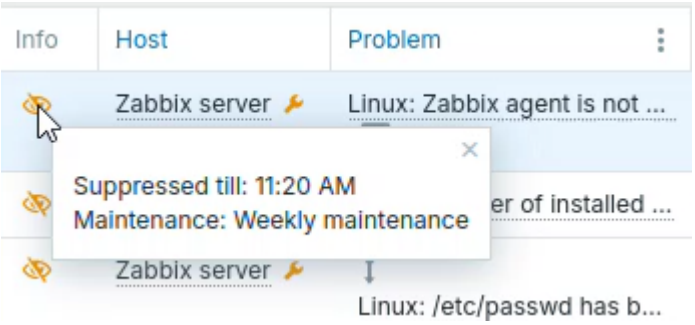
Maintenance details are displayed when the mouse pointer is positioned over the icon.

Additionally, hosts in maintenance get an orange background in *Monitoring* > *Maps*.

Displaying suppressed problems

Normally, problems for hosts in maintenance are suppressed, that is, not displayed in the frontend.

Suppressed problems may also be hidden because they were manually suppressed.



It is possible to display suppressed problems by selecting the *Show suppressed problems* option in these locations:

- *Dashboards* (in *Problem hosts*, *Problems*, *Problems by severity*, *Trigger overview* widget configuration)
- *Monitoring* > *Problems* (in the filter)
- *Monitoring* > *Maps* (in map configuration)
- Global notifications (in user profile configuration)

When suppressed problems are displayed, the following icon is shown: . If suppression is due to host maintenance, the following icons are shown:

- - problem has been suppressed due to host maintenance.
- - problem has been unsuppressed after host maintenance.

Hovering over the icon displays more details. In event details, you can check whether the event was suppressed because of maintenance or suppressed manually. If both maintenance and manual suppression apply, manual suppression takes priority in the icon color.

Calculation of queues during maintenance

Queues displayed in the Zabbix frontend (Administration > Queue) are calculated by the Zabbix server. They do not include items in *No data collection* maintenance, and queue length is always zero for these items, even when their values are delayed. Delayed items in *With data collection* maintenance are still counted in the queue.

The Zabbix proxy is not aware of maintenance periods because there is no synchronization of maintenance configuration between the Zabbix server and proxy. Internal checks calculated on Zabbix proxies (for example, `zabbix[queue,,]` and `zabbix[stats,,,queue,,]`) report delayed items regardless of the maintenance status on the Zabbix server.

As a result, different queue lengths may be reported for the same items in *No data collection* maintenance by the Zabbix frontend and by internal checks on Zabbix proxies.

Tagging

Tags have multiple purposes, most notably, to mark events. When entities are tagged, any new event related to a tagged entity will inherit its tags. For example:

- with tagged templates - any host problem (created by triggers from the template) will inherit the template tags.
- with tagged hosts - any host problem will inherit the host tags.
- with tagged items/web scenarios - any item/web scenario problem will inherit the item/web scenario tags.
- with tagged triggers - any problem created by the trigger will inherit the trigger tags.

A problem event inherits all tags from the whole chain of entities - templates, hosts, items/web scenarios, triggers. Identical `tag:value` combinations (after resolved macros) are merged into one, thus avoiding duplication.

Recovery events generated by a manual close also include the resolved event tags inherited from templates, hosts, items/web scenarios and triggers. These tags are available in notifications and via macros such as `{EVENT.RECOVERY.TAGS}` and `{EVENT.RECOVERY.TAGSJSON}`.

Custom event tags offer more flexibility. For example:

- event correlation can be configured based on event tags.
- action conditions can be configured based on event tags.
- item problems can be grouped based on event tags.
- problem tags can be used to map problems to services.

Entities may be tagged with the same tag name but different tag values (for example, `component:memory` and `component:storage`). Similarly, an entity can have a tag without a value and the same tag with a value (for example, `database` and `database:postgresql`). Such tags are not considered duplicates.

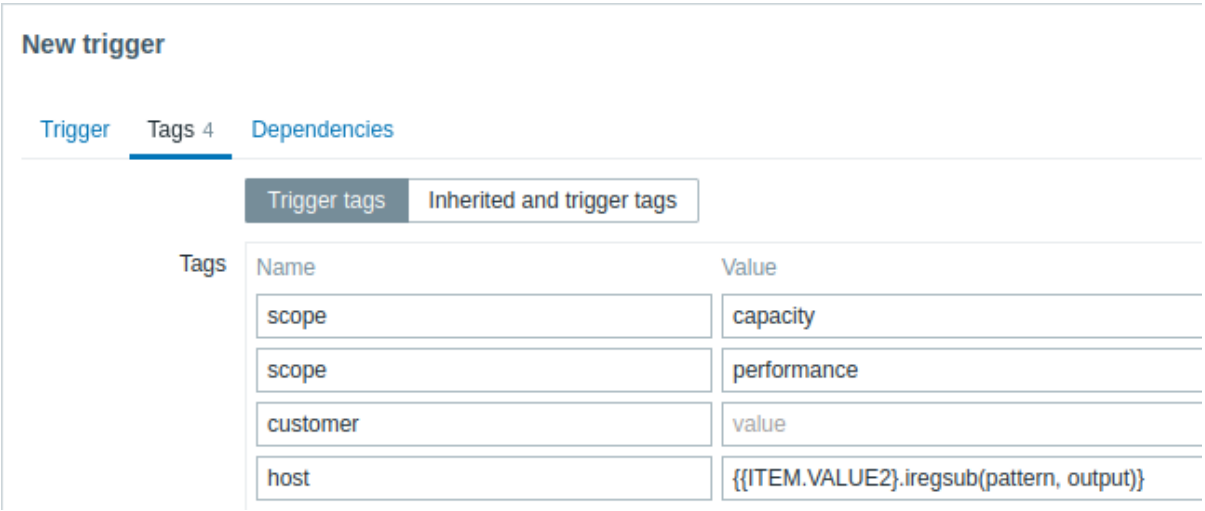
Tags consist of a tag name and a tag value. When tagging entities, you can use just the name or pair it with a value (for example, `mysql`, `jira`, `target:mysql`, `service:jira`, etc.).

Tags can be defined for various entities:

- Templates
- Hosts
- Items
- Web scenarios
- Triggers
- Services
- Template items and triggers
- Host, item, and trigger prototypes

In the *Templates*, *Hosts*, *Items*, *Triggers*, *Web scenarios* lists and their prototypes the *Tags* column displays both regular and inherited tags. When hovering over or clicking an *inherited* tag a JavaScript tooltip appears with the text "Inherited tag". If an inherited tag also exists as a regular tag, a different tooltip text is shown depending on the list where it appears (for example, "Inherited and template tag" in the templates list or "Inherited and host tag" in the hosts list). In other places of the frontend regular and inherited tags are displayed together (duplicates are removed), without icons and without additional tooltip text.

> **Note:**
> Refer to the official Zabbix guidelines for general recommendations on defining tags, along with specific guidance for templates, items, triggers, and low-level discovery rules.



Use cases Some common use cases for tagging are as follows:

1. Mark trigger events:
   - Define a trigger tag (for example, `scope:performance`).
   - Problems created by this trigger will have the trigger tag.
2. Mark template-inherited problems:
   - Define a template tag (for example, `target:mysql`).
   - Problems created by triggers from this template will have the template tag.
3. Mark host problems:
   - Define a host tag (for example, `service:jira`).
   - Problems created by triggers from this host will have the host tag.
4. Filter related items:
   - Define an item tag (for example, `component:cpu`).
   - In *Monitoring* > *Latest data*, items can be filtered by the `component:cpu` tag.
5. Use information extracted from the item value as the tag value:
   - Define a tag with a macro as the tag value (for example, `tag-name:{{ITEM.VALUE<N>}.regsub()}`).
   - In *Monitoring* > *Problems*, problems will have the tag value resolved to the data extracted from the item value.
6. Identify problems in a log file and close them separately:

- Define a trigger tag for the log monitoring item trigger that will extract values from the item value using a macro (for example, `service:{{ITEM.VALUE<N>}.regsub()}`).
- In the trigger configuration, set up event correlation:
  - set *PROBLEM event generation mode* to "Multiple";
  - set *OK event closes* to "All problems if tag values match";
  - set the tag for matching.
- Problems created by the log item trigger will have the trigger tag and will be closed individually.

7. Filter notifications:
   - Define trigger tags (for example, `scope:security` for trigger1 and `scope:availability` for trigger2).
   - Use tag filtering in action conditions to receive notifications only on the events that match tag data.
8. Identify problems in notifications:
   - Define trigger tags.
   - Use the {EVENT.TAGS} macro in the problem notification.
   - The problem notification will contain the trigger tags, making it easier to identify which application/service the notification belongs to.
9. Simplify configuration tasks by using template tags:
   - Define a template trigger tag.
   - Triggers created from this template trigger will have its tag.
10. Create triggers with tags from low-level discovery (LLD):
    - Define a trigger prototype tag with an LLD macro in the tag name or value (for example, `scope:{#FSNAME}`).
    - Triggers created from the trigger prototype will have its tag.
11. Match services using service tags:
    - Define service tags.
    - Configure service actions for services with matching tags.
    - Additionally, use service tags to link a service to an SLA for SLA calculations.
12. Link services to problems using service problem tags:
    - Define a problem tag in service configuration (for example, `target:mysql`).
    - Problems with a matching tag will be automatically correlated to the service, and service status will change based on the configured service status calculation rules.
13. Suppress problems when a host is in maintenance mode:
    - Define tags in maintenance period configuration.
    - Problems with the defined tags will be suppressed.
14. Grant access to user groups:
    - Define tags in user group configuration.
    - Users in the user group will be able to view only problems with the defined tags.

Configuration Tags can be defined in a dedicated tab, for example, in trigger configuration:

Macro support Built-in and user macros in tags are resolved at the time of the event. Until the event has occurred, these macros will be shown in Zabbix frontend unresolved.

Low-level discovery macros are resolved during discovery process.

The following macros may be used in trigger tag names and values:

- {ITEM.VALUE}, {ITEM.VALUE.AGE}, {ITEM.VALUE.DATE}, {ITEM.VALUE.TIME}, {ITEM.VALUE.TIMESTAMP}, {ITEM.LASTVALUE}, {ITEM.LASTVALUE.AGE}, {ITEM.LASTVALUE.DATE}, {ITEM.LASTVALUE.TIME}, {ITEM.LASTVALUE.TIMESTAMP}, {HOST.HOST}, {HOST.NAME}, {HOST.CONN}, {HOST.DNS}, {HOST.IP}, {HOST.PORT}, and {HOST.ID} built-in macros

- {INVENTORY.*} built-in macros (for referencing host inventory values from one or several hosts in a trigger expression)
- User macros and user macros with context (the context may include low-level discovery macros)
- Low-level discovery macros (only in trigger prototype tags)

The following macros may be used in template, host, and item/web scenario tag names and values:

- {HOST.HOST}, {HOST.NAME}, {HOST.CONN}, {HOST.DNS}, {HOST.IP}, {HOST.PORT} and {HOST.ID} built-in macros
- {INVENTORY.*} built-in macros
- User macros
- Low-level discovery macros (only in host and item prototype tags)

The following macros may be used in trigger-based notifications:

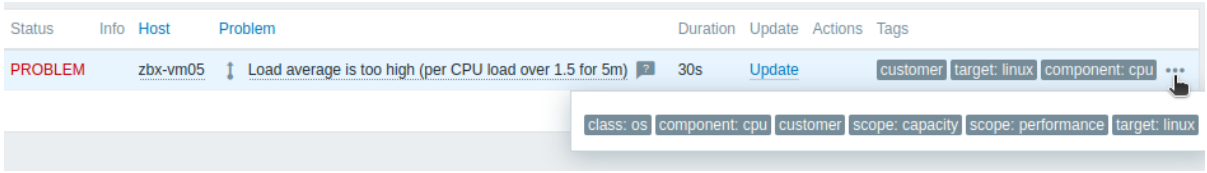
- {EVENT.TAGS} and {EVENT.RECOVERY.TAGS} built-in macros (these macros will resolve to a comma-separated list of event tags or recovery event tags)
- {EVENT.TAGSJSON} and {EVENT.RECOVERY.TAGSJSON} built-in macros (these macros will resolve to a JSON array containing event tag objects or recovery event tag objects)

Substring extraction in trigger tags

Substring extraction is supported for populating the tag name or tag value, using a macro function. The function applies a regular expression to the value obtained by the supported macro. For example:

```
{{ITEM.VALUE}.regsub(pattern, output)}
{{ITEM.VALUE}.iregsub(pattern, output)}

{{#LLDMACRO}.regsub(pattern, output)}
{{#LLDMACRO}.iregsub(pattern, output)}
```



If the tag name or value exceeds 255 characters after macro resolution, it will be truncated to 255 characters.

See also: Using macro functions in low-level discovery macros for event tagging.

Viewing event tags Tags, if defined, can be viewed with new events in:

- *Monitoring* > *Problems*
- *Monitoring* > *Problems* > *Event details*
- *Dashboards* > *Problems* widget

The order and number of displayed tags is determined by the *Tag display priority* and *Show tags* filtering options in *Monitoring* > *Problems* or the *Problems* dashboard widget. Note that a maximum of three tags can be displayed; if there are more tags, hovering over the three dots reveals all tags in a pop-up window.

Event correlation

Overview

Event correlation allows problem events to be correlated with their resolution in a manner that is very precise and flexible.

Event correlation can be defined:

- On trigger level - one trigger may be used to relate separate problems to their solution;
- Globally - problems can be correlated to their solution from a different trigger/polling method using global correlation rules.

Trigger-based event correlation

Overview

Trigger-based event correlation allows separate problems reported by one trigger to be correlated.

While generally an OK event can close all problem events created by one trigger, there are cases when a more detailed approach is needed. For example, when monitoring log files you may want to discover certain problems in a log file and close them individually rather than all together.

This is the case with triggers that have *PROBLEM event generation mode* parameter set to *Multiple*. Such triggers are normally used for log monitoring, trap processing, etc.

It is possible in Zabbix to relate problem events based on tagging. Tags are used to extract values and create identification for problem events. Taking advantage of that, problems can also be closed individually based on matching tag.

In other words, the same trigger can create separate events identified by the event tag. Therefore problem events can be identified one-by-one and closed separately based on the identification by the event tag.

How it works

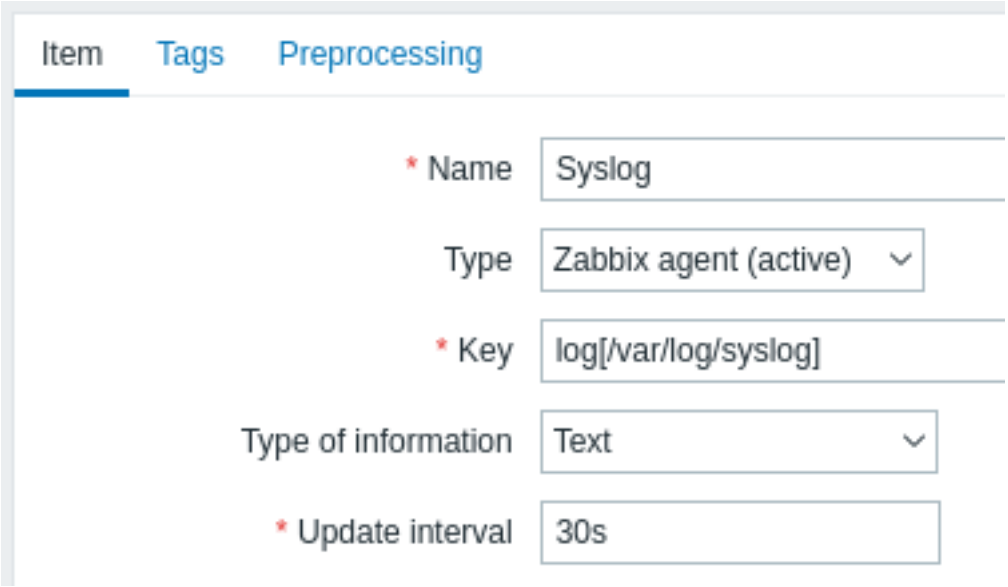
In log monitoring you may encounter lines similar to these:

```
Line1: Service 1 stopped
Line2: Service 2 stopped
Line3: Service 1 was restarted
Line4: Service 2 was restarted
```

The idea of event correlation is to be able to match the problem event from Line1 to the resolution from Line3 and the problem event from Line2 to the resolution from Line4, and close these problems one by one:

```
Line1: Service 1 stopped
Line3: Service 1 was restarted #problem from Line 1 closed

Line2: Service 2 stopped
Line4: Service 2 was restarted #problem from Line 2 closed
```



To do this you need to tag these related events as, for example, "Service 1" and "Service 2". That can be done by applying a regular expression to the log line to extract the tag value. Then, when events are created, they are tagged "Service 1" and "Service 2" respectively and problem can be matched to the resolution.

Configuration

Item

To begin with, you may want to set up an item that monitors a log file, for example:

```
log[/var/log/syslog]
```

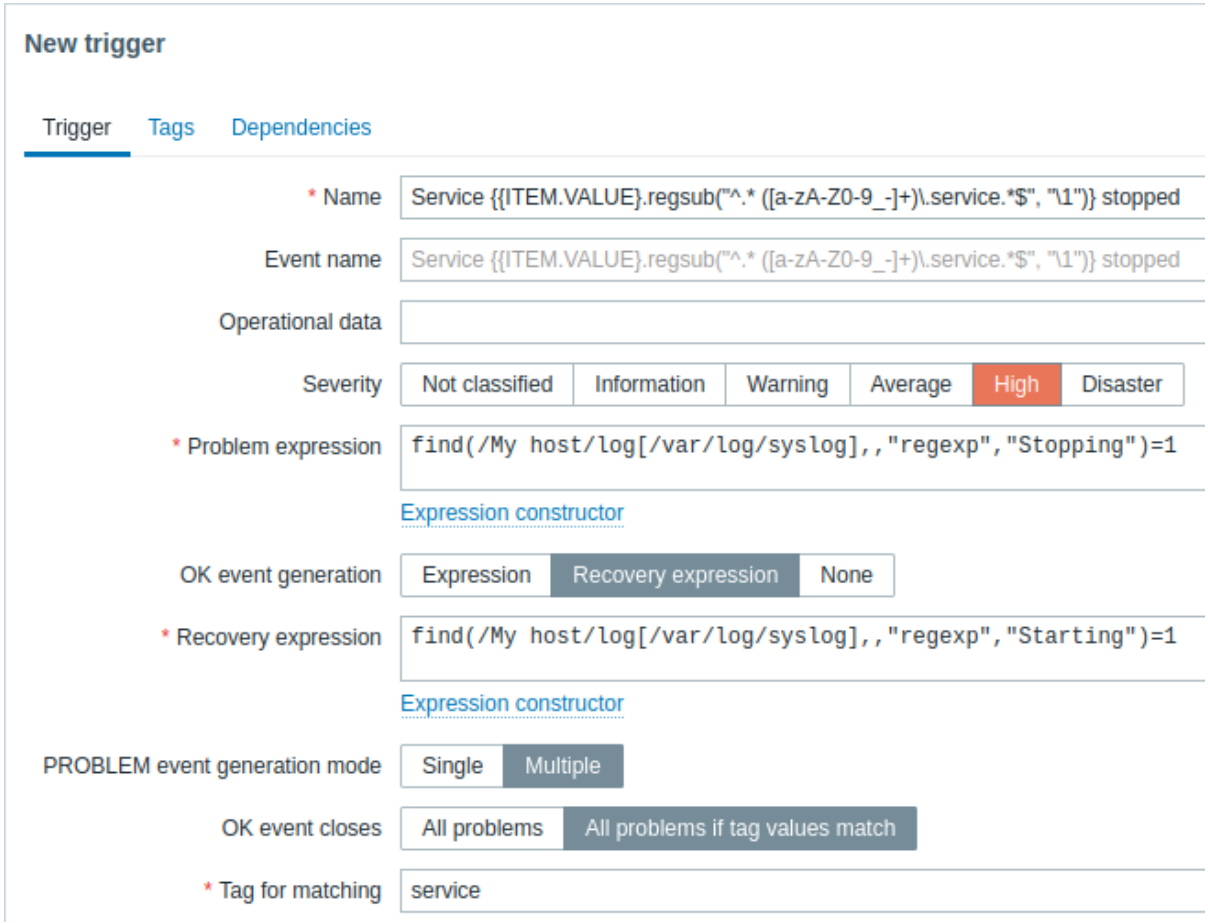
With the item set up, wait a minute for the configuration changes to be picked up and then go to Latest data to make sure that the item has started collecting data.

Trigger

With the item working you need to configure the trigger. It's important to decide what entries in the log file are worth paying attention to. For example, the following trigger expression will search for a string like 'Stopping' to signal potential problems:

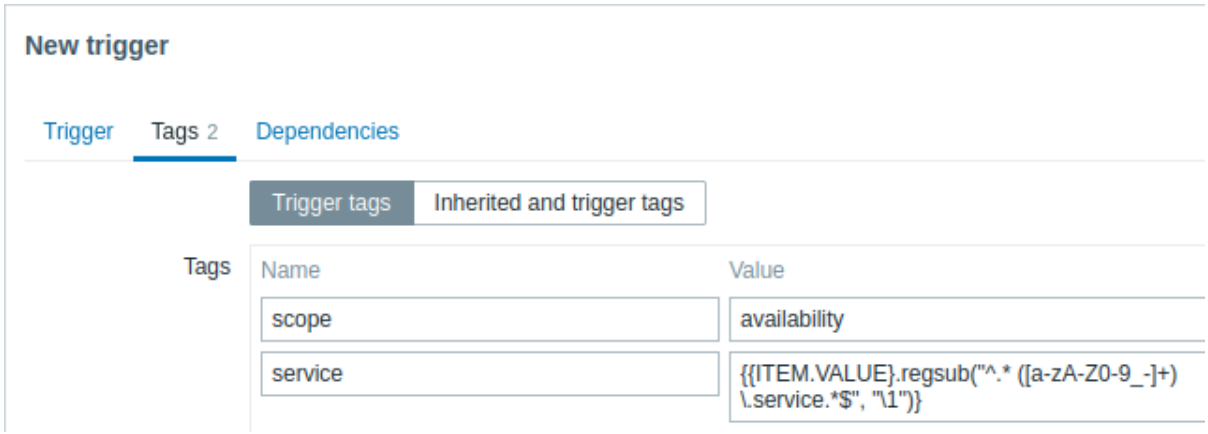
```
find(/My host/log[/var/log/syslog],,"regexp","Stopping")=1
```

Attention:
To make sure that each line containing the string "Stopping" is considered a problem also set the *Problem event generation mode* in trigger configuration to 'Multiple'.



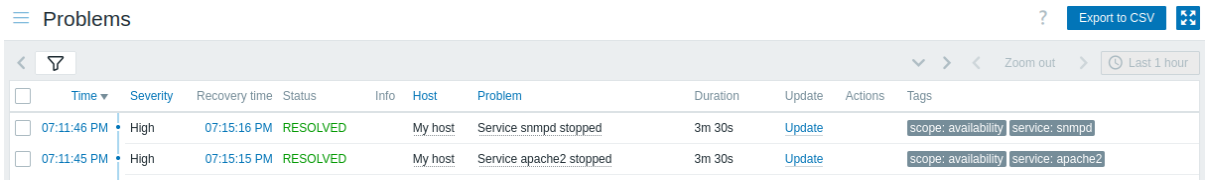
Then define a recovery expression. The following recovery expression will resolve all problems if a log line is found containing the string "Starting":

```
find(/My host/log[/var/log/syslog],,"regexp","Starting")=1
```



Since we do not want that it's important to make sure somehow that the corresponding root problems are closed, not just all problems. That's where tagging can help.

Problems and resolutions can be matched by specifying a tag in the trigger configuration. The following settings have to be made:



- *Problem event generation mode*: Multiple
- *OK event closes*: All problems if tag values match
- Enter the name of the tag for event matching

- configure the tags to extract tag values from log lines

If configured successfully you will be able to see problem events tagged by application and matched to their resolution in *Monitoring > Problems*.

Warning:
Because misconfiguration is possible, when similar event tags may be created for **unrelated** problems, please review the cases outlined below!

- Indexed macros always refer to the *Expression* field of the trigger configuration, not the *Recovery expression*. For example, in a recovery event, **{ITEM.VALUE1}** will resolve to the latest value of the first item **in the problem expression** at the time of recovery. If the recovery expression is based on a different item and the value of the problem expression item changes by the time of recovery, the events will get different tags and will not be correlated.

- With two applications writing error and recovery messages to the same log file a user may decide to use two *service* tags in the same trigger with different tag values by using separate regular expressions in the tag values to extract the names of, say, service A and service B from the {ITEM.VALUE} macro (e.g., when the message formats differ). However, this may not work as planned if there is no match to the regular expressions. Non-matching regexps will yield empty tag values and a single empty tag value in both problem and OK events is enough to correlate them. So a recovery message from service A may accidentally close an error message from service B.
- Actual tags and tag values only become visible when a trigger fires. If the regular expression used is invalid, it is silently replaced with an *UNKNOWN* string. If the initial problem event with an *UNKNOWN* tag value is missed, there may appear subsequent OK events with the same *UNKNOWN* tag value that may close problem events which they shouldn't have closed.
- If a user uses the {ITEM.VALUE} macro without macro functions as the tag value, the 255-character limitation applies. When log messages are long and the first 255 characters are non-specific, this may also result in similar event tags for unrelated problems.

Global event correlation

Overview

Global event correlation allows reaching out over all metrics monitored by Zabbix and create correlations.

It is possible to correlate events created by completely different triggers and apply the same operations to them all. By creating intelligent correlation rules it is actually possible to save yourself from thousands of repetitive notifications and focus on root causes of a problem!

Global event correlation is a powerful mechanism, which allows you to untie yourself from one-trigger based problem and resolution logic. So far, a single problem event was created by one trigger and we were dependent on that same trigger for the problem resolution. We could not resolve a problem created by one trigger with another trigger. But with event correlation based on event tagging, we can.

For example, a log trigger may report application problems, while a polling trigger may report the application to be up and running. Taking advantage of event tags you can tag the log trigger as *status:down* while tag the polling trigger as *status:up*. Then, in a global correlation rule you can relate these triggers and assign an appropriate operation to this correlation such as closing the old events.

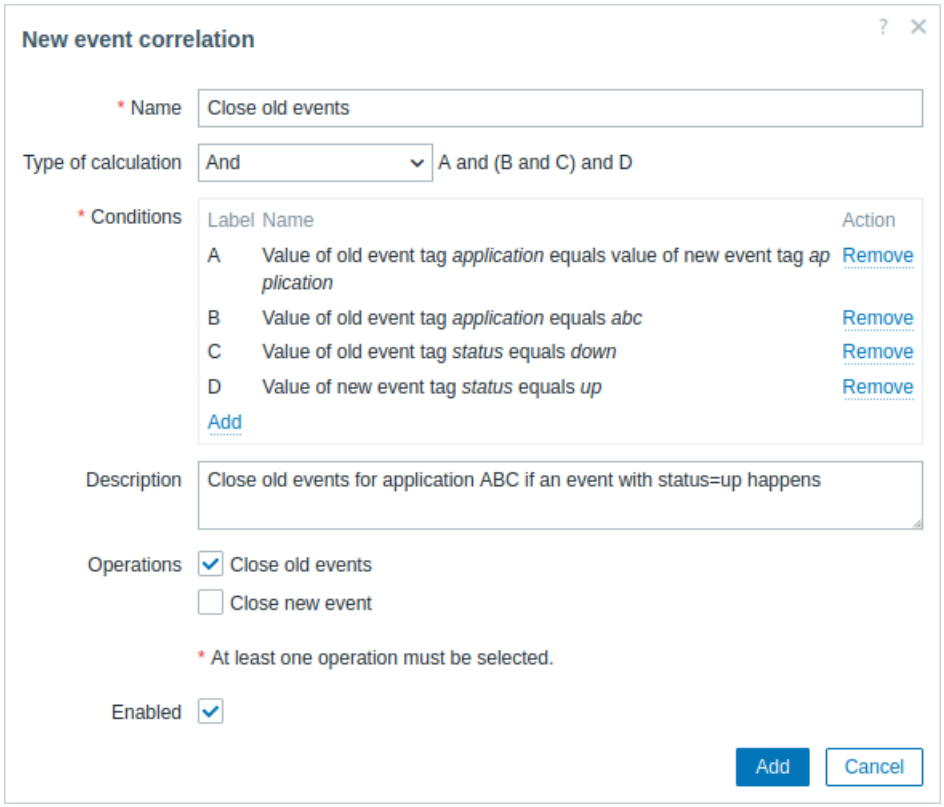
In another use, global correlation can identify similar triggers and apply the same operation to them. What if we could get only one problem report per network port problem? No need to report them all. That is also possible with global event correlation.

Global event correlation is configured in **correlation rules**. A correlation rule defines how the new problem events are paired with existing problem events and what to do in case of a match (close the new event, close matched old events by generating corresponding OK events). If a problem is closed by global correlation, it is reported in the *Info* column of *Monitoring* > *Problems*.

Configuring global correlation rules is available to Super Admin level users only.

Attention:
Event correlation must be configured very carefully, as it can negatively affect event processing performance or, if mis-configured, close more events than was intended (in the worst case even all problem events could be closed).

To configure global correlation **safely**, observe the following important tips:



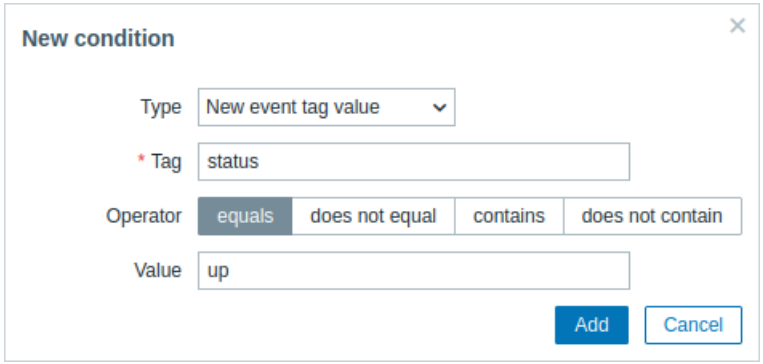
- Reduce the correlation scope. Always set a unique tag for the new event that is paired with old events and use the *New event tag name* correlation condition.
- Add an explicit old-event condition when using **Close old events**. Always add at least one *Old event* condition (for example, *Old event tag name*, *Old event tag value*, or *Event tag pair*) when selecting **Close old events**; otherwise, the rule may match and close unrelated existing problem events (in the worst case, all problems). Prefer **Event tag pair** for matching runtime values (host:port, session id, etc.), and further narrow the match by host or host group when possible.
- Avoid using common tag names that may end up being used by different correlation configurations.
- Keep the number of correlation rules limited to the ones you really need.

See also: known issues.

Configuration

To configure event correlation rules globally:

1. Go to *Data collection* > *Event correlation*.
2. Click *Create event correlation* to the right (or the correlation name to edit an existing rule).
3. Enter parameters of the correlation rule in the form.

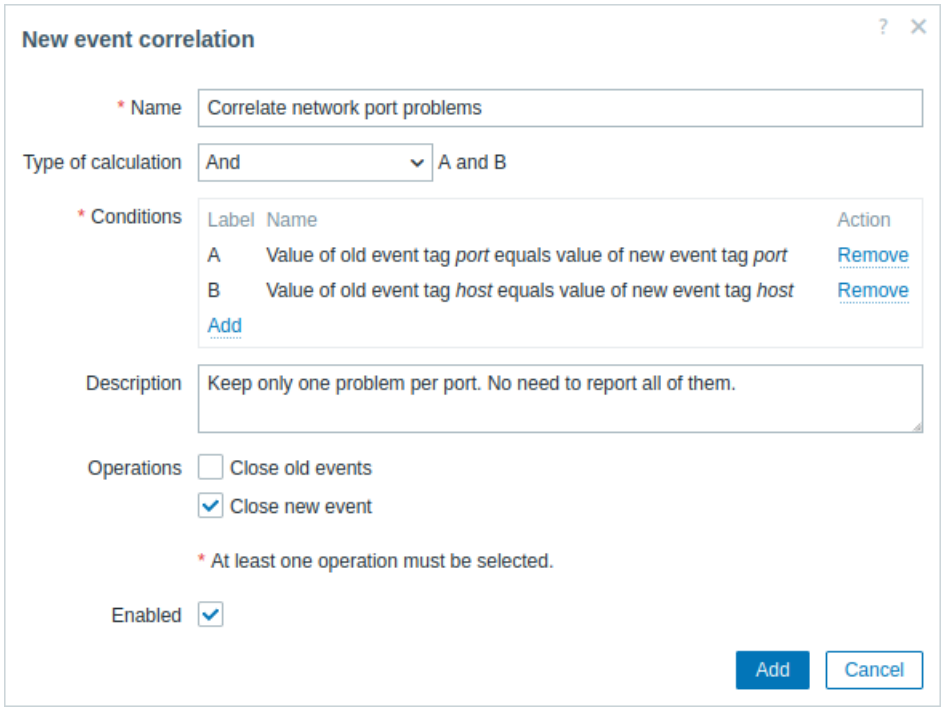


All mandatory input fields are marked with a red asterisk.

Parameter	Description
Name	Unique correlation rule name.
Type of calculation	The following options of calculating conditions are available: **And** - all conditions must be met **Or** - enough if one condition is met **And/Or** - AND with different condition types and OR with the same condition type **Custom expression** - a user-defined calculation formula for evaluating action conditions. It must include all conditions (represented as uppercase letters A, B, C, ...) and may include spaces, tabs, brackets ( ), **and** (case sensitive), **or** (case sensitive), **not** (case sensitive).
Conditions	List of conditions. See below for details on configuring a condition.
Description	Correlation rule description.

Parameter	Description
Operations	Mark the checkbox of the operation to perform when event is correlated. The following operations are available: **Close old events** - close old events when a new event happens. Always add a condition based on the old event when using the *Close old events* operation or all existing problems could be closed. **Close new event** - close the new event when it happens. **Warning!** Do not leave old/new event conditions empty when using *Close old events*/*Close new event*.If you select the *Close old events* operation without adding a condition that matches the old event, Zabbix may match all existing old events and close them.Always add an explicit old event condition (for example, *Old event tag name* or *Event tag pair*) when using *Close old events*. For example, a rule that uses only a *New event condition* and the *Close old events operation* will match all old events that meet the (missing) old-event criteria - effectively closing old problems.
Enabled	If you mark this checkbox, the correlation rule will be enabled.

To configure details of a new condition, click Add in the Conditions block. A popup window will open where you can edit the condition details.



Parameter	Description
New condition	Select a condition for correlating events. *Note* that if no old event condition is specified, all old events may be matched and closed. Similarly if no new event condition is specified, all new events may be matched and closed. The following conditions are available: **Old event tag name** - specify the old event tag name for matching. **New event tag name** - specify the new event tag name for matching. **New event host group** - specify the new event host group for matching. **Event tag pair** - specify new event tag name and old event tag name for matching. In this case there will be a match if the **values** of the tags in both events match. Tag *names* need not match. This option is useful for matching runtime values, which may not be known at the time of configuration (see also Example). **Old event tag value** - specify the old event tag name and value for matching, using the following operators: *equals* - has the old event tag value *does not equal* - does not have the old event tag value *contains* - has the string in the old event tag value *does not contain* - does not have the string in the old event tag value **New event tag value** - specify the new event tag name and value for matching, using the following operators: *equals* - has the new event tag value *does not equal* - does not have the new event tag value *contains* - has the string in the new event tag value *does not contain* - does not have the string in the new event tag value

Warning:
Because misconfiguration is possible, when similar event tags may be created for **unrelated** problems, please review the cases outlined below!

- Actual tags and tag values only become visible when a trigger fires. If the regular expression used is invalid, it is silently replaced with an *UNKNOWN* string. If the initial problem event with an *UNKNOWN* tag value is missed, there may appear subsequent OK events with the same *UNKNOWN* tag value that may close problem events which they shouldn't have closed.
- If a user uses the {ITEM.VALUE} macro without macro functions as the tag value, the 255-character limitation applies. When log messages are long and the first 255 characters are non-specific, this may also result in similar event tags for unrelated problems.

Example

Stop repetitive problem events from the same network port.

This global correlation rule will correlate problems if *host* and *port* tag values exist on the trigger and they are the same in the original event and the new one.

The operation will close new problem events on the same network port, keeping only the original problem open.

Discovery

Overview Discovery provides automatic ways to add hosts and configure monitoring without manual setup. Zabbix supports multiple discovery methods to adapt to different scenarios.

Discovery methods

- Network discovery - automatically detect hosts and services available on your network.
- Active agent autoregistration - allow active agents to automatically register themselves with the server.
- Low-level discovery - automatically create items, triggers, graphs, and hosts for discovered entities like file systems or network interfaces using prototypes and nested discovery rules.

Network discovery

Overview

Zabbix offers automatic network discovery functionality that is effective and very flexible.

With network discovery properly set up you can:

- Speed up Zabbix deployment.
- Simplify administration.

- Use Zabbix in rapidly changing environments without excessive administration.

Zabbix network discovery is based on the following information:

- IP ranges
- Availability of external services (FTP, SSH, WEB, POP3, IMAP, TCP, etc)
- Information received from Zabbix agent (only unencrypted mode is supported)
- Information received from SNMP agent

It does NOT provide discovery of network topology.

Network discovery basically consists of two phases: discovery and actions.

Discovery

Zabbix periodically scans the IP ranges defined in network discovery rules. The frequency of the check is configurable for each rule individually.

Each rule has a set of service checks defined to be performed for the IP range.

Discovery rules are processed by the discovery manager. The discovery manager creates a job per each rule with a list of tasks (network checks). Network checks are performed in parallel by the available discovery workers (the number is configurable in the frontend per each rule). The exception is SNMPv3 checks, which are processed by a single worker. Only checks with the same IP and port are scheduled sequentially because some devices will not accept parallel connections on the same port.

The queue size of network checks is limited to 2000000 or 4 GB of memory approximately. If the queue becomes full then the discovery rule will be skipped and a warning message will be printed in the log. You may use the `zabbix[discovery_queue]` internal item to monitor the number of discovery checks in the queue.

Discovery checks are processed independently from the other checks. If any checks do not find a service (or fail), other checks will still be processed.

Note:
If a discovery rule is changed during execution, then the current discovery execution will be aborted.

Every check of a service and a host (IP) performed by the network discovery module generates a discovery event.

Event	Check of service result
Service Discovered	The service is 'up' after it was 'down' or when discovered for the first time.
Service Up	The service is 'up', after it was already 'up'.
Service Lost	The service is 'down' after it was 'up'.
Service Down	The service is 'down', after it was already 'down'.
Host Discovered	At least one service of a host is 'up' after all services of that host were 'down' or a service is discovered which belongs to a not registered host.
Host Up	At least one service of a host is 'up', after at least one service was already 'up'.
Host Lost	All services of a host are 'down' after at least one was 'up'.
Host Down	All services of a host are 'down', after they were already 'down'.

Actions

Discovery events can be the basis of relevant actions, such as:

- Sending notifications
- Adding/removing hosts
- Enabling/disabling hosts
- Adding hosts to a group
- Removing hosts from a group
- Adding tags to a host
- Removing tags from a host
- Linking a template to hosts/unlinking a template from hosts
- Executing remote scripts

These actions can be configured with respect to the device type, IP, status, uptime/downtime, etc. For full details on configuring actions for network-discovery based events, see action operation and conditions pages.

Since network discovery actions are event-based, they will be triggered both when a discovered host is online and when it is offline. It is highly recommended to add an action condition *Discovery status: up* to avoid such actions as *Add host* being triggered upon

Service Lost/*Service Down* events. Otherwise, if a discovered host is manually removed, it will still generate *Service Lost*/*Service Down* events and will be recreated during the next discovery cycle.

Note:
Linking templates to a discovered host will fail collectively if any of the linkable templates has a unique entity (e.g., item key) that is the same as a unique entity (e.g., item key) already existing on the host or on another of the linkable templates.

Host creation

A host is added if the *Add host* operation is selected. A host is also added, even if the *Add host* operation is missing, if you select operations resulting in actions on a host. Such operations are:

- Enable host.
- Disable host.
- Add host to a host group.
- Link template to a host.

Created hosts are added to the *Discovered hosts* group (by default, configurable in *Administration* > *General* > *Other*). If you wish hosts to be added to another group, add a *Remove from host groups* operation (specifying "Discovered hosts") and also add an *Add to host groups* operation (specifying another host group), because a host must belong to a host group.

The IP address of the discovered device, together with the discovery source (Zabbix server, Zabbix proxy, or proxy group) and the interface type, is used as the criterion for finding a host in the system. If a host with the same IP address, interface type and discovery source already exists, that host will be the target for performing operations. If the discovery source differs, the discovered entity is treated as a different host and a new host may be created.

If the IP address of the discovered host is changed or the interface is deleted, a new host will be created upon the next discovery.

Host naming

When adding hosts, a host name is the result of reverse DNS lookup or IP address if reverse lookup fails. Lookup is performed from the Zabbix server or Zabbix proxy, depending on which is doing the discovery. If lookup fails on the proxy, it is not retried on the server. If the host with such a name already exists, the next host would get **_2** appended to the name, then **_3** and so on.

It is also possible to override DNS/IP lookup and instead use an item value for host name, for example:

- You may discover multiple servers with Zabbix agent running using a Zabbix agent item for discovery and assign proper names to them automatically, based on the string value returned by this item.
- You may discover multiple SNMP network devices using an SNMP agent item for discovery and assign proper names to them automatically, based on the string value returned by this item.

If the host name has been set using an item value, it is not updated during the following discovery checks. If it is not possible to set host name using an item value, default value (DNS name) is used.

If a host already exists with the discovered IP address and the discovery source (Zabbix server, proxy or proxy group) has not changed, a new host is not created. If the discovery source differs, the discovered entity is treated as distinct and a new host may be created. However, if the discovery action contains operations (link template, add to host group, etc), they are performed on the existing host that matches by IP address, interface type and discovery source.

Host removal

Hosts discovered by a network discovery rule are removed automatically from *Monitoring* > *Discovery* if a discovered entity is not in the rule's IP range any more. Hosts are removed immediately.

Interface creation when adding hosts

When hosts are added as a result of network discovery, they get interfaces created according to these rules:

- The services detected - for example, if an SNMP check succeeded, an SNMP interface will be created.
- If a host responded both to Zabbix agent and SNMP requests, both types of interfaces will be created.
- If uniqueness criteria are Zabbix agent or SNMP-returned data, the first interface found for a host will be created as the default one. Other IP addresses will be ignored, unless the default interface goes down. In case where the default interface is down, the smallest of the other IP addresses will be used as a replacement for the default interface. Action's conditions (such as Host IP) do not impact adding interfaces. *Note* that this will work if all interfaces are discovered by the same discovery rule. If a different discovery rule discovers a different interface of the same host, an additional host will be added.
- If a host responded to agent checks only, it will be created with an agent interface only. If it would start responding to SNMP later, additional SNMP interfaces would be added.
- If 3 separate hosts were initially created, having been discovered by the "IP" uniqueness criteria, and then the discovery rule is modified so that hosts A, B and C have identical uniqueness criteria result, B and C are created as additional interfaces for A, the first host. The individual hosts B and C remain. In *Monitoring* > *Discovery* the added interfaces will be displayed

in the ”Discovered device” column, in black font and indented, but the ”Monitored host” column will only display A, the first created host. ”Uptime/Downtime” is not measured for IPs that are considered to be additional interfaces.

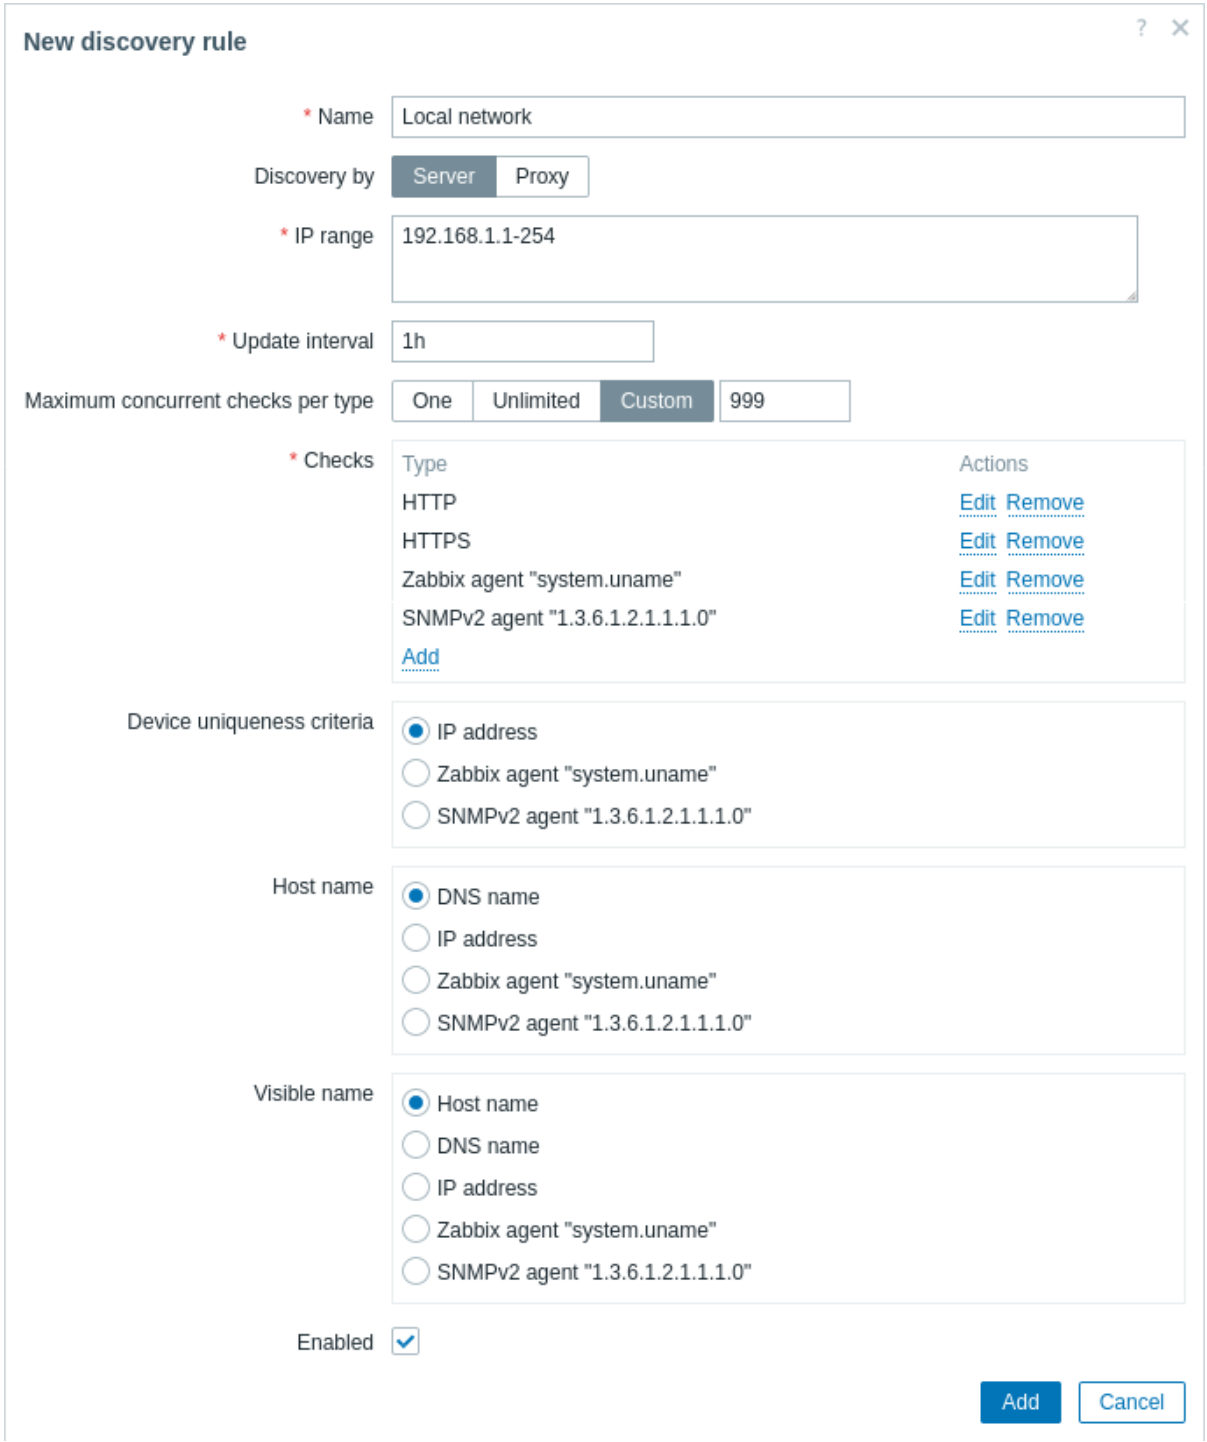
Changing proxy setting

The hosts discovered by different proxies are not always treated as different hosts. Discovery and uniqueness checks depend on the proxy group structure: when a proxy runs a discovery rule and creates a host, that host is added to the proxy’s parent proxy group, not assigned to the proxy itself. When Zabbix evaluates IP uniqueness during discovery, it checks hosts monitored by the parent proxy group. Hosts monitored by individual proxies within that group (including the proxy that ran the discovery) are ignored for the uniqueness check, which can result in duplicate hosts if multiple proxies monitor overlapping subnets.

While this behavior allows discovery to operate across overlapping IP ranges used by different subnets, changing the proxy assigned to an already monitored subnet is more complicated because proxy changes must be applied consistently to discovered hosts and to the membership of the parent proxy group to avoid duplicates.

For example, the steps to replace proxy in a discovery rule:

1. Disable discovery rule.
2. Sync proxy configuration.
3. Replace the proxy in the discovery rule.
4. Replace the proxy for all hosts discovered by this rule (ensure hosts in the parent proxy group and any hosts monitored by individual proxies in that group are updated to avoid duplicates).
5. Enable discovery rule.



Configuring a network discovery rule

Overview

To configure a network discovery rule used by Zabbix to discover hosts and services:

1. Go to *Data collection* > *Discovery*.
2. Click *Create discovery rule* (or the rule name to edit an existing one).
3. Edit the discovery rule attributes.

Rule attributes

All mandatory input fields are marked with a red asterisk.

Parameter	Description
Name	Unique name of the rule. For example, "Local network".
Discovery by	Discovery is performed by: **Server** - by Zabbix server **Proxy** - by Zabbix proxy (selected in the proxy name field)
IP range	The range of IP addresses for discovery. It may have the following formats: Single IP: 192.168.1.33 Range of IP addresses: 192.168.1-10.1-255. The range is limited by the total number of covered addresses (less than 64K). IP mask: 192.168.4.0/24 supported IP masks: /16 - /30 for IPv4 addresses /112 - /128 for IPv6 addresses List: 192.168.1.1-255, 192.168.2.1-100, 192.168.2.200, 192.168.4.0/24 This field supports spaces, tabulation and multiple lines.

Parameter	Description
Update interval	This parameter defines how often Zabbix will execute the rule. The interval is measured after the execution of previous discovery instance ends so there is no overlap. Time suffixes are supported, e.g., 30s, 1m, 2h, 1d. User macros are supported. *Note* that if a user macro is used and its value is changed (e.g., 1w → 1h), the next check will be executed according to the previous value (far in the future with the example values).
Maximum concurrent checks per type	Set the maximum number of discovery threads (workers) per service check for parallel processing of discovery checks: **One** - one thread **Unlimited** - unlimited number of threads (but no more than in the StartDiscoverers parameter) **Custom** - set a custom number of threads (0-999). SNMPv1 and SNMPv2 asynchronous service checks are processed concurrently by available workers. All discovery rules with SNMPv3 asynchronous service checks are processed by one worker due to the peculiarities of the libsnmp implementation; therefore, increasing the number of workers will not increase the discovery speed.
Checks	Zabbix will use this list of checks for discovery. Click Add to configure a new check in a popup window. Supported checks: SSH, LDAP, SMTP, FTP, HTTP, HTTPS, POP, NNTP, IMAP, TCP, Telnet, Zabbix agent, SNMPv1 agent, SNMPv2 agent, SNMPv3 agent, ICMP ping. A protocol-based discovery uses the **net.tcp.service[]** functionality to test each host, except for SNMP which queries an SNMP OID. Zabbix agent is tested by querying an item in unencrypted mode. Please see agent items for more details. The 'Ports' parameter may be one of following: Single port: 22 Range of ports: 22-45 List: 22-45,55,60-70 Since Zabbix 7.0, all service checks are performed asynchronously, except for LDAP checks. Since Zabbix 7.0 HTTP/HTTPs checking is done via libcurl. If Zabbix server/proxy is compiled without libcurl, then HTTP checks will work like in previous versions (i.e. as TCP checks), but HTTPS checks will not work.
Device uniqueness criteria	Uniqueness criteria may be: **IP address** - do not process multiple single-IP devices. If a device with the same IP already exists it will be considered already discovered and a new host will not be added. **<discovery check>** - either Zabbix agent or SNMP agent check. Note that uniqueness criteria used during discovery is not the same as host identification in the system when performing actions. Uniqueness criteria during discovery define whether two or more discovered devices are the same (or different), whereas only the IP address is the criterion for host identification in Zabbix (see Host creation).
Host name	Set the technical host name of a created host using: **DNS name** - DNS name (default) **IP address** - IP address **<discovery check>** - received string value of the discovery check (e.g., Zabbix agent, SNMP agent check) See also: Host naming.
Visible name	Set the visible host name of a created host using: **Host name** - technical host name (default) **DNS name** - DNS name **IP address** - IP address **<discovery check>** - received string value of the discovery check (e.g., Zabbix agent, SNMP agent check) See also: Host naming.
Enabled	With the check-box marked the rule is active and will be executed by Zabbix server. If unmarked, the rule is not active. It won't be executed.

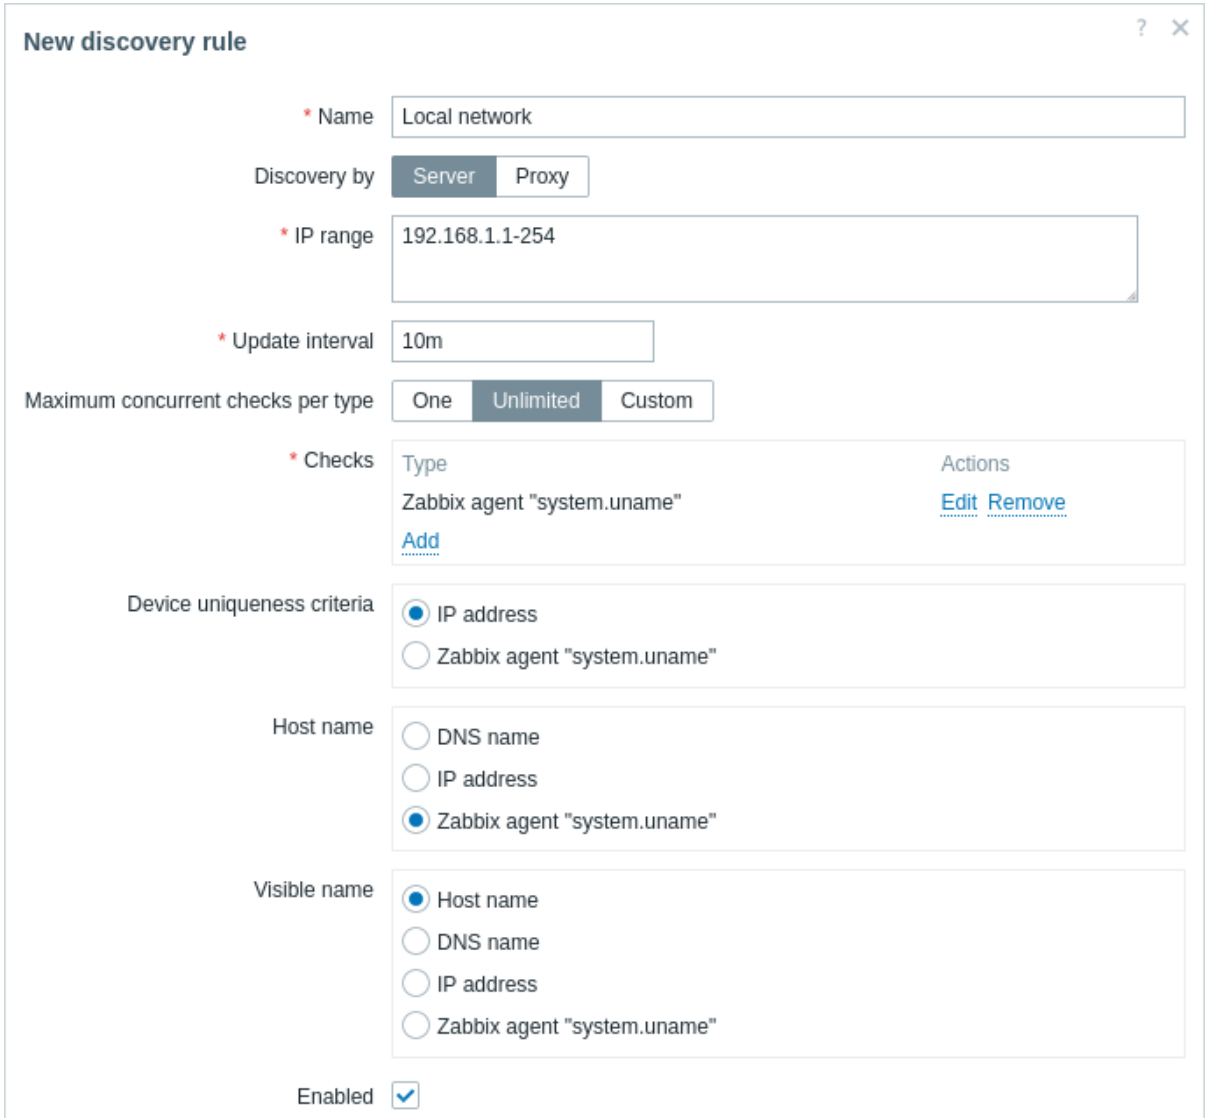
Exceeding file descriptor limit

In case of large number of concurrent checks, it is possible to exhaust the file descriptor limit for the discovery manager.

The number of file descriptors required for detection equates to the number of discovery workers * 1000. By default, there are 5 discovery workers, while the soft limit of the system is approximately 1024.

If this limit is approached, Zabbix will reduce the default number of concurrent checks per type for each worker and write a warning to the log file. But, if the user has set a higher value for *Maximum concurrent checks per type* than the value calculated by Zabbix, Zabbix will use the user-defined value for one worker.

A real life scenario



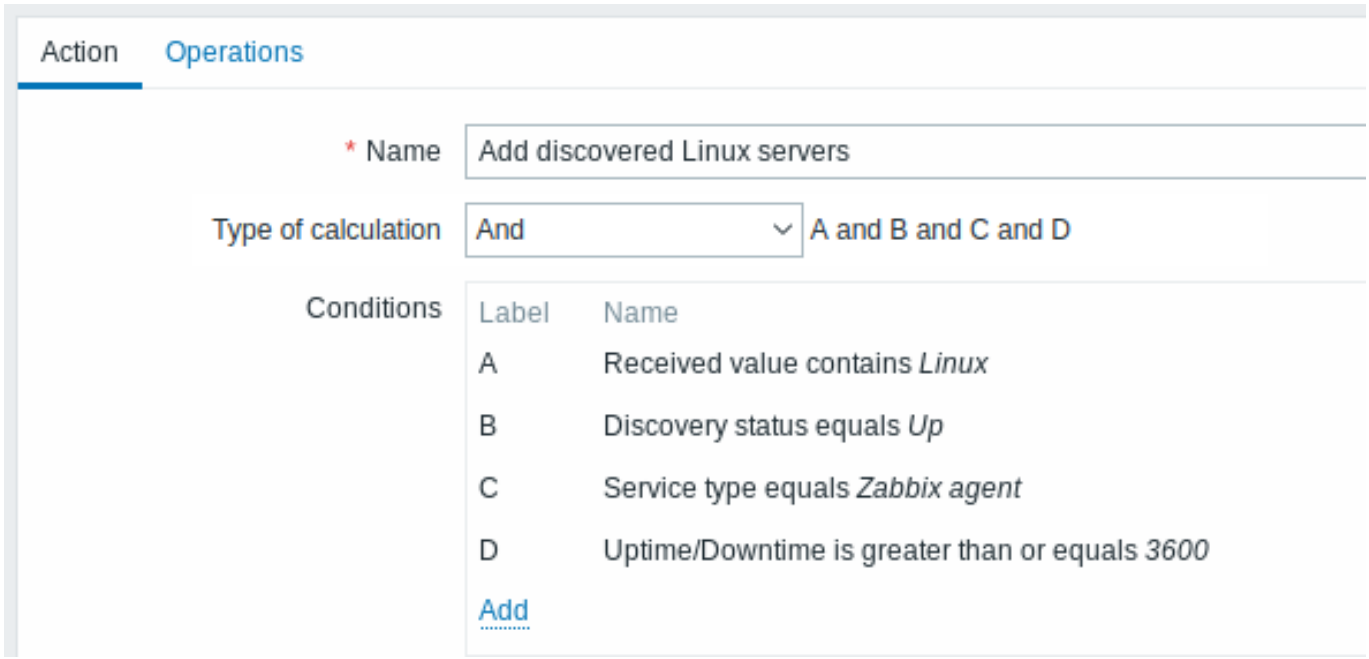
In this example, we would like to set up network discovery for the local network having an IP range of 192.168.1.1-192.168.1.254.

In our scenario we want to:

- discover those hosts that have Zabbix agent running
- run discovery every 10 minutes
- add a host to monitoring if the host uptime is more than 1 hour
- remove hosts if the host downtime is more than 24 hours
- add Linux hosts to the ”Linux servers” group
- add Windows hosts to the ”Windows servers” group
- use the template *Linux* for Linux hosts
- use the template *Windows* for Windows hosts

Step 1

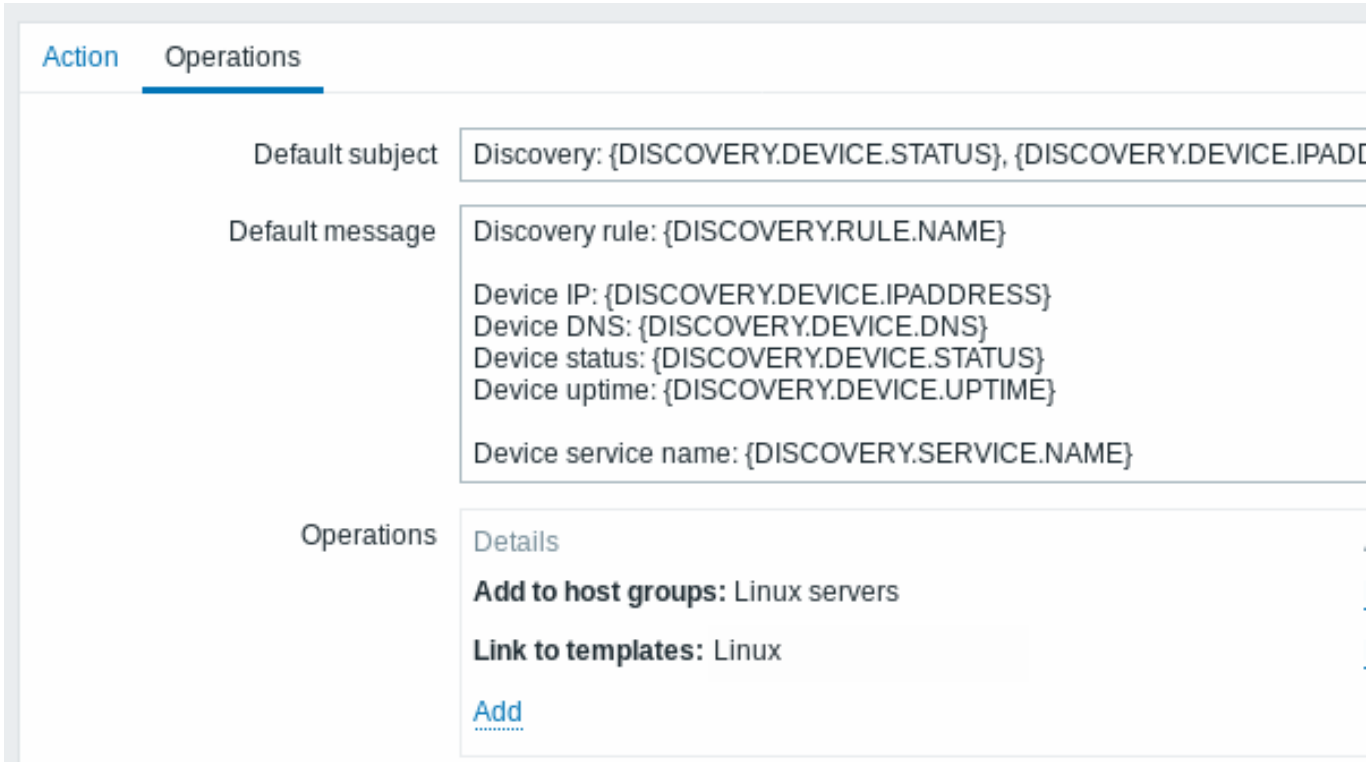
Defining a network discovery rule for our IP range.



Zabbix will try to discover hosts in the IP range of 192.168.1.1-192.168.1.254 by connecting to Zabbix agents and getting the value from the **system.uname** key. The value received from the agent can be used to name the hosts and also to apply different actions for different operating systems. For example, link Windows servers to the template *Windows*, Linux servers to the template *Linux*.

The rule will be executed every 10 minutes.

When this rule is added, Zabbix will automatically start the discovery and generation of the discovery-based events for further processing.

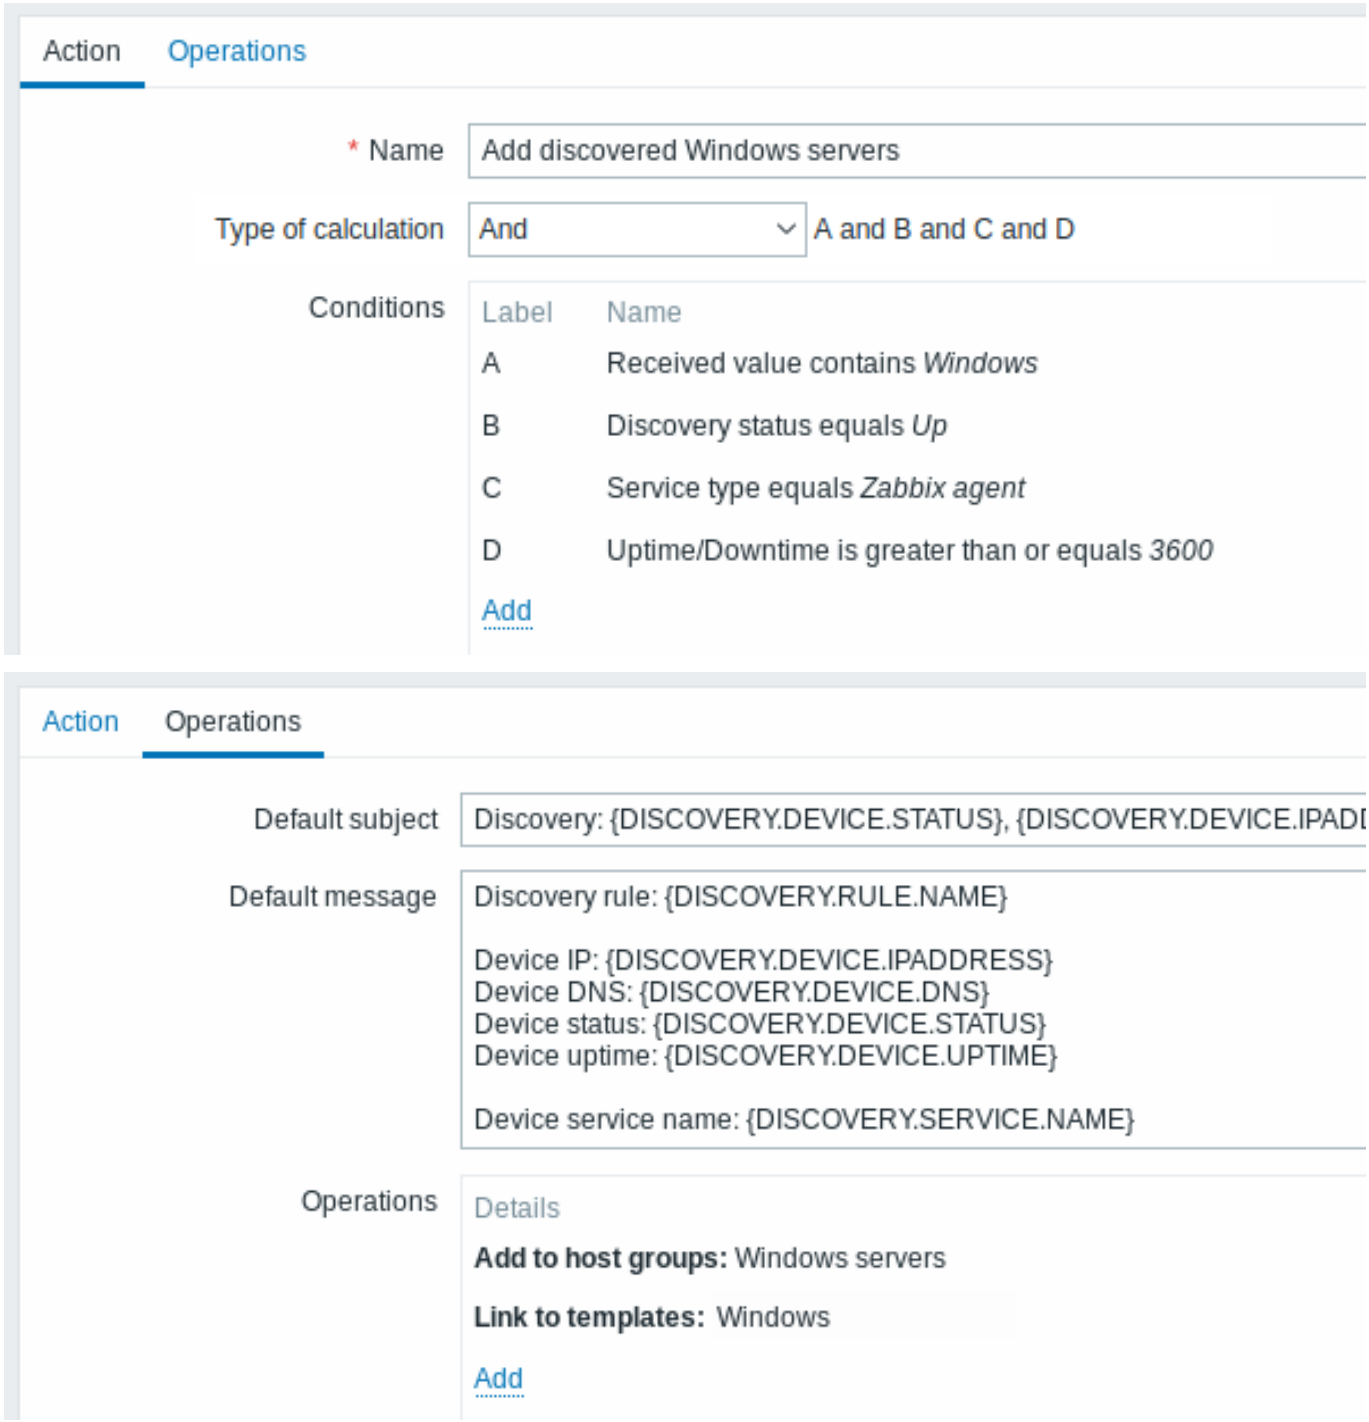


Step 2

Defining a discovery action for adding the discovered Linux servers to the respective group/template.

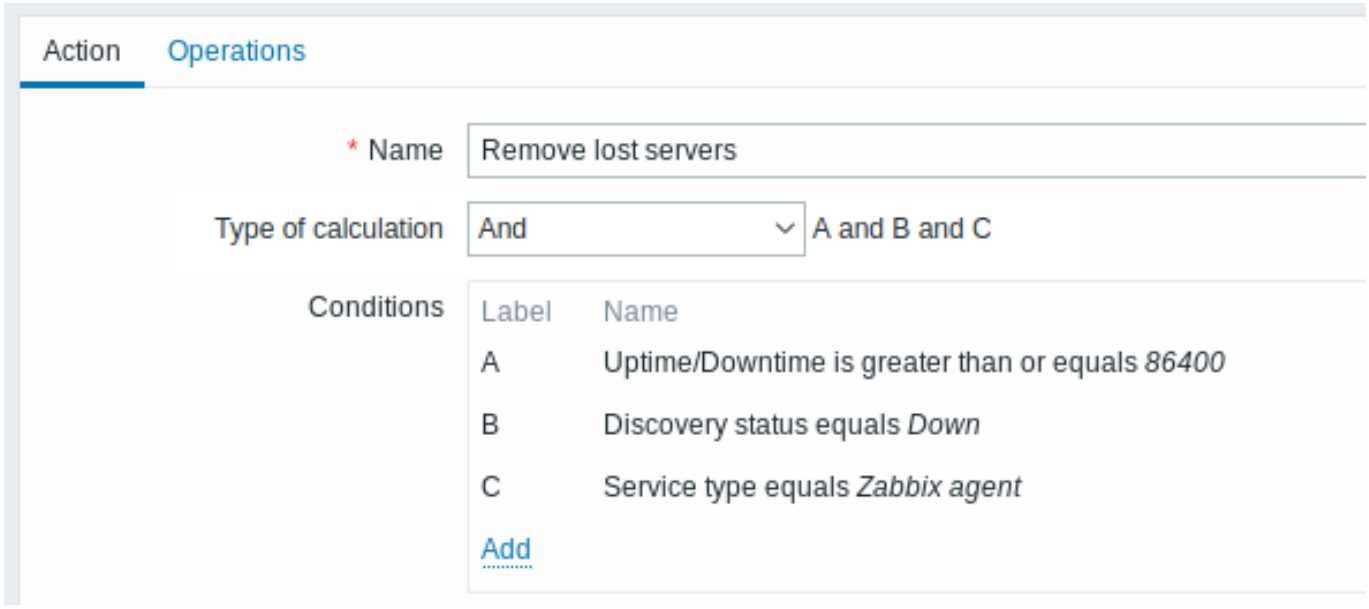
The action will be activated if:

- the ”Zabbix agent” service is ”up”
- the value of system.uname (the Zabbix agent key we used in rule definition) contains ”Linux”
- Uptime is 1 hour (3600 seconds) or more

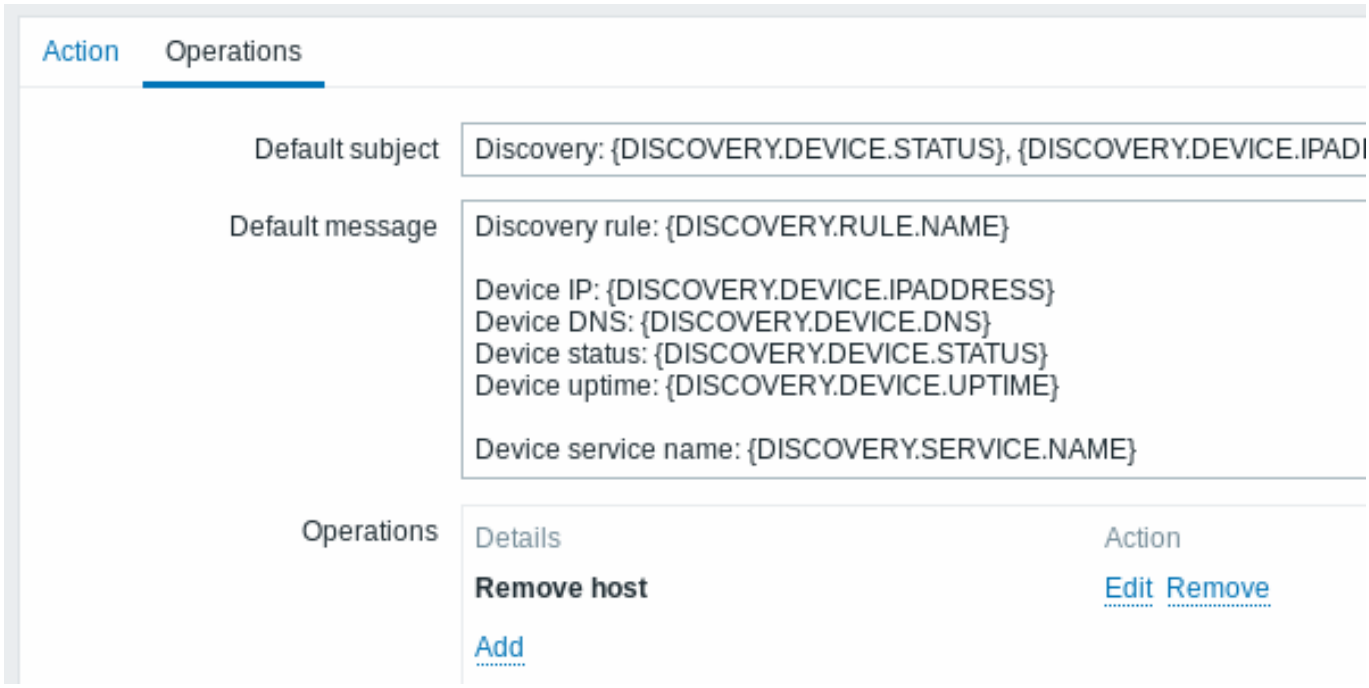


The action will execute the following operations:

- add the discovered host to the ”Linux servers” group (and also add host if it wasn’t added previously)
- link host to the *Linux* template. Zabbix will automatically start monitoring the host using items and triggers from the ”Linux” template.



Step 3



Defining a discovery action for adding the discovered Windows servers to the respective group/template.

Step 4

Defining a discovery action for removing lost servers.

A server will be removed if "Zabbix agent" service is 'down' for more than 24 hours (86400 seconds).

Active agent autoregistration

Overview

It is possible to allow active Zabbix agent autoregistration, after which the server can start monitoring them. This way new hosts can be added for monitoring without configuring them manually on the server.

Autoregistration can happen when a previously unknown active agent asks for checks.

The feature might be very handy for automatic monitoring of new cloud nodes. As soon as you have a new node in the Zabbix Cloud will automatically start the collection of performance and availability data of the host.

Active agent autoregistration also supports the monitoring of added hosts with passive checks. When the active agent asks for checks, providing it has the `ListenIP` or `ListenPort` configuration parameters defined in the configuration file, these are sent along to the server. If multiple IP addresses are specified, the first one is sent to the server.

Server, when adding the new autoregistered host, uses the received IP address and port to configure the agent. If no IP address value is received, the one used for the incoming connection is used. If no port value is received, 10050 is used.

It is possible to specify that the host should be autoregistered with a DNS name as the default agent interface.

Autoregistration is rerun:

- if host metadata information changes:
  - due to HostMetadata changed and agent restarted
  - due to value returned by HostMetadataItem changed
- for manually created hosts with metadata missing
- if a host is manually changed to be monitored by another Zabbix proxy
- if autoregistration for the same host comes from a new Zabbix proxy

The active agent autoregistration heartbeat for Zabbix server and Zabbix proxy is 120 seconds. So in case a discovered host is deleted, the autoregistration will be rerun in 120 seconds.

Configuration

Specify server

Make sure you have the Zabbix server identified in the agent configuration file (`zabbix_agentd.conf`):

```
ServerActive=10.0.0.1
```

Unless you specifically define a *Hostname* in `zabbix_agentd.conf`, the system hostname of agent location will be used by server for naming the host. The system hostname in Linux can be obtained by running the `hostname` command.

If *Hostname* is defined in Zabbix agent configuration as a comma-delimited list of hosts, hosts will be created for all listed hostnames.

Restart the agent after making any changes to the configuration file.

Action for active agent autoregistration

When server receives an autoregistration request from an agent it calls an action. An action of event source "Autoregistration" must be configured for agent autoregistration.

Note:
Setting up network discovery is not required to have active agents autoregister.

In the Zabbix frontend:

1. Go to *Alerts* > *Actions*.
2. Select *Autoregistration actions*.
3. Click *Create action*.
4. In the *Action* tab, give your action a name.
5. Optionally specify conditions. You can do a substring match or regular expression match in the conditions for host name/host metadata. If you are going to use the *Host metadata* condition type, see Using host metadata.
6. In the *Operations* tab, add relevant operations, such as *Add host*, *Add to host group* (for example, *Discovered hosts*), *Link templates*, etc.

Note:
If the hosts that will be autoregistering are likely to be supported for active monitoring only (such as hosts that are firewalled from your Zabbix server) then you might want to create a specific template like *Template_Linux-active* to link to.

Created hosts are added to the *Discovered hosts* group (by default, configurable in *Administration* > *General* > *Other*). If you wish hosts to be added to another group, add a *Remove from host group* operation (specifying "Discovered hosts") and also add an *Add to host group* operation (specifying another host group), because a host must belong to a host group.

Secure autoregistration

A secure way of autoregistration is possible by configuring PSK-based authentication with encrypted connections.

The level of encryption is configured globally in *Administration* > *General* > *Autoregistration*. It is possible to select no encryption, TLS encryption with PSK authentication or both (so that some hosts may register without encryption while others through encryption).

Authentication by PSK is verified by Zabbix server before adding a host. If successful, the host is added and *Connections from/to host* are set to 'PSK' only with identity/pre-shared key the same as in the global autoregistration setting.

Attention:
To ensure security of autoregistration on installations using proxies, encryption between Zabbix server and proxy should be enabled.

Using DNS as default interface

HostInterface and HostInterfaceItem configuration parameters allow you to specify a custom value for the host interface during autoregistration.

More specifically, they are useful if the host should be autoregistered with a DNS name as the default agent interface rather than its IP address. In that case the DNS name should be specified or returned as the value of either HostInterface or HostInterfaceItem parameters. If the value of one of these parameters changes—for example, from an IP address to a DNS name or vice versa—the default interface of the autoregistered host will be updated accordingly. This update is applied to the existing host, not by creating a new one. To send the new value, the agent must be restarted so that it re-initiates the autoregistration process.

> **Note:**
> If HostInterface or HostInterfaceItem parameters are not configured, the listen_dns parameter is used instead. This value is determined by performing a reverse DNS lookup of the agent's IP address. If reverse DNS is not properly configured or returns an invalid name, it may result in incorrect or failed autoregistration due to an invalid interface value.

Using host metadata

When agent is sending an autoregistration request to the server it sends its hostname. In some cases (for example, Amazon cloud nodes) a hostname is not enough for Zabbix server to differentiate discovered hosts. Host metadata can be optionally used to send other information from an agent to the server.

Host metadata is configured in the agent configuration file (`zabbix_agentd.conf`). There are 2 ways of specifying host metadata in the configuration file:

```
HostMetadata
HostMetadataItem
```

See the description of the options in the link above.

The HostMetadataItem parameter may return up to 65535 UTF-8 code points. A longer value will be truncated.

Note that on MySQL, the effective maximum length in characters will be less if the returned value contains multibyte characters. For example, a value containing 3-byte characters only will be limited to 21844 characters in total, while a value containing 4-byte characters only will be limited to 16383 symbols.

> **Attention:**
> An autoregistration attempt happens every time an active agent sends a request to refresh active checks to the server. The delay between requests is specified in the RefreshActiveChecks parameter of the agent. The first request is sent immediately after the agent is restarted.

Examples

Autoregistration by OS using HostMetadata

Say you would like the hosts to be autoregistered by the Zabbix server. You have active Zabbix agents (see "Configuration" section above) on your network. There are Windows hosts and Linux hosts on your network and you have "Linux by Zabbix agent" and "Windows by Zabbix agent" templates available in your Zabbix frontend. So at host registration, you would like the appropriate Linux/Windows template to be applied to the host being registered. By default, only the hostname is sent to the server at autoregistration, which might not be enough. In order to make sure the proper template is applied to the host you should use host metadata.

Frontend configuration

The first thing to do is to configure the frontend. Create 2 actions. The first action:

- Name: Linux host autoregistration
- Conditions: Host metadata contains *Linux*
- Operations: Link templates: Linux by Zabbix agent

> **Note:**
> You can skip an "Add host" operation in this case. Linking a template to a host requires adding the host first so the server will do that automatically.

The second action:

- Name: Windows host autoregistration
- Conditions: Host metadata contains *Windows*
- Operations: Link templates: Windows by Zabbix agent

Agent configuration

Now you need to configure the agents. Add the next line to the agent configuration files:

```
HostMetadataItem=system.uname
```

This way you make sure host metadata will contain ”Linux” or ”Windows” depending on the host an agent is running on. An example of host metadata in this case:

```
Linux: Linux server3 3.2.0-4-686-pae #1 SMP Debian 3.2.41-2 i686 GNU/Linux
Windows: Windows WIN-0PXGGSTYNHO 6.0.6001 Windows Server 2008 Service Pack 1 Intel IA-32
```

Do not forget to restart the agent after making any changes to the configuration file.

Using HostMetadata to control autoregistration and templates

Step 1 - Protect registration with HostMetadata

Using host metadata to allow some basic protection against unwanted hosts registering.

Frontend configuration

Create an action in the frontend, using some hard-to-guess secret code to disallow unwanted hosts:

- Name: Autoregistration action Linux
- Conditions:
  - Type of calculation: AND
  - Condition (A): Host metadata contains //Linux//
  - Condition (B): Host metadata contains //21df83bf21bf0be663090bb8d4128558ab9b95fba66a6dbf834f8b91ae5e08ae//
- Operations:
  - Send message to users: Admin via all media
  - Add to host groups: Linux servers
  - Link templates: Linux by Zabbix agent

Please note that this method alone does not provide strong protection because data is transmitted in plain text. Configuration cache reload is required for changes to have an immediate effect.

Agent configuration

Add the next line to the agent configuration file:

```
HostMetadata=Linux    21df83bf21bf0be663090bb8d4128558ab9b95fba66a6dbf834f8b91ae5e08ae
```

where ”Linux” is a platform, and the rest of the string is the hard-to-guess secret text.

Do not forget to restart the agent after making any changes to the configuration file.

Step 2 - Add template to registered host

It is possible to add additional templates for an already registered host. In this case the MySQL by Zabbix agent template will be linked only to hosts whose HostMetadata contains the token `MySQL`.

Frontend configuration

Update the action in the frontend:

- Name: Autoregistration action Linux
- Conditions:
  - Type of calculation: AND
  - Condition (A): Host metadata contains Linux
  - Condition (B): Host metadata contains 21df83bf21bf0be663090bb8d4128558ab9b95fba66a6dbf834f8b91ae5e08ae
  - Condition (C): Host metadata contains MySQL
- Operations:
  - Send message to users: Admin via all media
  - Add to host groups: Linux servers
  - Link templates: Linux by Zabbix agent
  - Link templates: MySQL by Zabbix Agent

Agent configuration

Update the next line in the agent configuration file:

```
HostMetadata=MySQL on Linux 21df83bf21bf0be663090bb8d4128558ab9b95fba66a6dbf834f8b91ae5e08ae
```

Do not forget to restart the agent after making any changes to the configuration file.

Overview Low-level discovery (LLD) automatically discovers entities (e.g., file systems, network interfaces) on a host and creates the corresponding items, triggers, and graphs without manual setup for each.

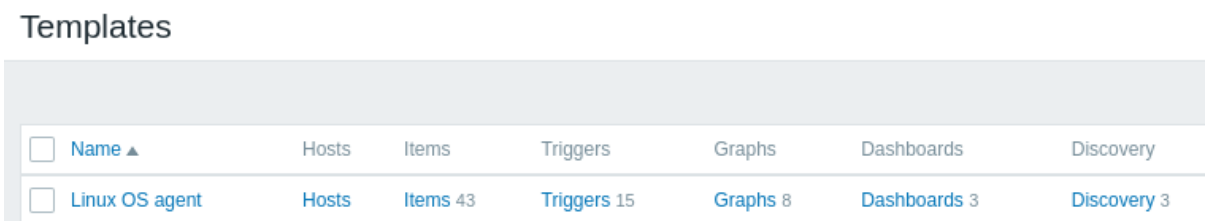
To use LLD, you create a **discovery rule** that collects JSON data describing entities, and **prototypes** (item, trigger, and graph) for each entity.

The JSON returned by the rule must be an array of objects, where each object represents one discovered entity using key-value pairs. For example, a discovery rule with `net.if.discovery` might return:

```
[
  {"{#IFNAME}": "lo"},
  {"{#IFNAME}": "eth0"}
]
```

A corresponding set of items, triggers, and graphs is then created from the prototypes—one per interface (`lo` and `eth0`).

If objects contain keys in the `{#MACRO}` format, those macros are used directly in prototypes. If not, or if additional/custom macros are required, macros can be defined manually and mapped to JSON fields using JSONPath.



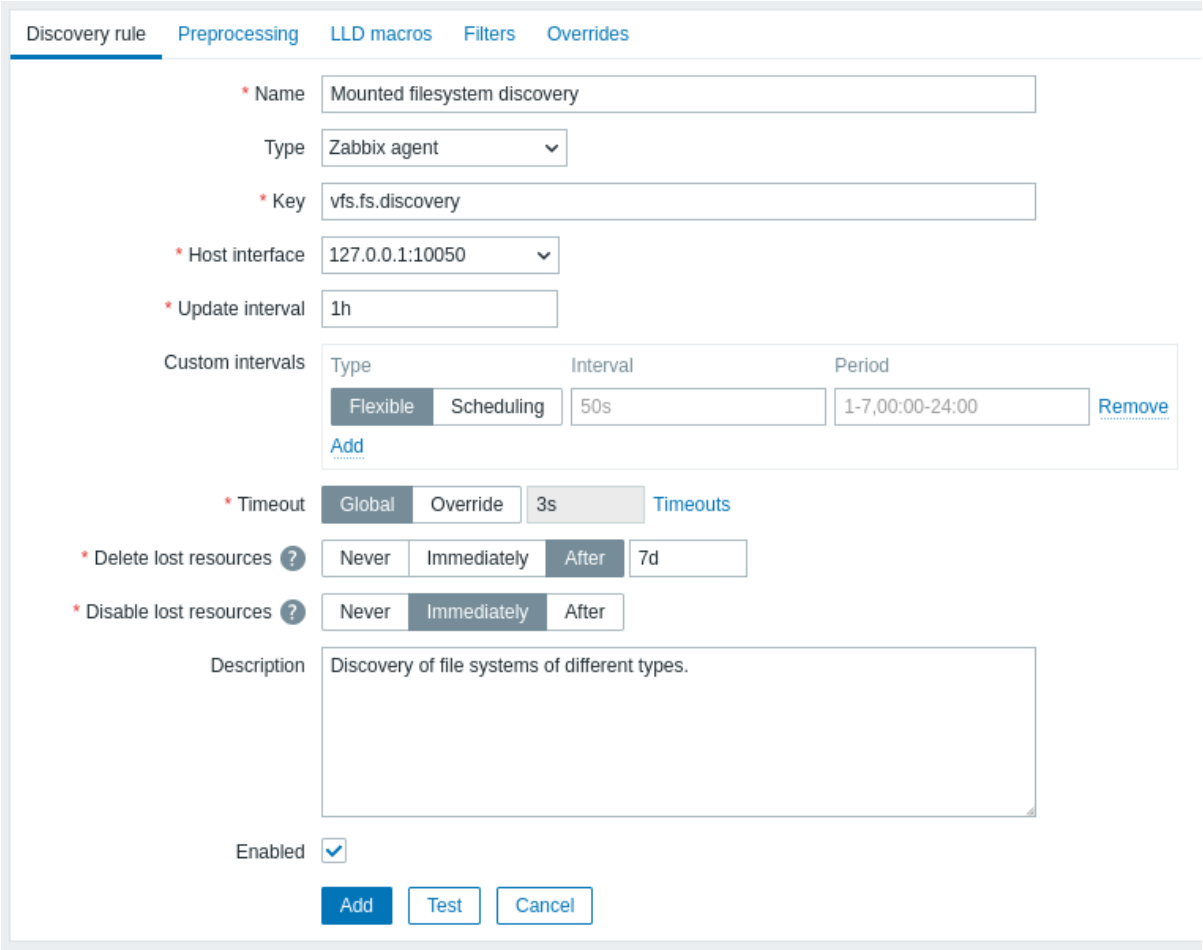
LLD can also create hosts (e.g., for virtual machines discovered on a hypervisor) and supports nested discovery rules for multi-level discovery.

Entities that are no longer discovered can be automatically disabled or deleted.

Configuring low-level discovery We will illustrate low-level discovery based on an example of file system discovery.

To configure the discovery, do the following:

1. Go to *Data collection* > *Templates* or *Hosts*.
2. Click *Discovery* in the row of an appropriate template/host.



3. Click *Create discovery rule* in the upper-right corner of the screen.
4. Fill in the discovery rule form with the required details.

Discovery rule

The discovery rule form contains five tabs, representing, from left to right, the data flow during discovery:

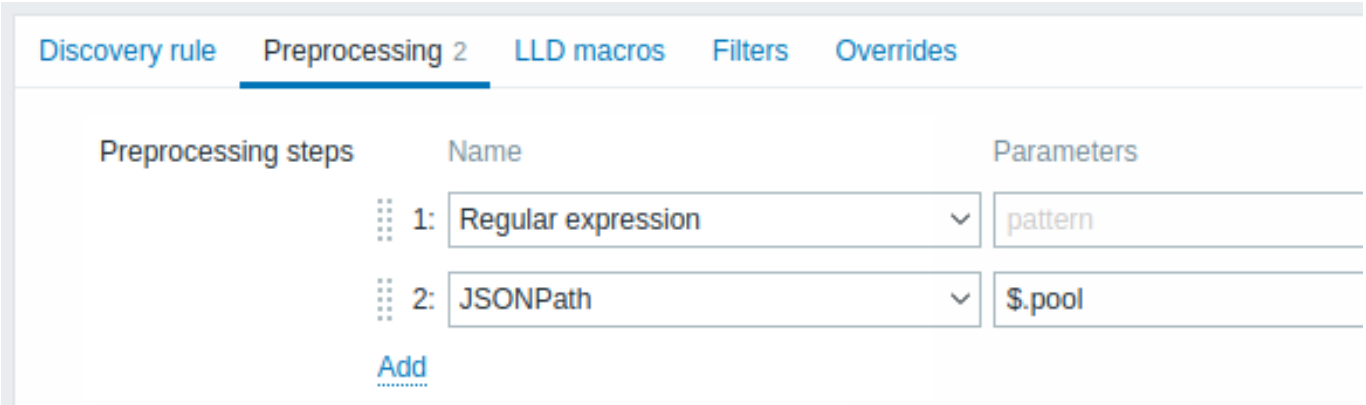
- *Discovery rule* - specify, most importantly, the built-in item or custom script to retrieve discovery data.
- *Preprocessing* - apply some preprocessing to the discovered data.
- *LLD macros* - allow the extraction of macro values for use in discovered items, triggers, etc.
- *Filters* - allow filtering of discovered values.
- *Overrides* - allow the modification of items, triggers, graphs or host prototypes when applying to specific discovered objects.

The **Discovery rule** tab contains the item key to use for discovery (as well as some general discovery rule attributes):

All mandatory input fields are marked with a red asterisk.

Parameter	Description
Name	Name of discovery rule.
Type	The type of check to perform discovery. In this example we are using a *Zabbix agent* item type. The discovery rule can also be a dependent item, depending on a regular item. It cannot depend on another discovery rule. For a dependent item, select the respective type (*Dependent item*) and specify the master item in the 'Master item' field. The master item must exist.
Key	Enter the discovery item key (up to 2048 characters). For example, you may use the built-in "vfs.fs.discovery" item key to return a JSON string with the list of file systems present on the computer, their types and mount options. Note that another option for filesystem discovery is using discovery results by the "vfs.fs.get" agent key (see example).
Update interval	This field specifies how often Zabbix performs discovery. In the beginning, when you are just setting up file system discovery, you might wish to set it to a small interval, but once you know it works you can set it to 30 minutes or more, because file systems usually do not change very often. Time suffixes are supported, e.g., 30s, 1m, 2h, 1d. User macros are supported. *Note*: The update interval can only be set to '0' if custom intervals exist with a non-zero value. If set to '0', and a custom interval (flexible or scheduled) exists with a non-zero value, the item will be polled during the custom interval duration. New discovery rules will be checked within 60 seconds of their creation, unless they have Scheduling or Flexible update interval and the *Update interval* is set to 0. *Note* that for an existing discovery rule the discovery can be performed immediately by pushing the *Execute now* button.
Custom intervals	You can create custom rules for checking the item: **Flexible** - create an exception to the *Update interval* (interval with different frequency) **Scheduling** - create a custom polling schedule. For detailed information see Custom intervals.

Parameter	Description
Timeout	Set the discovery check timeout. Select the timeout option: **Global** - proxy/global timeout is used (displayed in the grayed out *Timeout* field); **Override** - custom timeout is used (set in the *Timeout* field; allowed range: 1 - 600s). Time suffixes, e.g., 30s, 1m, and user macros are supported. Clicking the *Timeouts* link allows you to configure proxy timeouts or global timeouts (if a proxy is not used). Note that the *Timeouts* link is visible only to users of *Super admin* type with permissions to *Administration* > *General* or *Administration* > *Proxies* frontend sections.
Delete lost resources	Specify how soon the discovered entity will be deleted once its discovery status becomes "Not discovered anymore": *Never* - it will not be deleted; *Immediately* - it will be deleted immediately; *After* - it will be deleted after the specified time period. The value must be greater than *Disable lost resources* value. Time suffixes are supported, e.g., 2h, 1d. User macros are supported. *Note*: Using "Immediately" is not recommended, since just wrongly editing the filter may end up in the entity being deleted with all the historical data. Note that manually disabled resources will not be deleted by low-level discovery.
Disable lost resources	Specify how soon the discovered entity will be disabled once its discovery status becomes "Not discovered anymore": *Never* - it will not be disabled; *Immediately* - it will be disabled immediately; *After* - it will be disabled after the specified time period. The value should be greater than the discovery rule update interval. Note that automatically disabled resources will become enabled again, if re-discovered by low-level discovery. Manually disabled resources will not become enabled again if re-discovered. This field is not displayed if *Delete lost resources* is set to "Immediately". Time suffixes are supported, e.g., 2h, 1d. User macros are supported.
Description	Enter a description.
Enabled	If checked, the rule will be processed.



Note:
Discovery rule history is not preserved.

Preprocessing

The **Preprocessing** tab allows you to define transformation rules to apply to the result of discovery. One or several transformations are possible in this step. Transformations are executed in the order in which they are defined. All preprocessing is done by Zabbix server.

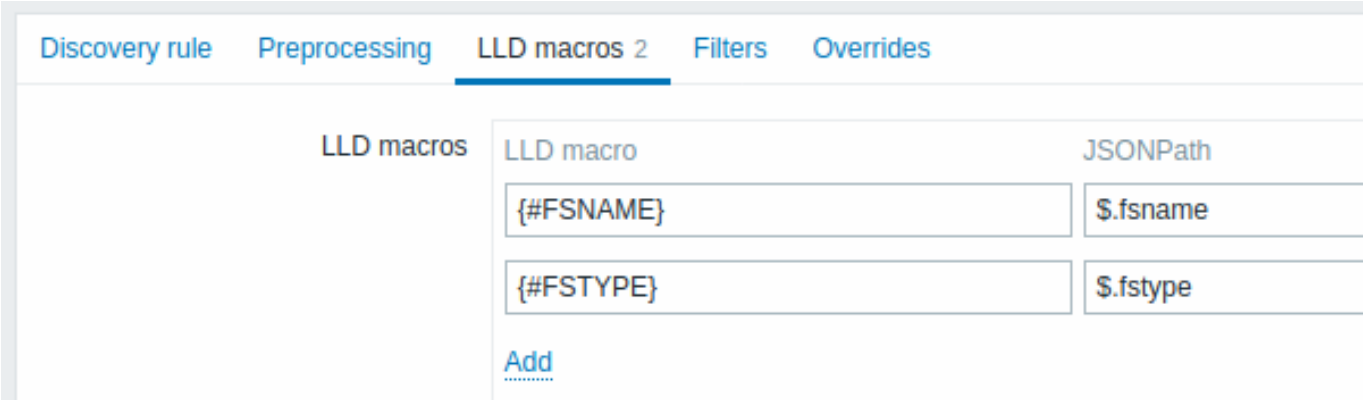
See also:

- Preprocessing details
- Preprocessing testing

Type		
	Transformation	Description
Text		
	Regular expression	Match the received value to the <pattern> regular expression and replace value with the extracted <output>. The regular expression supports extraction of maximum 10 captured groups with the \N sequence. Parameters: **pattern** - regular expression **output** - output formatting template. An \N (where N=1…9) escape sequence is replaced with the Nth matched group. A \0 escape sequence is replaced with the matched text. If you mark the *Custom on fail* checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.
	Replace	Find the search string and replace it with another (or nothing). All occurrences of the search string will be replaced. Parameters: **search string** - the string to find and replace, case-sensitive (required) **replacement** - the string to replace the search string with. The replacement string may also be empty, effectively allowing the search string to be deleted when found. It is possible to use escape sequences to search for or replace line breaks, carriage return, tabs and spaces "\n \r \t \s"; backslash can be escaped as "\\" and escape sequences can be escaped as "\\n". Escaping of line breaks, carriage return, tabs is automatically done during low-level discovery.
Structured data		
	JSONPath	Extract value or fragment from JSON data using JSONPath functionality. If you mark the *Custom on fail* checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.

	XML XPath	Extract value or fragment from XML data using XPath functionality.
		For this option to work, Zabbix server must be compiled with libxml support.
		Examples:
		`number(/document/item/value)` will extract 10 from `<document><item><value>10</value></item></document>`
		`number(/document/item/@attribute)` will extract 10 from `<document><item attribute="10"></item></document>`
		`/document/item` will extract `<item><value>10</value></item>` from `<document><item><value>10</value></item></document>`
		Note that namespaces are not supported.
		If you mark the *Custom on fail* checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.

	CSV to JSON	Convert CSV file data into JSON format. For more information, see: CSV to JSON preprocessing.
	XML to JSON	Convert data in XML format to JSON. For more information, see: Serialization rules. If you mark the *Custom on fail* checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.
SNMP		
	SNMP walk value	Extract value by the specified OID/MIB name and apply formatting options: **Unchanged** - return Hex-STRING as unescaped hex string (*note* that display hints are still applied); **UTF-8 from Hex-STRING** - convert Hex-STRING to UTF-8 string; **MAC from Hex-STRING** - convert Hex-STRING to MAC address string (which will have `' '` replaced by `':'`); **Integer from BITS** - convert the first 8 bytes of a bit string expressed as a sequence of hex characters (e.g., "1A 2B 3C 4D") into a 64-bit unsigned integer. In bit strings longer than 8 bytes, consequent bytes will be ignored. If you mark the *Custom on fail* checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.
	SNMP walk to JSON	Convert SNMP values to JSON. Specify a field name in the JSON and the corresponding SNMP OID path. Field values will be populated by values in the specified SNMP OID path. You may use this preprocessing step for SNMP OID discovery. Similar value formatting options as in the *SNMP walk value* step are available. If you mark the *Custom on fail* checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.



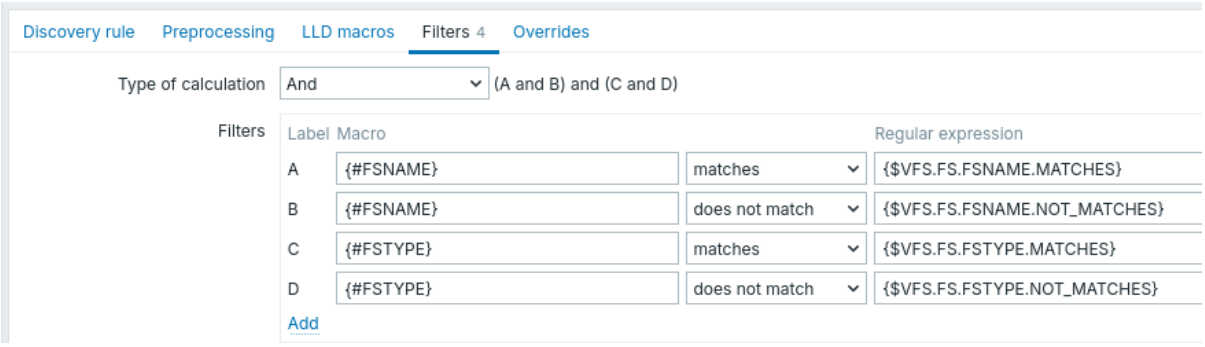
Type	
SNMP get value	Apply formatting options to the SNMP get value: **UTF-8 from Hex-STRING** - convert Hex-STRING to UTF-8 string; **MAC from Hex-STRING** - convert Hex-STRING to MAC address string (which will have `' '` replaced by `':'`); **Integer from BITS** - convert the first 8 bytes of a bit string expressed as a sequence of hex characters (e.g., "1A 2B 3C 4D") into a 64-bit unsigned integer. In bit strings longer than 8 bytes, consequent bytes will be ignored. If you mark the *Custom on fail* checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.
Custom scripts	
JavaScript	Enter JavaScript code in the modal editor that opens when clicking in the parameter field or on the pencil icon next to it. Note that available JavaScript length depends on the database used. For more information, see: Javascript preprocessing
Validation	
Does not match regular expression	Specify a regular expression that a value must not match. E.g., `Error:(.*?)\.` If you mark the *Custom on fail* checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.
Check for error in JSON	Check for an application-level error message located at JSONPath. Stop processing if succeeded and message is not empty; otherwise, continue processing with the value that was before this preprocessing step. Note that these external service errors are reported to user as is, without adding preprocessing step information. E.g., `$.errors`. If a JSON like `{"errors":"e1"}` is received, the next preprocessing step will not be executed. If you mark the *Custom on fail* checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.
Check for error in XML	Check for an application-level error message located at Xpath. Stop processing if succeeded and message is not empty; otherwise, continue processing with the value that was before this preprocessing step. Note that these external service errors are reported to user as is, without adding preprocessing step information. No error will be reported in case of failing to parse invalid XML. If you mark the *Custom on fail* checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.
Matches regular expression	Specify a regular expression that a value must match. If you mark the *Custom on fail* checkbox, it is possible to specify custom error-handling options: either to discard the value, set a specified value or set a specified error message.
Throttling	
Discard unchanged with heartbeat	Discard a value if it has not changed within the defined time period (in seconds). Positive integer values are supported to specify the seconds (minimum - 1 second). Time suffixes can be used in this field (e.g., `30s`, `1m`, `2h`, `1d`). User macros and low-level discovery macros can be used in this field. Only one throttling option can be specified for a discovery item. E.g., `1m`. If identical text is passed into this rule twice within 60 seconds, it will be discarded. *Note*: Changing item prototypes does not reset throttling. Throttling is reset only when preprocessing steps are changed.
Prometheus	
Prometheus to JSON	Convert required Prometheus metrics to JSON. See Prometheus checks for more details.

Note that if the discovery rule has been applied to the host via template then the content of this tab is read-only.

Custom macros

The **LLD macros** tab allows you to specify custom LLD macros when the returned JSON does not already contain keys in the `{#MACRO}` format.

For example, the `vfs.fs.get` agent item key returns JSON filesystem data without any predefined LLD macros.
Here, you define the macros manually and map them to values in the JSON using JSONPath expressions:



Parameter	Description
LLD macro	Name of the LLD macro in the format `{#MACRO}`.
JSONPath	Expression that defines which value to extract from each discovered entity in the JSON array. For example, `$.foo` extracts `"bar"` and `"baz"` from `[{"foo":"bar"}, {"foo":"baz"}]`. JSONPath supports both dot and bracket notation. Bracket notation must be used for keys containing special characters or Unicode, e.g., `$['unicode + special chars #1']['unicode + special chars #2']`.

The discovery rule must return a JSON array at the root (`$.`).
For backward compatibility, a JSON object containing a single `"data"` array is also accepted. In this case, the `"data"` array is automatically unwrapped:

```
{"data":[{"foo":"bar"}, {"foo":"baz"}]}
```

Filter

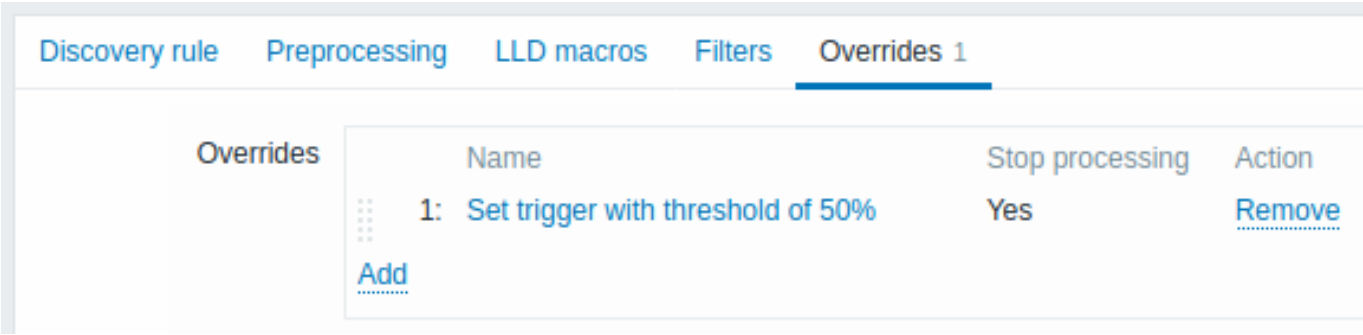
A filter can be used to generate real items, triggers, and graphs only for entities that match the criteria. The **Filters** tab contains discovery rule filter definitions that allow you to filter discovery values:

Parameter	Description
Type of calculation	The following options for calculating filters are available: **And** - all filters must be passed; **Or** - enough if one filter is passed; **And/Or** - uses *And* with different macro names and *Or* with the same macro name; **Custom expression** - offers the possibility to define a custom calculation of filters. The formula must include all filters in the list. Limited to 255 symbols.

Parameter	Description
Filters	The following filter condition operators are available: *matches*, *does not match*, *exists*, *does not exist*. *Matches* and *does not match* operators expect a Perl Compatible Regular Expression (PCRE). You can enter a regular expression or reference a global regular expression in the *Regular expression* field. *Exists* and *does not exist* operators allow filtering of entities based on the presence or absence of the specified LLD macro in the response. Note that if a macro from the filter is missing in the response, the found entity will be ignored, unless a "does not exist" condition is specified for this macro. A warning will be displayed, if the absence of a macro affects the expression result. For example, if {#B} is missing in: {#A} matches 1 and {#B} matches 2 - will give a warning {#A} matches 1 or {#B} matches 2 - no warning.

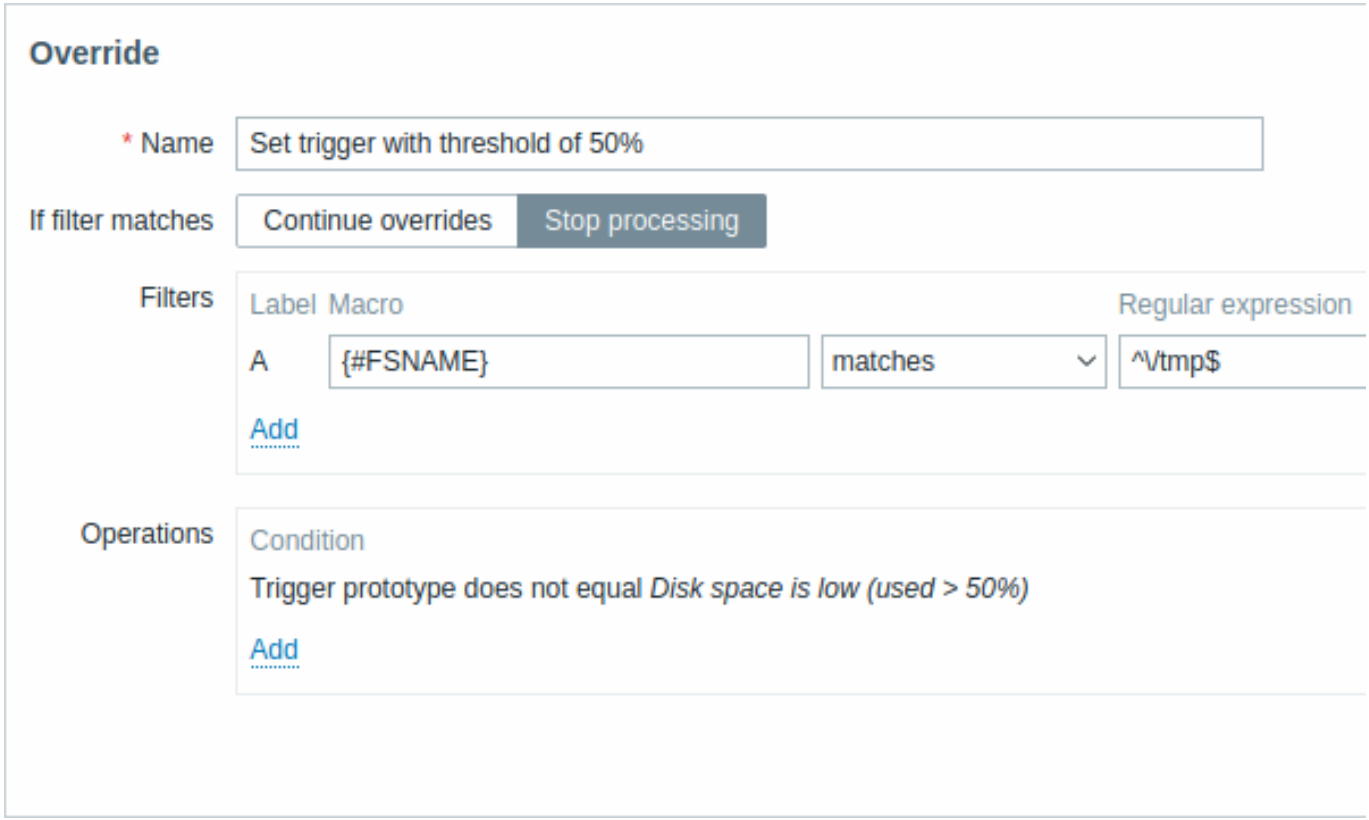
For example, if you are only interested in the C:, D:, and E: file systems, you can put {#FSNAME} into the *Macro* field and ^C|^D|^E into the *Regular expression* field.
 Filtering is also possible by file system types using the {#FSTYPE} macro (e.g., ^ext|^reiserfs) and by drive types (supported only by Windows agent) using the {#FSDRIVETYPE} macro (e.g., fixed).

In order to test a regular expression you can use grep -E, for example:



```
for f in ext2 nfs reiserfs smbfs;
do echo $f | grep -E '^ext|^reiserfs' || echo "SKIP: $f";
done
```

Warning:
A mistake or a typo in the regular expression used in the LLD rule (for example, an incorrect "File systems for discovery" regular expression) may cause deletion of thousands of configuration elements, historical values, and events for many hosts.

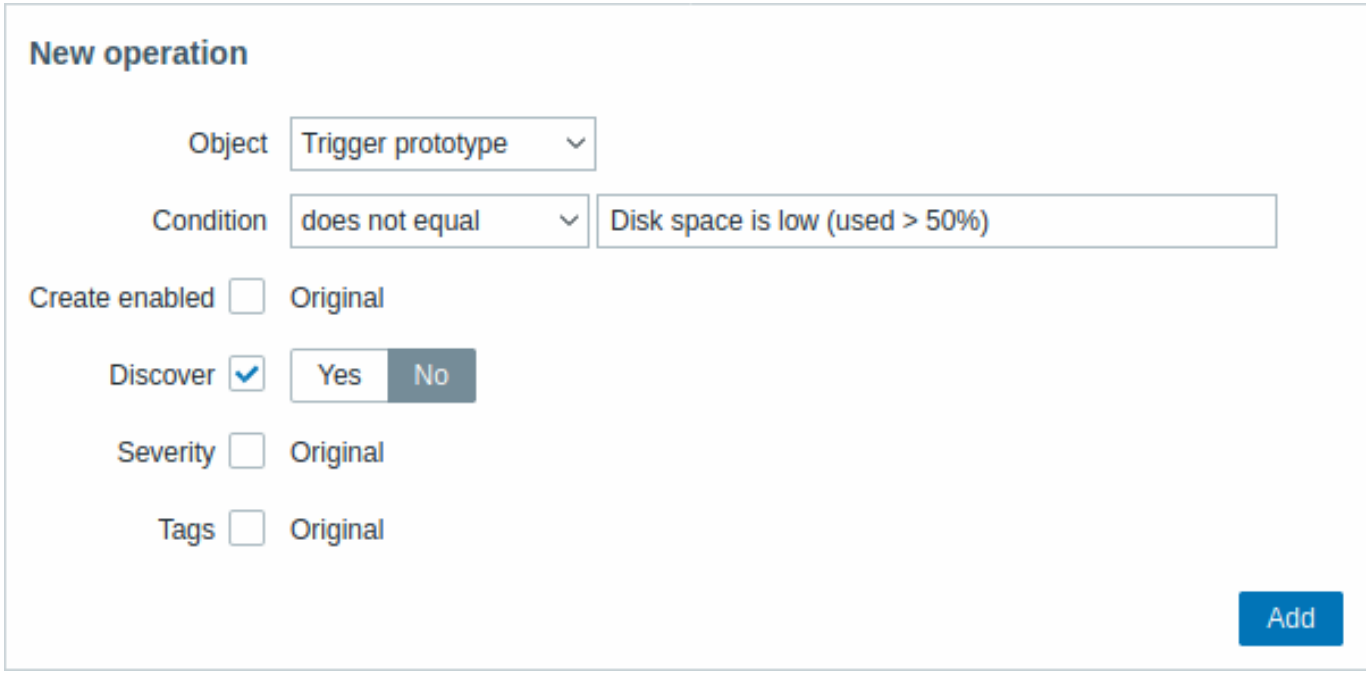


Attention:
Zabbix database in MySQL must be created as case-sensitive if file system names that differ only by case are to be discovered correctly.

Override

The **Overrides** tab allows setting rules to modify the list of item, trigger, graph, host, and discovery prototypes or their attributes for discovered objects that meet given criteria.

Overrides (if any) are displayed in a reorderable drag-and-drop list and executed in the order in which they are defined. To configure details of a new override, click Add in the *Overrides* block. To edit an existing override, click the override name. A popup window will open, allowing you to edit the override rule details.



All mandatory parameters are marked with red asterisks.

Parameter	Description
Name	A unique (per LLD rule) override name.
If filter matches	Defines whether next overrides should be processed when filter conditions are met: **Continue overrides** - subsequent overrides will be processed. **Stop processing** - operations from preceding (if any) and this override will be executed, subsequent overrides will be ignored for matched LLD rows.
Filters	Determines to which discovered entities the override should be applied. Override filters are processed after discovery rule filters and have the same functionality.
Operations	Override operations are displayed with these details: **Condition** - an object type and a condition to be met for the object name; for example: Trigger prototype does not equal *Disk space is low (used > 50%)*. **Actions** - links for editing and removing an operation are displayed.

Configuring an operation

To configure details of a new operation, click Add in the Operations block. To edit an existing operation, click Edit next to the operation. A popup window where you can edit the operation details will open.

Parameter	Description
Object	Five types of objects are available: Item prototype Trigger prototype Graph prototype Host prototype Discovery prototype
Condition	Allows filtering entities to which the operation should be applied.
Operator	Supported operators: **equals** - apply to this prototype **does not equal** - apply to all prototypes, except this **contains** - apply, if prototype name contains this string **does not contain** - apply, if prototype name does not contain this string **matches** - apply, if prototype name matches regular expression **does not match** - apply, if prototype name does not match regular expression
Pattern	A regular expression or a string to search for.
Object: *Item prototype*	
Create enabled	When the checkbox is marked, the buttons will appear, allowing you to override original item prototype settings: *Yes* - the item will be added in an enabled state. *No* - the item will be added to a discovered entity but in a disabled state.
Discover	When the checkbox is marked, the buttons will appear, allowing you to override original item prototype settings: *Yes* - the item will be added. *No* - the item will not be added.
Update interval	When the checkbox is marked, two options will appear, allowing you to set different interval for the item: *Delay* - Item update interval. User macros, LLD macros, and time suffixes (e.g., 30s, 1m, 2h, 1d) are supported. Should be set to 0 if *Custom interval* is used. *Custom interval* - click Add to specify flexible/scheduling intervals. For detailed information see Custom intervals.

Parameter	Description
History	When the checkbox is marked, the buttons will appear, allowing you to set different history storage periods for the item: *Do not store* - if selected, the history will not be stored. *Store up to* - if selected, an input field for specifying storage period will appear to the right. User macros and LLD macros are supported.
Trends	When the checkbox is marked, the buttons will appear, allowing you to set different trend storage periods for the item: *Do not store* - if selected, the trends will not be stored. *Store up to* - if selected, an input field for specifying storage period will appear to the right. User macros and LLD macros are supported.
Tags	When the checkbox is marked, a new block will appear, allowing you to specify tag-value pairs. User macros and LLD macros are supported. These tags will be appended to the tags specified in the item prototype, even if the tag names match.
Object: *Trigger prototype*	
Create enabled	When the checkbox is marked, the buttons will appear, allowing you to override original trigger prototype settings: *Yes* - the trigger will be added in an enabled state. *No* - the trigger will be added to a discovered entity, but in a disabled state.
Discover	When the checkbox is marked, the buttons will appear, allowing you to override original trigger prototype settings: *Yes* - the trigger will be added. *No* - the trigger will not be added.
Severity	When the checkbox is marked, trigger severity buttons will appear, allowing you to modify trigger severity.
Tags	When the checkbox is marked, a new block will appear, allowing you to specify tag-value pairs. User macros and LLD macros are supported. These tags will be appended to the tags specified in the trigger prototype, even if the tag names match.
Object: *Graph prototype*	
Discover	When the checkbox is marked, the buttons will appear, allowing you to override original graph prototype settings: *Yes* - the graph will be added. *No* - the graph will not be added.
Object: *Host prototype*	
Create enabled	When the checkbox is marked, the buttons will appear, allowing you to override original host prototype settings: *Yes* - the host will be created in an enabled state. *No* - the host will be created in a disabled state.
Discover	When the checkbox is marked, the buttons will appear, allowing you to original host prototype settings: *Yes* - the host will be discovered. *No* - the host will not be discovered.
Link templates	When the checkbox is marked, an input field for specifying templates will appear. Start typing the template name or click *Select* next to the field and select templates from the list in a popup window. Templates from this override are added to all templates already linked to the host prototype.

Parameter		Description
	Tags	When the checkbox is marked, a new block will appear, allowing you to specify tag-value pairs. User macros and LLD macros are supported. These tags will be appended to the tags specified in the host prototype, even if the tag names match.
	Host inventory	When the checkbox is marked, the buttons will appear, allowing you to select different inventory mode for the host prototype: *Disabled* - do not populate host inventory *Manual* - provide details manually *Automated* - auto-fill host inventory data based on collected metrics.
Object: *Discovery prototype*		
	Create enabled	When the checkbox is marked, the buttons will appear, allowing you to override original discovery prototype settings: *Yes* - the discovery rule will be added in an enabled state. *No* - the discovery rule will be added in a disabled state.
	Discover	When the checkbox is marked, the buttons will appear, allowing you to override original discovery prototype settings: *Yes* - the discovery rule will be added. *No* - the discovery rule will not be added.
	Update interval	When the checkbox is marked, two options will appear, allowing you to set different interval for the discovery rule: *Delay* - Rule update interval. User macros, LLD macros, and time suffixes (e.g., 30s, 1m, 2h, 1d) are supported. Should be set to 0 if *Custom interval* is used. *Custom interval* - click Add to specify flexible/scheduling intervals. For detailed information see Custom intervals.

Form buttons

Buttons at the bottom of the form allow you to perform several operations.

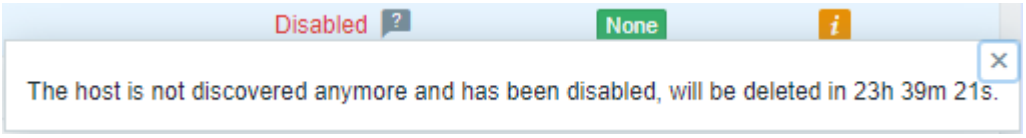
Add	Add a discovery rule. This button is only available for new discovery rules.
Update	Update the properties of a discovery rule. This button is only available for existing discovery rules.
Clone	Create another discovery rule based on the properties of the current discovery rule.
Execute now	Perform discovery based on the discovery rule immediately. The discovery rule must already exist. See more details. *Note* that when performing discovery immediately, configuration cache is not updated, thus the result will not reflect very recent changes to discovery rule configuration.
Test	Test the discovery rule configuration. Use this button to verify the configuration settings (such as connectivity and parameter correctness) without permanently applying any changes.
Delete	Delete the discovery rule.
Cancel	Cancel the editing of discovery rule properties.

Discovered entities The screenshots below illustrate how discovered items, triggers, and graphs look like in the host's configuration. Discovered entities are prefixed with an orange link to a discovery rule they come from.

Items

All hosts / Zabbix server Enabled ZBX SNMP IPMI JMX Items 140 Triggers 77 Graphs 14 Discovery rules 6 Web scenarios

Name ▲	Triggers	Key	Interval
Mounted filesystem discovery: Get filesystems: FS [/]: Get data		vfs.fs.dependent[/,data]	
Mounted filesystem discovery: FS [/]: Get data: FS [/]: Inodes: Free, in %	Triggers 2	vfs.fs.dependent.inode[/,pfree]	
Mounted filesystem discovery: FS [/]: Get data: FS [/]: Option: Read-only	Triggers 1	vfs.fs.dependent[/,readonly]	
Mounted filesystem discovery: FS [/]: Get data: FS [/]: Space: Available		vfs.fs.dependent.size[/,free]	
Mounted filesystem discovery: FS [/]: Get data: FS [/]: Space: Total		vfs.fs.dependent.size[/,total]	
Mounted filesystem discovery: FS [/]: Get data: FS [/]: Space: Used		vfs.fs.dependent.size[/,used]	
Mounted filesystem discovery: FS [/]: Get data: FS [/]: Space: Used, in %	Triggers 2	vfs.fs.dependent.size[/,pused]	



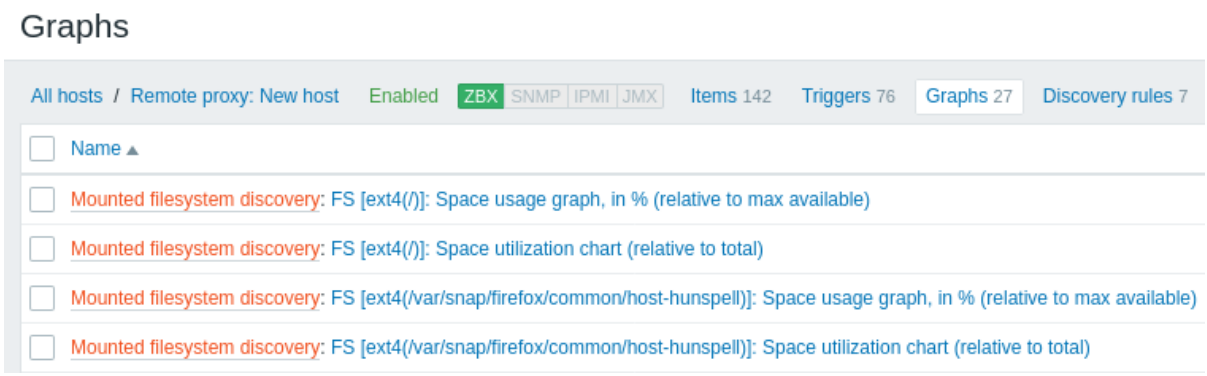
Note that discovered entities will not be created in case there are already existing entities with the same uniqueness criteria, for example, an item with the same key or graph with the same name. An error message is displayed in this case in the frontend that the low-level discovery rule could not create certain entities. The discovery rule itself, however, will not turn unsupported because some entity could not be created and had to be skipped. The discovery rule will go on creating/updating other entities.

If a discovered entity (host, file system, interface, etc) stops being discovered (or does not pass the filter anymore) the entities that were created based on it may be automatically disabled and eventually deleted.

Lost resources may be automatically disabled based on the value of the *Disable lost resources* parameter. This affects lost hosts, items and triggers.

Lost resources may be automatically deleted based on the value of the *Delete lost resources* parameter. This affects lost hosts, host groups, items, triggers, and graphs.

When discovered entities become 'Not discovered anymore', a lifetime indicator is displayed in the entity list. Move your mouse pointer over it and a message will be displayed indicating its status details.



If entities were marked for deletion, but were not deleted at the expected time (disabled discovery rule or item host), they will be deleted the next time the discovery rule is processed.

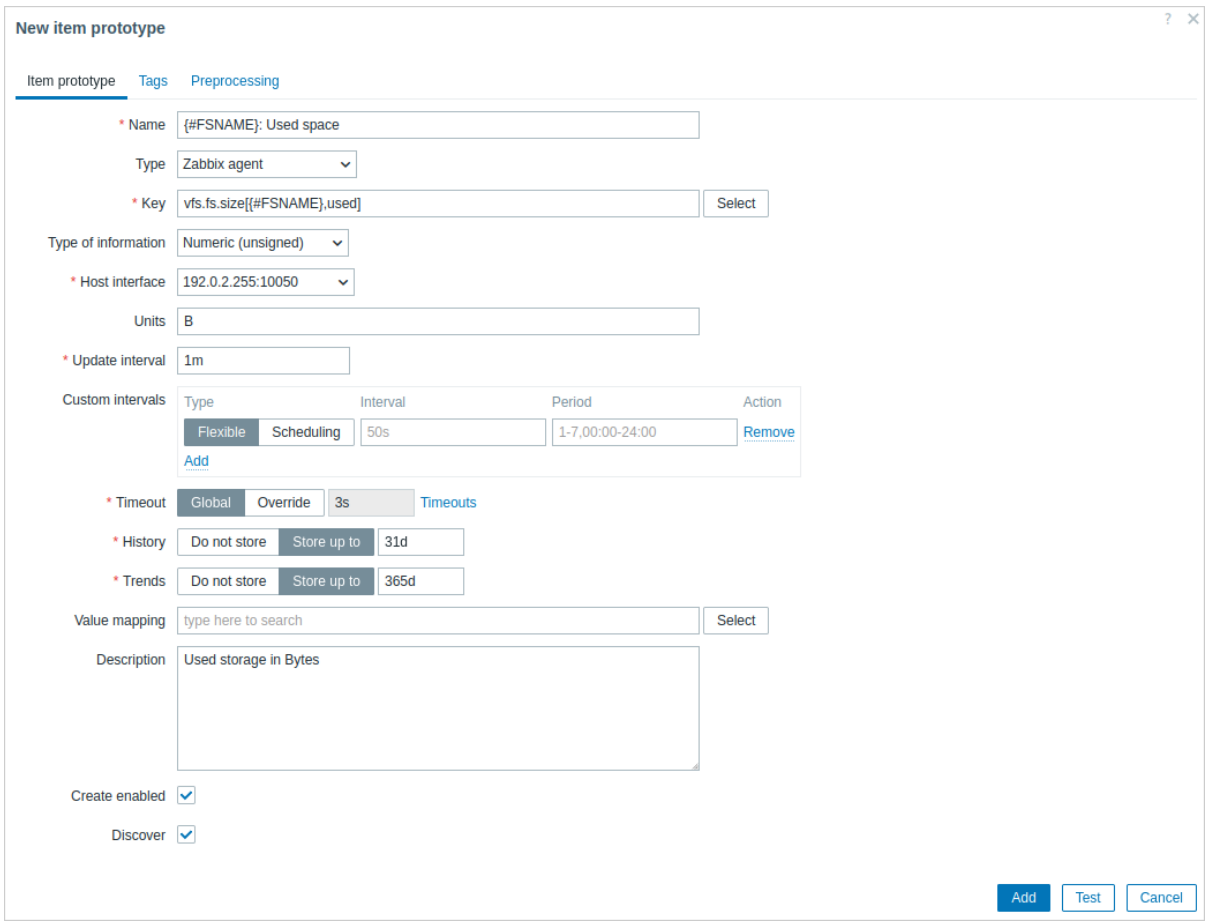
Entities containing other entities, which are marked for deletion, will not update if changed on the discovery rule level. For example, LLD-based triggers will not update if they contain items that are marked for deletion.

Triggers

All hosts / Zabbix server Enabled ZBX SNMP IPMI JMX Items 140 Triggers 77 Graphs 14 Discovery rules 6

Severity	Value	Name ▲	Operational data
Warning	OK	Mounted filesystem discovery: Linux: FS [/]: Running out of free inodes **Depends on:** Zabbix server: Linux: FS [/]: Running out of free inodes	Free inodes: {ITEM.LASTVALUE1}
Warning	OK	Mounted filesystem discovery: Linux: FS [/]: Space is low **Depends on:** Zabbix server: Linux: FS [/]: Space is critically low	Space used: {{ITEM.LASTVALUE1}.fmtnum(1)}%

Other types of discovery More detail and how-tos on other types of out-of-the-box discovery is available in the following sections:



- discovery of network interfaces
- discovery of CPUs and CPU cores
- discovery of SNMP OIDs
- discovery of JMX objects;
- discovery using ODBC SQL queries
- discovery of Windows services
- discovery of host interfaces in Zabbix

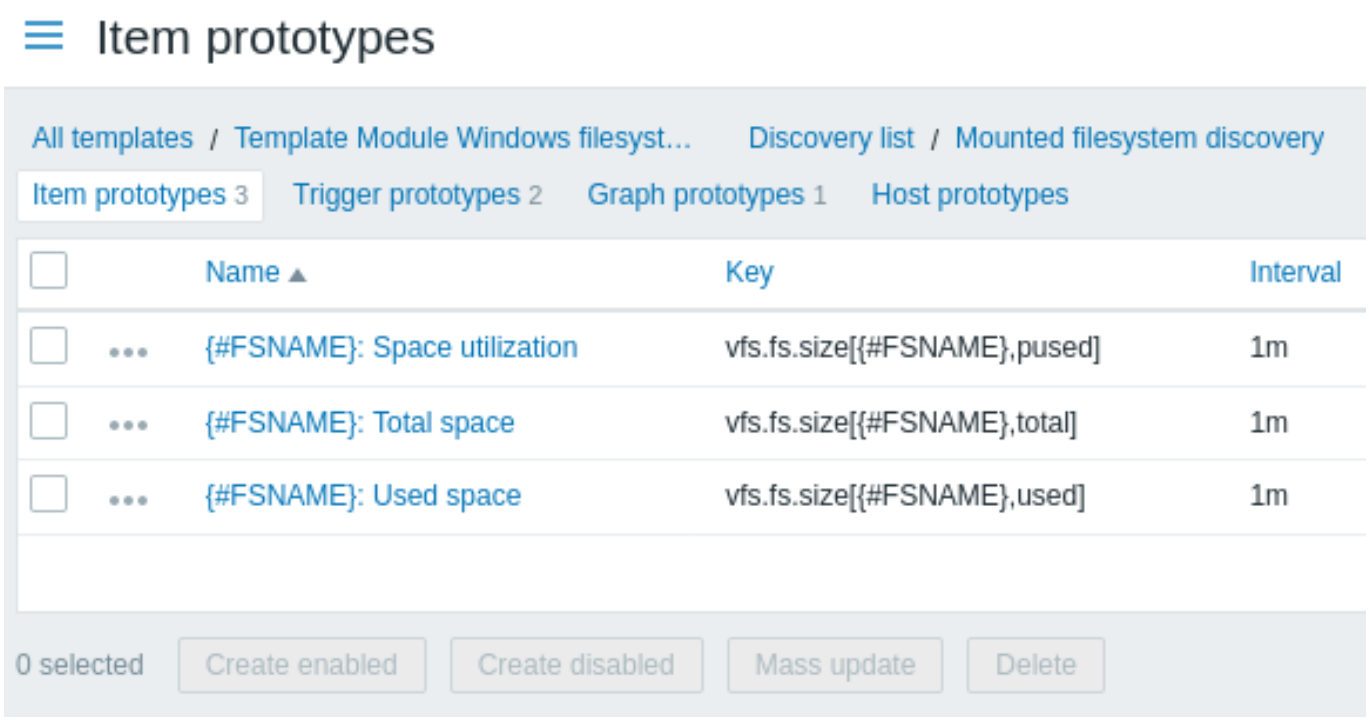
For more detail on the JSON format for discovery items and an example of how to implement your own file system discoverer as a Perl script, see creating custom LLD rules.

Item prototypes

Once a rule is created, go to the items for that rule and click *Create item prototype* to create an item prototype.

Note how the `{#FSNAME}` macro is used where a file system name is required. The use of a low-level discovery macro is mandatory in the item key to make sure that the discovery is processed correctly. When the discovery rule is processed, this macro will be substituted with the discovered file system.

Note:
When item key parameters are not used, place the LLD macro inside the item key brackets `[...]` (for example, `v_[{#MACRO}]`).



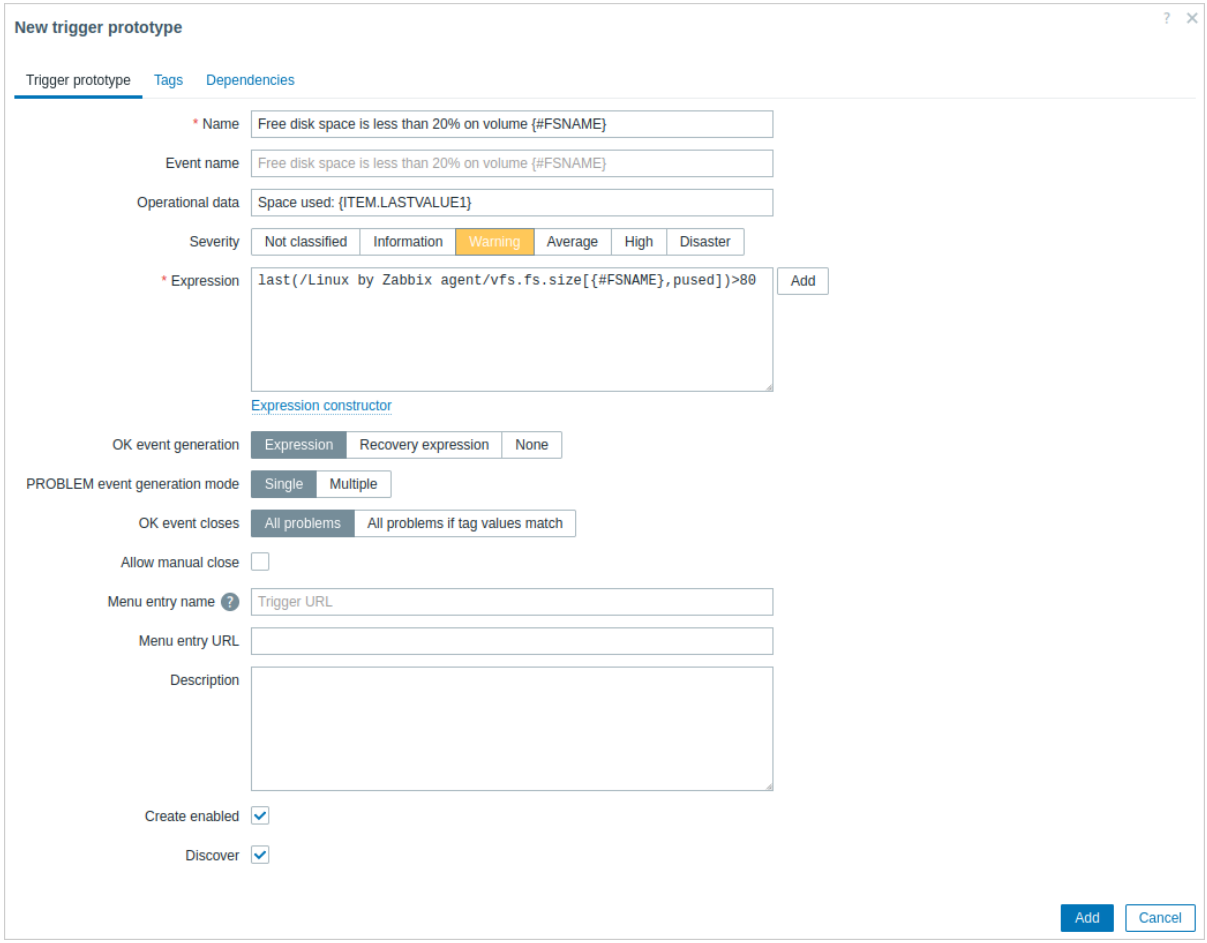
Low-level discovery macros and user macros are supported in item prototype configuration and item value preprocessing parameters.Note that when used in update intervals, a single macro has to fill the whole field. Multiple macros in one field or macros mixed with text are not supported.

Note:
Context-specific escaping of low-level discovery macros is performed for safe use in regular expression and XPath preprocessing parameters.

Attributes that are specific for item prototypes:

Parameter	Description
Create enabled	If checked the item will be added in an enabled state. If unchecked, the item will be added to a discovered entity, but in a disabled state.
Discover	If checked (default) the item will be added to a discovered entity. If unchecked, the item will not be added to a discovered entity, unless this setting is overridden in the discovery rule.

We can create several item prototypes for each file system metric we are interested in:



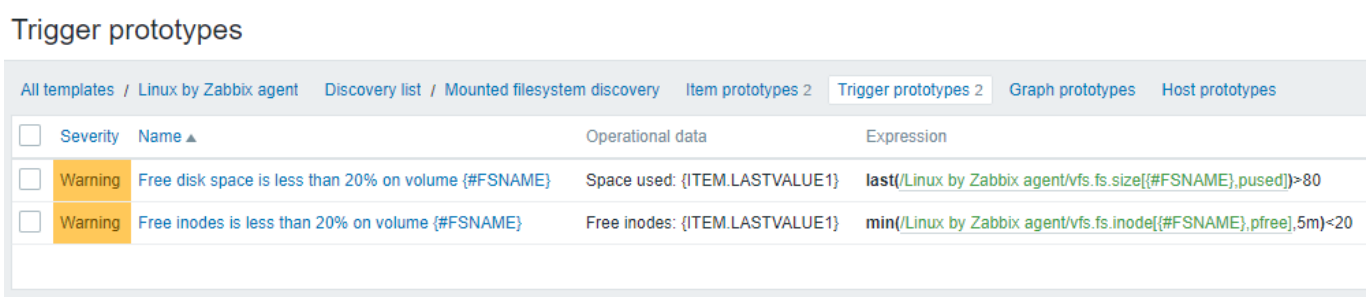
Click the three-dot icon to open the menu for the specific item prototype with these options:

- *Create trigger prototype* - create a trigger prototype based on this item prototype
- *Trigger prototypes* - click to see a list with links to already-configured trigger prototypes of this item prototype
- *Create dependent item* - create a dependent item for this item prototype

Mass update option is available if you want to update properties of several item prototypes at once.

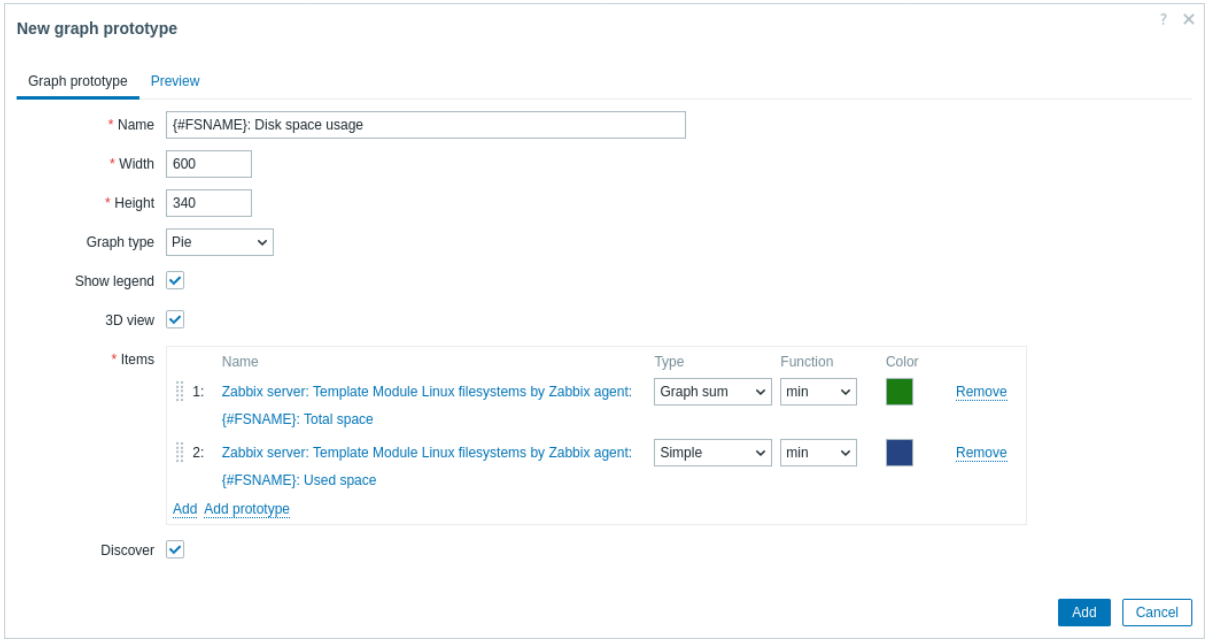
Trigger prototypes

We create trigger prototypes in a similar way as item prototypes:



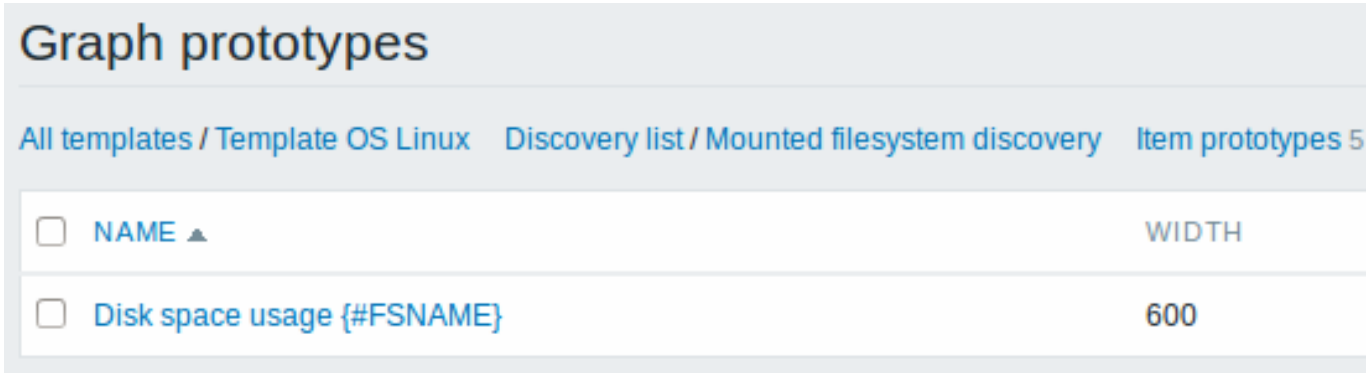
Attributes that are specific for trigger prototypes:

Parameter	Description
Create enabled	If checked the trigger will be added in an enabled state. If unchecked, the trigger will be added to a discovered entity, but in a disabled state.
Discover	If checked (default) the trigger will be added to a discovered entity. If unchecked, the trigger will not be added to a discovered entity, unless this setting is overridden in the discovery rule.



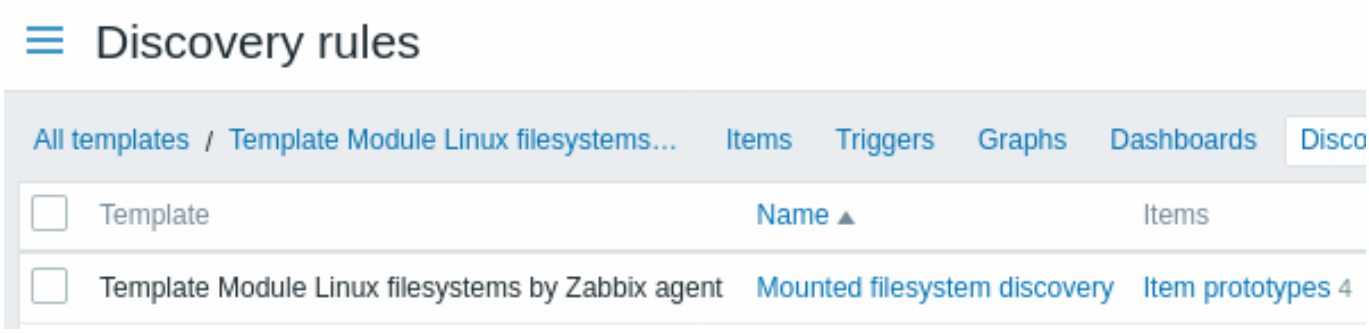
When real triggers are created from the prototypes, there may be a need to be flexible as to what constant ('20' in our example) is used for comparison in the expression. See how user macros with context can be useful to accomplish such flexibility.

You can define dependencies between trigger prototypes. To do that, go to the *Dependencies* tab. A trigger prototype may depend on another trigger prototype from the same low-level discovery (LLD) rule or on a regular trigger. A trigger prototype may not depend on a trigger prototype from a different LLD rule or on a trigger created from trigger prototype. Host trigger prototype cannot depend on a trigger from a template.



Graph prototypes

We can create graph prototypes, too:

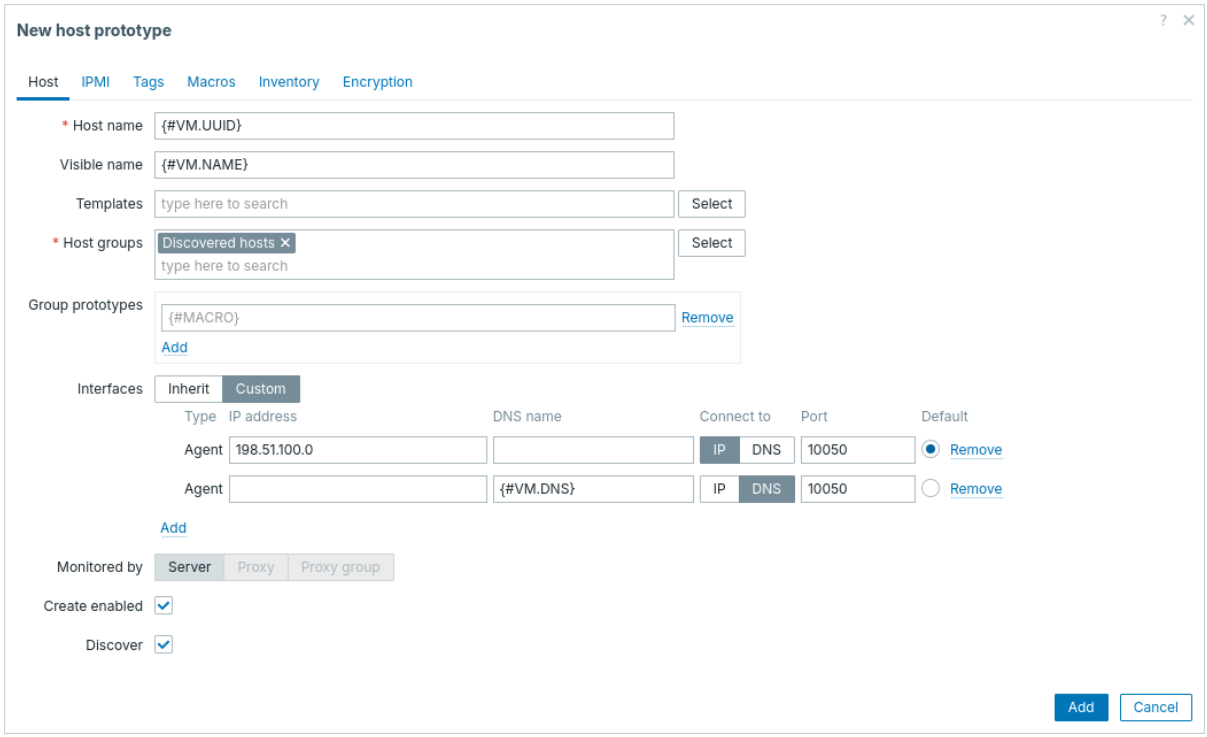


Attributes that are specific for graph prototypes:

Parameter	Description
Discover	If checked (default) the graph will be added to a discovered entity. If unchecked, the graph will not be added to a discovered entity, unless this setting is overridden in the discovery rule.

Finally, we have created a discovery rule that looks as shown below. It has five item prototypes, two trigger prototypes, and one graph prototype.

Host prototypes



Host prototypes are blueprints for creating hosts through low-level discovery rules. Before being discovered as hosts, these prototypes cannot have items and triggers, except those linked from templates.

Configuration

Host prototypes are configured under low-level discovery rules.

To create a host prototype:

1. Go to *Data collection > Hosts*.
2. Click *Discovery* for the required host to navigate to the list of low-level discovery rules configured for that host.
3. Click *Host prototypes* for the required discovery rule.
4. Click the *Create host prototype* button in the upper-right corner and complete the configuration form.

All mandatory input fields are marked with a red asterisk.

Parameter	Description
Host name	This parameter must contain at least one low-level discovery macro to ensure unique host names for created hosts.
Visible name	Low-level discovery macros are supported.
Group prototypes	Allows specifying host group prototypes by using low-level discovery macros. Based on the specified group prototypes, host groups will be discovered, created and linked to the created hosts; discovered groups that have already been created by other low-level discovery rules will also be linked to the created hosts. However, discovered host groups that match manually created host groups will not be linked to the created hosts.
Interfaces	Set whether discovered hosts inherit the IP from the host that the discovery rule belongs to (default), or get custom interfaces. Low-level discovery macros and user macros are supported.
Monitored by	This field is synced automatically with the respective field in host configuration.
Create enabled	Set the status of discovered hosts; if unchecked, hosts will be created as disabled.
Discover	Set whether hosts will be created from the host prototype; if unchecked, hosts will not be created from the host prototype (unless this setting is overridden in the low-level discovery rule).

Note:
Low-level discovery macros are also supported for tag values and host prototype user macro values.
 Value maps are not supported for host prototypes.

For an example of how to configure a host prototype, see *Virtual machine monitoring*.

Host interfaces

To add custom interfaces, switch the *Interfaces* selector from ”Inherit” to ”Custom”. Click Add and select the interface type - Zabbix agent, SNMP, JMX, IPMI.

Note:
If *Custom* is selected, but no interfaces have been set, the hosts will be created without interfaces.
 If *Inherit* is selected and the host prototype belongs to a template, all discovered hosts will inherit the host interface from the host to which the template is linked.

If multiple custom interfaces are specified, the primary interface can be set in the *Default* column.

For an example of how to configure a custom host interface, see *VMware monitoring setup example*.

Warning:
A host will only be created if a host interface contains correct data.

Discovered hosts

In the host list, discovered hosts are prefixed with the name of the discovery rule that created them.

Discovered hosts inherit most parameters from host prototypes as *read-only*. Only the following discovered host parameters can be configured:

- *Templates* - link new templates or unlink manually added ones. Templates inherited from a host prototype cannot be unlinked.
- *Description* - add or edit the host description.
- *Status* - enable or disable the host.
- *Tags* - add new tags or remove manually added ones. Tags inherited from a host prototype cannot be removed. Note that tags cannot have duplicates (tags with the same name and value). If a new tag is added to the host prototype and it matches a manually added tag on a discovered host, the manually added tag will be replaced with the inherited tag during discovery.
- *Macros* - add new host macros or remove manually added ones, as well as those inherited from a host prototype; change macro values and types.

Note:
Discovered hosts also inherit user macros from the host where the discovery rule is configured. These inherited macros can be removed, and their values and types can be changed.

Discovered hosts can also discover other hosts. For example, if a host prototype (used to discover hypervisors) has a template linked to it that includes a low-level discovery rule with its own host prototype (used to discover virtual machines), Zabbix will discover both hypervisors and their virtual machines. To additionally discover containers on those VMs, you can create low-level discovery rules or link a new template with host prototypes to the discovered VMs or pre-configure the VM host prototype by linking a template that itself includes host prototypes.

Discovered hosts can be deleted manually. Note, however, that they will be discovered again if discovery is enabled for them.

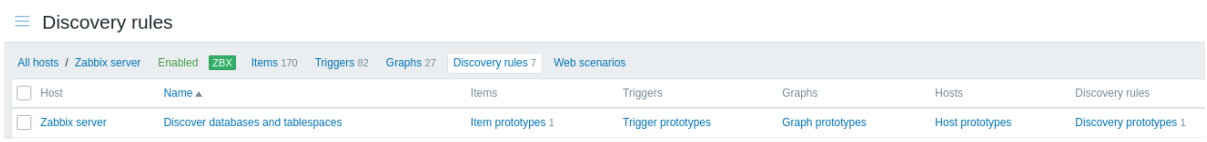
Hosts that are no longer discovered may be:

- automatically disabled (based on the *Disable lost resources* value of the discovery rule)
- automatically deleted (based on the *Delete lost resources* value of the discovery rule).

Discovery prototypes

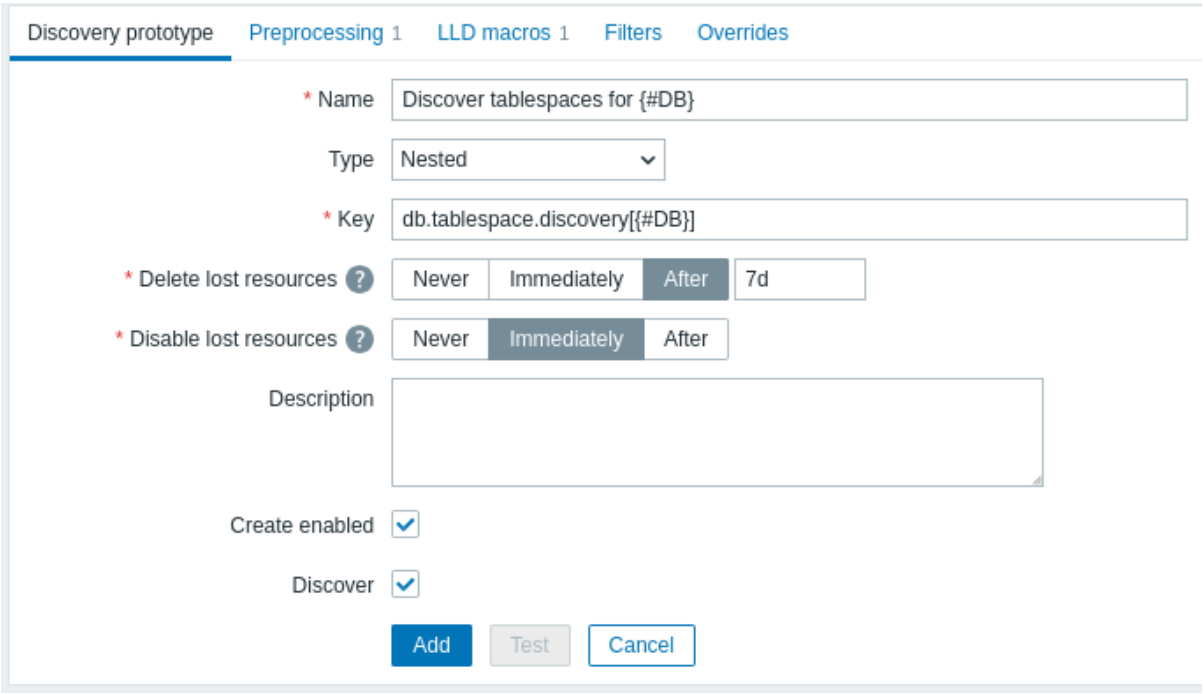
Overview

Discovery prototypes are **nested low-level discovery** rules within a "parent" discovery rule, allowing multi-level discovery of objects with their own items, triggers, etc. For example, you may want to discover all database instances on a database server, then discover tablespaces for each instance, then discover tables for each tablespace.



Discovery prototypes have their own item, trigger, graph, host, and discovery prototypes. A nested discovery prototype will use the same JSON value as the parent rule if you specify a *Nested* type.

The levels of nesting for discovery prototypes are unlimited.



Configuration

To create a discovery prototype:

- Click *Discovery prototypes* in the row of an existing discovery rule

- Click *Create discovery prototype*

Configuration fields of this form are shared with the regular low-level discovery.

If you select "Nested" as *Type* in the opened discovery prototype form, then discovery rules (from the discovery prototype) are generated based on a JSON object from the same JSON value as the parent discovery rule. For example, if the original JSON is [<object A>, <object B>] and there is one nested discovery rule prototype then two discovery rules would be generated based on object A and object B data respectively.

In this case the discovery prototype is activated at the same time as the parent rule. The nested rule thus can use preprocessing, to work on another "slice" of the same data, already acquired by the parent.

LLD macros from the parent LLD rule are available for nested discovery rules.

Nested LLD rules on discovered hosts

A *Nested* low-level discovery rule can be used on a host template assigned to host prototype. If a *Nested* discovery rule exists on a discovered host, then the JSON object used to discover the host is also sent to all LLD rules of nested type on this host. For more details, see example.

LLD macros from the discovery rule that created the host are available for nested discovery rules.

Example

Let's illustrate possible application of discovery prototypes, based on receiving the following example of multi-level JSON.

```
[
  {
    "database": "db1",
    "created_at": "2024-02-01T12:30:00Z",
    "encoding": "UTF8",
    "tablespaces": [
      { "name": "ts1", "max_size": "10GB" },
      { "name": "ts2", "max_size": "20GB" },
      { "name": "ts3", "max_size": "15GB" }
    ]
  },
  {
    "database": "db2",
    "created_at": "2023-11-15T08:45:00Z",
    "encoding": "UTF16",
    "tablespaces": [
      { "name": "ts1", "max_size": "5GB" },
      { "name": "ts2", "max_size": "25GB" },
      { "name": "ts3", "max_size": "30GB" }
    ]
```

```
  },
  {
    "database": "db3",
    "created_at": "2024-01-05T15:10:00Z",
    "encoding": "UTF8",
    "tablespaces": [
      { "name": "ts1", "max_size": "12GB" },
      { "name": "ts2", "max_size": "18GB" },
      { "name": "ts3", "max_size": "22GB" }
    ]
  }
]
```

Case 1

Discovering database instances on a database server, then discovering the tablespaces for each instance.

1. You have at least one host related to database server discovery.
2. Create an LLD rule for this host named *Discover databases and tablespaces*.
3. Switch to the *LLD Macros* tab on this rule, add macro `{#DB}=$.database`.
4. Add an item prototype for this rule named *Active connections to {#DB}* (Type: Agent, Key: `db.connections[{#DB}]`).
5. The items related to each database are discovered:

```
Active connections to db1, Active connections to db2, Active connections to db3.
```

6. Create a discovery prototype for this rule named *Discover tablespaces for {#DB}* (Type: Nested, Key: `db.tablespace.discovery[{#`
7. Switch to the *Preprocessing* tab of this discovery prototype and add the step `JSONPath=$.tablespaces`.
8. Switch to the *LLD Macros* tab of this discovery prototype, add macro `{#TSNAME}=$.name`.
9. Create an item prototype for this discovery prototype named *Size of tablespace {#TSNAME} for {#DB}* (Type: Agent, Key: `db.ts.size[{#DB}, {#TSNAME}]`).
10. The items related to each tablespace of each database are discovered:

```
Size of tablespace ts1 for db1, Size of tablespace ts2 for db1, Size of tablespace ts3 for db1,
Size of tablespace ts1 for db2, Size of tablespace ts2 for db2, Size of tablespace ts3 for db2,
Size of tablespace ts1 for db3, Size of tablespace ts2 for db3, Size of tablespace ts3 for db3.
```

with keys `db.ts.size[db1,ts1]`, `db.ts.size[db1,ts2]`, ... `db.ts.size[db3,ts3]`.

Case 2

Discovering database instances on the database server by representing them as discovered hosts, then discovering the tablespaces for each instance.

1. You have at least one host (root host) related to database server discovery.
2. Create a template to discover the tablespaces for each database.
3. Create an item in this template named *Active connections to {#DB}* (Type: Agent, Key: `db.connections[{#DB}]`).
4. Create an LLD rule for this template named *Discover tablespaces* (Type: Nested).
5. Switch to the *Preprocessing* tab of this rule and add the step `JSONPath=$.tablespaces`.
6. Switch to the *LLD Macros* tab of this rule, add macro `{#TSNAME}=$.name`.
7. Create an item prototype for this rule named *Size of tablespace {#TSNAME} for {#DB}* (Type: Agent, Key: `db.ts.size[{#DB}, {#TSNAME}]`).
8. Back on the root host, create an LLD rule for this host named *Discover databases and tablespaces*.
9. Switch to the *LLD Macros* tab on this rule, add macro `{#DB}=$.database`.
10. Add a host prototype for this rule named *Host for database {#DB}*.
11. Switch to the *Macros* tab on this host prototype, add macro `{$DB}={#DB}` (for the item's name and key from Step 3).
12. Link the template from step 2 to this host prototype.
13. The discovered hosts contain the discovered items related to each database and its tablespaces:

Host	Items
Host for database db1	Active connections to db1
	Size of tablespace ts1 for db1
	Size of tablespace ts2 for db1
	Size of tablespace ts3 for db1
Host for database db2	Active connections to db2
	Size of tablespace ts1 for db2
	Size of tablespace ts2 for db2
	Size of tablespace ts3 for db2
Host for database db3	Active connections to db3
	Size of tablespace ts1 for db3
	Size of tablespace ts2 for db3
	Size of tablespace ts3 for db3

Notes on low-level discovery

Using LLD macros in user macro contexts

LLD macros may be used inside user macro context, for example, in trigger prototypes.

Multiple LLD rules for the same item

It is possible to define several low-level discovery rules with the same discovery item.

To do that you need to define the Alias agent parameter, allowing you to use altered discovery item keys in different discovery rules, for example, `vfs.fs.discovery[foo]`, `vfs.fs.discovery[bar]`, etc.

Data limits for return values

There is no limit for low-level discovery rule JSON data if it is received directly by Zabbix server. This is because the return values are processed without being stored in a database.

There is also no limit for custom low-level discovery rules. However, if custom low-level discovery rule data is retrieved using a user parameter, the user parameter return value limit applies.

If data has to go through Zabbix proxy, it has to store this data in the database. In such a case, database limits apply.

Discovery rule examples

This section provides practical examples of configuring discovery rules for different types of entities, such as filesystems, network interfaces, services, sensors, SNMP objects, Java applications, and databases.

Each example illustrates how a discovery rule can be structured, including the item key or query used, the JSON output with LLD macros, and how those results are used to create item, trigger, and graph prototypes.

- Discovery of block devices
- Discovery of CPUs and CPU cores
- Discovery of host interfaces in Zabbix
- Discovery of IPMI sensors
- Discovery of JMX objects
- Discovery of mounted filesystems
- Discovery of network interfaces
- Discovery of SNMP OIDs
- Discovery of SNMP OIDs (legacy)
- Discovery of systemd services
- Discovery of Windows performance counter instances
- Discovery of Windows services
- Discovery using WMI queries
- Discovery using ODBC SQL queries
- Discovery using Prometheus data

Custom LLD rules

Overview

It is also possible to create a completely custom LLD rule, discovering any type of entities - for example, databases on a database server.

To do so, a custom item should be created that returns a JSON string, specifying the found objects and optionally - some properties of them. The amount of macros per entity is not limited - while the built-in discovery rules return either one or two macros (for example, two for filesystem discovery), it is possible to return more.

Example

The required JSON string format is best illustrated with an example. Suppose you are running an old Zabbix 1.8 agent (one that does not support the `vfs.fs.discovery` key), but you still need to discover file systems. Here is a simple Perl script for Linux that discovers mounted file systems and outputs in JSON, which includes both file system name and type. One way to use it would be as a UserParameter with key `vfs.fs.discovery_perl`:

```
####!/usr/bin/perl

$first = 1;

print "[\n";

for (`cat /proc/mounts`)
{
    ($fsname, $fstype) = m/\S+ (\S+) (\S+)/;

    print "\t,\n" if not $first;
    $first = 0;

    print "\t{\n";
    print "\t\t\"{#FSNAME}\":\"$fsname\",\n";
    print "\t\t\"{#FSTYPE}\":\"$fstype\"\n";
    print "\t}\n";
}

print "]\n";
```

Attention:
Allowed symbols for LLD macro names are **0-9** , **A-Z** , _ , **.**. Lowercase letters are not supported in the names.

An example of its output (reformatted for clarity) is shown below. The JSON for custom discovery checks has to follow the same format.

```
[
    { "{#FSNAME}":"/",                          "{#FSTYPE}":"rootfs"   },
    { "{#FSNAME}":"/sys",                       "{#FSTYPE}":"sysfs"    },
    { "{#FSNAME}":"/proc",                      "{#FSTYPE}":"proc"     },
    { "{#FSNAME}":"/dev",                       "{#FSTYPE}":"devtmpfs" },
    { "{#FSNAME}":"/dev/pts",                   "{#FSTYPE}":"devpts"   },
    { "{#FSNAME}":"/lib/init/rw",               "{#FSTYPE}":"tmpfs"    },
    { "{#FSNAME}":"/dev/shm",                   "{#FSTYPE}":"tmpfs"    },
    { "{#FSNAME}":"/home",                      "{#FSTYPE}":"ext3"     },
    { "{#FSNAME}":"/tmp",                       "{#FSTYPE}":"ext3"     },
    { "{#FSNAME}":"/usr",                       "{#FSTYPE}":"ext3"     },
    { "{#FSNAME}":"/var",                       "{#FSTYPE}":"ext3"     },
    { "{#FSNAME}":"/sys/fs/fuse/connections",   "{#FSTYPE}":"fusectl"  }
]
```

In the previous example it is required that the keys match the LLD macro names used in prototypes, the alternative is to extract LLD macro values using JSONPath {#FSNAME} → `$.fsname` and {#FSTYPE} → `$.fstype`, thus making such script possible:

```
####!/usr/bin/perl

$first = 1;

print "[\n";

for (`cat /proc/mounts`)
```

```
{
    ($fsname, $fstype) = m/\S+ (\S+) (\S+)/;

    print "\t,\n" if not $first;
    $first = 0;

    print "\t{\n";
    print "\t\t\"fsname\":\"$fsname\",\n";
    print "\t\t\"fstype\":\"$fstype\"\n";
    print "\t}\n";
}

print "]\n";
```

An example of its output (reformatted for clarity) is shown below.

```
[
    { "fsname":"/",                          "fstype":"rootfs"   },
    { "fsname":"/sys",                       "fstype":"sysfs"    },
    { "fsname":"/proc",                      "fstype":"proc"     },
    { "fsname":"/dev",                       "fstype":"devtmpfs" },
    { "fsname":"/dev/pts",                   "fstype":"devpts"   },
    { "fsname":"/lib/init/rw",               "fstype":"tmpfs"    },
    { "fsname":"/dev/shm",                   "fstype":"tmpfs"    },
    { "fsname":"/home",                      "fstype":"ext3"     },
    { "fsname":"/tmp",                       "fstype":"ext3"     },
    { "fsname":"/usr",                       "fstype":"ext3"     },
    { "fsname":"/var",                       "fstype":"ext3"     },
    { "fsname":"/sys/fs/fuse/connections",   "fstype":"fusectl"  }
]
```

Then, in the discovery rule's *Filter* field, you may specify `{#FSTYPE}` as a macro and `rootfs|ext3` as a regular expression.

Note:
You don't have to use macro names like FSNAME/FSTYPE with custom LLD rules, you are free to use whatever names you like. In case JSONPath is used then the LLD row will be an array element that can be an object, but it can be also another array or a value.

Note that, if using a user parameter, the return value is limited to 16 MB. For more details, see data limits for LLD return values.

Virtual machine monitoring

Overview Zabbix can use low-level discovery rules to automatically discover VMware hypervisors and virtual machines, and create hosts to monitor them based on pre-defined host prototypes.

Zabbix also includes ready-to-use templates for monitoring VMware vCenter or ESXi hypervisors.

The minimum required VMware vCenter or vSphere version is 5.1.

Data collection Virtual machine monitoring consists of two steps:

1. Zabbix *vmware collector* processes collect virtual machine data - the processes obtain necessary information from VMware web services over the SOAP protocol, pre-process it, and store it in Zabbix server shared memory.
2. Zabbix *poller* processes retrieve data using Zabbix simple check VMware monitoring item keys.

Zabbix divides collected data into VMware configuration data and VMware performance counter data. Both types of data are collected independently by the *vmware collector* processes.

The following statistics are available based on the VMware performance counter information:

- Datastore
- Disk device
- CPU

- Power
- Network interface
- Custom performance counter items

For the complete list of items that obtain data from VMware performance counters, see *VMware monitoring item keys*.

Note that the frequency of VMware event retrieval depends on the polling interval of vmware.eventlog, but cannot be less then 5 seconds.

Configuration If Zabbix server is compiled from sources, it must be compiled with the `--with-libcurl --with-libxml2` configuration options to enable virtual machine monitoring. Zabbix packages are compiled with these options already enabled.

The following Zabbix server configuration file parameters can be modified for virtual machine monitoring:

- StartVMwareCollectors

Note:
It is recommended to enable more collectors than the number of monitored VMware services; otherwise, the retrieval of VMware performance counter statistics might be delayed by the retrieval of VMware configuration data (which takes a while for large installations).

 Generally, the value of StartVMwareCollectors should not dip below 2 and should not exceed twice the amount of monitored VMware services: Amount of services < StartVMwareCollectors < (Amount of services * 2). For example, when monitoring one VMware service, set StartVMwareCollectors to 2; when monitoring three services, set StartVMwareCollectors to 5.

 Note that the required number of collectors also depends on the scope of the VMware environment, and the VMwareFrequency and VMwarePerfFrequency configuration parameters.

- VMwareCacheSize
- VMwareFrequency
- VMwarePerfFrequency
- VMwareTimeout

Attention:
To support datastore capacity metrics, ensure that the value of the VMware `vpxd.stats.maxQueryMetrics` key is set to at least 64. For more information, see the *VMware Knowledge Base* article.

Discovery

Zabbix can use low-level discovery rules (for example, `vmware.hv.discovery[{$VMWARE.URL}]`) to automatically discover VMware hypervisors and virtual machines. Moreover, Zabbix can use host prototypes to automatically generate real hosts for the discovered entities. For more information, see *Host prototypes*.

Configuration examples

For a basic example of how to set up Zabbix for monitoring VMware using the *VMware FQDN* template, see *Monitor VMware with Zabbix*.

For a more detailed example of how to create a host, a low-level discovery rule, and a host prototype for monitoring VMware, see *Setup example*.

Extended logging The data collected by the *vmware collector* processes can be logged for detailed debugging using debug level 5. The debug level can be configured in the server and proxy configuration files or using the runtime control option `-R log_level_increase="vmware collector,N"`, where `N` is the process number.

For example, to increase the debug level from 4 to 5 for all *vmware collector* processes, run the following command:

```
zabbix_server -R log_level_increase="vmware collector"
```

To increase the debug level from 4 to 5 for the second *vmware collector* process, run the following command:

```
zabbix_server -R log_level_increase="vmware collector,2"
```

When extended logging of VMware collector data is no longer required, it is recommended to decrease the debug level to default (3) by running the `-R log_level_decrease` command.

Troubleshooting

- In case of unavailable metrics, please ensure that they are not made unavailable or turned off by default in recent VMware vSphere versions, or if some limits are not placed on performance-metric database queries. For more information, see ZBX-12094.

- If `config.vpxd.stats.maxQueryMetrics` is invalid or exceeds the maximum number of characters permitted error, add a `config.vpxd.stats.maxQueryMetrics` parameter to the vCenter Server settings. The value of this parameter should be the same as the value of `maxQuerysize` in VMware's `web.xml` file. For more information, see *VMware Knowledge Base* article.
- If you suspect your Zabbix installation is using too much memory, see Profiling excessive memory usage with tcmalloc.

VMware monitoring item keys

Overview This page provides details on the simple checks that can be used to monitor VMware environments. The metrics are grouped by the monitoring target.

Supported item keys The item keys are listed without parameters and additional information. Click the item key to see the full details.

Item key	Description	Item group
vmware.eventlog	The VMware event log.	General service
vmware.fullname	The VMware service full name.	
vmware.version	The VMware service version.	
vmware.cl.perfcounter	The VMware cluster performance counter metrics.	Cluster
vmware.cluster.alarms.get	The VMware cluster alarms data.	
vmware.cluster.discovery	The discovery of VMware clusters.	
vmware.cluster.property	The VMware cluster property.	
vmware.cluster.status	The VMware cluster status.	
vmware.cluster.tags.get	The VMware cluster tags array.	
vmware.datastore.alarms.get	The VMware datastore alarms data.	Datastore
vmware.datastore.discovery	The discovery of VMware datastores.	
vmware.datastore.hv.list	The list of datastore hypervisors.	
vmware.datastore.perfcounter	The VMware datastore performance counter value.	
vmware.datastore.property	The VMware datastore property.	
vmware.datastore.read	The amount of time for a read operation from the datastore.	
vmware.datastore.size	The VMware datastore space in bytes or in percentage from total.	
vmware.datastore.tags.get	The VMware datastore tags array.	
vmware.datastore.write	The amount of time for a write operation to the datastore.	
vmware.dc.alarms.get	The VMware datacenter alarms data.	Datacenter
vmware.dc.discovery	The discovery of VMware datacenters.	
vmware.dc.tags.get	The VMware datacenter tags array.	
vmware.dvswitch.discovery	The discovery of VMware vSphere Distributed Switches.	vSphere Distributed Switch
vmware.dvswitch.fetchports.get	The VMware vSphere Distributed Switch ports data.	
vmware.hv.alarms.get	The VMware hypervisor alarms data.	Hypervisor
vmware.hv.cluster.name	The VMware hypervisor cluster name.	
vmware.hv.connectionstate	The VMware hypervisor connection state.	
vmware.hv.cpu.usage	The VMware hypervisor processor usage (Hz).	
vmware.hv.cpu.usage.perf	The VMware hypervisor processor usage as a percentage during the interval.	
vmware.hv.cpu.utilization	The VMware hypervisor processor usage as a percentage during the interval, depends on power management or HT.	
vmware.hv.datacenter.name	The VMware hypervisor datacenter name.	
vmware.hv.datastore.discovery	The discovery of VMware hypervisor datastores.	
vmware.hv.datastore.list	The list of VMware hypervisor datastores.	
vmware.hv.datastore.multipath	The number of available datastore paths.	
vmware.hv.datastore.read	The average amount of time for a read operation from the datastore.	
vmware.hv.datastore.size	The VMware datastore space in bytes or in percentage from total.	
vmware.hv.datastore.write	The average amount of time for a write operation to the datastore.	
vmware.hv.discovery	The discovery of VMware hypervisors.	
vmware.hv.diskinfo.get	The VMware hypervisor disk data.	
vmware.hv.fullname	The complete product name, including version information.	
vmware.hv.hw.cpu.freq	The VMware hypervisor processor frequency.	
vmware.hv.hw.cpu.model	The VMware hypervisor processor model.	

Item key	Description	Item group
vmware.hv.hw.cpu.num	The number of processor cores on VMware hypervisor.	
vmware.hv.hw.cpu.threads	The number of processor threads on VMware hypervisor.	
vmware.hv.hw.memory	The VMware hypervisor total memory size.	
vmware.hv.hw.model	The VMware hypervisor model.	
vmware.hv.hw.sensors.get	The VMware hypervisor hardware sensors value.	
vmware.hv.hw.serialnumber	The VMware hypervisor serial number.	
vmware.hv.hw.uuid	The VMware hypervisor BIOS UUID.	
vmware.hv.hw.vendor	The VMware hypervisor vendor name.	
vmware.hv.maintenance	The VMware hypervisor maintenance status.	
vmware.hv.memory.size.ballooned	The VMware hypervisor ballooned memory size.	
vmware.hv.memory.used	The VMware hypervisor used memory size.	
vmware.hv.net.if.discovery	The discovery of VMware hypervisor network interfaces.	
vmware.hv.network.in	The VMware hypervisor network input statistics.	
vmware.hv.network.linkspeed	The VMware hypervisor network interface speed.	
vmware.hv.network.out	The VMware hypervisor network output statistics.	
vmware.hv.perfcounter	The VMware hypervisor performance counter value.	
vmware.hv.property	The VMware hypervisor property.	
vmware.hv.power	The VMware hypervisor power usage.	
vmware.hv.sensor.health.state	The VMware hypervisor health state rollup sensor.	
vmware.hv.sensors.get	The VMware hypervisor HW vendor state sensors.	
vmware.hv.status	The VMware hypervisor status.	
vmware.hv.tags.get	The VMware hypervisor tags array.	
vmware.hv.uptime	The VMware hypervisor uptime.	
vmware.hv.version	The VMware hypervisor version.	
vmware.hv.vm.num	The number of virtual machines on the VMware hypervisor.	
vmware.rp.cpu.usage	The CPU usage in hertz during the interval on VMware Resource Pool.	Resource pool
vmware.rp.memory	The memory metrics of VMware resource pool.	
vmware.alarms.get	The VMware virtual center alarms data.	Virtual center
vmware.vm.alarms.get	The VMware virtual machine alarms data.	Virtual machine
vmware.vm.attribute	The VMware virtual machine custom attribute value.	
vmware.vm.cluster.name	The VMware virtual machine name.	
vmware.vm.consolidationneeded	The VMware virtual machine disk requires consolidation.	
vmware.vm.cpu.latency	The percentage of time the virtual machine is unable to run because it is contending for access to the physical CPU(s).	
vmware.vm.cpu.num	The number of processors on VMware virtual machine.	
vmware.vm.cpu.readiness	The percentage of time that the virtual machine was ready, but could not get scheduled to run on the physical CPU.	
vmware.vm.cpu.ready	The time that the virtual machine was ready, but could not get scheduled to run on the physical CPU.	
vmware.vm.cpu.swapwait	The percentage of CPU time spent waiting for swap-in.	
vmware.vm.cpu.usage	The VMware virtual machine processor usage (Hz).	
vmware.vm.cpu.usage.perf	The VMware virtual machine processor usage as a percentage during the interval.	
vmware.vm.datacenter.name	The VMware virtual machine datacenter name.	
vmware.vm.discovery	The discovery of VMware virtual machines.	
vmware.vm.guest.memory.swapped	The amount of guest physical memory that is swapped out to the swap space.	
vmware.vm.guest.osuptime	The total time elapsed since the last operating system boot-up.	
vmware.vm.hv.maintenance	The VMware virtual machine hypervisor maintenance status.	
vmware.vm.hv.name	The VMware virtual machine hypervisor name.	
vmware.vm.memory.size	The VMware virtual machine total memory size.	
vmware.vm.memory.size.ballooned	The VMware virtual machine ballooned memory size.	
vmware.vm.memory.size.compressed	The VMware virtual machine compressed memory size.	
vmware.vm.memory.size.consumed	The amount of host physical memory consumed for backing up guest physical memory pages.	
vmware.vm.memory.size.private	The VMware virtual machine private memory size.	
vmware.vm.memory.size.shared	The VMware virtual machine shared memory size.	
vmware.vm.memory.size.swapped	The VMware virtual machine swapped memory size.	
vmware.vm.memory.size.usage.guest	The VMware virtual machine guest memory usage.	
vmware.vm.memory.size.usage.host	The VMware virtual machine host memory usage.	

Item key	Description	Item group
vmware.vm.memory.usage	The percentage of host physical memory that has been consumed.	
vmware.vm.net.if.discovery	The discovery of VMware virtual machine network interfaces.	
vmware.vm.net.if.in	The VMware virtual machine network interface input statistics.	
vmware.vm.net.if.out	The VMware virtual machine network interface output statistics.	
vmware.vm.net.if.usage	The VMware virtual machine network utilization during the interval.	
vmware.vm.perfcounter	The VMware virtual machine performance counter value.	
vmware.vm.powerstate	The VMware virtual machine power state.	
vmware.vm.property	The VMware virtual machine property.	
vmware.vm.snapshot.get	The VMware virtual machine snapshot state.	
vmware.vm.state	The VMware virtual machine state.	
vmware.vm.storage.committed	The VMware virtual machine committed storage space.	
vmware.vm.storage.readoio	The average number of outstanding read requests to the virtual disk during the collection interval.	
vmware.vm.storage.totalreadlatency	The average time a read from the virtual disk takes.	
vmware.vm.storage.totalwritelatency	The average time a write to the virtual disk takes.	
vmware.vm.storage.uncommitted	The VMware virtual machine uncommitted storage space.	
vmware.vm.storage.unshared	The VMware virtual machine unshared storage space.	
vmware.vm.storage.writeoio	The average number of outstanding write requests to the virtual disk during the collection interval.	
vmware.vm.tags.get	The VMware virtual machine tags array.	
vmware.vm.tools	The VMware virtual machine guest tools state or version.	
vmware.vm.uptime	The VMware virtual machine uptime.	
vmware.vm.vfs.dev.discovery	The discovery of VMware virtual machine disk devices.	
vmware.vm.vfs.dev.read	The VMware virtual machine disk device read statistics.	
vmware.vm.vfs.dev.write	The VMware virtual machine disk device write statistics.	
vmware.vm.vfs.fs.discovery	The discovery of VMware virtual machine file systems.	
vmware.vm.vfs.fs.size	The VMware virtual machine file system statistics.	

Item key details Parameters without angle brackets are mandatory. Parameters marked with angle brackets **< >** are optional.

vmware.eventlog[url,<mode>,<severity>]

 The VMware event log.
 Return value: *Log*.

Parameters:

- **url** - the VMware service URL;
- **mode** - *all* (default) or *skip* - skip the processing of older data;
- **severity** - filter by severity: *error*, *warning*, *info* or *user*. This parameter must be quoted if more than one severity is specified in a comma-delimited list (e.g.,`"error,warning,info,user"`). Disabled by default.

Comments:

- There must be only one `vmware.eventlog` item key per URL;
- See also example of filtering VMware event log records.

vmware.fullnameurl

 The VMware service full name.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL.

vmware.versionurl

 The VMware service version.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL.

vmware.cl.perfcounter[url,id,path,<instance>]

 The VMware cluster performance counter metrics.
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **id** - the VMware cluster ID. `id` can be received from `vmware.cluster.discovery[]` as {#CLUSTER.ID}.

- **path** - the performance counter path[1];
- **instance** - the performance counter instance.

vmware.cluster.alarms.get[url,id]

 The VMware cluster alarms data.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **id** - the VMware cluster ID.

vmware.cluster.discoveryurl

 The discovery of VMware clusters.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL.

vmware.cluster.property[url,id,prop]

 The VMware cluster property.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **id** - the VMware cluster ID;
- **prop** - the property path which is the name of a property of the VM object as defined in the VMware SDK.

Examples:

```
vmware.vm.property[{$VMWARE.URL},{$VMWARE.VM.UUID},overallStatus]
vmware.vm.property[{$VMWARE.URL},{$VMWARE.VM.UUID},runtime.powerState]
```

vmware.cluster.status[url,name]

 The VMware cluster status.
 Return value: *0* - gray; *1* - green; *2* - yellow; *3* - red.

Parameters:

- **url** - the VMware service URL;
- **name** - the VMware cluster name.

vmware.cluster.tags.get[url,id]

 The VMware cluster tags array.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **id** - the VMware cluster ID.

This item works with vSphere 6.5 and newer.

vmware.datastore.alarms.get[url,uuid]

 The VMware datastore alarms data.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware datastore global unique identifier.

vmware.datastore.discovery[url,<filter_uuid>]

 The discovery of VMware datastores.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **filter_uuid** - a single HV or VM unique identifier (default: empty). If specified, only linked datastores will be discovered.

vmware.datastore.hv.list[url,datastore]

 The list of datastore hypervisors.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;

- **datastore** - the datastore UUID or name.

Output example:

```
esx7-01-host.zabbix.sandbox
esx7-02-host.zabbix.sandbox
```

vmware.datastore.perfcounter[url,uuid,path,<instance>]

 The VMware datastore performance counter value.
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware datastore global unique identifier;
- **path** - the performance counter path[1];
- **instance** - the performance counter instance. Use empty instance for aggregate values (default). `instance` can be received from `vmware.datastore.discovery[]` as part of the {#DATASTORE.EXTENT} array.

vmware.datastore.property[url,uuid,prop]

 The VMware datastore property.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware datastore global unique identifier;
- **prop** - the property path.

vmware.datastore.read[url,datastore,<mode>]

 The amount of time for a read operation from the datastore (milliseconds).
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **datastore** - the datastore UUID or name;
- **mode** - *latency* (average value, default) or *maxlatency* (maximum value).

vmware.datastore.size[url,datastore,<mode>]

 The VMware datastore space in bytes or in percentage from total.
 Return value: *Integer* - for bytes; *Float* - for percentage.

Parameters:

- **url** - the VMware service URL;
- **datastore** - the datastore UUID or name;
- **mode** - possible values: *total* (default), *free*, *pfree* (free percentage), *uncommitted*.

vmware.datastore.tags.get[url,uuid]

 The VMware datastore tags array.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware datastore global unique identifier.

This item works with vSphere 6.5 and newer.

vmware.datastore.write[url,datastore,<mode>]

 The amount of time for a write operation to the datastore (milliseconds).
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **datastore** - the datastore UUID or name;
- **mode** - *latency* (average value, default) or *maxlatency* (maximum value).

vmware.dc.alarms.get[url,id]

 The VMware datacenter alarms data.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **id** - the VMware datacenter ID.

vmware.dc.discoveryurl

 The discovery of VMware datacenters.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL.

vmware.dc.tags.get[url,id]

 The VMware datacenter tags array.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **id** - the VMware datacenter ID.

This item works with vSphere 6.5 and newer.

vmware.dvswitch.discoveryurl

 The discovery of VMware vSphere Distributed Switches.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL.

vmware.dvswitch.fetchports.get[url,uuid,<filter>,<mode>]

 The VMware vSphere Distributed Switch ports data.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware DVSwitch global unique identifier.
- **filter** - a single string with comma-separated criteria for selecting ports;
- **mode** - *state* (all XML without ”config” XML nodes, default) or *full*.

The **filter** parameter supports the criteria available in the VMware data object DistributedVirtualSwitchPortCriteria.

Example:

```
vmware.dvswitch.fetchports.get[{$VMWARE.URL},{$VMWARE.DVS.UUID},"connected:true,active:true,uplinkPort:fal
```

vmware.hv.alarms.get[url,uuid]

 The VMware hypervisor alarms data.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.cluster.name[url,uuid]

 The VMware hypervisor cluster name.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.connectionstate[url,uuid]

 The VMware hypervisor connection state.
 Return value: *String*: *connected*, *disconnected*, or *notResponding*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.cpu.usage[url,uuid]

 The VMware hypervisor processor usage (Hz).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.cpu.usage.perf[url,uuid]

 The VMware hypervisor processor usage as a percentage during the interval.
 Return value: *Float*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.cpu.utilization[url,uuid]

 The VMware hypervisor processor usage as a percentage during the interval, depends on power management or HT.
 Return value: *Float*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.datacenter.name[url,uuid]

 The VMware hypervisor datacenter name.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.datastore.discovery[url,uuid]

 The discovery of VMware hypervisor datastores.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.datastore.list[url,uuid]

 The list of VMware hypervisor datastores.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

Output example:

```
SSD-RAID1-VAULT1
SSD-RAID1-VAULT2
SSD-RAID10
```

vmware.hv.datastore.multipath[url,uuid,<datastore>,<partitionid>]

 The number of available datastore paths.
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier;
- **datastore** - the datastore UUID or name;
- **partitionid** - the internal ID of physical device from `vmware.hv.datastore.discovery`.

vmware.hv.datastore.read[url,uuid,datastore,<mode>]

 The average amount of time for a read operation from the datastore (milliseconds).
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier;
- **datastore** - the datastore UUID or name;
- **mode** - *latency* (default).

vmware.hv.datastore.size[url,uuid,datastore,<mode>]

 The VMware datastore space in bytes or in percentage from total.
 Return value: *Integer* - for bytes; *Float* - for percentage.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier;
- **datastore** - the datastore UUID or name;
- **mode** - possible values: *total* (default), *free*, *pfree* (free percentage), *uncommitted*.

vmware.hv.datastore.write[url,uuid,datastore,<mode>]

 The average amount of time for a write operation to the datastore (milliseconds).
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier;
- **datastore** - the datastore UUID or name;
- **mode** - *latency* (default).

vmware.hv.discoveryurl

 The discovery of VMware hypervisors.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL.

vmware.hv.diskinfo.get[url,uuid]

 The VMware hypervisor disk data.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.fullname[url,uuid]

 The complete product name, including version information.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.hw.cpu.freq[url,uuid]

 The VMware hypervisor processor frequency (Hz).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.hw.cpu.model[url,uuid]

 The VMware hypervisor processor model.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.hw.cpu.num[url,uuid]

 The number of processor cores on VMware hypervisor.
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.hw.cpu.threads[url,uuid]

 The number of processor threads on VMware hypervisor.
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.hw.memory[url,uuid]

 The VMware hypervisor total memory size (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.hw.model[url,uuid]

 The VMware hypervisor model.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.hw.sensors.get[url,uuid]

 The VMware hypervisor hardware sensors value.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.hw.serialnumber[url,uuid]

 The VMware hypervisor serial number.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

This item works with vSphere API 6.7 and newer.

vmware.hv.hw.uuid[url,uuid]

 The VMware hypervisor BIOS UUID.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

This item works with vSphere API 6.7 and newer.

vmware.hv.hw.vendor[url,uuid]

 The VMware hypervisor vendor name.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

This item works with vSphere API 6.7 and newer.

vmware.hv.maintenance[url,uuid]

 The VMware hypervisor maintenance status.
 Return value: *0* - not in maintenance; *1* - in maintenance.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.memory.size.ballooned[url,uuid]

 The VMware hypervisor ballooned memory size (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.memory.used[url,uuid]

 The VMware hypervisor used memory size (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.net.if.discovery[url,uuid]

 The discovery of VMware hypervisor network interfaces.
 Return value: *JSON object*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.network.in[url,uuid,<mode>]

 The VMware hypervisor network input statistics (bytes per second).
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier;
- **mode** - *bps* (default), *packets*, *dropped*, *errors*, *broadcast*.

vmware.hv.network.linkspeed[url,uuid,ifname]

 The VMware hypervisor network interface speed.
 Return value: *Integer*. Returns *0*, if the network interface is down; otherwise, the speed value of the interface.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier;
- **ifname** - the interface name.

vmware.hv.network.out[url,uuid,<mode>]

 The VMware hypervisor network output statistics (bytes per second).
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier;
- **mode** - *bps* (default), *packets*, *dropped*, *errors*, *broadcast*.

vmware.hv.perfcounter[url,uuid,path,<instance>]

 The VMware hypervisor performance counter value.
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier;
- **path** - the performance counter path [1];
- **instance** - the performance counter instance. Use empty instance for aggregate values (default).

vmware.hv.property[url,uuid,prop]

 The VMware hypervisor property.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier;
- **prop** - the property path.

vmware.hv.power[url,uuid,<max>]

 The VMware hypervisor power usage (W).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier;

- **max** - the maximum allowed power usage.

vmware.hv.sensor.health.state[url,uuid]

 The VMware hypervisor health state rollup sensor.
 Return value: *Integer*: *0* - gray; *1* - green; *2* - yellow; *3* - red.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

Note that the item might not work in VMware vSphere 6.5 and newer, because VMware has deprecated the *VMware Rollup Health State* sensor.

vmware.hv.sensors.get[url,uuid]

 The VMware hypervisor HW vendor state sensors.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.status[url,uuid]

 The VMware hypervisor status.
 Return value: *Integer*: *0* - gray; *1* - green; *2* - yellow; *3* - red.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

This item uses the host system overall status property.

vmware.hv.tags.get[url,uuid]

 The VMware hypervisor tags array.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

This item works with vSphere 6.5 and newer.

vmware.hv.uptime[url,uuid]

 The VMware hypervisor uptime (seconds).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

This item uses the host system overall status property.

vmware.hv.version[url,uuid]

 The VMware hypervisor version.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.hv.vm.num[url,uuid]

 The number of virtual machines on the VMware hypervisor.
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware hypervisor global unique identifier.

vmware.rp.cpu.usage[url,rpid]

 The CPU usage in hertz during the interval on VMware Resource Pool.
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;

- **rpid** - the VMware resource pool ID.

vmware.rp.memory[url,rpid,<mode>]

 The memory metrics of VMware resource pool.
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **rpid** - the VMware resource pool ID;
- **mode** - possible values:
consumed (default) - the amount of host physical memory consumed for backing up guest physical memory pages
 ballooned - the amount of guest physical memory reclaimed from the virtual machine by the balloon driver in the guest
overhead - the host physical memory consumed by ESXi data structures for running the virtual machines

vmware.alarms.geturl

 The VMware virtual center alarms data.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL.

vmware.vm.alarms.get[url,uuid]

 The VMware virtual machine alarms data.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.attribute[url,uuid,name]

 The VMware virtual machine custom attribute value.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **name** - the custom attribute name.

vmware.vm.cluster.name[url,uuid]

 The VMware virtual machine name.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.consolidationneeded[url,uuid]

 The VMware virtual machine disk requires consolidation.
 Return value: *String*: *true* - consolidation is needed; *false* - consolidation is not needed.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.cpu.latency[url,uuid]

 The percentage of time the virtual machine is unable to run because it is contending for access to the physical CPU(s).
 Return value: *Float*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.cpu.num[url,uuid]

 The number of processors on VMware virtual machine.
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.cpu.readiness[url,uuid,<instance>]

 The percentage of time that the virtual machine was ready, but could not get scheduled to run on the physical CPU.
 Return value: *Float*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **instance** - the CPU instance.

vmware.vm.cpu.ready[url,uuid]

 The time (in milliseconds) that the virtual machine was ready, but could not get scheduled to run on the physical CPU. CPU ready time is dependent on the number of virtual machines on the host and their CPU loads (%).
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.cpu.swapwait[url,uuid,<instance>]

 The percentage of CPU time spent waiting for swap-in.
 Return value: *Float*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **instance** - the CPU instance.

vmware.vm.cpu.usage[url,uuid]

 The VMware virtual machine processor usage (Hz).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.cpu.usage.perf[url,uuid]

 The VMware virtual machine processor usage as a percentage during the interval.
 Return value: *Float*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.datacenter.name[url,uuid]

 The VMware virtual machine datacenter name.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.discoveryurl

 The discovery of VMware virtual machines.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL.

vmware.vm.guest.memory.size.swapped[url,uuid]

 The amount of guest physical memory that is swapped out to the swap space (KB).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.guest.osuptime[url,uuid]

 The total time elapsed since the last operating system boot-up (in seconds).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.hv.maintenance[url,uuid]

 The VMware virtual machine hypervisor maintenance status.
 Return value: *0* - not in maintenance; *1* - in maintenance.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.hv.name[url,uuid]

 The VMware virtual machine hypervisor name.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.memory.size[url,uuid]

 The VMware virtual machine total memory size (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.memory.size.ballooned[url,uuid]

 The VMware virtual machine ballooned memory size (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.memory.size.compressed[url,uuid]

 The VMware virtual machine compressed memory size (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.memory.size.consumed[url,uuid]

 The amount of host physical memory consumed for backing up guest physical memory pages (KB).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.memory.size.private[url,uuid]

 The VMware virtual machine private memory size (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.memory.size.shared[url,uuid]

 The VMware virtual machine shared memory size (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.memory.size.swapped[url,uuid]

 The VMware virtual machine swapped memory size (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.memory.size.usage.guest[url,uuid]

 The VMware virtual machine guest memory usage (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.memory.size.usage.host[url,uuid]

 The VMware virtual machine host memory usage (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.memory.usage[url,uuid]

 The percentage of host physical memory that has been consumed.
 Return value: *Float*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.net.if.discovery[url,uuid]

 The discovery of VMware virtual machine network interfaces.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.net.if.in[url,uuid,instance,<mode>]

 The VMware virtual machine network interface input statistics (bytes/packets per second).
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **instance** - the network interface instance;
- **mode** - *bps* (default) or *pps* - bytes or packets per second.

vmware.vm.net.if.out[url,uuid,instance,<mode>]

 The VMware virtual machine network interface output statistics (bytes/packets per second).
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **instance** - the network interface instance;
- **mode** - *bps* (default) or *pps* - bytes or packets per second.

vmware.vm.net.if.usage[url,uuid,<instance>]

 The VMware virtual machine network utilization (combined transmit-rates and receive-rates) during the interval (KBps).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **instance** - the network interface instance.

vmware.vm.perfcounter[url,uuid,path,<instance>]

 The VMware virtual machine performance counter value.
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **path** - the performance counter path [1];
- **instance** - the performance counter instance. Use empty instance for aggregate values (default).

vmware.vm.powerstate[url,uuid]

 The VMware virtual machine power state.
 Return value: *0* - poweredOff; *1* - poweredOn; *2* - suspended.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.property[url,uuid,prop]

 The VMware virtual machine property.
 Return value: *String*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **prop** - the property path.

vmware.vm.snapshot.get[url,uuid]

 The VMware virtual machine snapshot state.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.state[url,uuid]

 The VMware virtual machine state.
 Return value: *String*: *notRunning*, *resetting*, *running*, *shuttingDown*, *standby*, or *unknown*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.storage.committed[url,uuid]

 The VMware virtual machine committed storage space (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.storage.readoio[url,uuid,instance]

 The average number of outstanding read requests to the virtual disk during the collection interval.
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **instance** - the disk device instance.

vmware.vm.storage.totalreadlatency[url,uuid,instance]

 The average time a read from the virtual disk takes (milliseconds).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **instance** - the disk device instance.

vmware.vm.storage.totalwritelatency[url,uuid,instance]

 The average time a write to the virtual disk takes (milliseconds).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;

- **uuid** - the VMware virtual machine global unique identifier;
- **instance** - the disk device instance.

vmware.vm.storage.uncommitted[url,uuid]

 The VMware virtual machine uncommitted storage space (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.storage.unshared[url,uuid]

 The VMware virtual machine unshared storage space (bytes).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.storage.writeoio[url,uuid,instance]

 The average number of outstanding write requests to the virtual disk during the collection interval.
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **instance** - the disk device instance.

vmware.vm.tags.get[url,uuid]

 The VMware virtual machine tags array.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

This item works with vSphere 6.5 and newer.

vmware.vm.tools[url,uuid,<mode>]

 The VMware virtual machine guest tools state.
 Return value: *String*.
 In *status* mode: *guestToolsExecutingScripts* - VMware Tools is starting; *guestToolsNotRunning* - VMware Tools is not running; *guestToolsRunning* - VMware Tools is running.
 In *version* mode: version.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **mode** - *version*, *status* (default).

vmware.vm.uptime[url,uuid]

 The VMware virtual machine uptime (seconds).
 Return value: *Integer*.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.vfs.dev.discovery[url,uuid]

 The discovery of VMware virtual machine disk devices.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

vmware.vm.vfs.dev.read[url,uuid,instance,<mode>]

 The VMware virtual machine disk device read statistics (bytes/operations per second).
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;

- **uuid** - the VMware virtual machine global unique identifier;
- **instance** - the disk device instance;
- **mode** - *bps* (default) or *ops* - bytes or operations per second.

vmware.vm.vfs.dev.write[url,uuid,instance,<mode>]

 The VMware virtual machine disk device write statistics (bytes/operations per second).
 Return value: *Integer* [2].

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **instance** - the disk device instance;
- **mode** - *bps* (default) or *ops* - bytes or operations per second.

vmware.vm.vfs.fs.discovery[url,uuid]

 The discovery of VMware virtual machine file systems.
 Return value: JSON object.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier.

VMware Tools must be installed on the guest virtual machine for this item to work.

vmware.vm.vfs.fs.size[url,uuid,fsname,<mode>]

 The VMware virtual machine file system statistics (bytes/percentages).
 Return value: *Integer* - for bytes; *Float* - for percentage.

Parameters:

- **url** - the VMware service URL;
- **uuid** - the VMware virtual machine global unique identifier;
- **fsname** - the file system name;
- **mode** - *total*, *free*, *used*, *pfree*, or *pused*.

VMware Tools must be installed on the guest virtual machine for this item to work.

Footnotes

[1] See Creating custom performance counter names for VMware.

[2] The value of these items is obtained from VMware performance counters and the VMwarePerfFrequency parameter is used to refresh their data in Zabbix VMware cache:

- vmware.cl.perfcounter
- vmware.hv.datastore.read
- vmware.hv.datastore.write
- vmware.hv.network.in
- vmware.hv.network.out
- vmware.hv.perfcounter
- vmware.vm.cpu.ready
- vmware.vm.net.if.in
- vmware.vm.net.if.out
- vmware.vm.perfcounter
- vmware.vm.vfs.dev.read
- vmware.vm.vfs.dev.write

More info

See Virtual machine monitoring for detailed information how to configure Zabbix to monitor VMware environments.

Virtual machine discovery key fields

The following table lists fields returned by virtual machine related discovery keys.

Item key		
Description	**Field**	**Retrieved content**

Item key		
vmware.cluster.discovery		
Performs cluster discovery.	{#CLUSTER.ID}	Cluster identifier.
	{#CLUSTER.NAME}	Cluster name.

	"resource_pool"	An array containing resource pool data, including resource group ID, tags array, resource pool path, number of virtual machines.
		
		Array structure:
		`[{`
		`"rpid":"resource group id",`
		`"tags":[{}],`
		`"rpath":"resource group path",`
		`"vm_count":0`
		`}]`
		
		For `"tags"` array structure, see the "tags" field.

	"tags"	An array containing tags with tag name, description and category.
		
		Array structure:
		`[{`
		`"tag":"tag name",`
		`"tag_description":"tag description",`
		`"category":"tag category"`
		`}]`

vmware.datastore.discovery		
Performs datastore discovery.	{#DATASTORE}	Datastore name.

	{#DATASTORE.EXTENT}	An array containing datastore extent partition ID and instance name.
		
		Array structure:
		`[{`
		`"partitionid":1,`
		`"instance":"name"`
		`}]`

	{#DATASTORE.TYPE}	Datastore type. Value examples: `VMFS`, `NFS`, `vsan`, etc.
	{#DATASTORE.UUID}	Datastore identifier.

	"tags"	An array containing tags with tag name, description and category.
		
		Array structure:
		`[{`
		`"tag":"tag name",`
		`"tag_description":"tag description",`
		`"category":"tag category"`
		`}]`

vmware.dc.discovery		
Performs datacenter discovery.	{#DATACENTER}	Datacenter name.
	{#DATACENTERID}	Datacenter identifier.

	"tags"	An array containing tags with tag name, description and category.
		
		Array structure:
		`[{`
		`"tag":"tag name",`
		`"tag_description":"tag description",`
		`"category":"tag category"`
		`}]`

vmware.dvswitch.discovery		
Performs vSphere distributed switches discovery.	{#DVS.NAME}	Switch name.

Item key		
	{#DVS.UUID}	Switch identifier.
vmware.hv.discovery		
Performs hypervisor discovery.	{#HV.UUID}	Unique hypervisor identifier.
	{#HV.ID}	Hypervisor identifier (HostSystem managed object name).
	{#HV.NAME}	Hypervisor name.
	{#HV.NETNAME}	Hypervisor network host name.
	{#HV.IP}	Hypervisor IP address, might be empty. In case of an HA configuration with multiple net interfaces, the following selection priority for interface is observed: - prefer the IP which shares the IP-subnet with the vCenter IP; - prefer the IP from IP-subnet with default gateway; - prefer the IP from interface with the lowest ID.
	{#CLUSTER.NAME}	Cluster name, might be empty.
	{#DATACENTER.NAME}	Datacenter name.
	{#PARENT.NAME}	Name of container that stores the hypervisor.
	{#PARENT.TYPE}	Type of container in which the hypervisor is stored. The values could be `Datacenter`, `Folder`, `ClusterComputeResource`, `VMware`, where ”VMware” stands for unknown container type.

	”resource_pool”	An array containing resource pool data, including resource group ID, tags array, resource pool path, number of virtual machines.
		
		Array structure:
		`[{`
		`"rpid":"resource group id",`
		`"tags":[{}],`
		`"rpath":"resource group path",`
		`"vm_count":0`
		`}]`
		
		For `"tags"` array structure, see the ”tags” field.

	”tags”	An array containing tags with tag name, description and category.
		
		Array structure:
		`[{`
		`"tag":"tag name",`
		`"tag_description":"tag description",`
		`"category":"tag category"`
		`}]`

vmware.hv.datastore.discovery		
Performs hypervisor datastore discovery. Note that multiple hypervisors can use the same datastore.	{#DATASTORE}	Datastore name.
	{#DATASTORE.TYPE}	Datastore type. Value examples: `VMFS`, `NFS`, `vsan`, etc.
	{#DATASTORE.UUID}	Datastore identifier.
	{#MULTIPATH.COUNT}	Registered number of datastore paths.
	{#MULTIPATH.PARTITION.COUNT}	Number of available disk partitions.

	”datastore_extent”	An array containing datastore extent instance name and partition ID.
		
		Array structure:
		`[{`
		`"partitionid":1,`
		`"instance":"name"`
		`}]`

Item key		

	”tags”	An array containing tags with tag name, description and category.
		
		Array structure:
		`[{`
		`"tag":"tag name",`
		`"tag_description":"tag description",`
		`"category":"tag category"`
		`}]`

vmware.hv.net.if.discovery		
Performs hypervisor network interfaces discovery.	{#IFNAME}	Interface name.
	{#IFDRIVER}	Interface driver.
	{#IFDUPLEX}	Interface duplex settings.
	{#IFSPEED}	Interface speed.
	{#IFMAC}	Interface mac address.
vmware.vm.discovery		
Performs virtual machine discovery.	{#VM.UUID}	Unique virtual machine identifier.
	{#VM.ID}	Virtual machine identifier (VirtualMachine managed object name).
	{#VM.NAME}	Virtual machine name.
	{#HV.NAME}	Hypervisor name.
	{#HV.UUID}	Unique hypervisor identifier.
	{#HV.ID}	Hypervisor identifier (HostSystem managed object name).
	{#CLUSTER.NAME}	Cluster name, might be empty.
	{#DATACENTER.NAME}	Datacenter name.
	{#DATASTORE.NAME}	Datastore name.
	{#DATASTORE.UUID}	Datastore identifier.
	{#VM.IP}	Virtual machine IP address, might be empty.
	{#VM.DNS}	Virtual machine DNS name, might be empty.
	{#VM.GUESTFAMILY}	Guest virtual machine OS family, might be empty.
	{#VM.GUESTFULLNAME}	Full guest virtual machine OS name, might be empty.
	{#VM.FOLDER}	The chain of virtual machine parent folders, can be used as value for nested groups; folder names are combined with ”/”. Might be empty.
	{#VM.TOOLS.STATUS}	VMware virtual machine tools state.
	{#VM.POWERSTATE}	VMware virtual machine power state (`poweredOff`, `poweredOn`, or `suspended`).
	{#VM.RPOOL.ID}	Resource pool identifier.
	{#VM.RPOOL.PATH}	Full resource pool path excluding the ”root” name ”Resources”. Folder names are combined with ”/”.
	{#VM.SNAPSHOT.COUNT}	Number of VM snapshots.

	”tags”	An array containing tags with tag name, description and category.
		
		Array structure:
		`[{`
		`"tag":"tag name",`
		`"tag_description":"tag description",`
		`"category":"tag category"`
		`}]`

	”vm_customattribute”	An array of virtual machine custom attributes (if defined).
		
		Array structure:
		`[{`
		`"name":"custom field name",`
		`"value":"custom field value"`
		`}]`

Item key		
	”net_if”	An array of virtual machine network interfaces. Array structure: [{ "ifname": "interface name", "ifdesc": "interface description", "ifmac": "00:00:00:00:00:00", "ifconnected": true, "iftype": "interface type", "ifbackingdevice": "interface backing device", "ifdvswitch_uuid": "interface switch uuid", "ifdvswitch_portgroup": "interface switch port group", "ifdvswitch_port": "interface switch port", "ifip": ["interface ip addresses"] }] For the description of returned data, see the ”vmware.vm.net.if.discovery” item key.
vmware.vm.net.if.discovery		
Performs virtual machine network interface discovery.	{#IFNAME}	Network interface name.
	{#IFDESC}	Interface description.
	{#IFMAC}	Interface mac address.
	{#IFCONNECTED}	Interface connection status (`false` - disconnected; `true` - connected).
	{#IFTYPE}	Interface type.
	{#IFBACKINGDEVICE}	Name of the backing device.
	{#IFDVSWITCH.UUID}	Unique vSphere Distributed Switch identifier.
	{#IFDVSWITCH.PORTGROUP}	Distributed port group.
	{#IFDVSWITCH.PORT}	vSphere Distributed Switch port.
	”ifip”	An array of interface addresses.
vmware.vm.vfs.dev.discovery		
Performs virtual machine disk device discovery.	{#DISKNAME}	Disk device name.
vmware.vm.vfs.fs.discovery		
Performs virtual machine file system discovery.	{#FSNAME}	File system name.

JSON examples for VMware items

Overview This section provides additional information about JSON objects returned by various VMware items.

vmware.*.alarms.get The items **vmware.alarms.get[]**, **vmware.cluster.alarms.get[]**, **vmware.datastore.alarms.get[]**, **vmware.dc.alarms.get[]**, **vmware.hv.alarms.get[]**, **vmware.vm.alarms.get[]** return JSON objects with the following structure (values are provided as an example):

```
{
    "alarms": [
        {
            "name": "Host connection and power state",
            "system_name": "alarm.HostConnectionStateAlarm",
            "description": "Default alarm to monitor host connection and power state",
            "enabled": true,
            "key": "alarm-1.host-2013",
            "time": "2022-06-27T05:27:38.759976Z",
```

```
            "overall_status": "red",
            "acknowledged": false,
            "entity": {
                "id": "host-2013",
                "uuid": "4201b707-f737-7cf8-881f-49215d1aad2a",
                "type": "HostSystem",
                "name": "esx-riga-01.prod.local"
            }
        },
        {
            "name": "Host memory usage",
            "system_name": "alarm.HostMemoryUsageAlarm",
            "description": "Default alarm to monitor host memory usage",
            "enabled": true,
            "key": "alarm-4.host-1004",
            "time": "2022-05-16T13:32:42.47863Z",
            "overall_status": "yellow",
            "acknowledged": false,
            "entity": {
                "id": "host-1004",
                "uuid": "5315c818-g848-8dg9-992g-50326e2bbe3a",
                "type": "HostSystem",
                "name": "esx-riga-02.prod.local",
            }
        },
        {
            // other alarms
        }
    ]
}
```

vmware.*.tags.get The items **vmware.cluster.tags.get[]**, **vmware.datastore.tags.get[]**, **vmware.dc.tags.get[]**, **vmware.hv.tags.get[]**, **vmware.vm.tags.get[]** return JSON objects with the following structure (values are provided as an example):

```
{
    "tags": [
        {
            "name": "Windows",
        "description": "tag for cat OS type",
        "category": "OS type"
    },
    {
            "name": "SQL Server",
        "description": "tag for cat application name",
        "category": "application name"
        },
    {
            // other tags
        }
    ]
}
```

vmware.hv.diskinfo.get The item **vmware.hv.diskinfo.get[]** returns JSON objects with the following structure (values are provided as an example):

```
[
  {
    "instance": "mpx.vmhba32:C0:T0:L0",
    "hv_uuid": "8002299e-d7b9-8728-d224-76004bbb6100",
    "datastore_uuid": "",
    "operational_state": [
      "ok"
```

```
    ],
    "lun_type": "disk",
    "queue_depth": 1,
    "model": "USB DISK",
    "vendor": "SMI Corp",
    "revision": "1100",
    "serial_number": "CCYYMMDDHHmmSS9S62CK",
    "vsan": {}
  },
  {
    // other instances
  }
]
```

vmware.dvswitch.fetchports.get The item **vmware.dvswitch.fetchports.get[]** returns JSON objects with the following structure (values are provided as an example):

```
{
    "FetchDVPortsResponse":
    {
        "returnval": [
            {
                "key": "0",
                "dvsUuid": "50 36 6a 24 25 c0 10 9e-05 4a f6 ea 4e 3d 09 88",
                "portgroupKey": "dvportgroup-2023",
                "proxyHost":
                {
                    "@type": "HostSystem",
                    "#text": "host-2021"
                },
                "connectee":
                {
                    "connectedEntity":
                    {
                        "@type": "HostSystem",
                        "#text": "host-2021"
                    },
                    "nicKey": "vmnic0",
                    "type": "pnic"
                },
                "conflict": "false",
                "state":
                {
                    "runtimeInfo":
                    {
                        "linkUp": "true",
                        "blocked": "false",
                        "vlanIds":
                        {
                            "start": "0",
                            "end": "4094"
                        },
                        "trunkingMode": "true",
                        "linkPeer": "vmnic0",
                        "macAddress": "00:00:00:00:00:00",
                        "statusDetail": null,
                        "vmDirectPathGen2Active": "false",
                        "vmDirectPathGen2InactiveReasonOther": "portNptIncompatibleConnectee"
                    },
                    "stats":
                    {
                        "packetsInMulticast": "2385470",
                        "packetsOutMulticast": "45",
```

```
                        "bytesInMulticast": "309250248",
                        "bytesOutMulticast": "5890",
                        "packetsInUnicast": "155601537",
                        "packetsOutUnicast": "113008658",
                        "bytesInUnicast": "121609489384",

                        "bytesInBroadcast": "77339771",
                        "bytesOutBroadcast": "430392",
                        "packetsInDropped": "0",
                        "packetsOutDropped": "0",
                        "packetsInException": "0",
                        "packetsOutException": "0"
                    }
                },
                "connectionCookie": "1702765133",
                "lastStatusChange": "2022-03-25T14:01:11Z",
                "hostLocalPort": "false"
            },
            {
                //other keys
            }
        ]
    }
}
```

vmware.hv.hw.sensors.get The item **vmware.hv.hw.sensors.get[]** returns JSON objects with the following structure (values are provided as an example):

```
{
    "val":
        {
            "@type": "HostHardwareStatusInfo",
            "storageStatusInfo": [
                {
                    "name": "Intel Corporation HD Graphics 630 #2",
                "status":
                        {
                            "label": "Unknown",
                    "summary": "Cannot report on the current status of the physical element",
                    "key": "Unknown"
                }
            },
            {
                    "name": "Intel Corporation 200 Series/Z370 Chipset Family USB 3.0 xHCI Controller #20"
                "status":
                        {
                     "label": "Unknown",
                     "summary": "Cannot report on the current status of the physical element",
                     "key": "Unknown"
                 }
            },
            {
                    // other hv hw sensors
                }
        ]
        }
}
```

vmware.hv.sensors.get The item **vmware.hv.sensors.get[]** returns JSON objects with the following structure (values are provided as an example):

```
{
    "val":
        {
            "@type": "ArrayOfHostNumericSensorInfo", "HostNumericSensorInfo": [
                {
                    "@type": "HostNumericSensorInfo",
                    "name": "System Board 1 PwrMeter Output --- Normal",
                    "healthState":
                        {
                            "label": "Green",
                            "summary": "Sensor is operating under normal conditions",
                    "key": "green"
                },
                    "currentReading": "10500",
                "unitModifier": "-2",
                "baseUnits": "Watts",
                "sensorType": "other"
            },
                {
                    "@type": "HostNumericSensorInfo",
                    "name": "Power Supply 1 PS 1 Output --- Normal",
                    "healthState":
                        {
                            "label": "Green",
                    "summary": "Sensor is operating under normal conditions",
                    "key": "green"
                },
                    "currentReading": "10000",
            "unitModifier": "-2",
            "baseUnits": "Watts",
            "sensorType": "power"
        },
            {
                    // other hv sensors
                }
        ]
        }
}
```

vmware.vm.snapshot.get If any snapshots exist, the item **vmware.snapshot.get[]** returns a JSON object with the following structure (values are provided as an example):

```
{
  "snapshot": [
    {
      "name": "VM Snapshot 4%2f1%2f2022, 9:16:39 AM",
      "description": "Descr 1",
      "createtime": "2022-04-01T06:16:51.761Z",
      "size": 5755795171,
      "uniquesize": 5755795171
    },
    {
      "name": "VM Snapshot 4%2f1%2f2022, 9:18:21 AM",
      "description": "Descr 2",
      "createtime": "2022-04-01T06:18:29.164999Z",
      "size": 118650595,
      "uniquesize": 118650595
    },
    {
      "name": "VM Snapshot 4%2f1%2f2022, 9:37:29 AM",
      "description": "Descr 3",
      "createtime": "2022-04-01T06:37:53.534999Z",
      "size": 62935016,
```

```
      "uniquesize": 62935016
    }
  ],
  "count": 3,
  "latestdate": "2022-04-01T06:37:53.534999Z",
  "latestage": 22729203,
  "oldestdate": "2022-04-01T06:16:51.761Z",
  "oldestage": 22730465,
  "size": 5937380782,
  "uniquesize": 5937380782
}
```

If no snapshot exists, the item **vmware.snapshot.get[]** returns a JSON object with empty values:

```
{
  "snapshot": [],
  "count": 0,
  "latestdate": null,
  "latestage": 0,
  "oldestdate": null,
  "oldestage": 0,
  "size": 0,
  "uniquesize": 0
}
```

VMware monitoring setup example

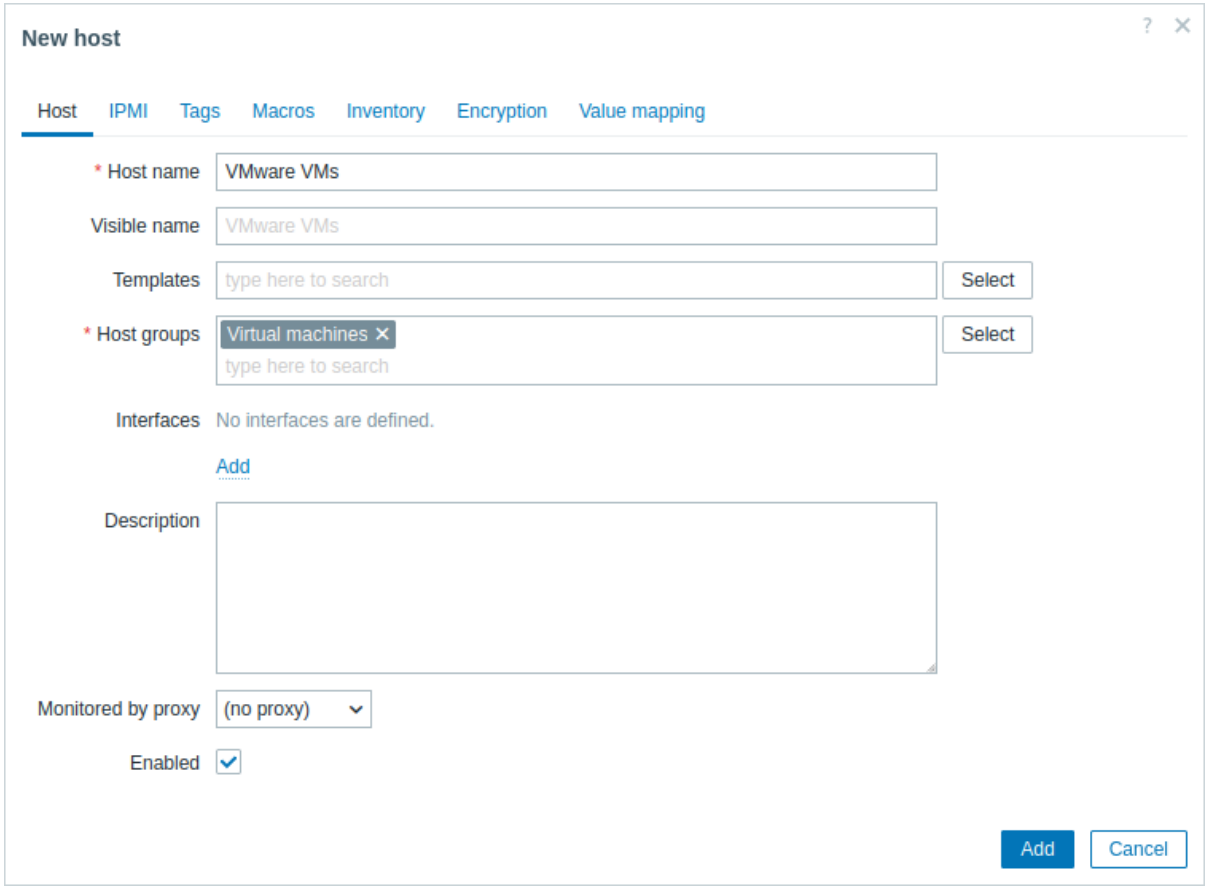
Overview

The following example describes how to set up Zabbix for monitoring VMware virtual machines. This involves:

- creating a host that represents your VMware environment;
- creating a low-level discovery rule that discovers virtual machines in your VMware environment;
- creating a host prototype, based on which Zabbix will generate real hosts for virtual machines discovered by the low-level discovery rule.

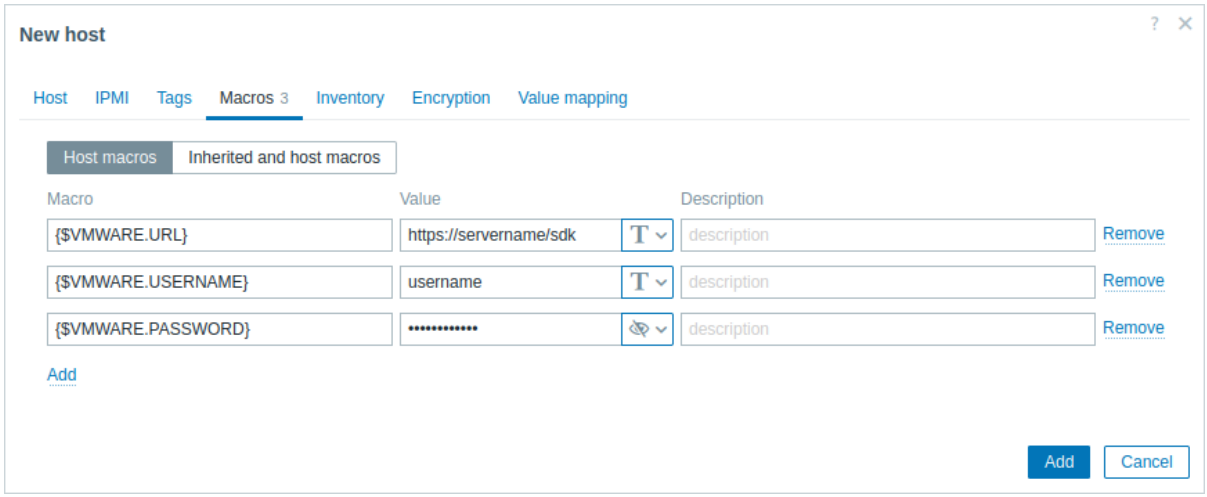
Prerequisites

> **Note:**
> This example does not cover the configuration of VMware. It is assumed that VMware is already configured.



Before proceeding, set the `StartVMwareCollectors` parameter in Zabbix server configuration file to 2 or more (the default value is 0).

Create a host

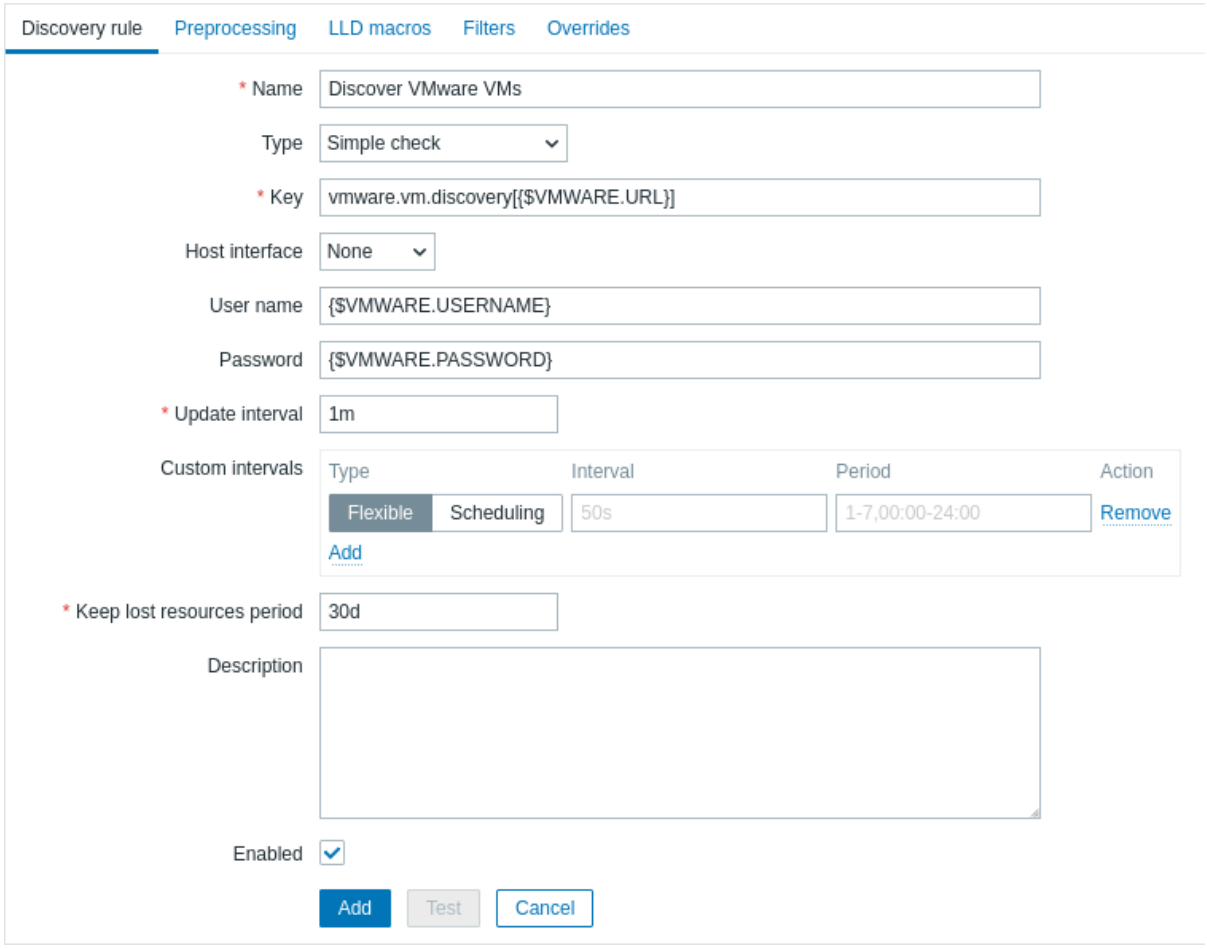


1. Go to *Data collection* > *Hosts*.

2. Create a host:

- In the *Host name* field, enter a host name (for example, "VMware VMs").
- In the *Host groups* field, type or select a host group (for example, "Virtual machines").

- In the *Macros* tab, set the following host macros:
  - {$VMWARE.URL} - VMware service (ESXi hypervisor) SDK URL (https://servername/sdk)
  - {$VMWARE.USERNAME} - VMware service user name
  - {$VMWARE.PASSWORD} - VMware service {$VMWARE.USERNAME} user password



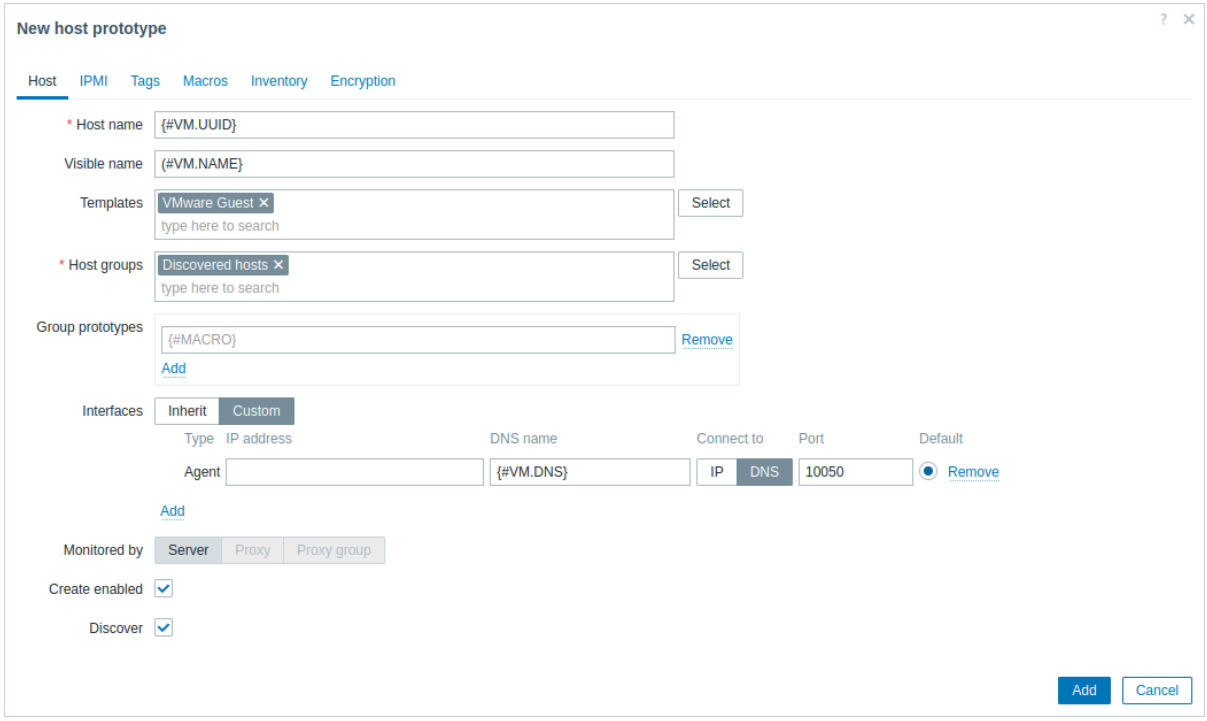
3. Click the *Add* button to create the host. This host will represent your VMware environment.

Create a low-level discovery rule

1. Click *Discovery* for the created host to go to the list of low-level discovery rules for that host.

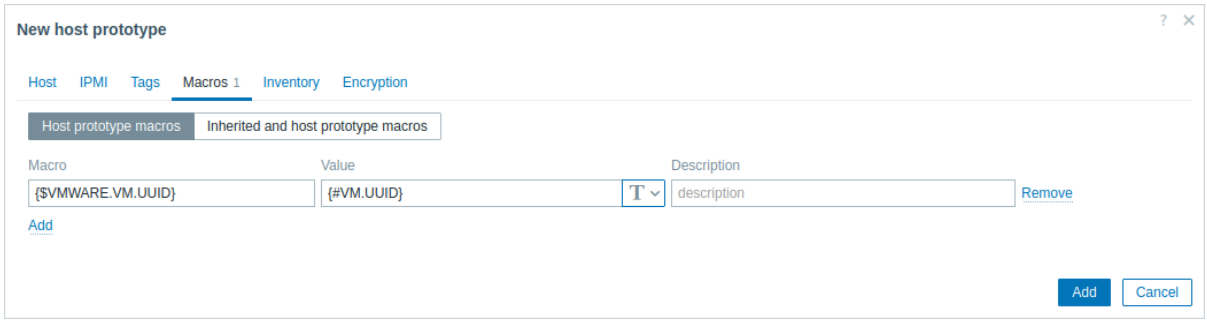
2. Create a low-level discovery rule:

- In the *Name* field, enter a low-level discovery rule name (for example, "Discover VMware VMs").
- In the *Type* field, select "Simple check".
- In the *Key* field, enter the built-in item key for discovering VMware virtual machines: `vmware.vm.discovery[{$VMWARE.URL}]`
- In the *User name* and *Password* fields, enter the corresponding macros previously configured on the host.



3. Click the *Add* button to create the low-level discovery rule. This discovery rule will discover virtual machines in your VMware environment.

Create a host prototype

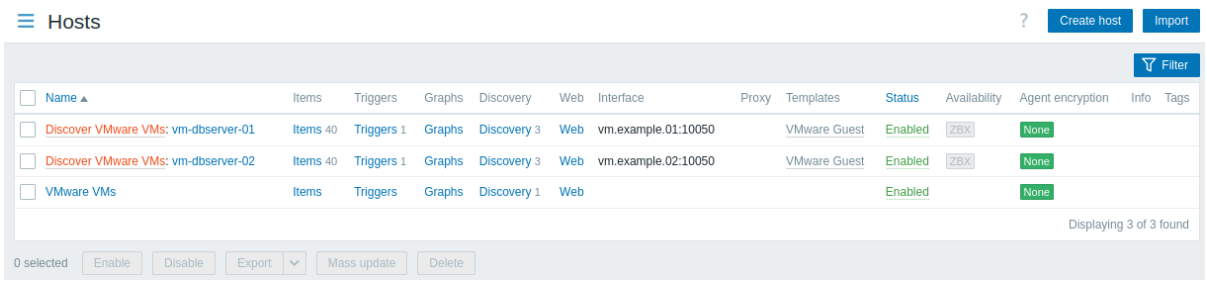


1. In the list of low-level discovery rules, click *Host prototypes* for the previously created low-level discovery rule.

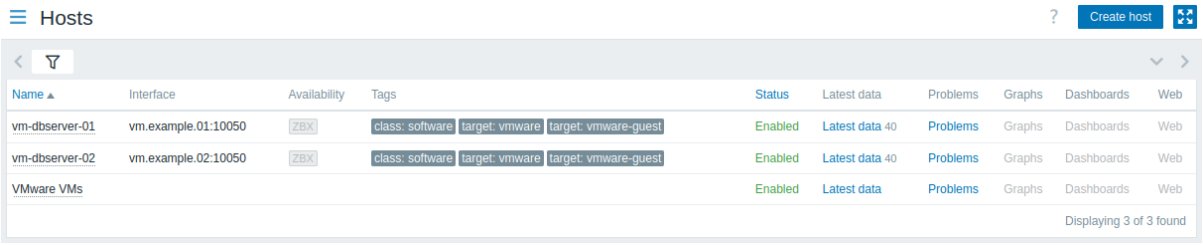
2. Create a host prototype. Since host prototypes are blueprints for creating hosts through low-level discovery rules, most fields will contain low-level discovery macros. This ensures that the hosts are created with properties based on the content retrieved by the previously created low-level discovery rule.

- In the *Host name* field, enter the macro {#VM.UUID}.
- In the *Visible name* field, enter the macro {#VM.NAME}.
- In the *Templates* field, enter or select the ”VMware Guest” template. This template contains VMware items and discovery rules for monitoring the power state of a virtual machine, CPU usage, memory usage, network devices, etc.
- In the *Host groups* field, enter or select a host group (for example, ”Discovered hosts”).
- In the *Interfaces* field, add a custom host interface. Then, enter the macro {#VM.DNS} in the *DNS name* field, or enter the macro {#VM.IP} in the *IP address* field. Alternatively, if your VMware environment virtual machines have multiple interfaces, proceed to the *Advanced host interface configuration* section. Configuring a custom host interface is necessary for the correct functioning of the *VMware Guest* template.

- In the *Macros* tab, set the {$VMWARE.VM.UUID} macro with the value {#VM.UUID}. This is necessary for the correct functioning of the *VMware Guest* template that uses this macro as a host-level user macro in item parameters (for example, *vmware.vm.net.if.discovery[{$VMWARE.URL}, {$VMWARE.VM.UUID}]*).



3. Click the *Add* button to create the host prototype. This host prototype will be used to create hosts for virtual machines discovered by the previously created low-level discovery rule.



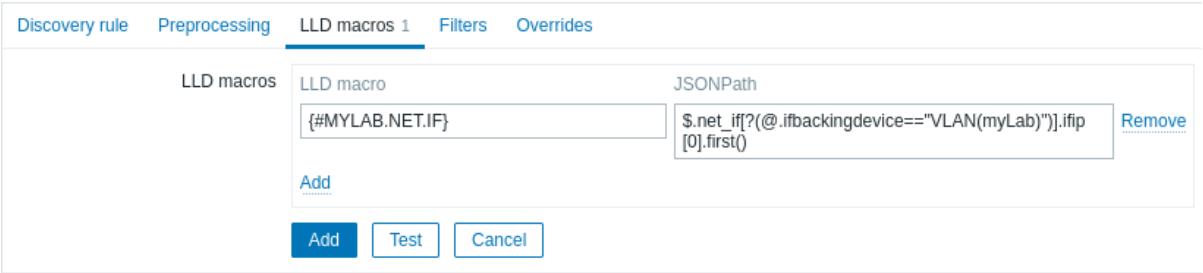
View hosts and metrics

After the host prototype has been created, the low-level discovery rule will create hosts for discovered VMware virtual machines, and Zabbix will start to monitor them. Note that the discovery and creation of hosts can also be executed manually, if necessary.

To view the created hosts, navigate to the *Data collection > Hosts* menu section.

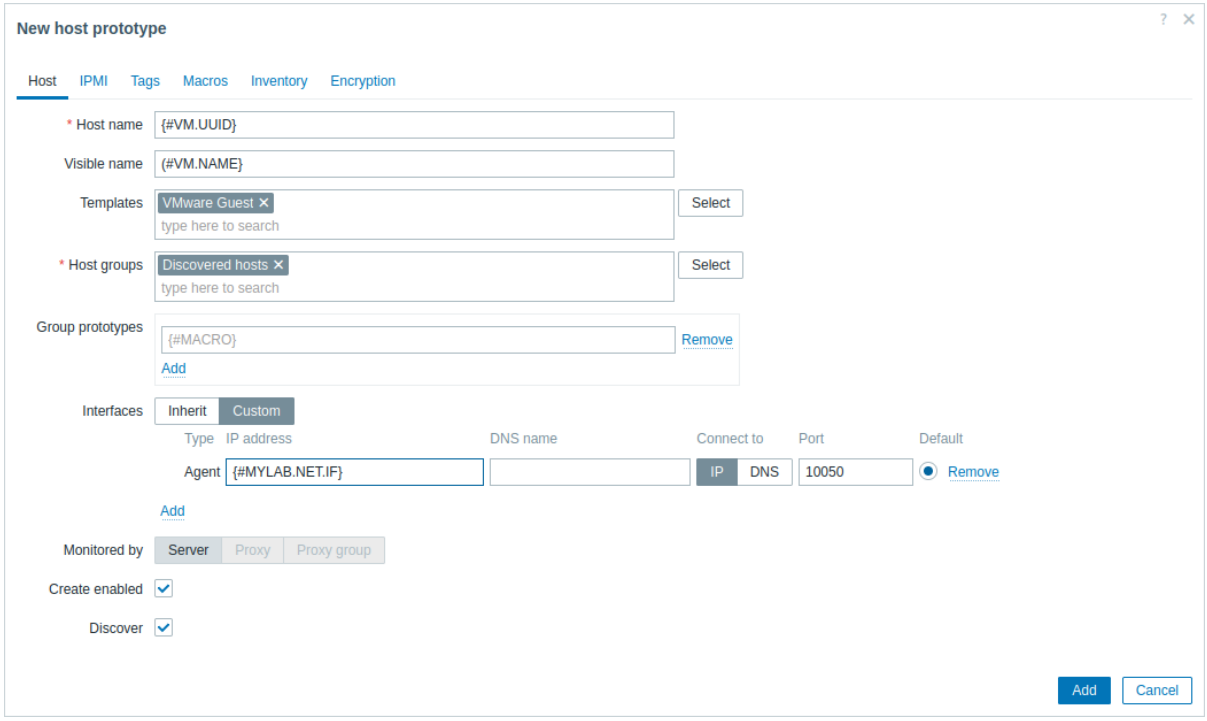
To view collected metrics, navigate to the *Monitoring > Hosts* menu section and click *Latest data* for one of the hosts.

Advanced host interface configuration



The `vmware.vm.discovery[{$VMWARE.URL}]` item key, configured in the *Create a low-level discovery rule* section, returns network interfaces data in the "net_if" field:

```
"net_if": [
      {
        "ifname": "5000",
        "ifdesc": "Network adapter 1",
        "ifmac": "00:11:22:33:44:55",
        "ifconnected": true,
        "iftype": "VirtualVmxnet3",
        "ifbackingdevice": "VLAN(myLab)",
        "ifdvswitch_uuid": "",
        "ifdvswitch_portgroup": "",
        "ifdvswitch_port": "",
        "ifip": [
          "127.0.0.1",
          "::1"
        ]
      },
      {
        "ifname": "5001",
        "ifdesc": "Network adapter 2",
        "ifmac": "00:11:22:33:44:55",
        "ifconnected": false,
        "iftype": "VirtualVmxnet3",
        "ifbackingdevice": "VLAN(myLab2)",
        "ifdvswitch_uuid": "",
        "ifdvswitch_portgroup": "",
        "ifdvswitch_port": "",
        "ifip": []
      }
    ]
```



This data can be used to configure a custom host interface.

1. When creating a low-level discovery rule, additionally configure a low-level discovery macro. In the *LLD macros* tab, create a custom LLD macro with a JSONPath value. For example:

- `{#MYLAB.NET.IF}` - `$.net_if[?(@.ifbackingdevice=="VLAN(myLab)")].ifip[0].first()`

2. When creating a host prototype, add a custom host interface and enter the LLD macro in the *DNS name* or *IP address* field.

Web monitoring

Overview With Zabbix you can check several availability aspects of web sites.

Attention:
To perform web monitoring Zabbix server must be initially configured with cURL (libcurl) support.

To activate web monitoring you need to define web scenarios. A web scenario consists of one or several HTTP requests or "steps". The steps are periodically executed by Zabbix server in a pre-defined order. If a host is monitored by proxy, the steps are executed by the proxy.

Web scenarios are attached to hosts/templates in the same way as items, triggers, etc. That means that web scenarios can also be created on a template level and then applied to multiple hosts in one move.

The following information is collected in any web scenario:

- average download speed per second for all steps of whole scenario
- number of the step that failed
- last error message

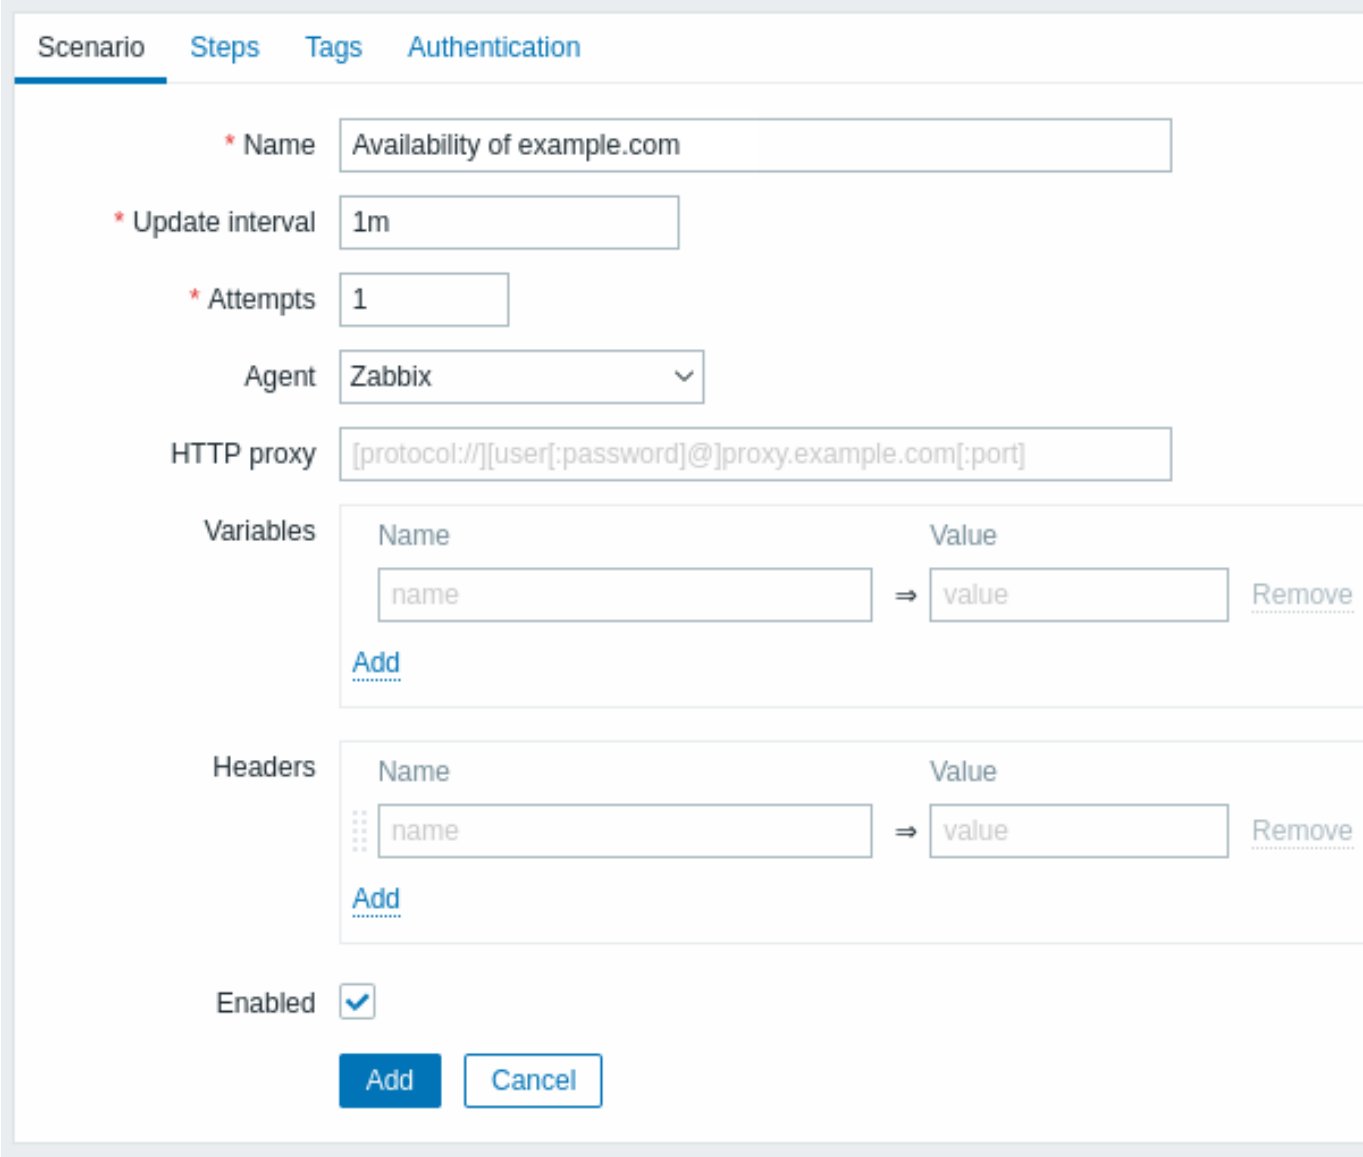
The following information is collected in any web scenario step:

- download speed per second
- response time
- response code

For more details, see web monitoring items.

Data collected from executing web scenarios is kept in the database. The data is automatically used for graphs, triggers and notifications.

Zabbix can also check if a retrieved HTML page contains a pre-defined string. It can execute a simulated login and follow a path of simulated mouse clicks on the page.



Zabbix web monitoring supports both HTTP and HTTPS. When running a web scenario, Zabbix will optionally follow redirects (see option *Follow redirects* below). Maximum number of redirects is hard-coded to 10 (using cURL option CURLOPT_MAXREDIRS). All cookies are preserved during the execution of a single scenario.

Configuring a web scenario To configure a web scenario:

1. Go to: *Data collection* > *Hosts* (or *Templates*).

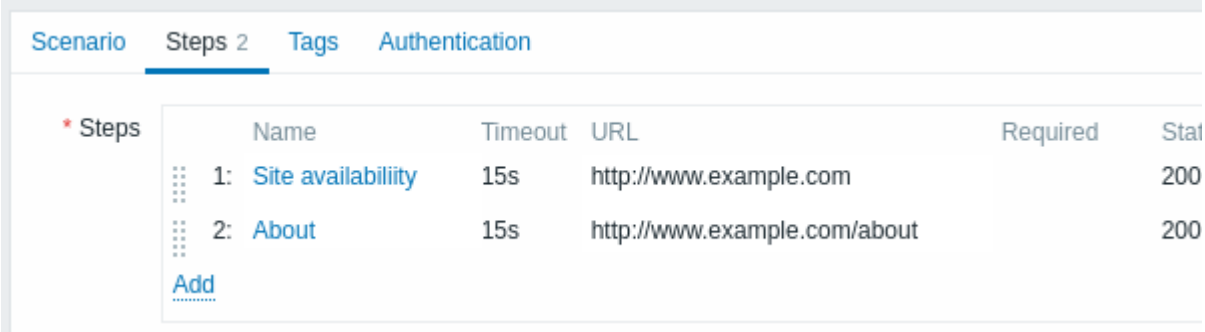
2. Click *Web* in the row of the host/template.
3. Click *Create web scenario* to the right (or the scenario name to edit an existing scenario).
4. Enter parameters of the scenario in the form.

The **Scenario** tab allows you to configure the general parameters of a web scenario.

All mandatory input fields are marked with a red asterisk.

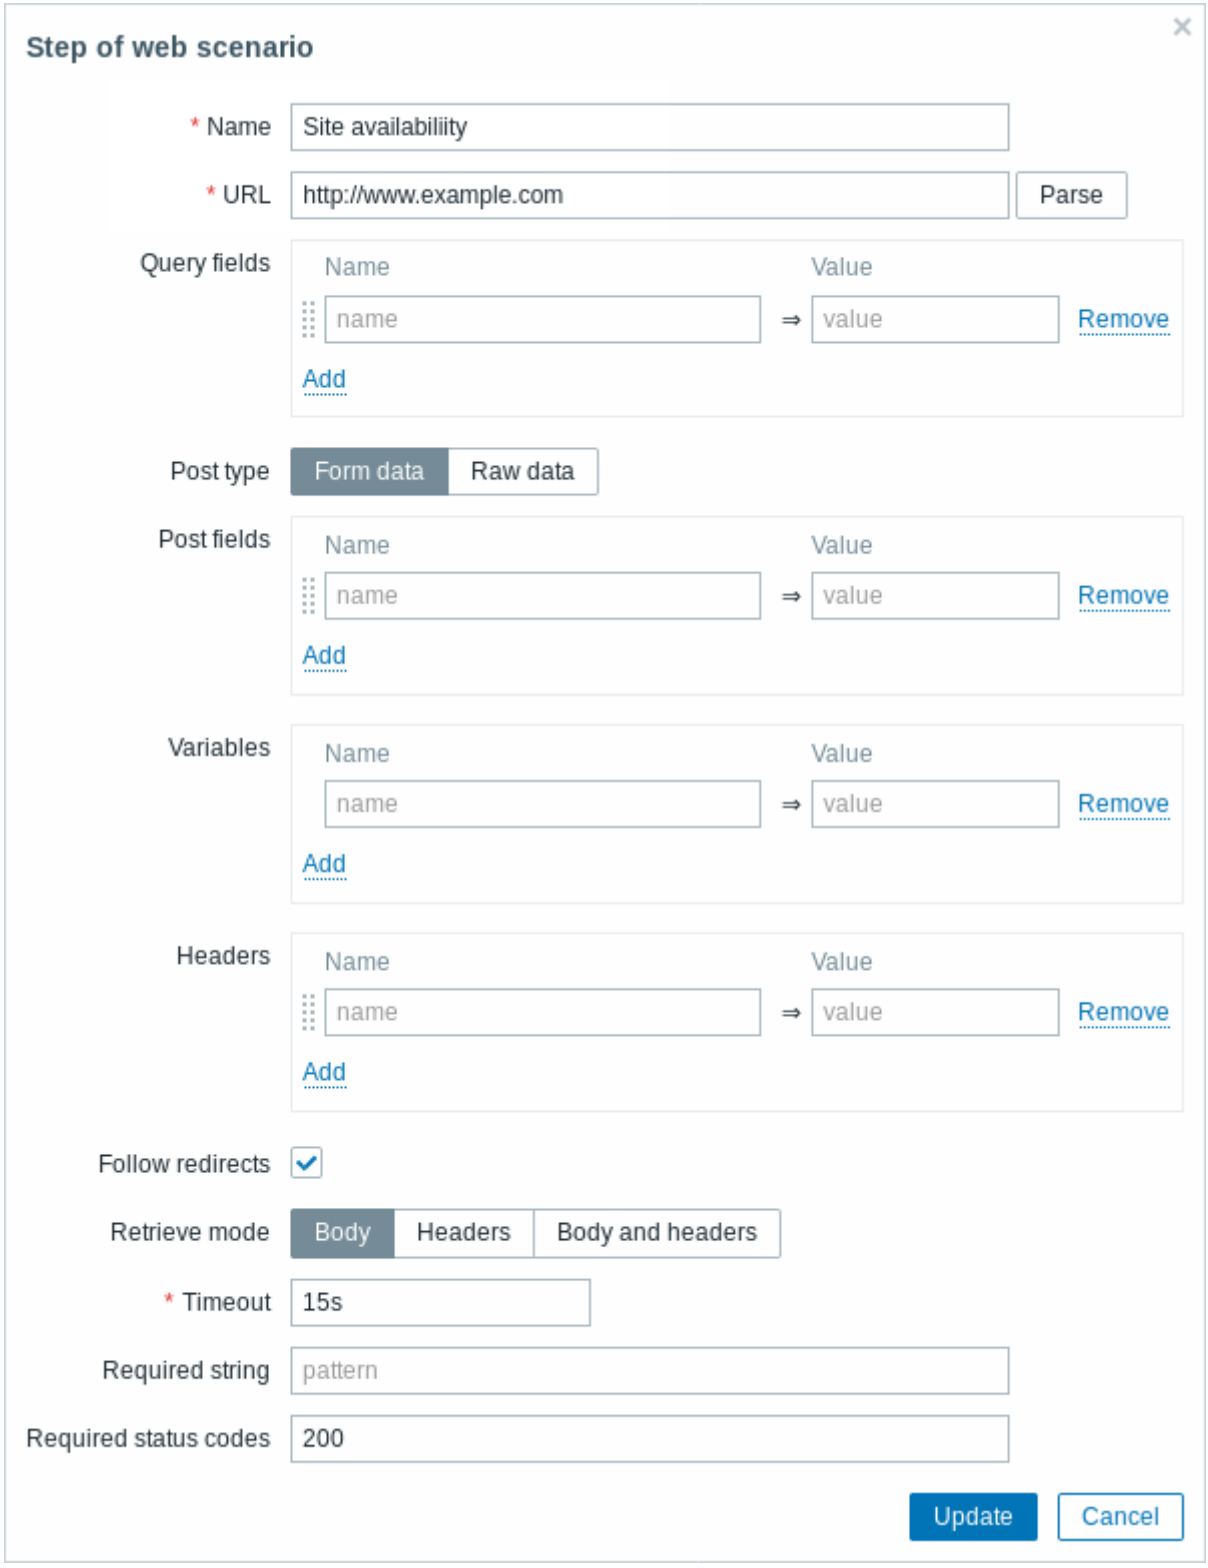
Scenario parameters:

Parameter	Description
Name	Unique scenario name. User macros are supported. *Note* that if user macros are used, these macros will be left unresolved in web monitoring item names.
Update interval	How often the scenario will be executed. Time suffixes are supported, e.g., 30s, 1m, 2h, 1d. User macros are supported. *Note* that if a user macro is used and its value is changed (e.g., 5m → 30s), the next check will be executed according to the previous value (farther in the future with the example values). New web scenarios will be checked within 60 seconds of their creation.
Attempts	The number of attempts for executing web scenario steps. In case of network problems (timeout, no connectivity, etc) Zabbix can repeat executing a step several times. The figure set will equally affect each step of the scenario. Up to 10 attempts can be specified, default value is 1. *Note*: Zabbix will not repeat a step because of a wrong response code or the mismatch of a required string.



Parameter	Description
Agent	Select a client agent. Zabbix will pretend to be the selected browser. This is useful when a website returns different content for different browsers. User macros can be used in this field.
HTTP proxy	You can specify an HTTP proxy to use, using the format `[protocol://][username[:password]@]proxy.example.com[:port]`. This sets the CURLOPT_PROXY cURL option. The optional `protocol://` prefix may be used to specify alternative proxy protocols (the protocol prefix support was added in cURL 7.21.7). With no protocol specified, the proxy will be treated as an HTTP proxy. By default, 1080 port will be used. If specified, the proxy will overwrite proxy related environment variables like http_proxy, HTTPS_PROXY. If not specified, the proxy will not overwrite proxy-related environment variables. The entered value is passed on "as is", no sanity checking takes place. You may also enter a SOCKS proxy address. If you specify the wrong protocol, the connection will fail and the item will become unsupported. *Note* that only simple authentication is supported with HTTP proxy. User macros can be used in this field.
Variables	Variables that may be used in scenario steps (URL, post variables). They have the following format: **{macro1}**=value1 **{macro2}**=value2 **{macro3}**=regex:<regular expression> **{macro4}**=jsonpath:<jsonpath> **{macro5}**=xmlxpath:<xmlxpath> **{macro6}**={{macro}.function()} (see macro functions) For example: {username}=Alexei {password}=kj3h5kJ34bd {hostid}=regex:hostid is ([0-9]+) {url}=jsonpath:$.host_url {status}=xmlxpath://host/response/status {newvar}={{myvar}.btoa()} The macros can then be referenced in the steps as {username}, {password}, {hostid}, etc. Zabbix will automatically replace them with actual values. Note that variables with `regex:` need one step to get the value of the regular expression so the extracted value can only be applied to the step after. If the value part starts with `regex:` then the part after it is treated as a regular expression that searches the web page and, if found, stores the match in the variable. At least one subgroup must be present so that the matched value can be extracted. User macros and {HOST.*} macros are supported. Variables are automatically URL-encoded when used in query fields or form data for post variables, but must be URL-encoded manually when used in raw post or directly in URL.
Headers	HTTP Headers are used when performing a request. Default and custom headers can be used. Headers will be assigned using default settings depending on the Agent type selected from a drop-down list on a scenario level, and will be applied to all the steps, unless they are custom defined on a step level. **It should be noted that defining the header on a step level automatically discards all the previously defined headers, except for a default header that is assigned by selecting the 'User-Agent' from a drop-down list on a scenario level.** However, even the 'User-Agent' default header can be overridden by specifying it on a step level. To unset the header on a scenario level, the header should be named and attributed with no value on a step level. Headers should be listed using the same syntax as they would appear in the HTTP protocol, optionally using some additional features supported by the CURLOPT_HTTPHEADER cURL option. For example: Accept-Charset=utf-8 Accept-Language=en-US Content-Type=application/xml; charset=utf-8 User macros and {HOST.*} macros are supported.
Enabled	The scenario is active if this box is checked; otherwise, it is disabled.

Note that when editing an existing scenario, two extra buttons are available in the form:



Clone	Create another scenario based on the properties of the existing one.
Clear history and trends	Delete history and trend data for the scenario. This will make the server perform the scenario immediately after deleting the data.

Note:
If *HTTP proxy* field is left empty, another way for using an HTTP proxy is to set proxy related environment variables.
For HTTP checks - set the `http_proxy` environment variable for the Zabbix server user. For example, `http_proxy=http://proxy_ip:proxy_port`.
For HTTPS checks - set the `HTTPS_PROXY` environment variable. For example, `HTTPS_PROXY=http://proxy_ip:proxy_port`.
More details are available by running a shell command: `# man curl`.

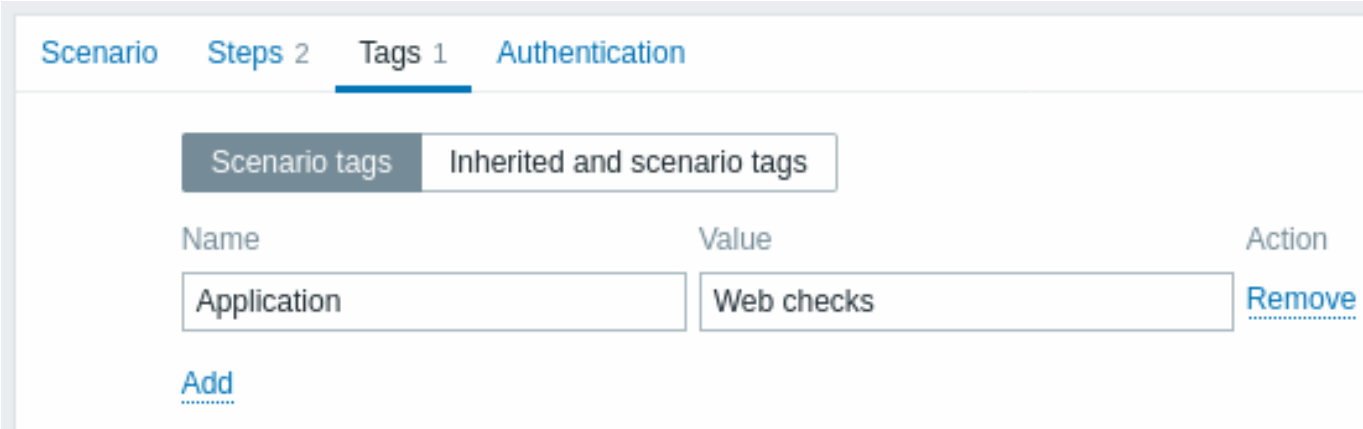
The **Steps** tab allows you to configure the web scenario steps. To add a web scenario step, click *Add* in the *Steps* block.

Note:
Secret user macros must not be used in URLs as they will resolve to "******".

Configuring steps

Step parameters:

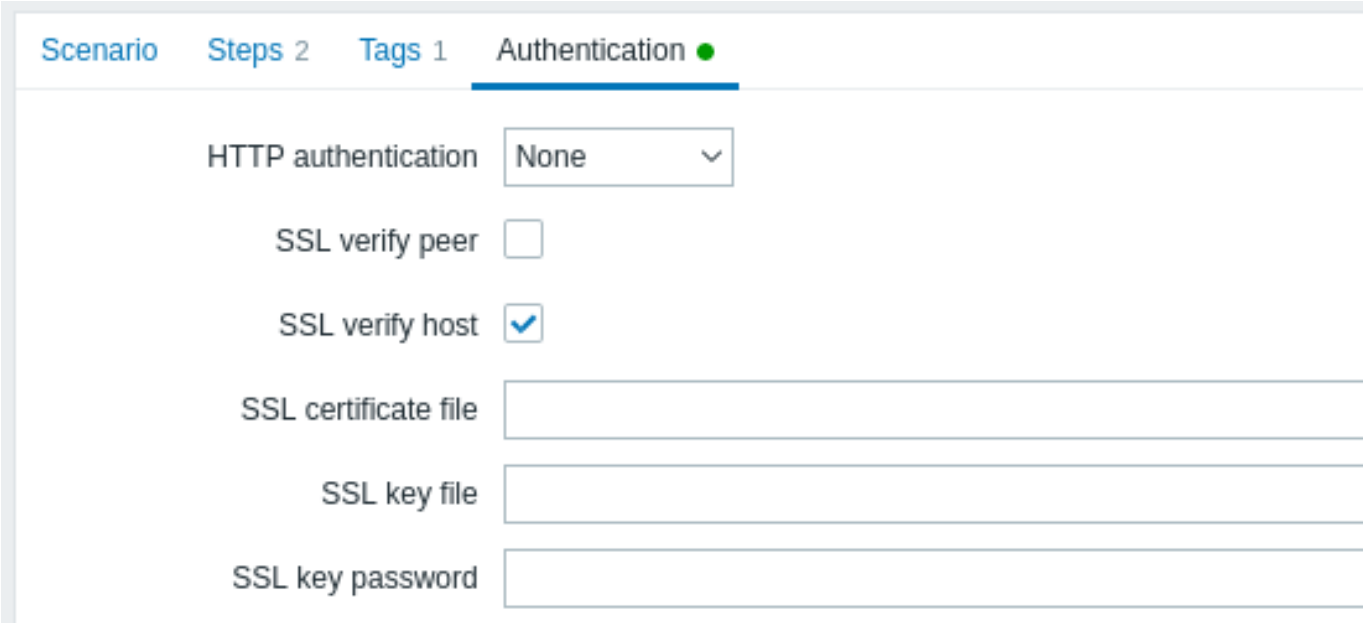
Parameter	Description
Name	Unique step name. User macros are supported. *Note* that if user macros are used, these macros will be left unresolved in web monitoring item names.



Parameter	Description
URL	URL to connect to and retrieve data. For example: https://www.example.com http://www.example.com/download Domain names can be specified in Unicode characters. They are automatically punycode-converted to ASCII when executing the web scenario step. The *Parse* button can be used to separate optional query fields (like `?key=value&limit=10`) from the URL, moving the attributes and values into *Query fields* for automatic URL-encoding. Variables can be used in the URL, using the {macro} syntax. Variables can be URL-encoded manually using a {{macro}.urlencode()} syntax. User macros and `{HOST.*}` macros are supported. For security reasons, do not include actual usernames or passwords in URLs. Use user macros instead to avoid exposing credentials. Limited to 2048 characters.
Query fields	HTTP GET variables for the URL. Specified as attribute and value pairs. Values are URL-encoded automatically. Values from scenario variables, user macros or `{HOST.*}` macros are resolved and then URL-encoded automatically. Using a {{macro}.urlencode()} syntax will double URL-encode them. User macros and `{HOST.*}` macros are supported.
Post	HTTP POST variables. In **Form data** mode, specified as attribute and value pairs. Values are URL-encoded automatically. Values from scenario variables, user macros or `{HOST.*}` macros are resolved and then URL-encoded automatically. In **Raw data** mode, attributes/values are displayed on a single line and concatenated with a **&** symbol. Raw values can be URL-encoded/decoded manually using a {{macro}.urlencode()} or {{macro}.urldecode()} syntax. For example: id=2345&userid={user} If {user} is defined as a variable of the web scenario, it will be replaced by its value when the step is executed. If you wish to URL-encode the variable, substitute {user} with {{user}.urlencode()}. User macros and `{HOST.*}` macros are supported.
Variables	Step-level variables that may be used for GET and POST functions. Specified as attribute and value pairs. Step-level variables override scenario-level variables or variables from the previous step. However, the value of a step-level variable only affects the step after (and not the current step). They have the following format: **{macro}**=value **{macro}**=regex:<regular expression> For more information see variable description on the scenario level. Variables are automatically URL-encoded when used in query fields or form data for post variables, but must be URL-encoded manually when used in raw post or directly in URL.
Headers	Custom HTTP headers that will be sent when performing a request. Specified as attribute and value pairs. A header defined on a step level will be used for that particular step. **It should be noted that defining the header on a step level automatically discards all the previously defined headers, except for a default header that is assigned by selecting the 'User-Agent' from a drop-down list on a scenario level.** However, even the 'User-Agent' default header can be overridden by specifying it on a step level. For example, assigning the name to a header, but setting no value will unset the default header on a scenario level. User macros and `{HOST.*}` macros are supported. This sets the `CURLOPT_HTTPHEADER` cURL option.
Follow redirects	Mark the checkbox to follow HTTP redirects. This sets the CURLOPT_FOLLOWLOCATION cURL option.
Retrieve mode	Select the retrieve mode: **Body** - retrieve only body from the HTTP response **Headers** - retrieve only headers from the HTTP response **Body and headers** - retrieve body and headers from the HTTP response

Parameter	Description
Timeout	Zabbix will not spend more than the set amount of time on processing the URL (from one second to maximum of 1 hour). Actually this parameter defines the maximum time for making connection to the URL and maximum time for performing an HTTP request. Therefore, Zabbix will not spend more than **2 x Timeout** seconds on the step. Time suffixes are supported, e.g., 30s, 1m, 1h. User macros are supported.
Required string	Required regular expression pattern. Unless retrieved content (HTML) matches the required pattern the step will fail. If empty, no check on required string is performed. For example: Homepage of Zabbix Welcome.*admin *Note*: Referencing regular expressions created in the Zabbix frontend is not supported in this field. User macros and `{HOST.*}` macros are supported.
Required status codes	List of expected HTTP status codes. If Zabbix gets a code which is not in the list, the step will fail. If empty, no check on status codes is performed. For example: 200,201,210-299 User macros are supported.

Note:
Any changes in web scenario steps will only be saved when the whole scenario is saved.



See also a real-life example of how web monitoring steps can be configured.

Configuring tags The **Tags** tab allows you to define scenario-level tags.

Tagging makes it possible to filter web scenarios and web monitoring items.

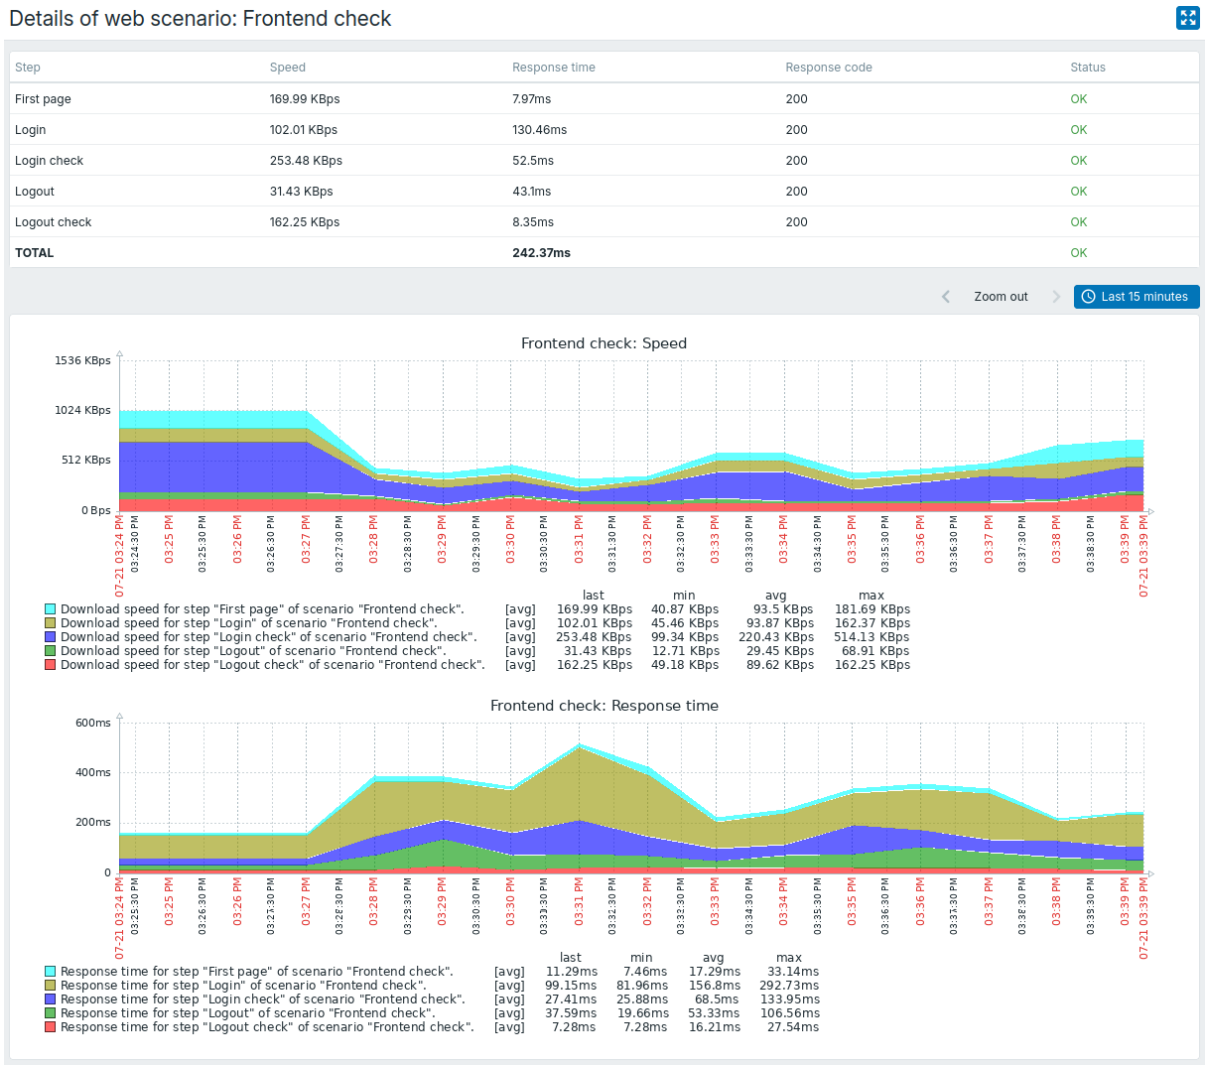
Configuring authentication The **Authentication** tab allows you to configure scenario authentication options. A green dot next to the tab name indicates that some type of HTTP authentication is enabled.

Authentication parameters:

Parameter	Description
HTTP authentication	Select the authentication option: **None** - no authentication used; **Basic** - basic authentication is used; **NTLM** - NTLM (Windows NT LAN Manager) authentication is used; **Kerberos** - Kerberos authentication is used (see also: Configuring Kerberos with Zabbix); **Digest** - Digest authentication is used.
User	Enter the user name (up to 255 characters). This field is available if *HTTP authentication* is set to Basic, NTLM, Kerberos, or Digest. User macros are supported.
Password	Enter the user password (up to 255 characters). This field is available if *HTTP authentication* is set to Basic, NTLM, Kerberos, or Digest. User macros are supported.
SSL verify peer	Mark the checkbox to verify the SSL certificate of the web server. The server certificate is verified against the trusted certificate authority (CA) certificates from the system-wide CA location. You can override the location of CA files using Zabbix server or proxy configuration parameter SSLCALocation. This sets the CURLOPT_SSL_VERIFYPEER cURL option.
SSL verify host	Mark the checkbox to verify that the *Common Name* field or the *Subject Alternate Name* field of the web server certificate matches. This sets the CURLOPT_SSL_VERIFYHOST cURL option.
SSL certificate file	Name of the SSL certificate file used for client authentication. The certificate file must be in PEM[1] format. If the certificate file contains also the private key, leave the *SSL key file* field empty. If the key is encrypted, specify the password in *SSL key password* field. The directory containing this file is specified by Zabbix server or proxy configuration parameter SSLCertLocation. `HOST.*` macros and user macros can be used in this field. This sets the CURLOPT_SSLCERT cURL option.
SSL key file	Name of the SSL private key file used for client authentication. The private key file must be in PEM[1] format. The directory containing this file is specified by Zabbix server or proxy configuration parameter SSLKeyLocation. `HOST.*` macros and user macros can be used in this field. This sets the CURLOPT_SSLKEY cURL option.
SSL key password	SSL private key file password. User macros can be used in this field. This sets the CURLOPT_KEYPASSWD cURL option.

Attention:
[1] Zabbix supports certificate and private key files in PEM format only. In case you have your certificate and private key data in PKCS #12 format file (usually with extension *.p12 or *.pfx) you may generate the PEM file from it using the following commands:

```
openssl pkcs12 -in ssl-cert.p12 -clcerts -nokeys -out ssl-cert.pem
openssl pkcs12 -in ssl-cert.p12 -nocerts -nodes  -out ssl-cert.key
```



Note:
Zabbix server picks up changes in certificates without a restart.

Note:
If you have client certificate and private key in a single file just specify it in a "SSL certificate file" field and leave "SSL key file" field empty. The certificate and key must still be in PEM format. Combining certificate and key is easy:

```
cat client.crt client.key > client.pem
```

Display To view web scenarios configured for a host:

1. Go to *Monitoring* > *Hosts*.
2. Locate the host in the list and click the *Web* hyperlink in the last column.
3. Click the scenario name to get detailed information.

An overview of web scenarios can also be displayed in *Dashboards* by the Web monitoring widget.

Recent results of the web scenario execution are available in the *Monitoring* > *Latest data* section.

Extended monitoring Sometimes it is necessary to log received HTML page content. This is especially useful if some web scenario step fails. Debug level 5 (trace) serves that purpose. This level can be set in server and proxy configuration files or

using a runtime control option (`-R log_level_increase="http poller,N"`, where N is the process number). The following examples demonstrate how extended monitoring can be started provided debug level 4 is already set:

```
# Increase log level of all http pollers:
zabbix_server -R log_level_increase="http poller"

# Increase log level of second http poller:
zabbix_server -R log_level_increase="http poller,2"
```

If extended web monitoring is not required it can be stopped using the `-R log_level_decrease` option.

Web monitoring items

Overview

Some new items are automatically added for monitoring when web scenarios are created.

All items inherit tags from the web scenario.

Scenario items

As soon as a scenario is created, Zabbix automatically adds the following items for monitoring.

Item	Description
Download speed for scenario <Scenario>	This item will collect information about the download speed (bytes per second) of the whole scenario, i.e. average for all steps. Item key: web.test.in[Scenario„bps] Type: *Numeric(float)*
Failed step of scenario <Scenario>	This item will display the number of the step that failed on the scenario. If all steps are executed successfully, 0 is returned. Item key: web.test.fail[Scenario] Type: *Numeric(unsigned)*
Last error message of scenario <Scenario>	This item returns the last error message text of the scenario. A new value is stored only if the scenario has a failed step. If all steps are ok, no new value is collected. Item key: web.test.error[Scenario] Type: *Character*

The actual scenario name will be used instead of ”Scenario”.

Note:
If the scenario name contains user macros, these macros will be left unresolved in web monitoring item names.

 If the scenario name starts with a doublequote or contains a comma or a square bracket, it will be properly quoted in item keys. In other cases no additional quoting will be performed.

Note:
Web monitoring items are added with a 30 day history and a 90 day trend retention period.

These items can be used to create triggers and define notification conditions.

Example 1

To create a ”Web scenario failed” trigger, you can define a trigger expression:

```
last(/host/web.test.fail[Scenario])<>0
```

Make sure to replace ’Scenario’ with the real name of your scenario.

Example 2

To create a ”Web scenario failed” trigger with a useful problem description in the trigger name, you can define a trigger with name:

```
Web scenario "Scenario" failed: {ITEM.VALUE}
```

and trigger expression:

```
length(last(/host/web.test.error[Scenario]))>0 and last(/host/web.test.fail[Scenario])>0
```

Make sure to replace 'Scenario' with the real name of your scenario.

Example 3

To create a "Web application is slow" trigger, you can define a trigger expression:

```
last(/host/web.test.in[Scenario,,bps])<10000
```

Make sure to replace 'Scenario' with the real name of your scenario.

Scenario step items

As soon as a step is created, Zabbix automatically adds the following items for monitoring.

Item	Description
Download speed for step <Step> of scenario <Scenario>	This item will collect information about the download speed (bytes per second) of the step. Item key: web.test.in[Scenario,Step,bps] Type: *Numeric(float)*
Response time for step <Step> of scenario <Scenario>	This item will collect information about the response time of the step in seconds. Response time is counted from the beginning of the request until all information has been transferred. Item key: web.test.time[Scenario,Step,resp] Type: *Numeric(float)*
Response code for step <Step> of scenario <Scenario>	This item will collect response codes of the step. Item key: web.test.rspcode[Scenario,Step] Type: *Numeric(unsigned)*

Actual scenario and step names will be used instead of "Scenario" and "Step" respectively.

Note:
Web monitoring items are added with a 30 day history and a 90 day trend retention period.

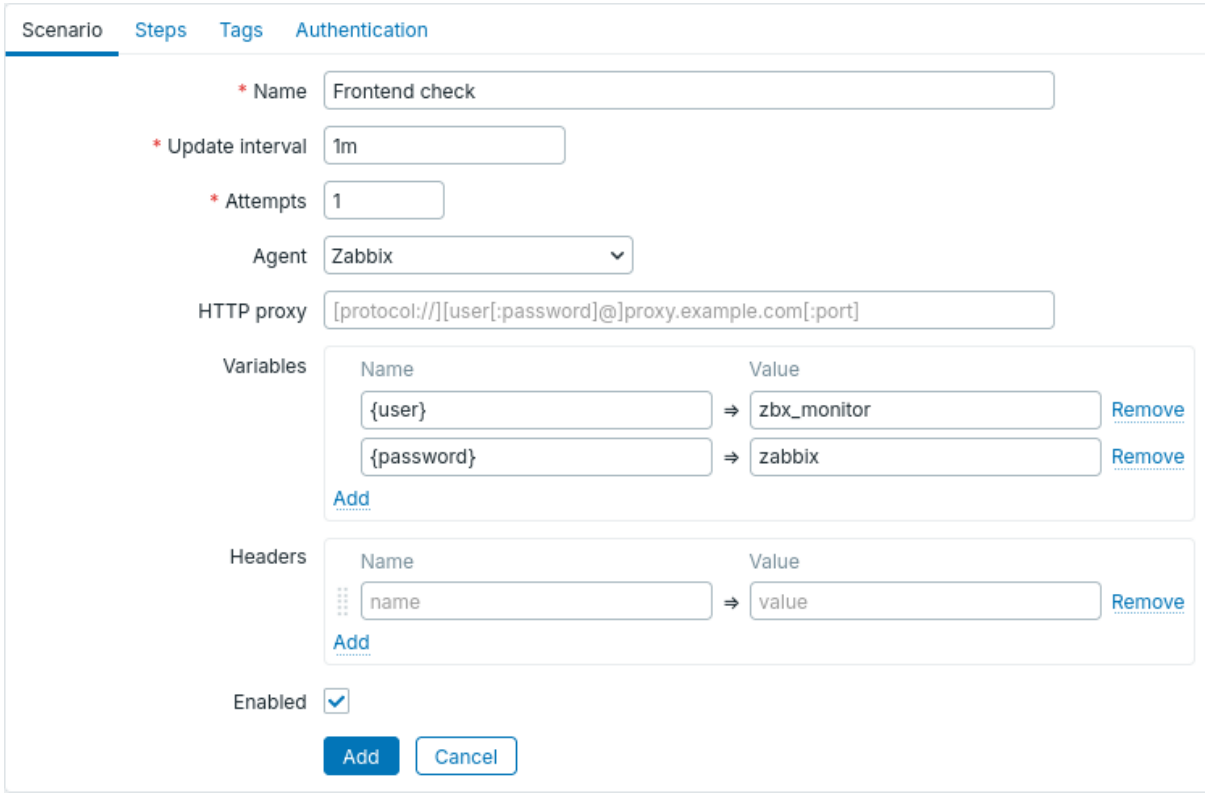
Note:
If scenario name starts with a doublequote or contains comma or square bracket, it will be properly quoted in item keys. In other cases no additional quoting will be performed.

These items can be used to create triggers and define notification conditions. For example, to create a "Zabbix GUI login is too slow" trigger, you can define a trigger expression:

```
last(/zabbix/web.test.time[ZABBIX GUI,Login,resp])>3
```

Real-life scenario

Overview



This section presents a step-by-step real-life example of how web monitoring can be used.

Zabbix web monitoring will be used to monitor Zabbix frontend. The goal is to determine if it is available, provides the right content, and how quickly it works. To achieve this, several steps are required, including checking the availability of the first page, logging in with a username and password, verifying the login success, logging out, and confirming the logout.

Scenario

Add a new web scenario

1. Go to *Data collection* > *Hosts*.
2. Choose a host and click *Web* in the row of that host.
3. Click *Create web scenario*.

4. In the new scenario form, on the *Scenario* tab, fill out the following fields:

    - *Name*: Frontend check.
    - *Update interval*: 1m.
    - *Attempts*: 1.
    - *Agent*: Zabbix.
 In the *Variables* section, add the following name-value pairs:
    - `{user}`: your existing Zabbix user credentials;
    - `{password}`: your existing Zabbix user credentials.

Note:
For safety reasons, it is recommended to create a separate user with minimal permissions to use for monitoring purposes.

Optionally, switch to the *Tags* tab and add web scenario tags. You can use web scenario tags to quickly identify related items and triggers or search through collected data. For example, suitable tags for this tutorial are `component: web-scenario` and/or `target: frontend`.

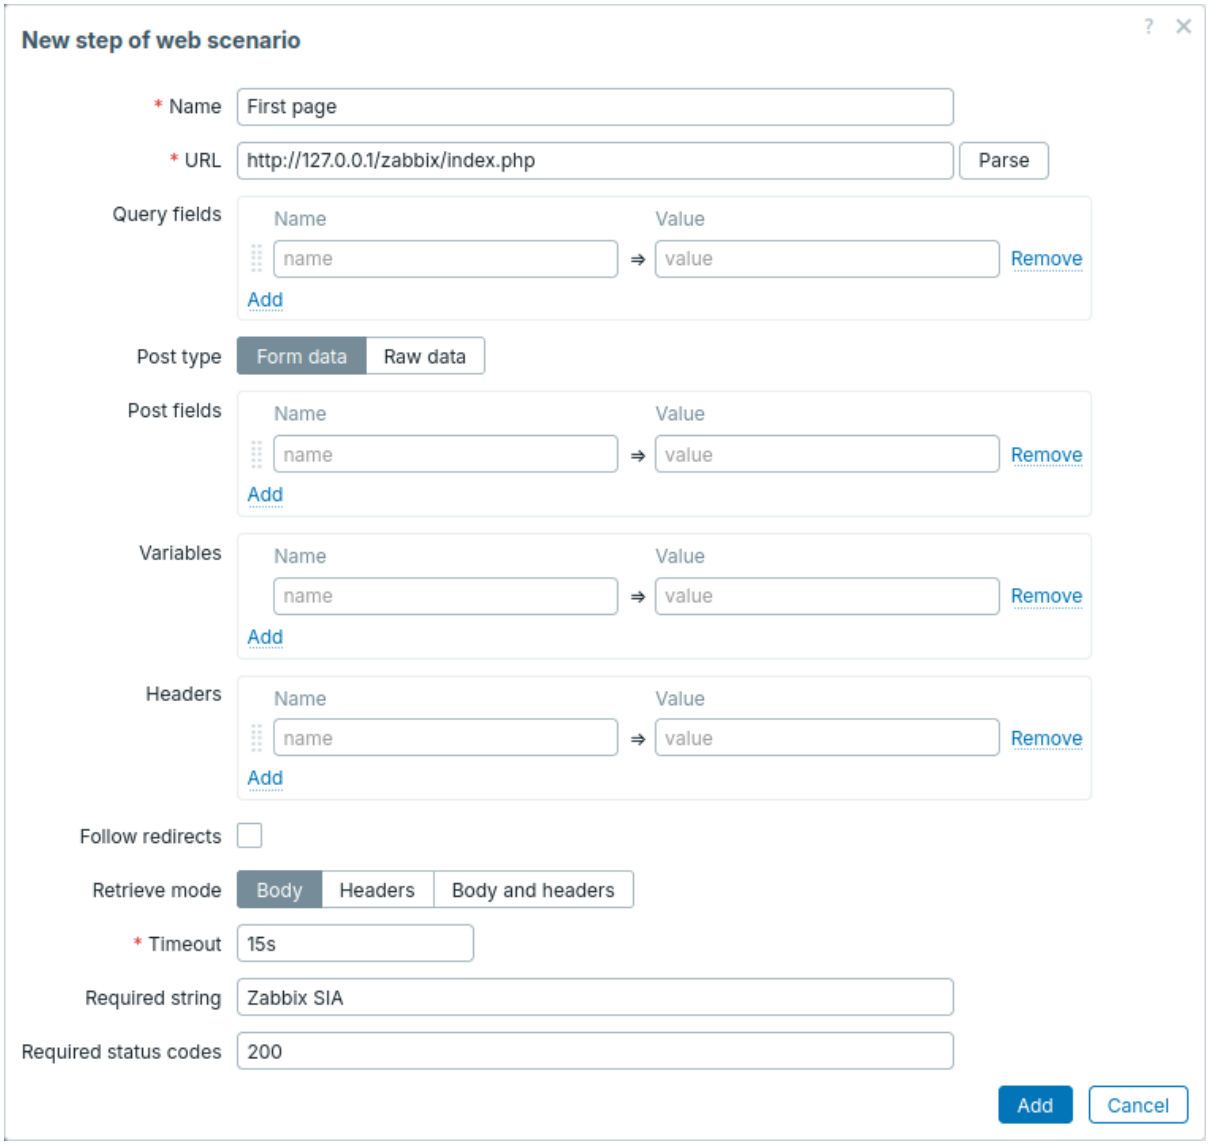
Configure web scenario steps

Switch to the *Steps* tab and define steps for the scenario.
 After configuring each step, click the *Add* button.

Attention:
Note that Zabbix frontend uses JavaScript redirect when logging in, so login must occur first, and logged-in features can be checked only in further steps. Additionally, the login step must use the full URL to **index.php** file.

Common fields for all steps

In addition to the step-specific fields, fill out the following common fields for each step described below:



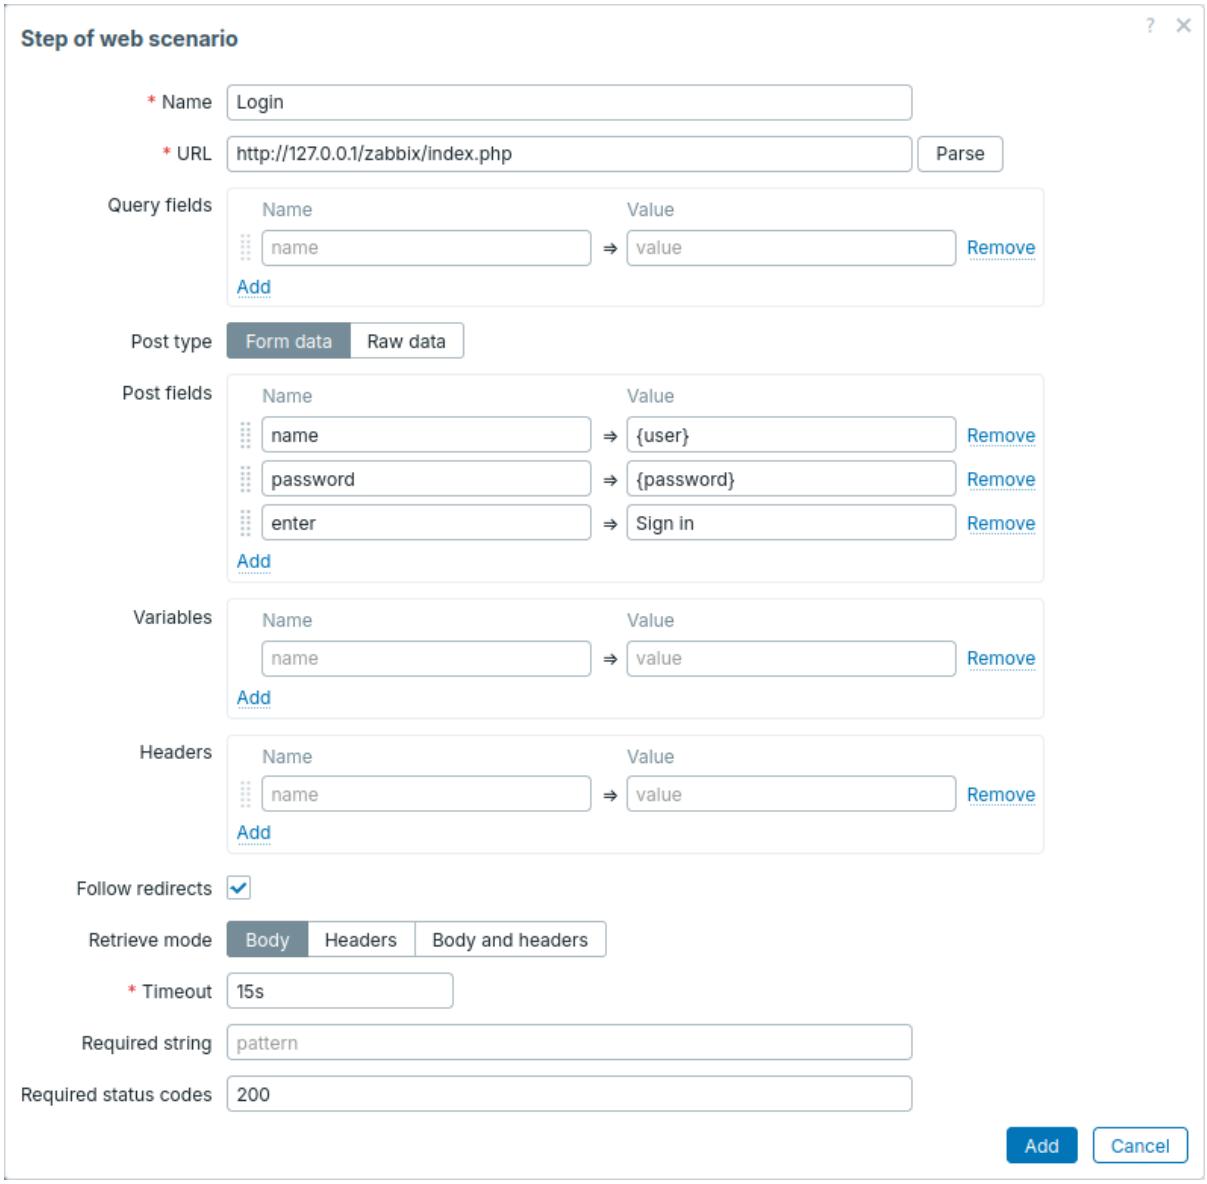
- *URL*: the URL of the Zabbix frontend (`http://<server_ip_or_name>/zabbix/index.php` (for Apache) or `http://<server_ip_o` (for NGINX)). For Web scenario step 3, use a different URL as described below.
- *Timeout*: 15s.
- *Required status codes*: 200.

Web scenario step 1

Check that the first page responds correctly, returns HTTP status code 200, and contains the text *Zabbix SIA*.
 Fill out the following fields:

- *Name*: First page.
- *Timeout*: 15s.
- *Required string*: Zabbix SIA.

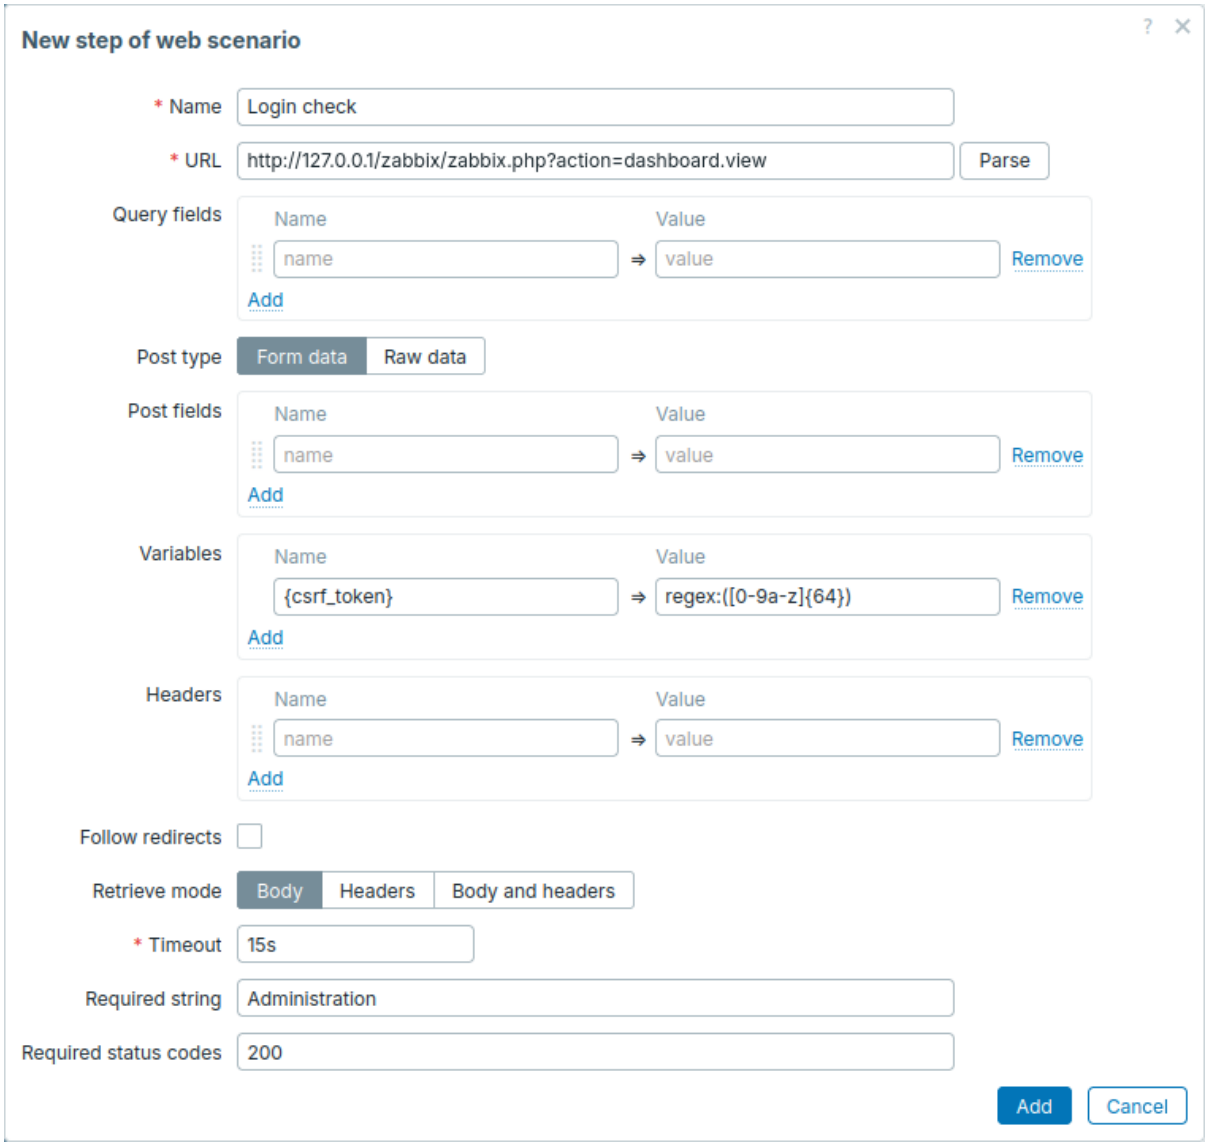
- The common fields for all steps.



Web scenario step 2

Log in to the Zabbix frontend using the macros (variables) defined in the *Scenario* tab: *{user}* and *{password}*.
 Fill out the following fields:

- *Name*: Login.
- In the *Post fields* section, add the following name-value pairs:
  - name: `{user}`;
  - password: `{password}`;
  - enter: Sign in.
- The common fields for all steps.

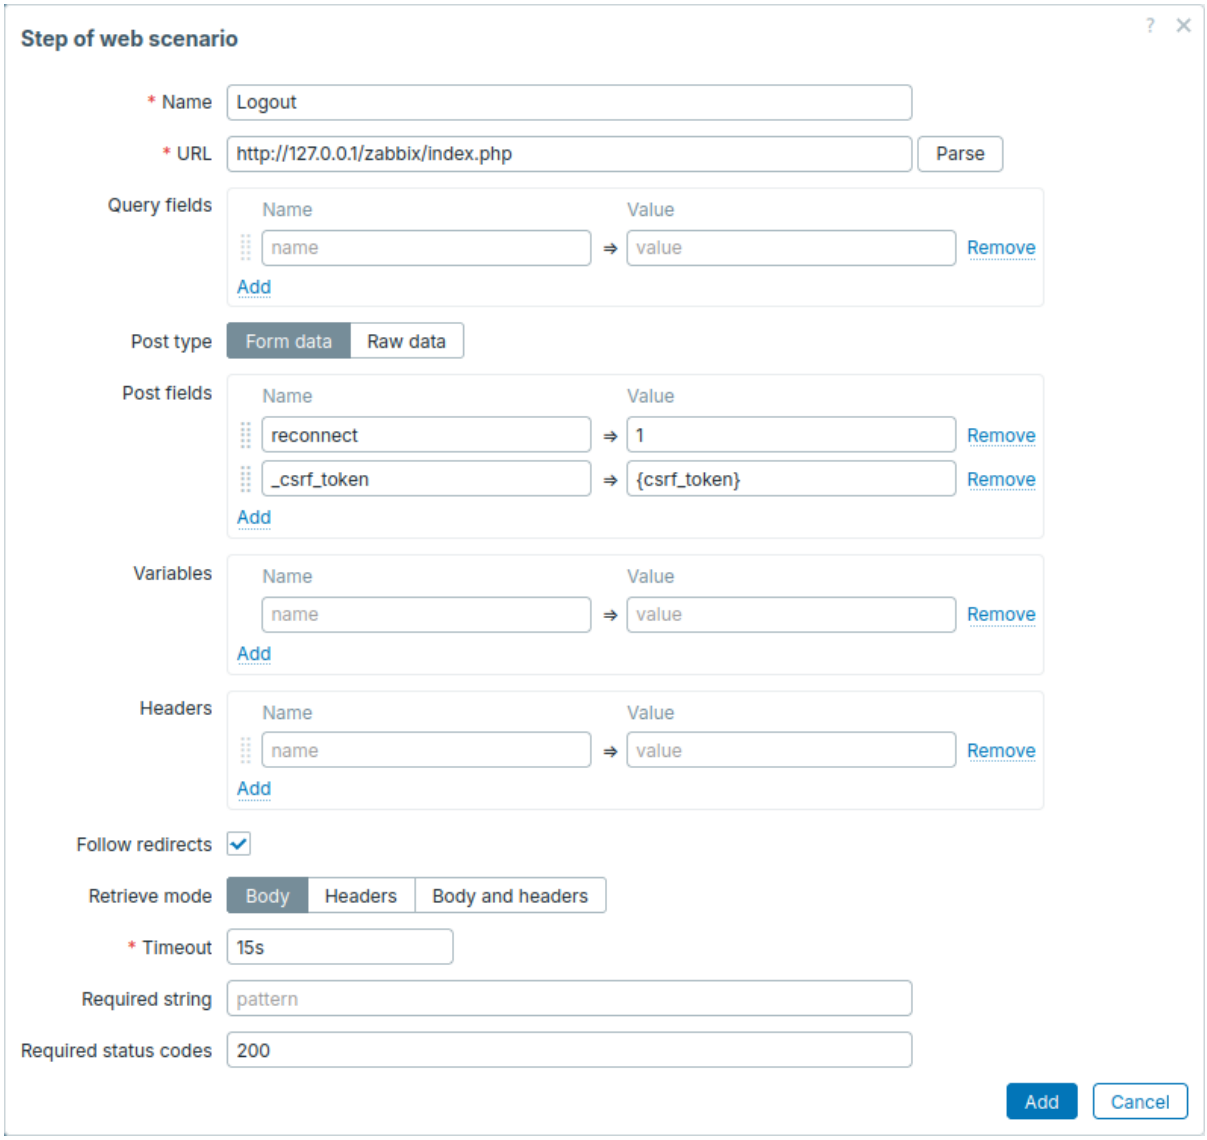


Select the *Follow redirects* checkbox.

Web scenario step 3

After logging in, verify success by checking for a string visible only when logged in, for example, *Administration*.
 Fill out the following fields:

- *Name*: Login check.
- *URL*: the URL to which the user is redirected after login (for example, http://127.0.0.1/zabbix/zabbix.php?action=dashboard.view).
- In the *Variables* section, add the name-value pair `{csrf_token}: regex:([0-9a-z]{64})`. This variable will catch the value of the assigned CSRF token to reuse in the web scenario step 4.
- *Required string*: Administration.
- The common fields for all steps.

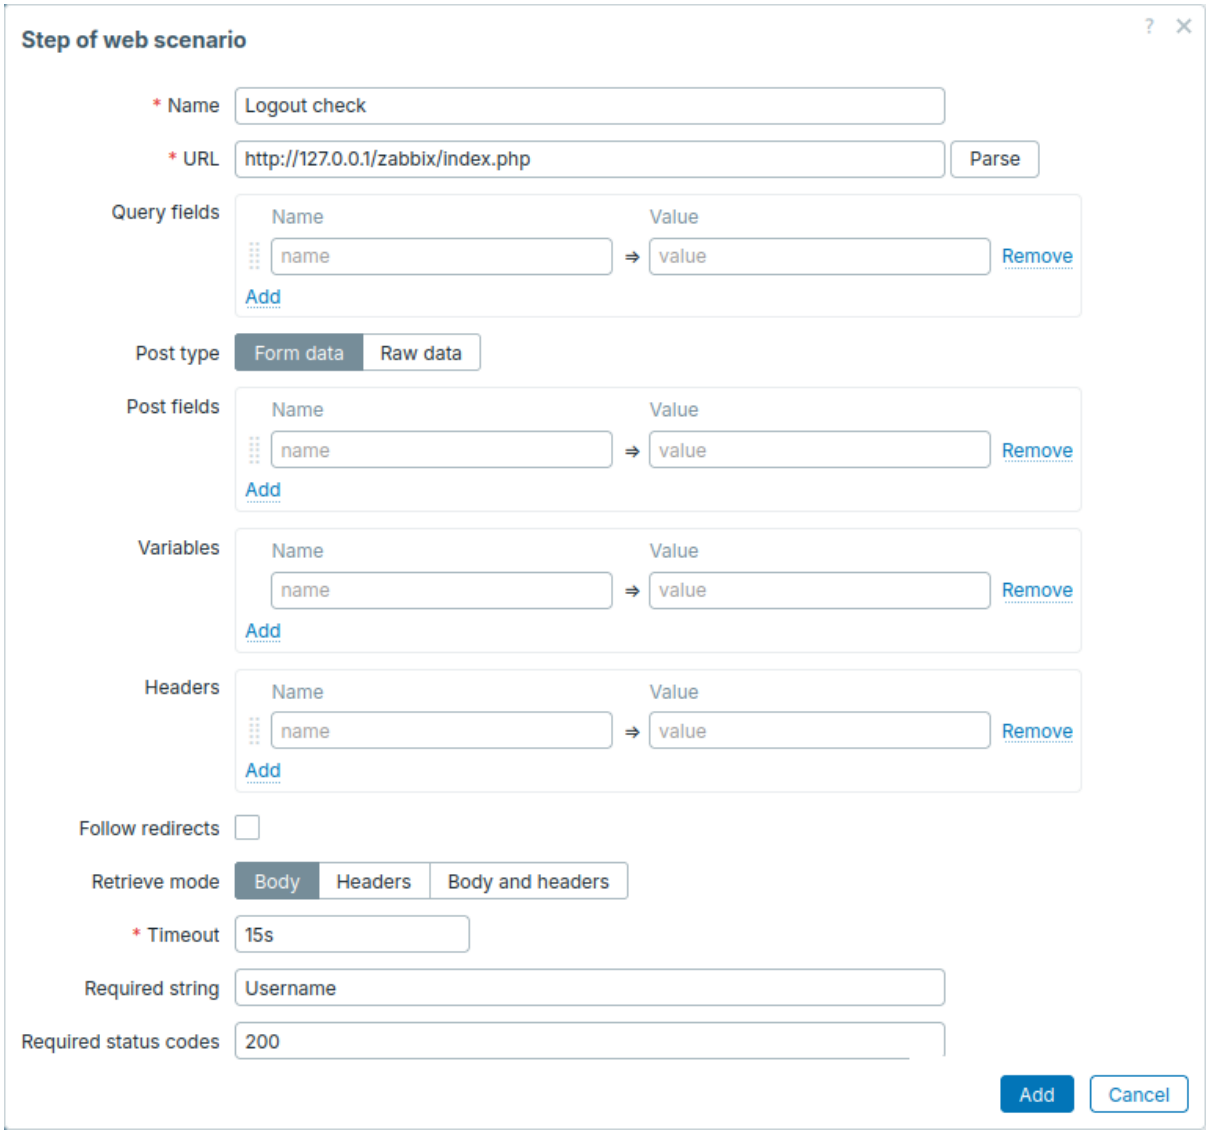


Web scenario step 4

Once the frontend's accessibility and login have been verified, add a logout step; otherwise, the Zabbix database will become cluttered with many open session records.
 Fill out the following fields:

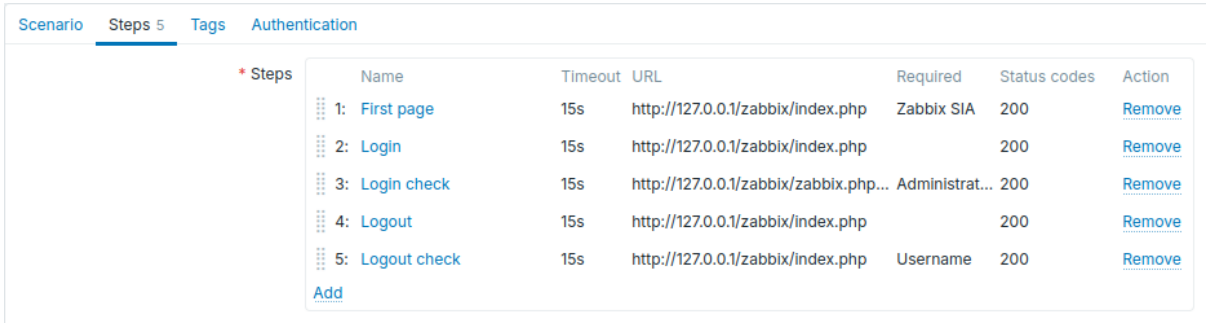
- *Name*: Logout.
- In the *Post fields* section, add the following name-value pairs:
  - reconnect: 1;
  - _csrf_token: `{csrf_token}`.
- The common fields for all steps.

Select the *Follow redirects* checkbox.



This step uses the variable `{csrf_token}` obtained in the web scenario step 3.

Web scenario step 5

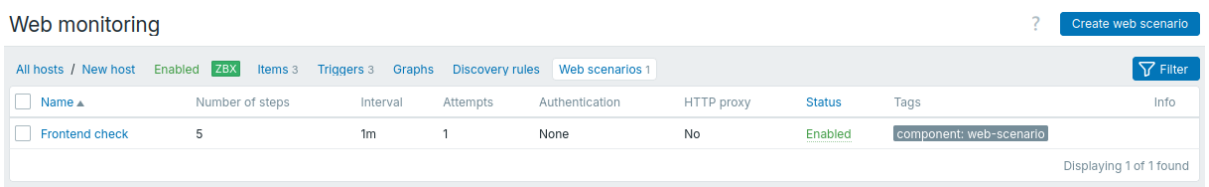


To confirm the logout, check for the *Username* string.
 Fill out the following fields:

- *Name*: Logout check.
- *Required string*: Username.
- The common fields for all steps.

Full configuration of steps

A complete configuration of web scenario steps should look like this:



Check the results

Save the finished web monitoring scenario.

When the web scenario is created, new web monitoring items are automatically added for monitoring.

The scenario will be added to the host. To view web scenario information go to *Monitoring* > *Hosts*, locate the host in the list and click the *Web* hyperlink in the last column.

Click the scenario name to see detailed statistics:

Service monitoring

Overview Service monitoring is a business-level monitoring that can be used to get an overview of the entire IT infrastructure service tree, identify weak places of the infrastructure, calculate SLA of various IT services, and check out other information at a higher level. Service monitoring focuses on the overall availability of a service instead of low-level details, such as the lack of disk space, high processor load, etc. Service monitoring also provides functionality to find the root cause of a problem if a service is not performing as expected.

Service monitoring provides a way to create a hierarchical representation of monitored data.

A very simple service structure may look like:

```
Service
|
|-Workstations
| |
| |-Workstation1
| |
| |-Workstation2
|
|-Servers
```

Each node of the structure has attribute status. The status is calculated and propagated to upper levels according to the selected algorithm. The status of individual nodes is affected by the status of the mapped problems. Problem mapping is accomplished with tagging.

Zabbix can send notifications or automatically execute a script on the Zabbix server in case a change of service state is detected. It is possible to define flexible rules whether a parent service should go into a 'Problem state' based on the statuses of child services. Services problem data can then be used to calculate SLA and send SLA reports based on the flexible set of conditions.

Service monitoring is configured in the Services menu, which consists of the following sections:

- Services

Services section allows you to build a hierarchy of your monitored infrastructure by adding parent services, and then - child services to the parent services.

In addition to configuring service tree, this section provides an overview of the whole infrastructure and allows you to quickly identify the problems that led to a change of service state.

- SLA

In this section you can define service level agreements and set service level objectives for specific services.

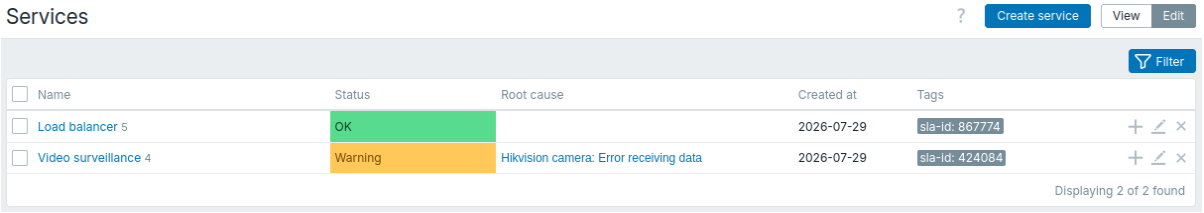
- SLA report

In this section you can view SLA reports.

Service actions

You may also configure service actions.

Service actions are optional and allow you to:

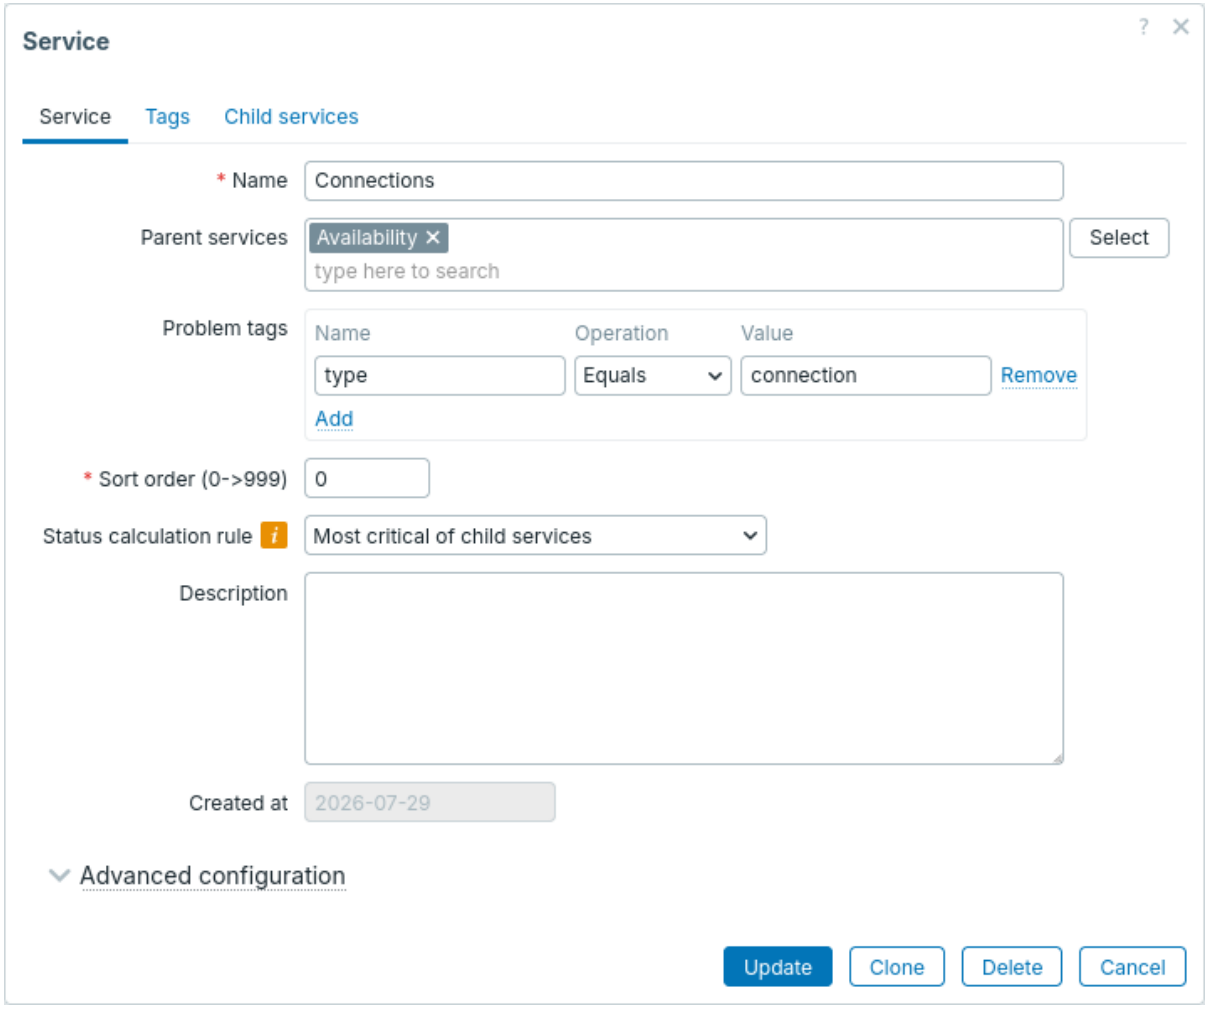


- send a notification that a service is down
- execute a remote command on Zabbix server upon a change of service state
- send a recovery notification when a service is up again.

See also:

- SLA monitoring configuration example
- Notes about upgrading services from Zabbix versions below 6.0

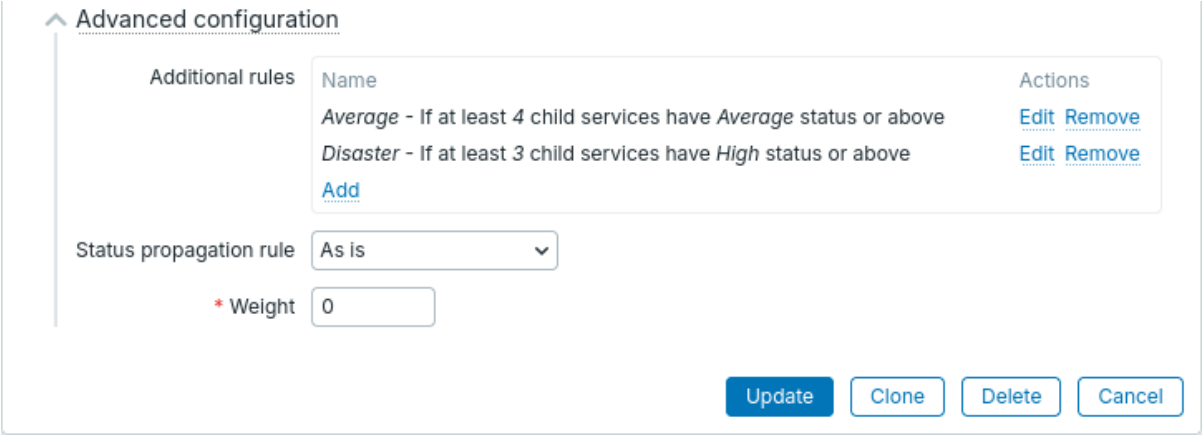
Service tree



The service tree is configured in the *Services* > *Services* menu section. In the upper-right corner, switch from view to edit mode.

To configure a new service, click the *Create service* button in the upper-right corner.

To quickly add a child service, you can alternatively click the plus icon next to the parent service. This will open the same service configuration form, but the *Parent services* parameter will be pre-filled.



Service configuration In the **Service** tab, specify required service parameters:

All mandatory input fields are marked with a red asterisk.

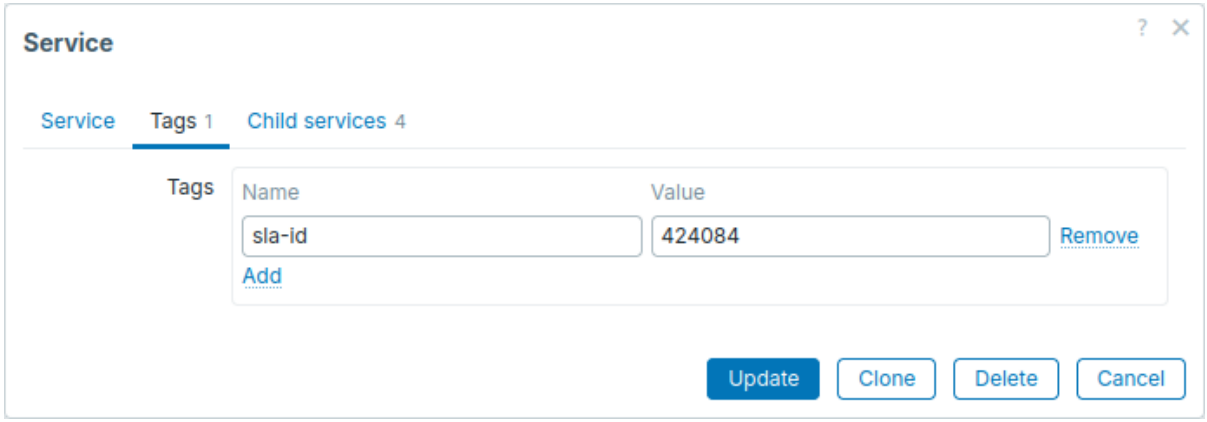
Parameter	Description
Name	Service name.
Parent services	Parent services the service belongs to. Leave this field empty if you are adding the service of highest level. One service may have multiple parent services. In this case, it will be displayed in the service tree under each of the parent services.
Problem tags	Specify tags to map problem data to the service. Several conditions can be set. Tag name matching is always case-sensitive. There are two operators available for each condition: **Equals** - include the specified tag names and values (case-sensitive) **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-sensitive)
Sort order	Sort order for display, lowest comes first.
Status calculation rule	Rule for calculating service status: **Most critical if all children have problems** - the most critical problem in the child services is used to color the service status, if all children have problems **Most critical of child services** - the most critical problem in the child services is used to color the service status **Set status to OK** - do not calculate service status Additional status calculation rules can be configured in the advanced configuration options.
Description	Service description.
Created at	The time when the service was created; displayed when editing an existing service.
Advanced configuration	Click the *Advanced configuration* header to display advanced configuration options.

Advanced configuration

Parameter	Description
Additional rules	Click *Add* to configure additional status calculation rules.
Set status to	Set service status to either *OK* (default), *Not classified*, *Information*, *Warning*, *Average*, *High* or *Disaster* in case of a condition match.
Condition	Select the condition for direct child services: **if at least (N) child services have (Status) status or above** **if at least (N%) of child services have (Status) status or above** **if less than (N) child services have (Status) status or below** **if less than (N%) of child services have (Status) status or below** **if weight of child services with (Status) status or above is at least (W)** **if weight of child services with (Status) status or above is at least (N%)** **if weight of child services with (Status) status or below is less than (W)** **if weight of child services with (Status) status or below is less than (N%)** If several conditions are specified and the situation matches more than one condition, the highest severity will be set.
N (W)	Set the value of N or W (1-100000), or N% (1-100) in the condition.
Status	Select the value of *Status* in the condition: *OK* (default), *Not classified*, *Information*, *Warning*, *Average*, *High* or *Disaster*.
Status propagation rule	Rule for propagating the service status to the parent service: **As is** - the status is propagated without change **Increase by** - you may increase the propagated status by 1 to 5 severities **Decrease by** - you may decrease the propagated status by 1 to 5 severities **Ignore this service** - the status is not propagated to the parent service at all **Fixed status** - the status is propagated statically, i.e. as always the same
Weight	Weight of the service (integer in the range from 0 (default) to 1000000).

Note:
Additional status calculation rules can only be used to increase severity level over the level calculated according to the main *Status calculation rule* parameter. If according to additional rules the status should be Warning, but according to the *Status calculation rule* the status is Disaster - the service will have status Disaster.

The *Tags* tab contains service-level tags. Service-level tags are used to identify a service. Tags of this type are not used to map problems to the service (for that, use *Problem tags* from the first tab).



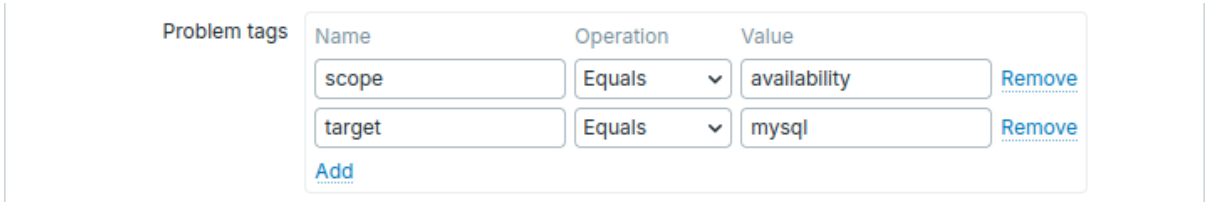
The *Child services* tab allows you to specify dependant services. Click *Add* to add a service from the list of existing services. If you want to add a new child service, save this service first, then click a plus icon next to the service that you have just created.

Tags There are two different types of tags in services:

- Service tags
- Problem tags

Service tags

Service tags are used to match services with service actions and SLAs. These tags are specified at the *Tags* service configuration tab. For mapping SLAs, *OR* logic is used: a service will be mapped to an SLA if it has at least one matching tag. In service actions, mapping rules are configurable and can use either *AND*, *OR*, or *AND/OR* logic.

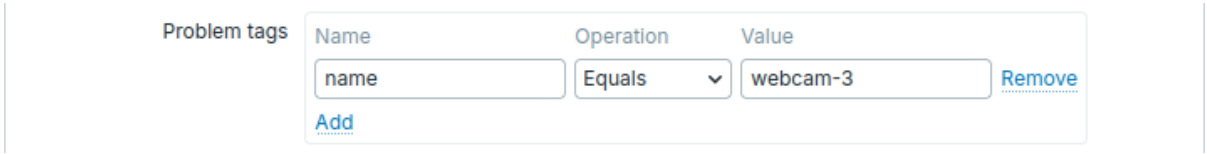


Problem tags

Problem tags are used to match problems and services. These tags are specified at the primary service configuration tab.

Only child services of the lowest hierarchy level may have problem tags defined and be directly correlated to problems. If problem tags match, the service status will change to the same status as the problem has. In case of several problems, a service will have the status of the most severe one. Status of a parent service is then calculated based on child services statuses according to Status calculation rules.

If several tags are specified, *AND* logic is used: a problem must have all tags specified in the service configuration to be mapped to the service.



Note:
A problem in Zabbix inherits tags from the whole chain of templates, hosts, items, web scenarios, and triggers. Any of these tags can be used for matching problems to services.

Example:

Problem *Web camera 3 is down* has tags `type:video-surveillance`, `floor:1` and `name:webcam-3` and status *Warning*

The service **Web camera 3** has the only problem tag specified: `name:webcam-3`

Service status will change from *OK* to *Warning* when this problem is detected.

If the service **Web camera 3** had problem tags `name:webcam-3` and `floor:2`, its status would not be changed, when the problem is detected, because the conditions are only partially met.

Modifying existing services

Note:
The buttons described below are visible only when the *Services* section is in edit mode.

To edit an existing service, click the pencil icon next to the service.

To clone an existing service, click the pencil icon to open its configuration and then click the *Clone* button. When a service is cloned, its parent links are preserved, while the child links are not.

To delete a service, click the x icon next to it. When you delete a parent service, its child services will not be deleted and will move one level higher in the service tree (1st level children will get the same level as the deleted parent service).

Two buttons below the list of services offer some mass-editing options:

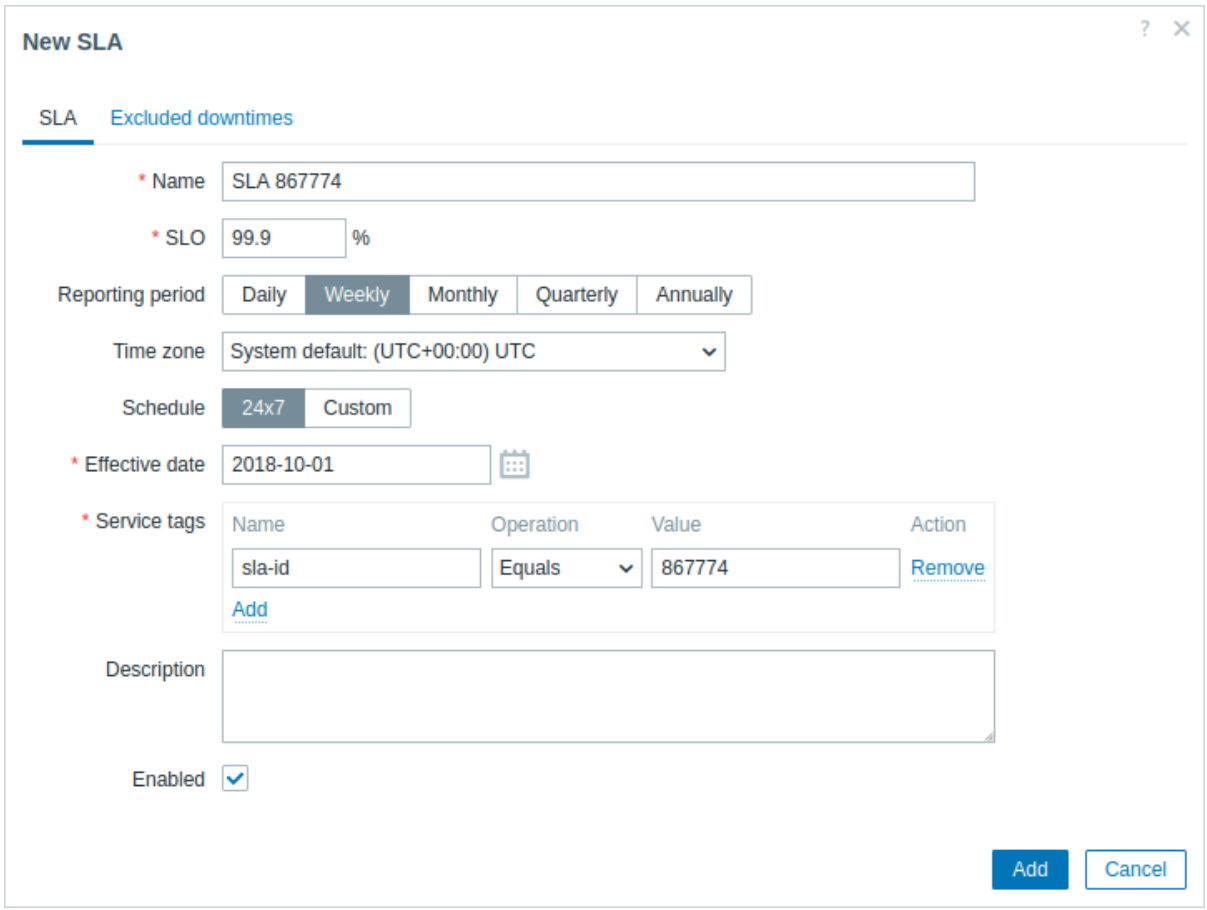
- *Mass update* - mass update service properties

- *Delete* - delete the services

To use these options, mark the checkboxes before the respective services, then click the required button.

SLA

Overview Once the services are created, you can start monitoring whether their performance is on track with service level agreement (SLA).

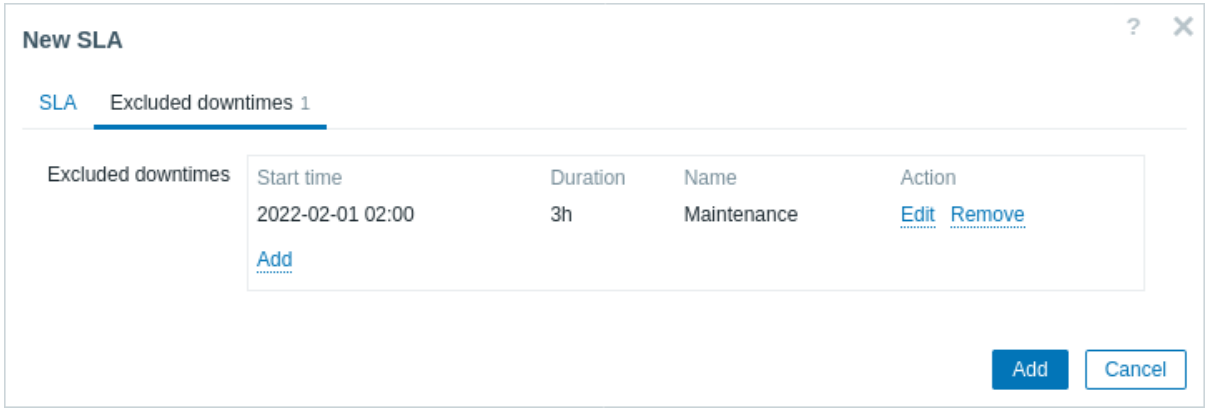


Services > *SLA* menu section allows SLAs to be configured for various services. An SLA in Zabbix defines service level objective (SLO), expected uptime schedule and planned downtimes.

SLAs and services are matched by service tags. The same SLA may be applied to multiple services - performance will be measured for each matching service separately. A single service may have multiple SLAs assigned - data for each of the SLAs will be displayed separately.

In SLA reports Zabbix provides Service level indicator (SLI) data, which measures real service availability. Whether a service meets the SLA targets is determined by comparing SLO (expected availability in %) with SLI (real-life availability in %).

Configuration To create a new SLA, click the *Create SLA* button.



The *SLA* tab allows you to specify general SLA parameters.

Parameter	Description
Name	Enter the SLA name.
SLO	Enter the service level objective (SLO) as percentage.
Reporting period	Select the SLI reporting period used for calculating the SLI data in the SLA report: **Daily** - each day, from 00:00:00 to 23:59:59. **Weekly** - each week, from Sunday 00:00:00 to Saturday 23:59:59. **Monthly** - each month, from the first day 00:00:00 to the last day 23:59:59. **Quarterly** - each calendar quarter: Q1 (Jan-Mar), Q2 (Apr-Jun), Q3 (Jul-Sep), Q4 (Oct-Dec). **Annually** - each calendar year, from January 1 00:00:00 to December 31 23:59:59.
Time zone	Select the SLA time zone.

Parameter	Description
Schedule	Select the SLA schedule - 24x7 or custom.
Effective date	Select the date of starting SLA calculation.
Service tags	Add service tags to identify the services towards which this SLA should be applied. **Name** - service tag name, must be exact match, case-sensitive. **Operation** - select *Equals* if the tag value must match exactly (case-sensitive) or *Contains* if part of the tag value must match (case-insensitive). **Value** - service tag value to search for according to selected operation. The SLA is applied to a service, if at least one service tag matches.
Description	Add a description for the SLA.
Enabled	Mark the checkbox to enable the SLA calculation.

The *Excluded downtimes* tab allows you to specify downtimes that are excluded from the SLA calculation.

Click *Add* to configure excluded downtimes, then enter the period name, start date and duration.

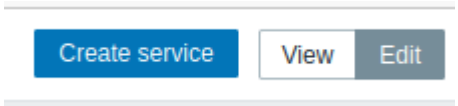
SLA reports How a service performs compared to an SLA is visible in the SLA report. SLA reports can be viewed:

- from the *SLA* section by clicking the SLA report hyperlink;
- from the *Services* section by clicking the SLA name in the info tab;
- in the Dashboard widget *SLA report*.

Once an SLA is configured, the *Info* tab in the services section will also display some information about service performance.

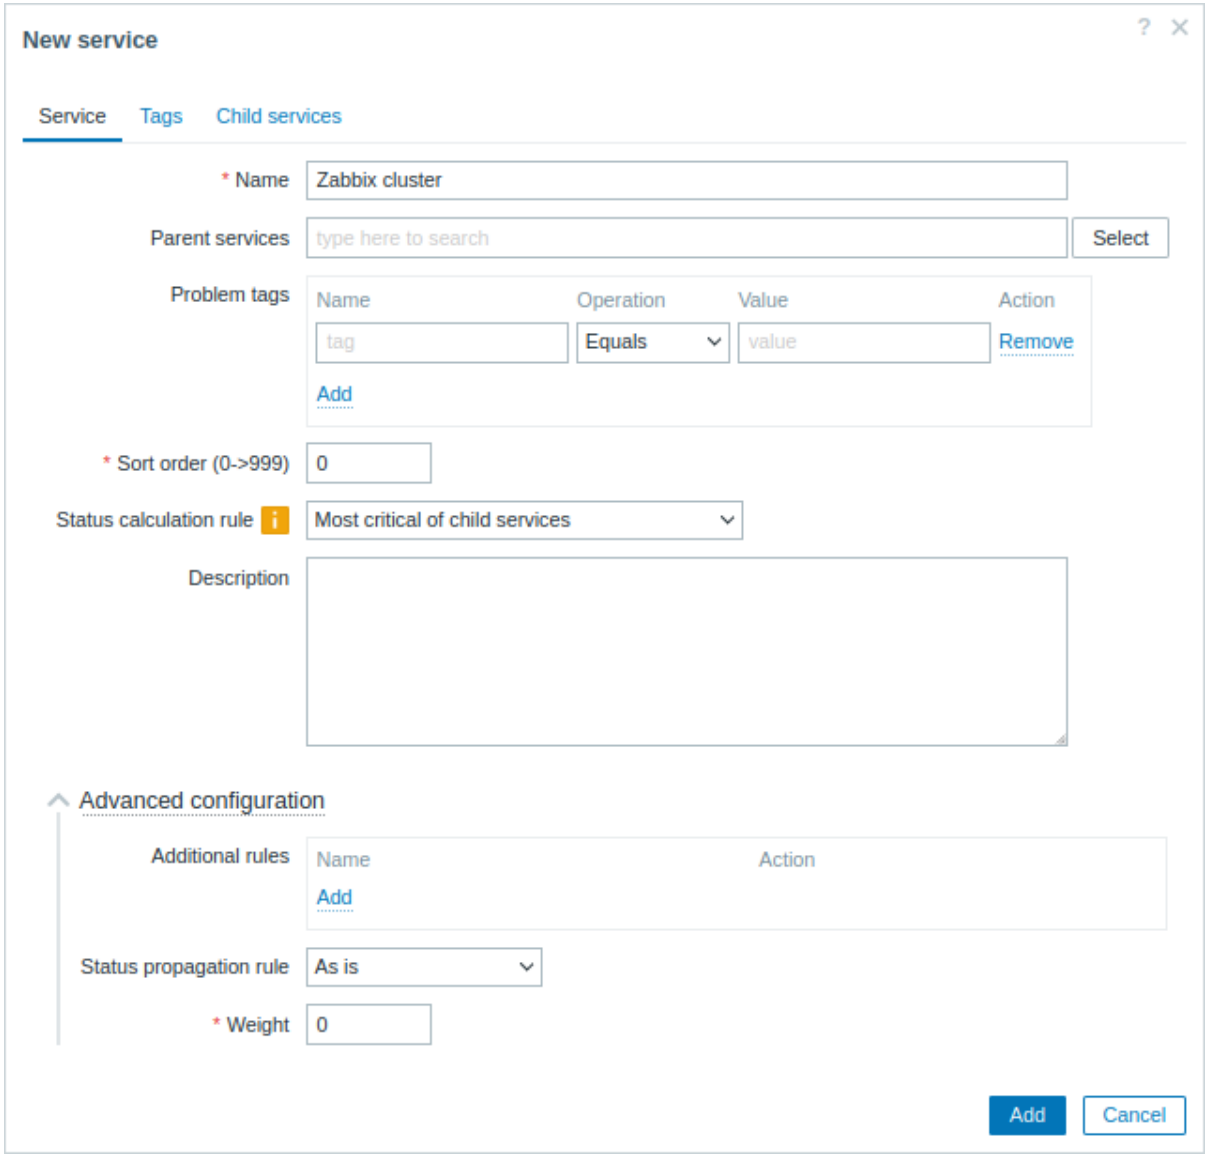
Setup example

Overview This section describes a simple setup for monitoring Zabbix high availability cluster as a service.



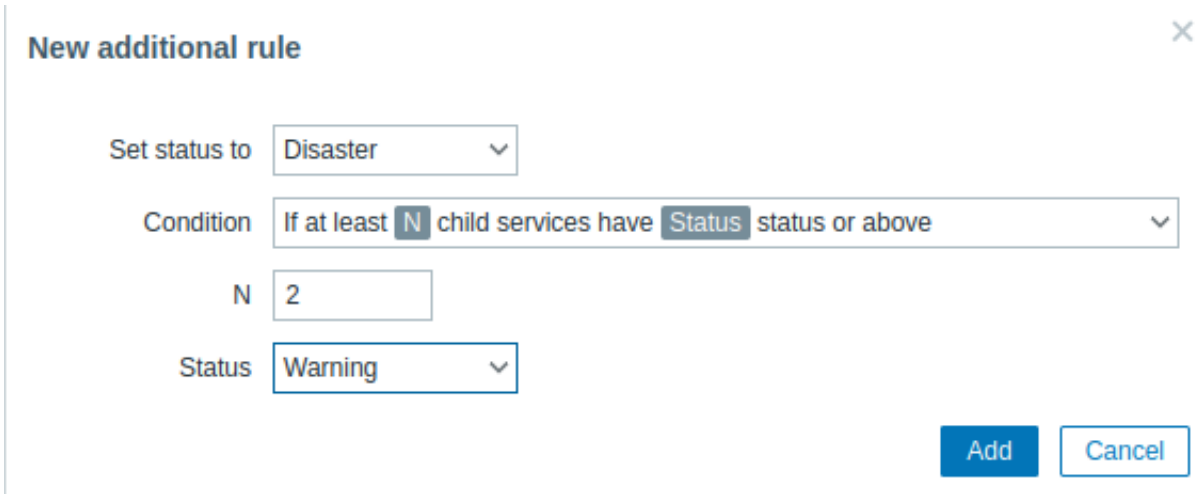
Pre-requisites Prior to configuring service monitoring, you need to have the hosts configured:

- *HA node 1* with at least one trigger and a tag (preferably set on a trigger level) `component:ha-node-1`
- *HA node 2* with at least one trigger and a tag (preferably set on a trigger level) `component:ha-node-2`



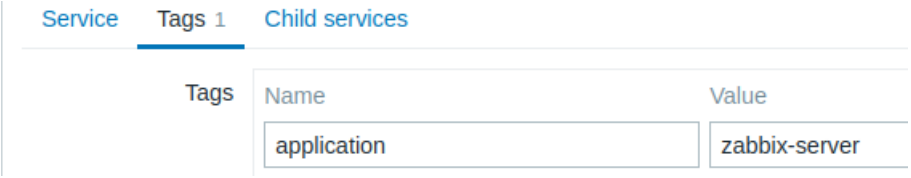
Service tree The next step is to build the service tree. In this example, the infrastructure is very basic and consists of three services: *Zabbix cluster* (parent) and two child services *Zabbix server node 1* and *Zabbix server node 2*.

```
Zabbix cluster
|
|- Zabbix server node 1
|- Zabbix server node 2
```



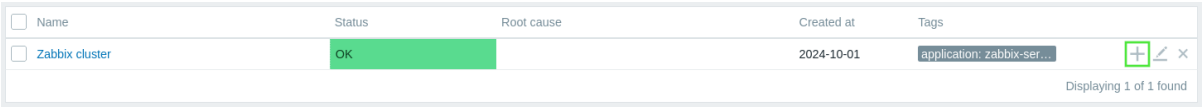
At the Services page, turn on *Edit* mode and click *Create service*:

In the service configuration window, enter name *Zabbix cluster* and click the *Advanced configuration* header to display advanced configuration options.



Configure additional rule:

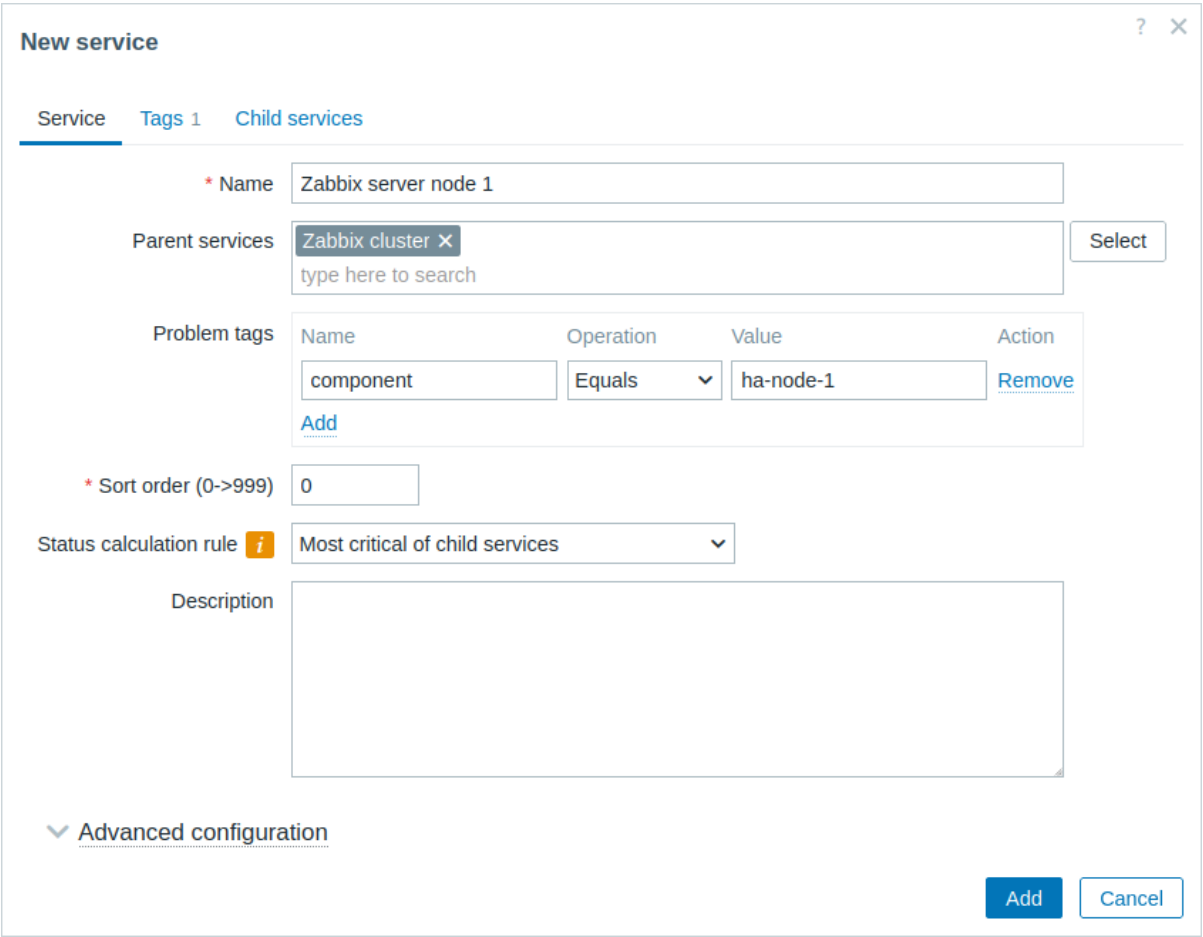
Zabbix cluster will have two child services - one for each of the HA nodes. If both HA nodes have problems of at least *Warning* status, parent service status should be set to *Disaster*. To achieve this, additional rule should be configured as:



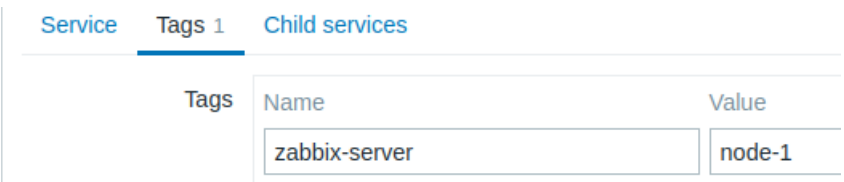
- Set status to: Disaster
- Condition: If at least `N` child services have `Status` status or above
- N: 2
- Status: Warning

Switch to the *Tags* tab and add a tag `application:zabbix-server`. This tag will be used later for service actions and SLA reports.

Save the new service.



To add a child service, click the plus icon next to the Zabbix cluster service (the icon is visible only in *Edit* mode).



In the service configuration window, enter name *Zabbix server node 1*. Note that the Parent services parameter is already pre-filled with *Zabbix cluster*.

Availability of this service is affected by problems on the host *HA node 1*, marked with `component:ha-node-1` problem tag. In the Problem tags parameter, enter:

- Name: component
- Operation: Equals
- Value: ha-node-1

Switch to the *Tags* tab and add a service tag: `zabbix-server:node-1`. This tag will be used later for service actions and SLA reports.

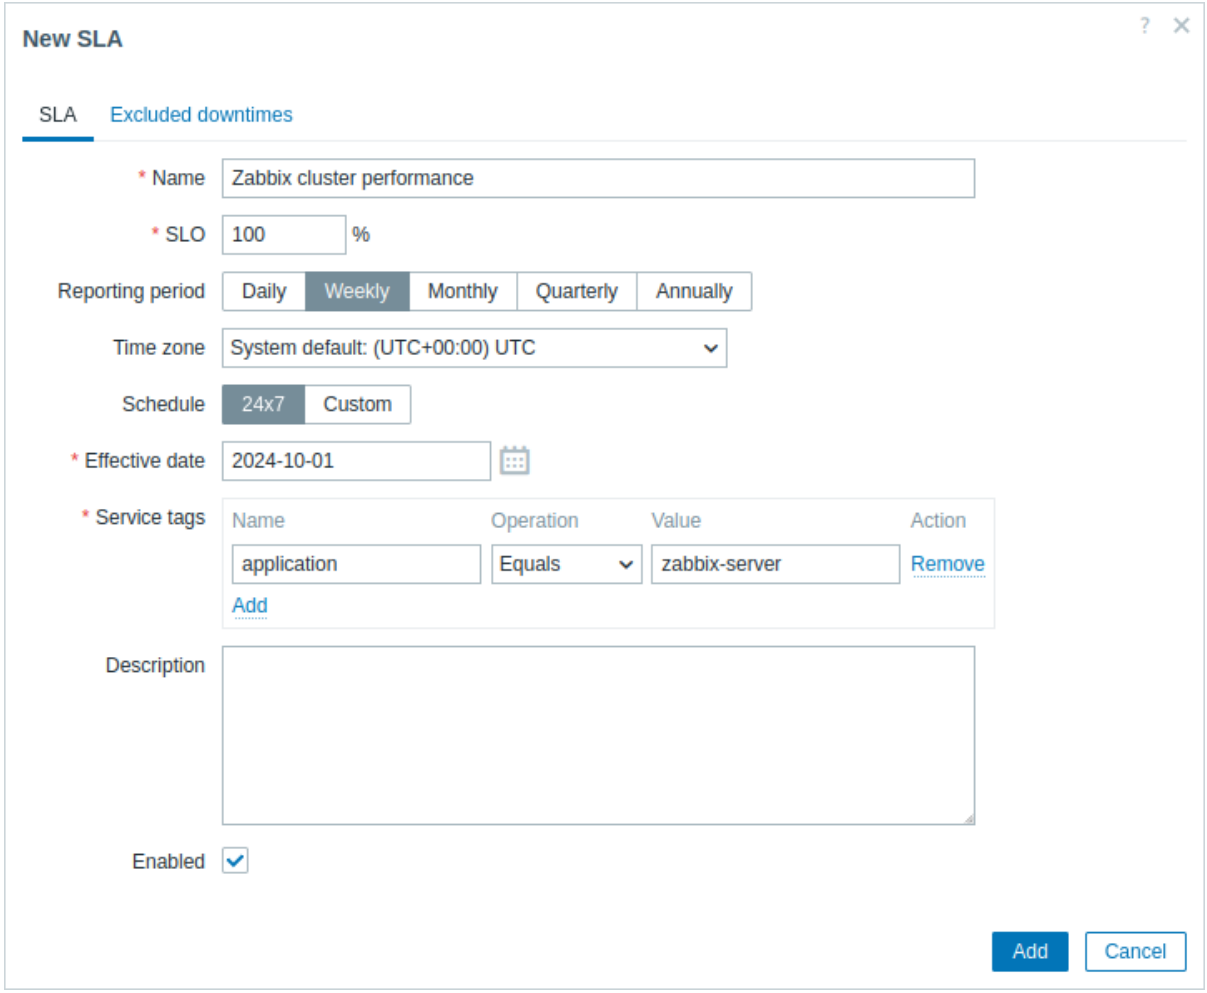
Save the new service.

Create another child service of Zabbix cluster with name ”Zabbix server node 2”.

Set the Problem tags as:

- Name: component
- Operation: Equals
- Value: ha-node-2

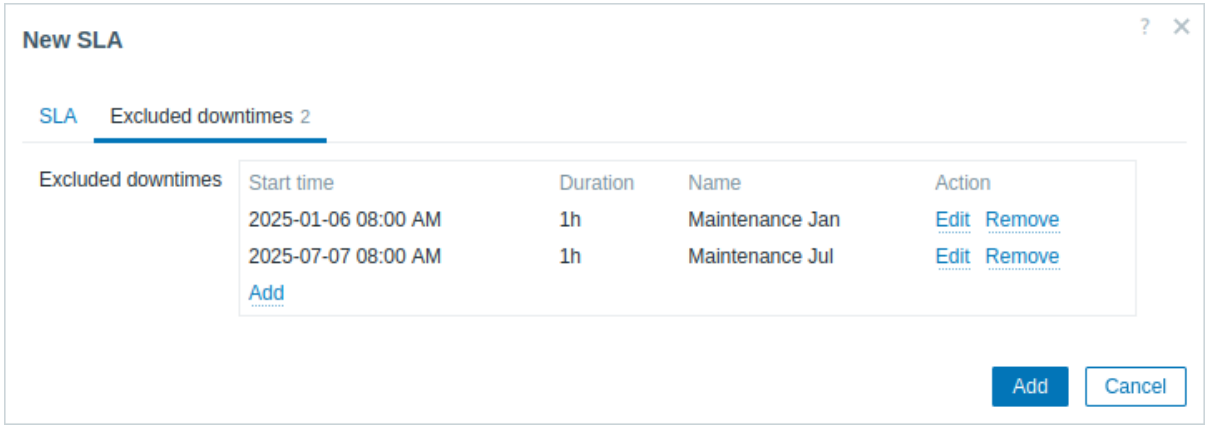
Switch to the *Tags* tab and add a service tag: `zabbix-server:node-2`.



Save the new service.

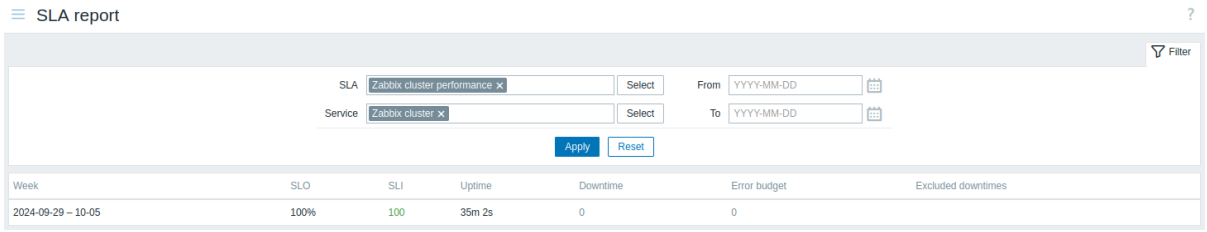
SLA In this example, expected Zabbix cluster performance is 100% excluding semi-annual one hour maintenance period.

First, you need to add a new service level agreement:



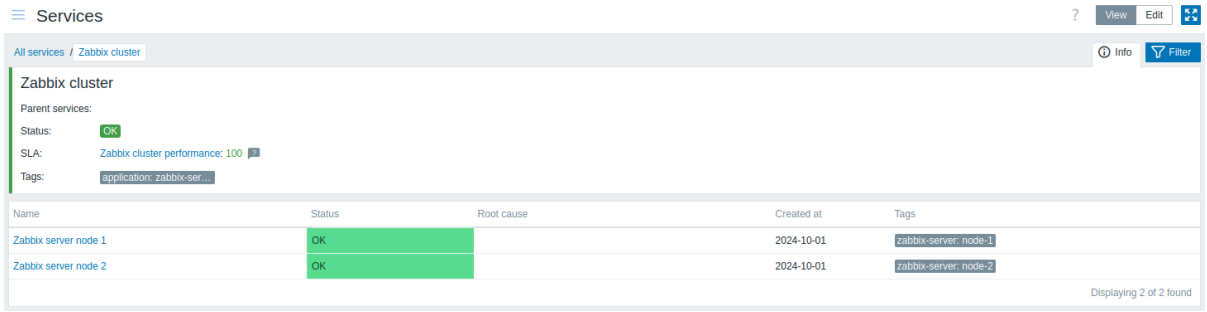
1. Go to *Services* > *SLA*.
2. Click *Create SLA*.
3. Enter the *Zabbix cluster performance* name and set the SLO to 100%. The service Zabbix cluster has a service tag `application:zabbix-server`.
4. To use this SLA for measuring performance of Zabbix cluster, in the *Service tags* parameter, specify:

- Name: application
- Operation: Equals
- Value: zabbix-server



In a real-life setup, you can also update desired reporting period, time zone and start date or change the schedule from 24/7 to custom. For this example, the default settings are sufficient.

5. Switch to the *Excluded downtimes* tab and add downtimes for scheduled maintenance periods to exclude these periods from SLA calculation.
6. In the *Excluded downtimes* section, click the *Add* link, enter the downtime name, planned start time, and duration.



7. Click *Add* to save the new SLA.

Switch to the SLA reports section to view the SLA report for Zabbix cluster.

The SLA info can also be checked in the *Services* section.

Service monitoring upgrade

Overview In Zabbix 6.0, service monitoring functionality has been reworked significantly (see What's new in Zabbix 6.0.0 for the list of changes).

This page describes how services and SLAs, defined in earlier Zabbix versions, are changed during an upgrade to Zabbix 6.0 or newer.

Services In older Zabbix versions, services had two types of dependencies: soft and hard. After an upgrade, all dependencies will become equal.

If a service "Child service" has been previously linked to "Parent service 1" via hard dependency and additionally "Parent service 2" via soft dependency, after an upgrade the "Child service" will have two parent services "Parent service 1" and "Parent service 2".

Trigger-based mapping between problems and services has been replaced by tag-based mapping. In Zabbix 6.0 and newer, service configuration form has a new parameter *Problem tags*, which allows specifying one or multiple tag name and value pairs for problem matching. Triggers that have been linked to a service will get a new tag `ServiceLink : <trigger ID>:<trigger name>` (tag value will be truncated to 32 characters). Linked services will get `ServiceLink` problem tag with the same value.

Status calculation rules

The 'Status calculation algorithm' will be upgraded using the following rules:

- Do not calculate → Set status to OK
- Problem, if at least one child has a problem → Most critical of child services

- Problem, if all children have problems → Most critical if all children have problems

SLAs Previously, SLA targets had to be defined for each service separately. Since Zabbix 6.0, SLA has become a separate entity, which contains information about service schedule, expected service level objective (SLO) and downtime periods to exclude from the calculation. Once configured, an SLA can be assigned to multiple services through service tags.

During an upgrade:

- Identical SLAs defined for each service will be grouped and one SLA per each group will be created.
- Each affected service will get a special tag `SLA:<ID>` and the same tag will be specified in the *Service tags* parameter of the corresponding SLA.
- Service creation time, a new metric in SLA reports, will be set to 01/01/2000 00:00 for existing services.

Encryption and security

Encryption Zabbix supports encrypted communications between Zabbix components using Transport Layer Security (TLS) protocol v.1.2 and 1.3 (depending on the crypto library). Certificate-based and pre-shared key-based encryption is supported.

Encryption can be configured for connections:

- Between Zabbix server, Zabbix proxy, Zabbix agent, Zabbix web service, zabbix_sender and zabbix_get utilities
- To Zabbix database from Zabbix frontend and server/proxy
- Between Zabbix frontend and Zabbix server

Encryption is optional and configurable for individual components:

- Some proxies and agents can be configured to use certificate-based encryption with the server, while others can use pre-shared key-based encryption, and yet others continue with unencrypted communications (as before).
- Server (proxy) can use different encryption configurations for different hosts.

Zabbix daemon programs use one listening port for encrypted and unencrypted incoming connections. Adding an encryption does not require opening new ports on firewalls.

Limitations

- Private keys are stored in plain text in files readable by Zabbix components during startup.
- Pre-shared keys are entered in Zabbix frontend and stored in Zabbix database in plain text.
- Built-in encryption does not protect communications between the web server running Zabbix frontend and user web browser.
- Currently each encrypted connection opens with a full TLS handshake, no session caching and tickets are implemented.
- Adding encryption increases the time for item checks and actions, depending on network latency:
  - For example, if packet delay is 100ms then opening a TCP connection and sending unencrypted request takes around 200ms. With encryption about 1000 ms are added for establishing the TLS connection.
  - Timeouts may need to be increased; otherwise, some items and actions running remote scripts on agents may work with unencrypted connections, but fail with timeout with encrypted.
- Encryption is not supported by network discovery. Zabbix agent checks performed by network discovery will be unencrypted and if Zabbix agent is configured to reject unencrypted connections such checks will not succeed.

Compiling Zabbix with encryption support To support encryption Zabbix must be compiled and linked with one of the supported crypto libraries:

- GnuTLS - from version 3.1.18
- OpenSSL - versions 1.0.1, 1.0.2, 1.1.0, 1.1.1, 3.0.x - 3.5.x
- LibreSSL - tested with versions 2.7.4, 2.8.2:
  - LibreSSL 2.6.x is not supported
  - LibreSSL is supported as a compatible replacement of OpenSSL; the new `tls_*()` LibreSSL-specific API functions are not used. Zabbix components compiled with LibreSSL will not be able to use PSK, only certificates can be used.

> **Note:**
> You can find out more about setting up SSL for Zabbix frontend by referring to these best practices.

The library is selected by specifying the respective option to "configure" script:

- `--with-gnutls[=DIR]`
- `--with-openssl[=DIR]` (also used for LibreSSL)

For example, to configure the sources for server and agent with *OpenSSL* you may use something like:

```
./configure --enable-server --enable-agent --with-mysql --enable-ipv6 --with-net-snmp --with-libcurl --wit
```

Different Zabbix components may be compiled with different crypto libraries (e.g., a server with *OpenSSL*, an agent with *GnuTLS*).

Attention:
If you plan to use pre-shared keys (PSK), consider using *GnuTLS* or *OpenSSL 1.1.0* (or newer) libraries in Zabbix components using PSKs. *GnuTLS* and *OpenSSL 1.1.0* libraries support PSK ciphersuites with Perfect Forward Secrecy. Older versions of the *OpenSSL* library (1.0.1, 1.0.2c) also support PSKs, but available PSK ciphersuites do not provide Perfect Forward Secrecy.

Connection encryption management Connections in Zabbix can use:

- no encryption (default)
- RSA certificate-based encryption
- PSK-based encryption

There are two important parameters used to specify encryption between Zabbix components:

- TLSConnect - specifies what encryption to use for outgoing connections (unencrypted, PSK or certificate)
- TLSAccept - specifies what types of connections are allowed for incoming connections (unencrypted, PSK or certificate). One or more values can be specified.

`TLSConnect` is used in the configuration files for Zabbix proxy (in active mode, specifies only connections to server) and Zabbix agent (for active checks). In Zabbix frontend the `TLSConnect` equivalent is the *Connections to host* field in *Data collection* > *Hosts* > <some host> > *Encryption* tab and the *Connections to proxy* field in *Administration* > *Proxies* > <some proxy> > *Encryption* tab. If the configured encryption type for connection fails, no other encryption types will be tried.

`TLSAccept` is used in the configuration files for Zabbix proxy (in passive mode, specifies only connections from server) and Zabbix agent (for passive checks). In Zabbix frontend the TLSAccept equivalent is the *Connections from host* field in *Data collection* > *Hosts* > <some host> > *Encryption* tab and the *Connections from proxy* field in *Administration* > *Proxies* > <some proxy> > *Encryption* tab.

Normally you configure only one type of encryption for incoming connections. But you may want to switch the encryption type, e.g., from unencrypted to certificate-based with minimum downtime and rollback possibility. To achieve this:

- Set `TLSAccept=unencrypted,cert` in the agent configuration file and restart Zabbix agent.
- Test connection with `zabbix_get` to the agent using certificate. If it works, you can reconfigure encryption for that agent in Zabbix frontend in the *Data collection* > *Hosts* > <some host> > *Encryption* tab by setting *Connections to host* to *Certificate*.
- When server configuration cache gets updated (and proxy configuration is updated if the host is monitored by proxy) then connections to that agent will be encrypted.
- If everything works as expected you can set `TLSAccept=cert` in the agent configuration file and restart Zabbix agent. Now the agent will be accepting only encrypted certificate-based connections. Unencrypted and PSK-based connections will be rejected.

In a similar way it works on server and proxy. If in Zabbix frontend in host configuration *Connections from host* is set to "Certificate" then only certificate-based encrypted connections will be accepted from the agent (active checks) and zabbix_sender (trapper items).

Most likely you will configure incoming and outgoing connections to use the same encryption type or no encryption at all. But technically it is possible to configure it asymmetrically, e.g., certificate-based encryption for incoming and PSK-based for outgoing connections.

Encryption configuration for each host is displayed in the Zabbix frontend, in *Data collection* > *Hosts* in the *Agent encryption* column. For example:

Example	Connections to host	Allowed connections from host	Rejected connections from host
NONE	Unencrypted	Unencrypted	Encrypted, certificate and PSK-based encrypted
CERT NONE PSK CERT	Encrypted, certificate-based	Encrypted, certificate-based	Unencrypted and PSK-based encrypted
PSK NONE PSK CERT	Encrypted, PSK-based	Encrypted, PSK-based	Unencrypted and certificate-based encrypted
PSK NONE PSK CERT	Encrypted, PSK-based	Unencrypted and PSK-based encrypted	Certificate-based encrypted

Example	Connections to host	Allowed connections from host	Rejected connections from host
CERT NONE PSK CERT	Encrypted, certificate-based	Unencrypted, PSK or certificate-based encrypted	-

Attention:
Connections are unencrypted by default. Encryption must be configured for each host and proxy individually.

zabbix_get and zabbix_sender with encryption See zabbix_get and zabbix_sender manpages for using them with encryption.

Ciphersuites Ciphersuites by default are configured internally during Zabbix startup.

Also user-configured ciphersuites are supported for GnuTLS and OpenSSL. Users may configure ciphersuites according to their security policies. Using this feature is optional (built-in default ciphersuites still work).

For crypto libraries compiled with default settings Zabbix built-in rules typically result in the following ciphersuites (in order from higher to lower priority):

Library	Certificate ciphersuites	PSK ciphersuites
GnuTLS 3.1.18	TLS_ECDHE_RSA_AES_128_GCM_SHA256 TLS_ECDHE_RSA_AES_128_CBC_SHA256 TLS_ECDHE_RSA_AES_128_CBC_SHA1 TLS_RSA_AES_128_GCM_SHA256 TLS_RSA_AES_128_CBC_SHA256 TLS_RSA_AES_128_CBC_SHA1	TLS_ECDHE_PSK_AES_128_CBC_SHA256 TLS_ECDHE_PSK_AES_128_CBC_SHA1 TLS_PSK_AES_128_GCM_SHA256 TLS_PSK_AES_128_CBC_SHA256 TLS_PSK_AES_128_CBC_SHA1
OpenSSL 1.0.2c	ECDHE-RSA-AES128-GCM-SHA256 ECDHE-RSA-AES128-SHA256 ECDHE-RSA-AES128-SHA AES128-GCM-SHA256 AES128-SHA256 AES128-SHA	PSK-AES128-CBC-SHA
OpenSSL 1.1.0	ECDHE-RSA-AES128-GCM-SHA256 ECDHE-RSA-AES128-SHA256 ECDHE-RSA-AES128-SHA AES128-GCM-SHA256 AES128-CCM8 AES128-CCM AES128-SHA256 AES128-SHA	ECDHE-PSK-AES128-CBC-SHA256 ECDHE-PSK-AES128-CBC-SHA PSK-AES128-GCM-SHA256 PSK-AES128-CCM8 PSK-AES128-CCM PSK-AES128-CBC-SHA256 PSK-AES128-CBC-SHA
OpenSSL 1.1.1d	TLS_AES_256_GCM_SHA384 TLS_CHACHA20_POLY1305_SHA256 TLS_AES_128_GCM_SHA256 ECDHE-RSA-AES128-GCM-SHA256 ECDHE-RSA-AES128-SHA256 ECDHE-RSA-AES128-SHA AES128-GCM-SHA256 AES128-CCM8 AES128-CCM AES128-SHA256 AES128-SHA	TLS_CHACHA20_POLY1305_SHA256 TLS_AES_128_GCM_SHA256 ECDHE-PSK-AES128-CBC-SHA256 ECDHE-PSK-AES128-CBC-SHA PSK-AES128-GCM-SHA256 PSK-AES128-CCM8 PSK-AES128-CCM PSK-AES128-CBC-SHA256 PSK-AES128-CBC-SHA

User-configured ciphersuites The built-in ciphersuite selection criteria can be overridden with user-configured ciphersuites.

Attention:
User-configured ciphersuites is a feature intended for advanced users who understand TLS ciphersuites, their security and consequences of mistakes, and who are comfortable with TLS troubleshooting.

The built-in ciphersuite selection criteria can be overridden using the following parameters:

Override scope	Parameter	Value	Description
Ciphersuite selection for certificates	TLSCipherCert13	Valid OpenSSL 1.1.1 cipher strings for TLS 1.3 protocol (their values are passed to the OpenSSL function `SSL_CTX_set_ciphersuites()`).	Certificate-based ciphersuite selection criteria for TLS 1.3 Only OpenSSL 1.1.1 or newer.
	TLSCipherCert	Valid OpenSSL cipher strings for TLS 1.2 or valid GnuTLS priority strings. Their values are passed to the `SSL_CTX_set_cipher_list()` or `gnutls_priority_init()` functions, respectively.	Certificate-based ciphersuite selection criteria for TLS 1.2/1.3 (GnuTLS), TLS 1.2 (OpenSSL)
Ciphersuite selection for PSK	TLSCipherPSK13	Valid OpenSSL 1.1.1 cipher strings for TLS 1.3 protocol (their values are passed to the OpenSSL function `SSL_CTX_set_ciphersuites()`).	PSK-based ciphersuite selection criteria for TLS 1.3 Only OpenSSL 1.1.1 or newer.
	TLSCipherPSK	Valid OpenSSL cipher strings for TLS 1.2 or valid GnuTLS priority strings. Their values are passed to the `SSL_CTX_set_cipher_list()` or `gnutls_priority_init()` functions, respectively.	PSK-based ciphersuite selection criteria for TLS 1.2/1.3 (GnuTLS), TLS 1.2 (OpenSSL)
Combined ciphersuite list for certificate and PSK	TLSCipherAll13	Valid OpenSSL 1.1.1 cipher strings for TLS 1.3 protocol (their values are passed to the OpenSSL function `SSL_CTX_set_ciphersuites()`).	Ciphersuite selection criteria for TLS 1.3 Only OpenSSL 1.1.1 or newer.
	TLSCipherAll	Valid OpenSSL cipher strings for TLS 1.2 or valid GnuTLS priority strings. Their values are passed to the `SSL_CTX_set_cipher_list()` or `gnutls_priority_init()` functions, respectively.	Ciphersuite selection criteria for TLS 1.2/1.3 (GnuTLS), TLS 1.2 (OpenSSL)

To override the ciphersuite selection in zabbix_get and zabbix_sender utilities - use the command-line parameters:

- `--tls-cipher13`
- `--tls-cipher`

The new parameters are optional. If a parameter is not specified, the internal default value is used. If a parameter is defined it cannot be empty.

If the setting of a TLSCipher* value in the crypto library fails then the server, proxy or agent will not start and an error is logged.

It is important to understand when each parameter is applicable.

Outgoing connections

The simplest case is outgoing connections:

- For outgoing connections with certificate - use TLSCipherCert13 or TLSCipherCert
- For outgoing connections with PSK - use TLSCipherPSK13 or TLSCipherPSK
- In case of zabbix_get and zabbix_sender utilities the command-line parameters `--tls-cipher13` or `--tls-cipher` can be used (encryption is unambiguously specified with a `--tls-connect` parameter)

Incoming connections

It is a bit more complicated with incoming connections because rules are specific for components and configuration.

For Zabbix **agent**:

Agent connection setup	Cipher configuration
TLSConnect=cert	TLSCipherCert, TLSCipherCert13
TLSConnect=psk	TLSCipherPSK, TLSCipherPSK13
TLSAccept=cert	TLSCipherCert, TLSCipherCert13
TLSAccept=psk	TLSCipherPSK, TLSCipherPSK13

Agent connection setup	Cipher configuration
TLSAccept=cert,psk	TLSCipherAll, TLSCipherAll13

For Zabbix **server** and **proxy**:

Connection setup	Cipher configuration
Outgoing connections using PSK	TLSCipherPSK, TLSCipherPSK13
Incoming connections using certificates	TLSCipherAll, TLSCipherAll13
Incoming connections using PSK if server has no certificate	TLSCipherPSK, TLSCipherPSK13
Incoming connections using PSK if server has certificate	TLSCipherAll, TLSCipherAll13

Some pattern can be seen in the two tables above:

- TLSCipherAll and TLSCipherAll13 can be specified only if a combined list of certificate- **and** PSK-based ciphersuites is used. There are two cases when it takes place: server (proxy) with a configured certificate (PSK ciphersuites are always configured on server, proxy if crypto library supports PSK), agent configured to accept both certificate- and PSK-based incoming connections
- in other cases TLSCipherCert* and/or TLSCipherPSK* are sufficient

The following tables show the `TLSCipher*` built-in default values. They could be a good starting point for your own custom values.

Parameter	GnuTLS 3.6.12
TLSCipherCert	NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL:+CTYPE-X.509
TLSCipherPSK	NONE:+VERS-TLS1.2:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL
TLSCipherAll	NONE:+VERS-TLS1.2:+ECDHE-RSA:+RSA:+ECDHE-PSK:+PSK:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+SHA1:+CURVE-ALL:+COMP-NULL:+SIGN-ALL:+CTYPE-X.509

Parameter	OpenSSL 1.1.1d [1]
TLSCipherCert13	
TLSCipherCert	EECDH+aRSA+AES128:RSA+aRSA+AES128
TLSCipherPSK13	TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256
TLSCipherPSK	kECDHEPSK+AES128:kPSK+AES128
TLSCipherAll13	
TLSCipherAll	EECDH+aRSA+AES128:RSA+aRSA+AES128:kECDHEPSK+AES128:kPSK+AES128

[1] Default values are different for older OpenSSL versions (1.0.1, 1.0.2, 1.1.0), for LibreSSL and if OpenSSL is compiled without PSK support.

Examples of user-configured ciphersuites

See below the following examples of user-configured ciphersuites:

- Testing cipher strings and allowing only PFS ciphersuites
- Switching from AES128 to AES256

Testing cipher strings and allowing only PFS ciphersuites

To see which ciphersuites have been selected you need to set 'DebugLevel=4' in the configuration file, or use the `-vv` option for zabbix_sender.

Some experimenting with `TLSCipher*` parameters might be necessary before you get the desired ciphersuites. It is inconvenient to restart Zabbix server, proxy or agent multiple times just to tweak `TLSCipher*` parameters. More convenient options are using zabbix_sender or the `openssl` command. Let's show both.

1. Using zabbix_sender.

Let's make a test configuration file, for example, `/home/zabbix/test.conf`, with the syntax of a `zabbix_agentd.conf` file:

```
Hostname=nonexisting
ServerActive=nonexisting

TLSConnect=cert
TLSCAFile=/home/zabbix/ca.crt
TLSCertFile=/home/zabbix/agent.crt
TLSKeyFile=/home/zabbix/agent.key
TLSPSKIdentity=nonexisting
TLSPSKFile=/home/zabbix/agent.psk
```

You need valid CA and agent certificates and PSK for this example. Adjust certificate and PSK file paths and names for your environment.

If you are not using certificates, but only PSK, you can make a simpler test file:

```
Hostname=nonexisting
ServerActive=nonexisting

TLSConnect=psk
TLSPSKIdentity=nonexisting
TLSPSKFile=/home/zabbix/agentd.psk
```

The selected ciphersuites can be seen by running zabbix_sender (example compiled with OpenSSL 1.1.d):

```
$ zabbix_sender -vv -c /home/zabbix/test.conf -k nonexisting_item -o 1 2>&1 | grep ciphersuites
zabbix_sender [41271]: DEBUG: zbx_tls_init_child() certificate ciphersuites: TLS_AES_256_GCM_SHA384 TLS_
zabbix_sender [41271]: DEBUG: zbx_tls_init_child() PSK ciphersuites: TLS_CHACHA20_POLY1305_SHA256 TLS_AE
zabbix_sender [41271]: DEBUG: zbx_tls_init_child() certificate and PSK ciphersuites: TLS_AES_256_GCM_SHA
```

Here you see the ciphersuites selected by default. These default values are chosen to ensure interoperability with Zabbix agents running on systems with older OpenSSL versions (from 1.0.1).

With newer systems, you can choose to tighten security by allowing only a few ciphersuites, e.g., only ciphersuites with PFS (Perfect Forward Secrecy). Let's configure the `TLSCipher*` parameters to allow only cipher suites that support PFS.

Attention:
The result will not be interoperable with systems using OpenSSL 1.0.1 and 1.0.2, if PSK is used. Certificate-based encryption should work.

Add two lines to the `test.conf` configuration file:

```
TLSCipherCert=EECDH+aRSA+AES128
TLSCipherPSK=kECDHEPSK+AES128
```

and test again:

```
$ zabbix_sender -vv -c /home/zabbix/test.conf -k nonexisting_item -o 1 2>&1 | grep ciphersuites
zabbix_sender [42892]: DEBUG: zbx_tls_init_child() certificate ciphersuites: TLS_AES_256_GCM_SHA384 TLS_
zabbix_sender [42892]: DEBUG: zbx_tls_init_child() PSK ciphersuites: TLS_CHACHA20_POLY1305_SHA256 TLS_AE
zabbix_sender [42892]: DEBUG: zbx_tls_init_child() certificate and PSK ciphersuites: TLS_AES_256_GCM_SHA
```

The "certificate ciphersuites" and "PSK ciphersuites" lists have changed - they are shorter than before, only containing TLS 1.3 ciphersuites and TLS 1.2 ECDHE-* ciphersuites as expected.

2. TLSCipherAll and TLSCipherAll13 cannot be tested with zabbix_sender; they do not affect "certificate and PSK ciphersuites" value shown in the example above. To tweak TLSCipherAll and TLSCipherAll13 you need to experiment with the agent, proxy or server.

So, to allow only PFS ciphersuites you may need to add up to three parameters

```
TLSCipherCert=EECDH+aRSA+AES128
TLSCipherPSK=kECDHEPSK+AES128
TLSCipherAll=EECDH+aRSA+AES128:kECDHEPSK+AES128
```

to `zabbix_agentd.conf`, `zabbix_proxy.conf` and `zabbix_server.conf` if each of them has a configured certificate and agent has also PSK.

If your Zabbix environment uses only PSK-based encryption and no certificates, then only one:

```
TLSCipherPSK=kECDHEPSK+AES128
```

Now that you understand how it works you can test the ciphersuite selection even outside of Zabbix, with the `openssl` command. Let's test all three `TLSCipher*` parameter values:

```
$ openssl ciphers EECDH+aRSA+AES128 | sed 's/:/ /g'
TLS_AES_256_GCM_SHA384 TLS_CHACHA20_POLY1305_SHA256 TLS_AES_128_GCM_SHA256 ECDHE-RSA-AES128-GCM-SHA256 E
$ openssl ciphers kECDHEPSK+AES128 | sed 's/:/ /g'
TLS_AES_256_GCM_SHA384 TLS_CHACHA20_POLY1305_SHA256 TLS_AES_128_GCM_SHA256 ECDHE-PSK-AES128-CBC-SHA256 E
$ openssl ciphers EECDH+aRSA+AES128:kECDHEPSK+AES128 | sed 's/:/ /g'
TLS_AES_256_GCM_SHA384 TLS_CHACHA20_POLY1305_SHA256 TLS_AES_128_GCM_SHA256 ECDHE-RSA-AES128-GCM-SHA256 E
```

You may prefer `openssl ciphers` with option `-V` for a more verbose output:

```
$ openssl ciphers -V EECDH+aRSA+AES128:kECDHEPSK+AES128
          0x13,0x02 - TLS_AES_256_GCM_SHA384  TLSv1.3 Kx=any      Au=any  Enc=AESGCM(256) Mac=AEAD
          0x13,0x03 - TLS_CHACHA20_POLY1305_SHA256 TLSv1.3 Kx=any      Au=any  Enc=CHACHA20/POLY1305(256
          0x13,0x01 - TLS_AES_128_GCM_SHA256  TLSv1.3 Kx=any      Au=any  Enc=AESGCM(128) Mac=AEAD
          0xC0,0x2F - ECDHE-RSA-AES128-GCM-SHA256 TLSv1.2 Kx=ECDH     Au=RSA  Enc=AESGCM(128) Mac=AEAD
          0xC0,0x27 - ECDHE-RSA-AES128-SHA256 TLSv1.2 Kx=ECDH     Au=RSA  Enc=AES(128)  Mac=SHA256
          0xC0,0x13 - ECDHE-RSA-AES128-SHA    TLSv1 Kx=ECDH     Au=RSA  Enc=AES(128)  Mac=SHA1
          0xC0,0x37 - ECDHE-PSK-AES128-CBC-SHA256 TLSv1 Kx=ECDHEPSK Au=PSK  Enc=AES(128)  Mac=SHA256
          0xC0,0x35 - ECDHE-PSK-AES128-CBC-SHA TLSv1 Kx=ECDHEPSK Au=PSK  Enc=AES(128)  Mac=SHA1
```

Similarly, you can test the priority strings for GnuTLS:

```
$ gnutls-cli -l --priority=NONE:+VERS-TLS1.2:+ECDHE-RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+CURVE-A
Cipher suites for NONE:+VERS-TLS1.2:+ECDHE-RSA:+AES-128-GCM:+AES-128-CBC:+AEAD:+SHA256:+CURVE-ALL:+COMP-
TLS_ECDHE_RSA_AES_128_GCM_SHA256                        0xc0, 0x2f      TLS1.2
TLS_ECDHE_RSA_AES_128_CBC_SHA256                        0xc0, 0x27      TLS1.2

Protocols: VERS-TLS1.2
Ciphers: AES-128-GCM, AES-128-CBC
MACs: AEAD, SHA256
Key Exchange Algorithms: ECDHE-RSA
Groups: GROUP-SECP256R1, GROUP-SECP384R1, GROUP-SECP521R1, GROUP-X25519, GROUP-X448, GROUP-FFDHE2048, GR
PK-signatures: SIGN-RSA-SHA256, SIGN-RSA-PSS-SHA256, SIGN-RSA-PSS-RSAE-SHA256, SIGN-ECDSA-SHA256, SIGN-E
```

Switching from AES128 to AES256

Zabbix uses AES128 as the built-in default for data. Let's assume you are using certificates and want to switch to AES256, on OpenSSL 1.1.1.

This can be achieved by adding the respective parameters in `zabbix_server.conf`:

```
TLSCAFile=/home/zabbix/ca.crt
TLSCertFile=/home/zabbix/server.crt
TLSKeyFile=/home/zabbix/server.key
TLSCipherCert13=TLS_AES_256_GCM_SHA384
TLSCipherCert=EECDH+aRSA+AES256:-SHA1:-SHA384
TLSCipherPSK13=TLS_CHACHA20_POLY1305_SHA256
TLSCipherPSK=kECDHEPSK+AES256:-SHA1
TLSCipherAll13=TLS_AES_256_GCM_SHA384
TLSCipherAll=EECDH+aRSA+AES256:-SHA1:-SHA384
```

Attention:
Although only certificate-related ciphersuites will be used, `TLSCipherPSK*` parameters are defined as well to avoid their default values which include less secure ciphers for wider interoperability. PSK ciphersuites cannot be completely disabled on server/proxy.

And in `zabbix_agentd.conf`:

```
TLSConnect=cert
TLSAccept=cert
TLSCAFile=/home/zabbix/ca.crt
TLSCertFile=/home/zabbix/agent.crt
TLSKeyFile=/home/zabbix/agent.key
TLSCipherCert13=TLS_AES_256_GCM_SHA384
TLSCipherCert=EECDH+aRSA+AES256:-SHA1:-SHA384
```

Troubleshooting encryption issues General recommendations:

- Start with understanding which component acts as a TLS client and which one acts as a TLS server in problem case.
 Zabbix server, proxies and agents, depending on interaction between them, all can work as TLS servers and clients.
 For example, Zabbix server connecting to agent for a passive check, acts as a TLS client. The agent is in role of TLS server.
 Zabbix agent, requesting a list of active checks from proxy, acts as a TLS client. The proxy is in role of TLS server.
 `zabbix_get` and `zabbix_sender` utilities always act as TLS clients.
- Zabbix uses mutual authentication.
 Each side verifies its peer and may refuse connection.
 For example, Zabbix server connecting to agent can close connection immediately if agent's certificate is invalid. And vice versa - Zabbix agent accepting a connection from server can close connection if server is not trusted by agent.
- Examine logfiles in both sides - in TLS client and TLS server.
 The side which refuses connection may log a precise reason why it was refused. Other side often reports rather general error (e.g., "Connection closed by peer", "connection was non-properly terminated").
- Sometimes misconfigured encryption results in confusing error messages in no way pointing to real cause.
 In subsections below we try to provide a (far from exhaustive) collection of messages and possible causes which could help in troubleshooting.
 Please note that different crypto toolkits (OpenSSL, GnuTLS) often produce different error messages in same problem situations.
 Sometimes error messages depend even on particular combination of crypto toolkits on both sides.

Troubleshooting connection type or permission problems Server is configured to connect with PSK to agent but agent accepts only unencrypted connections

In server or proxy log (with *GnuTLS* 3.3.16)

```
Get value from agent failed: zbx_tls_connect(): gnutls_handshake() failed: \
    -110 The TLS connection was non-properly terminated.
```

In server or proxy log (with *OpenSSL* 1.0.2c)

```
Get value from agent failed: TCP connection successful, cannot establish TLS to [[127.0.0.1]:10050]: \
    Connection closed by peer. Check allowed connection types and access rights
```

One side connects with certificate but other side accepts only PSK or vice versa

In any log (with *GnuTLS*):

```
failed to accept an incoming connection: from 127.0.0.1: zbx_tls_accept(): gnutls_handshake() failed:\
    -21 Could not negotiate a supported cipher suite.
```

In any log (with *OpenSSL* 1.0.2c):

```
failed to accept an incoming connection: from 127.0.0.1: TLS handshake returned error code 1:\
    file .\ssl\s3_srvr.c line 1411: error:1408A0C1:SSL routines:ssl3_get_client_hello:no shared cipher:\
    TLS write fatal alert "handshake failure"
```

Attempting to use Zabbix sender compiled with TLS support to send data to Zabbix server/proxy compiled without TLS In connecting-side log:

Linux:

```
...In zbx_tls_init_child()
...OpenSSL library (version OpenSSL 1.1.1  11 Sep 2018) initialized
...
...In zbx_tls_connect(): psk_identity:"PSK test sender"
...End of zbx_tls_connect():FAIL error:'connection closed by peer'
...send value error: TCP successful, cannot establish TLS to [[localhost]:10051]: connection closed by pee
```

Windows:

```
...OpenSSL library (version OpenSSL 1.1.1a  20 Nov 2018) initialized
...
...In zbx_tls_connect(): psk_identity:"PSK test sender"
...zbx_psk_client_cb() requested PSK identity "PSK test sender"
...End of zbx_tls_connect():FAIL error:'SSL_connect() I/O error: [0x00000000] The operation completed succ
...send value error: TCP successful, cannot establish TLS to [[192.168.1.2]:10051]: SSL_connect() I/O erro
```

In accepting-side log:

```
...failed to accept an incoming connection: from 127.0.0.1: support for TLS was not compiled in
```

One side connects with PSK but other side uses LibreSSL or has been compiled without encryption support LibreSSL does not support PSK.

In connecting-side log:

```
...TCP successful, cannot establish TLS to [[192.168.1.2]:10050]: SSL_connect() I/O error: [0] Success
```

In accepting-side log:

```
...failed to accept an incoming connection: from 192.168.1.2: support for PSK was not compiled in
```

In Zabbix frontend:

```
Get value from agent failed: TCP successful, cannot establish TLS to [[192.168.1.2]:10050]: SSL_connect()
```

One side connects with PSK but other side uses OpenSSL with PSK support disabled In connecting-side log:

```
...TCP successful, cannot establish TLS to [[192.168.1.2]:10050]: SSL_connect() set result code to SSL_ERR
```

In accepting-side log:

```
...failed to accept an incoming connection: from 192.168.1.2: TLS handshake set result code to 1: file ssl
```

Encryption using certificates

Overview Zabbix can use RSA certificates in PEM format, signed by a public or an in-house certificate authority (CA).

Certificate verification is performed against a pre-configured CA certificate. Optionally, Certificate Revocation Lists (CRL) can be used.

Each Zabbix component can have only one certificate configured.

For more information on setting up and operating an internal CA, generating and signing certificate requests, and revoking certificates, refer to tutorials such as the OpenSSL PKI Tutorial v2.0.

Carefully consider and test your certificate extensions. For more details, see Limitations on using X.509 v3 certificate extensions.

Certificate configuration parameters The following configuration parameters are supported for setting up certificates on Zabbix components.

Parameter	Mandatory	Description
TLSCAFile	yes	Full pathname of a file containing the top-level CA(s) certificates for peer certificate verification. If using a certificate chain with multiple members, order the certificates with lower level CA(s) certificates first, followed by higher level CA(s) certificates. Certificates from multiple CAs can be included in a single file.
TLSCRLFile	no	Full pathname of a file containing Certificate Revocation Lists (CRL).
TLSCertFile	yes	Full pathname of a file containing the certificate. If using a certificate chain with multiple members, order the certificates with the server, proxy, or agent certificate first, followed by lower level CA(s) certificates, and concluded by higher level CA(s) certificates.
TLSKeyFile	yes	Full pathname of a file containing the private key. Ensure that this file is readable only by the Zabbix user by setting appropriate access rights.
TLSServerCertIssuer	no	Allowed server certificate issuer.
TLSServerCertSubject	no	Allowed server certificate subject.

Configuration examples After setting up the necessary certificates, configure Zabbix components to use certificate-based encryption.

Below are detailed steps for configuring:

- Zabbix server
- Zabbix proxy
- Zabbix agent

Zabbix server

1. Prepare the CA certificate file.

In order to verify peer certificates, Zabbix server must have access to the file containing the top-level, self-signed root CA certificates. For example, if certificates from two independent root CAs are needed, place them into a file at `/home/zabbix/zabbix_ca_file.crt`

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number: 1 (0x1)
    Signature Algorithm: sha1WithRSAEncryption
        Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root1 CA
            ...
        Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root1 CA
        Subject Public Key Info:
            Public Key Algorithm: rsaEncryption
                Public-Key: (2048 bit)
            ...
        X509v3 extensions:
            X509v3 Key Usage: critical
                Certificate Sign, CRL Sign
            X509v3 Basic Constraints: critical
                CA:TRUE
            ...
-----BEGIN CERTIFICATE-----
MIID2jCCAsKgAwIBAgIBATANBgkqhkiG9w0BAQUFADB+MRMwEQYKCZImiZPyLGQB
....
9wEzdN8uTrqoyU78gi12npLj08LegRKjb5hFTVm0
-----END CERTIFICATE-----
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number: 1 (0x1)
    Signature Algorithm: sha1WithRSAEncryption
        Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root2 CA
            ...
        Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root2 CA
        Subject Public Key Info:
            Public Key Algorithm: rsaEncryption
                Public-Key: (2048 bit)
            ....
        X509v3 extensions:
            X509v3 Key Usage: critical
                Certificate Sign, CRL Sign
            X509v3 Basic Constraints: critical
                CA:TRUE
            ....
-----BEGIN CERTIFICATE-----
MIID3DCCAsSgAwIBAgIBATANBgkqhkiG9w0BAQUFADB/MRMwEQYKCZImiZPyLGQB
...
vdGNYoSfvu41GQAR5Vj5FnRJRzv5XQOZ3B6894GY1zY=
-----END CERTIFICATE-----
```

2. Place the Zabbix server certificate/certificate chain into a file, for example, at `/home/zabbix/zabbix_server.crt`. The first certificate is the Zabbix server certificate, followed by the intermediate CA certificate:

```
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number: 1 (0x1)
    Signature Algorithm: sha1WithRSAEncryption
        Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Signing CA
        ...
        Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Zabbix server
```

```
        Subject Public Key Info:
            Public Key Algorithm: rsaEncryption
                Public-Key: (2048 bit)
                ...
        X509v3 extensions:
            X509v3 Key Usage: critical
                Digital Signature, Key Encipherment
            X509v3 Basic Constraints:
                CA:FALSE
            ...
-----BEGIN CERTIFICATE-----
MIIECDCCAvCgAwIBAgIBATANBgkqhkiG9w0BAQUFADCBgTETMBEGCgmSJomT8ixk
...
h02u1GHiy46GI+xfR3LsPwFKlkTaaLaL/6aaoQ==
-----END CERTIFICATE-----
Certificate:
    Data:
        Version: 3 (0x2)
        Serial Number: 2 (0x2)
    Signature Algorithm: sha1WithRSAEncryption
        Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Root1 CA
        ...
        Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Signing CA
        Subject Public Key Info:
            Public Key Algorithm: rsaEncryption
                Public-Key: (2048 bit)
            ...
        X509v3 extensions:
            X509v3 Key Usage: critical
                Certificate Sign, CRL Sign
            X509v3 Basic Constraints: critical
                CA:TRUE, pathlen:0
        ...
-----BEGIN CERTIFICATE-----
MIID4TCCAsmgAwIBAgIBAjANBgkqhkiG9w0BAQUFADB+MRMwEQYKCZImiZPyLGQB
...
dyCeWnvL7u5sd6ffo8iRny0QzbHKmQt/wUtcVIvWXdMIFJM0Hw==
-----END CERTIFICATE-----
```

Note:
Use only the attributes mentioned above for both client and server certificates to avoid affecting the certificate verification process. For example, OpenSSL might fail to establish an encrypted connection if *X509v3 Subject Alternative Name* or *Netscape Cert Type* extensions are used. For more information, see Limitations on using X.509 v3 certificate extensions.

3. Place the Zabbix server private key into a file, for example, at `/home/zabbix/zabbix_server.key`:

```
-----BEGIN PRIVATE KEY-----
MIIEwAIBADANBgkqhkiG9w0BAQEFAASCBKowggSmAgEAAoIBAQC9tIXIJoVnNXDl
...
IJLkhbybBYEf47MLhffWa7XvZTY=
-----END PRIVATE KEY-----
```

4. Edit the TLS configuration parameters in the Zabbix server configuration file:

```
TLSCAFile=/home/zabbix/zabbix_ca_file.crt
TLSCertFile=/home/zabbix/zabbix_server.crt
TLSKeyFile=/home/zabbix/zabbix_server.key
```

Zabbix proxy

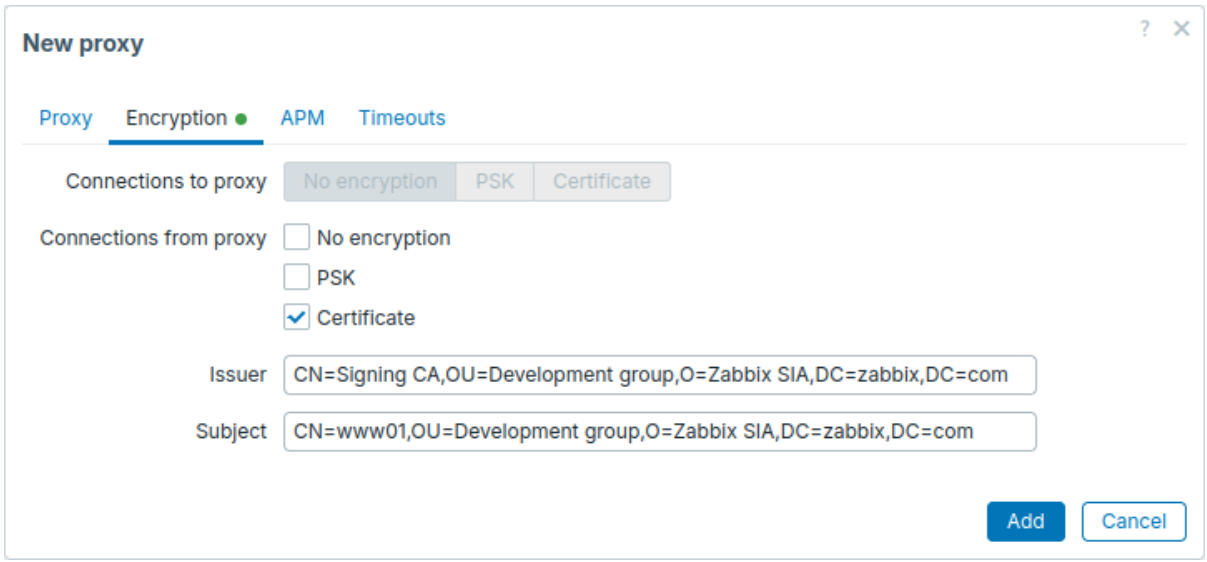
1. Prepare files with the top-level CA certificates, the Zabbix proxy certificate/certificate chain, and the private key as described in the Zabbix server section. Then, edit the `TLSCAFile`, `TLSCertFile`, and `TLSKeyFile` parameters in the Zabbix proxy configuration file accordingly.

2. Edit additional TLS parameters in the Zabbix proxy configuration file:

- For active proxy: `TLSConnect=cert`
- For passive proxy: `TLSAccept=cert`

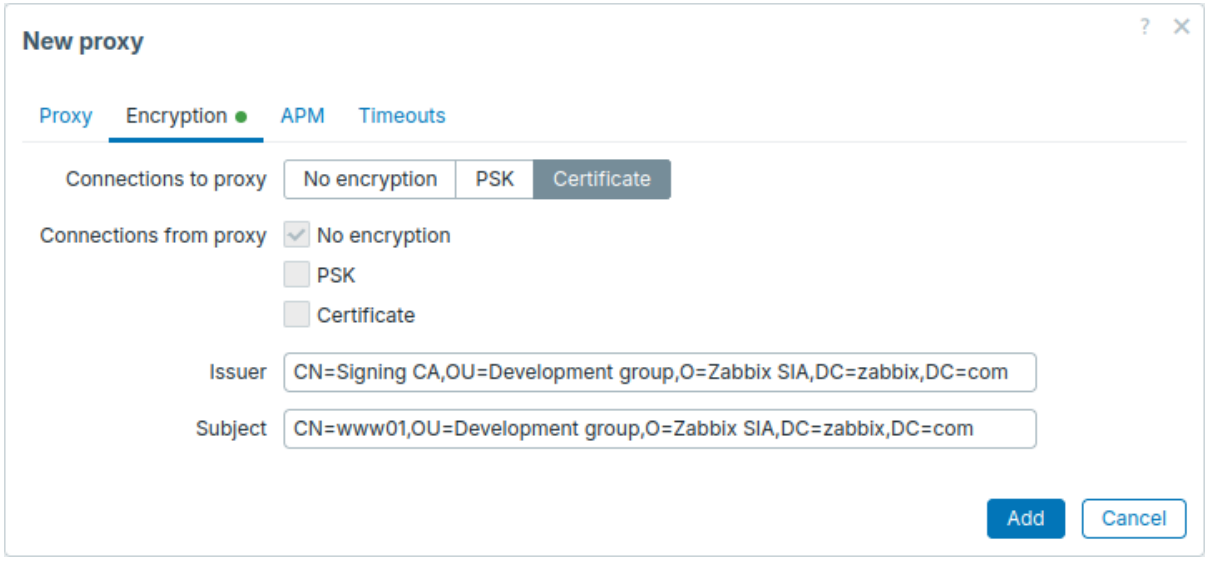
Note:
To improve proxy security, you can also set the `TLSServerCertIssuer` and `TLSServerCertSubject` parameters. For more information, see Restricting allowed certificate issuer and subject.

TLS parameters in the final proxy configuration file may look as follows:



```
TLSConnect=cert
TLSAccept=cert
TLSCAFile=/home/zabbix/zabbix_ca_file.crt
TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix server,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSCertFile=/home/zabbix/zabbix_proxy.crt
TLSKeyFile=/home/zabbix/zabbix_proxy.key
```

3. Configure encryption for this proxy in Zabbix frontend:



- Go to: *Administration* > *Proxies*.
- Select the proxy and click the *Encryption* tab.

In the examples below, the *Issuer* and *Subject* fields are filled in. For more information on why and how to use these fields, see Restricting allowed certificate issuer and subject.

For active proxy:

For passive proxy:

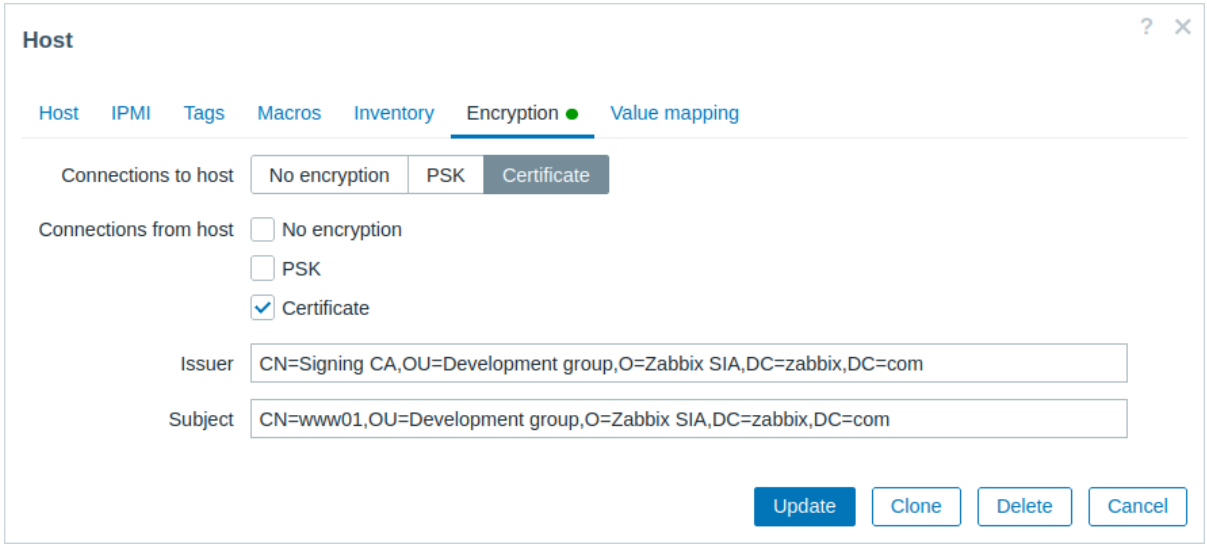
Zabbix agent

1. Prepare files with the top-level CA certificates, the Zabbix agent certificate/certificate chain, and the private key as described in the Zabbix server section. Then, edit the `TLSCAFile`, `TLSCertFile`, and `TLSKeyFile` parameters in the Zabbix agent configuration file accordingly.

2. Edit additional TLS parameters in the Zabbix agent configuration file:

- For active agent: `TLSConnect=cert`
- For passive agent: `TLSAccept=cert`

Note:
To improve agent security, you can set the `TLSServerCertIssuer` and `TLSServerCertSubject` parameters. For more information, see Restricting allowed certificate issuer and subject.



The TLS parameters in the final agent configuration file may look as follows. Note that the example assumes that the host is monitored by a proxy, hence it is specified as the certificate Subject:

```
TLSConnect=cert
TLSAccept=cert
TLSCAFile=/home/zabbix/zabbix_ca_file.crt
TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSCertFile=/home/zabbix/zabbix_agentd.crt
TLSKeyFile=/home/zabbix/zabbix_agentd.key
```

3. Configure encryption in Zabbix frontend for the host monitored by this agent.

- Go to: *Data collection* > *Hosts*.
- Select the host and click the *Encryption* tab.

In the example below, the *Issuer* and *Subject* fields are filled in. For more information on why and how to use these fields, see Restricting allowed certificate issuer and subject.

Zabbix web service

1. Prepare files with the top-level CA certificates, the Zabbix web service certificate/certificate chain, and the private key as described in the Zabbix server section. Then, edit the `TLSCAFile`, `TLSCertFile`, and `TLSKeyFile` parameters in the Zabbix web service configuration file accordingly.

2. Edit an additional TLS parameter in the Zabbix web service configuration file: `TLSAccept=cert`

TLS parameters in the final web service configuration file may look as follows:

```
TLSAccept=cert
TLSCAFile=/home/zabbix/zabbix_ca_file.crt
TLSCertFile=/home/zabbix/zabbix_web_service.crt
TLSKeyFile=/home/zabbix/zabbix_web_service.key
```

3. Configure Zabbix server to connect to the TLS-configured Zabbix web service by editing the `WebServiceURL` parameter in the Zabbix server configuration file:

```
WebServiceURL=https://example.com:443/report
```

Restricting allowed certificate issuer and subject When two Zabbix components (for example, server and agent) establish a TLS connection, they validate each other's certificates. If a peer certificate is signed by a trusted CA (with a pre-configured top-level certificate in `TLSCAFile`), is valid, has not expired, and passes other checks, then the communication between components can proceed. In this simplest case, the certificate issuer and subject are not verified.

However, this presents a risk: anyone with a valid certificate can impersonate anyone else (for example, a host certificate could be used to impersonate a server). While this may be acceptable in small environments where certificates are signed by a dedicated in-house CA and the risk of impersonation is low, it may not be sufficient in larger or more security-sensitive environments.

If your top-level CA issues certificates that should not be accepted by Zabbix or if you want to reduce the risk of impersonation, you can restrict allowed certificates by specifying their issuer and subject.

For example, in the Zabbix proxy configuration file, you could specify:

```
TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix server,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
```

With these settings, an active proxy will not communicate with a Zabbix server whose certificate has a different issuer or subject. Similarly, a passive proxy will not accept requests from such a server.

Rules for matching `Issuer` and `Subject` strings

The rules for matching `Issuer` and `Subject` strings are as follows:

- `Issuer` and `Subject` strings are checked independently. Both are optional.
- An unspecified string means that any string is accepted.
- Strings are compared *as is* and must match exactly.
- UTF-8 characters are supported. However, wildcards (`*`) or regular expressions are not supported.
- The following RFC 4514 requirements are implemented - characters that require escaping (with a '\' backslash, U+005C):
  - anywhere in the string: '"' (U+0022), '+' (U+002B), ',' (U+002C), ';' (U+003B), '<' (U+003C), '>' (U+003E), '\\' (U+005C);
  - at the beginning of the string: space (' ', U+0020) or number sign ('#', U+0023);
  - at the end of the string: space (' ', U+0020).
- Null characters (U+0000) are not supported. If a null character is encountered, the matching will fail.
- RFC 4517 and RFC 4518 standards are not supported.

For example, if `Issuer` and `Subject` organization (`O`) strings contain trailing spaces and the `Subject` organizational unit (`OU`) string contains double quotes, these characters must be escaped:

```
TLSServerCertIssuer=CN=Signing CA,OU=Development head,O=\ Example SIA\ ,DC=example,DC=com
TLSServerCertSubject=CN=Zabbix server,OU=Development group \"5\",O=\ Example SIA\ ,DC=example,DC=com
```

Field order and formatting

Zabbix follows the recommendations of RFC 4514, which specifies a "reverse" order for these fields, starting with the lowest-level fields (`CN`), proceeding to the mid-level fields (`OU`, `O`), and concluding with the highest-level fields (`DC`).

```
TLSServerCertIssuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
TLSServerCertSubject=CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
```

In contrast, OpenSSL by default displays the `Issuer` and `Subject` strings in top-level to low-level order. In the following example, `Issuer` and `Subject` fields start with the top-level (`DC`) and end with the low-level (`CN`) field. The formatting with spaces and field separators also varies based on the options used, and thus will not match the format required by Zabbix.

```
$ openssl x509 -noout -in /home/zabbix/zabbix_proxy.crt -issuer -subject
issuer= /DC=com/DC=zabbix/O=Zabbix SIA/OU=Development group/CN=Signing CA
subject= /DC=com/DC=zabbix/O=Zabbix SIA/OU=Development group/CN=Zabbix proxy

$ openssl x509 -noout -text -in /home/zabbix/zabbix_proxy.crt
Certificate:
    ...
        Issuer: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Signing CA
        ...
        Subject: DC=com, DC=zabbix, O=Zabbix SIA, OU=Development group, CN=Zabbix proxy
```

To format *Issuer* and *Subject* strings correctly for Zabbix, invoke OpenSSL with the following options:

```
$ openssl x509 -noout -issuer -subject \
    -nameopt esc_2253,esc_ctrl,utf8,dump_nostr,dump_unknown,dump_der,sep_comma_plus,dn_rev,sname\
    -in /home/zabbix/zabbix_proxy.crt
```

The output will then be in reverse order, comma-separated, and usable in Zabbix configuration files and frontend:

```
issuer=CN=Signing CA,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
subject=CN=Zabbix proxy,OU=Development group,O=Zabbix SIA,DC=zabbix,DC=com
```

Limitations on using X.509 v3 certificate extensions When implementing X.509 v3 certificates within Zabbix, certain extensions may not be fully supported or could result in inconsistent behavior.

Subject Alternative Name extension

Zabbix does not support the *Subject Alternative Name* extension, which is used to specify alternative DNS names such as IP addresses or email addresses. Zabbix can only validate the value in the *Subject* field of the certificate (see Restricting Allowed Certificate Issuer and Subject). If certificates include the `subjectAltName` field, the outcome of certificate validation may vary depending on the specific crypto toolkits used to compile Zabbix components. As a result, Zabbix may either accept or reject certificates based on these combinations.

Extended Key Usage extension

Zabbix supports the *Extended Key Usage* extension. However, if used, it is generally required that both *clientAuth* (for TLS WWW client authentication) and *serverAuth* (for TLS WWW server authentication) attributes are specified. For example:

- In passive checks, where Zabbix agent operates as a TLS server, the *serverAuth* attribute must be included in the agent's certificate.
- For active checks, where the agent operates as a TLS client, the *clientAuth* attribute must be included in the agent's certificate.

While GnuTLS may issue a warning for key usage violations, it typically allows communication to proceed despite these warnings.

Name Constraints extension

Support for the *Name Constraints* extension varies among crypto toolkits. Ensure that your chosen toolkit supports this extension. This extension may restrict Zabbix from loading CA certificates if this section is marked as critical, depending on the specific toolkit in use.

Certificate Revocation Lists (CRL) If a certificate is compromised, the Certificate Authority (CA) can revoke it by including the certificate in a Certificate Revocation List (CRL). CRLs are managed through configuration files and can be specified using the `TLSCRLFile` parameter in server, proxy, and agent configuration files. For example:

```
TLSCRLFile=/home/zabbix/zabbix_crl_file.crt
```

In this case, `zabbix_crl_file.crt` may contain CRLs from multiple CAs, and could look like this:

```
-----BEGIN X509 CRL-----
MIIB/DCB5QIBATANBgkqhkiG9w0BAQUFADCBgTETMBEGCgmSJomT8ixkARkWA2Nv
...
treZeUPjb7LSmZ3K2hpbZN7SoOZcAoHQ3GWd9npuctg=
-----END X509 CRL-----
-----BEGIN X509 CRL-----
MIIB+TCB4gIBATANBgkqhkiG9w0BAQUFADB/MRMwEQYKCZImiZPyLGQBGRYDY29t
...
CAEebS2CND3ShBedZ8YSil59O6JvaDP61lR5lNs=
-----END X509 CRL-----
```

The CRL file is loaded only when Zabbix starts. To update the CRL, restart Zabbix.

> **Attention:**
> If Zabbix components are compiled with OpenSSL and CRLs are used, ensure that each top-level and intermediate CA in the certificate chains has a corresponding CRL (even if it is empty) included in the `TLSCRLFile`.

Troubleshooting certificate problems OpenSSL used with CRLs and for some CA in the certificate chain its CRL is not included in `TLSCRLFile`

In TLS server log in case of *OpenSSL* peer:

```
failed to accept an incoming connection: from 127.0.0.1: TLS handshake with 127.0.0.1 returned error code
    file s3_srvr.c line 3251: error:14089086: SSL routines:ssl3_get_client_certificate:certificate verify
    TLS write fatal alert "unknown CA"
```

In TLS server log in case of *GnuTLS* peer:

```
failed to accept an incoming connection: from 127.0.0.1: TLS handshake with 127.0.0.1 returned error code
    file rsa_pk1.c line 103: error:0407006A: rsa routines:RSA_padding_check_PKCS1_type_1:\
    block type is not 01 file rsa_eay.c line 705: error:04067072: rsa routines:RSA_EAY_PUBLIC_DECRYPT:padd
```

CRL expired or expires during server operation

OpenSSL, in server log:

- before expiration:

```
cannot connect to proxy "proxy-openssl-1.0.1e": TCP successful, cannot establish TLS to [[127.0.0.1]:20004
    SSL_connect() returned SSL_ERROR_SSL: file s3_clnt.c line 1253: error:14090086:\
    SSL routines:ssl3_get_server_certificate:certificate verify failed:\
    TLS write fatal alert "certificate revoked"
```

- after expiration:

```
cannot connect to proxy "proxy-openssl-1.0.1e": TCP successful, cannot establish TLS to [[127.0.0.1]:20004
    SSL_connect() returned SSL_ERROR_SSL: file s3_clnt.c line 1253: error:14090086:\
    SSL routines:ssl3_get_server_certificate:certificate verify failed:\
    TLS write fatal alert "certificate expired"
```

The point here is that with valid CRL a revoked certificate is reported as "certificate revoked". When CRL expires the error message changes to "certificate expired" which is quite misleading.

GnuTLS, in server log:

- before and after expiration the same:

```
cannot connect to proxy "proxy-openssl-1.0.1e": TCP successful, cannot establish TLS to [[127.0.0.1]:20004
     invalid peer certificate: The certificate is NOT trusted. The certificate chain is revoked.
```

Self-signed certificate, unknown CA

OpenSSL, in log:

```
error:'self signed certificate: SSL_connect() set result code to SSL_ERROR_SSL: file ../ssl/statem/statem_
     line 1924: error:1416F086:SSL routines:tls_process_server_certificate:certificate verify failed:\
     TLS write fatal alert "unknown CA"'
```

This was observed when server certificate by mistake had the same Issuer and Subject string, although it was signed by CA. Issuer and Subject are equal in top-level CA certificate, but they cannot be equal in server certificate. (The same applies to proxy and agent certificates.)

To check whether a certificate contains the same Issuer and Subject entries, run:

```
openssl x509 -in <yourcertificate.crt> -noout -text
```

It is acceptable for the root (top-level) certificate to have identical values for Issuer and Subject.

Encryption using pre-shared keys

Overview Each pre-shared key (PSK) in Zabbix actually is a pair of:

- non-secret PSK identity string,
- secret PSK string value.

PSK identity string is a non-empty UTF-8 string. For example, "PSK ID 001 Zabbix agentd". It is a unique name by which this specific PSK is referred to by Zabbix components. Do not put sensitive information in PSK identity string - it is transmitted over the network unencrypted.

PSK value is a hard to guess string of hexadecimal digits, for example, e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d08

Warning:
Never use the example PSK values provided in the documentation in production environments. Instead, generate a unique, cryptographically secure PSK.

Size limits There are size limits for PSK identity and value in Zabbix, in some cases a crypto library can have lower limit:

Component	PSK identity max size	PSK value min size	PSK value max size
Zabbix	128 UTF-8 characters	128-bit (16-byte PSK, entered as 32 hexadecimal digits)	2048-bit (256-byte PSK, entered as 512 hexadecimal digits)
GnuTLS	128 bytes (may include UTF-8 characters)	-	2048-bit (256-byte PSK, entered as 512 hexadecimal digits)
OpenSSL 1.0.x, 1.1.0	127 bytes (may include UTF-8 characters)	-	2048-bit (256-byte PSK, entered as 512 hexadecimal digits)
OpenSSL 1.1.1	127 bytes (may include UTF-8 characters)	-	512-bit (64-byte PSK, entered as 128 hexadecimal digits)
OpenSSL 1.1.1a and later	127 bytes (may include UTF-8 characters)	-	2048-bit (256-byte PSK, entered as 512 hexadecimal digits)

Attention:
Zabbix frontend allows configuring up to 128-character long PSK identity string and 2048-bit long PSK regardless of crypto libraries used.
 If some Zabbix components support lower limits, it is the user's responsibility to configure PSK identity and value with allowed length for these components.
 Exceeding length limits results in communication failures between Zabbix components.

Before Zabbix server connects to agent using PSK, the server looks up the PSK identity and PSK value configured for that agent in database (actually in configuration cache). Upon receiving a connection the agent uses PSK identity and PSK value from its configuration file. If both parties have the same PSK identity string and PSK value the connection may succeed.

Attention:
Each PSK identity must be paired with only one value. It is the user's responsibility to ensure that there are no two PSKs with the same identity string but different values. Failing to do so may lead to unpredictable errors or disruptions of communication between Zabbix components using PSKs with this PSK identity string.

Generating PSK For example, a 256-bit (32 bytes) PSK can be generated using the following commands:

- with *OpenSSL*:

```
$ openssl rand -hex 32
af8ced32dfe8714e548694e2d29e1a14ba6fa13f216cb35c19d0feb1084b0429
```

- with *GnuTLS*:

```
$ psktool -u psk_identity -p database.psk -s 32
Generating a random key for user 'psk_identity'
Key stored to database.psk

$ cat database.psk
psk_identity:9b8eafedfaae00cece62e85d5f4792c7d9c9bcc851b23216a1d300311cc4f7cb
```

Note that "psktool" above generates a database file with a PSK identity and its associated PSK. Zabbix expects just a PSK in the PSK file, so the identity string and colon (':') should be removed from the file.

Configuring PSK for server-agent communication (example) On the agent host, write the PSK value generated above into a file, for example, `/home/zabbix/zabbix_agentd.psk`. The file must contain the PSK value on the first line.

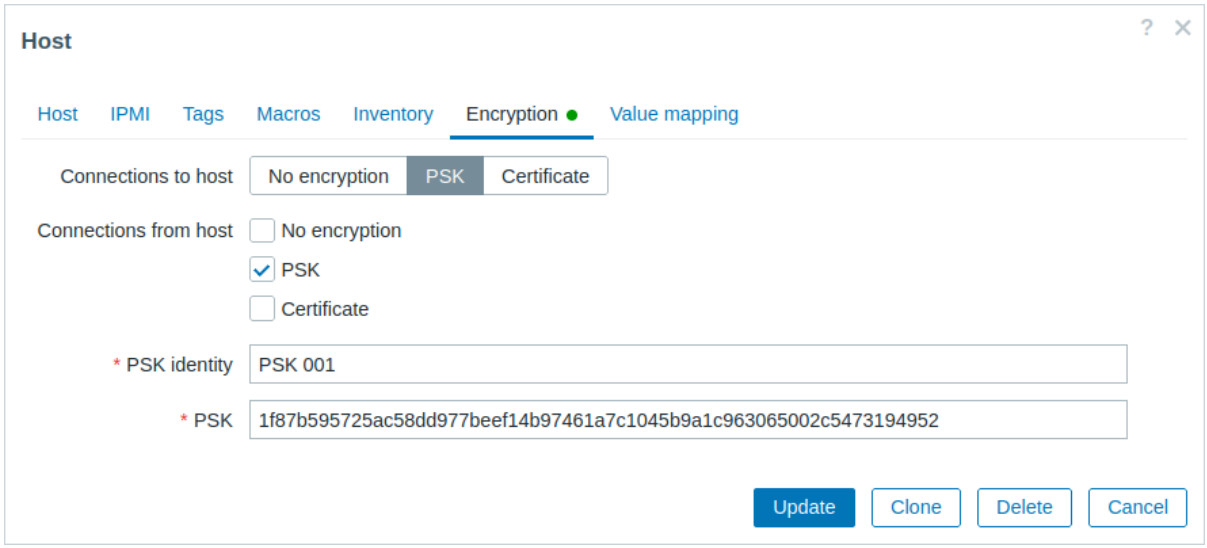
Set access rights to PSK file - it must be readable only by Zabbix user.

Edit TLS parameters in the Zabbix agent configuration file (`zabbix_agentd.conf`). For example, set:

```
TLSConnect=psk
TLSAccept=psk
TLSPSKFile=/home/zabbix/zabbix_agentd.psk
TLSPSKIdentity=PSK 001
```

The agent will connect to server (active checks) and accept from server and `zabbix_get` only connections using PSK. PSK identity will be "PSK 001".

Restart the agent. Now you can test the connection using `zabbix_get`, for example:



```
zabbix_get -s 127.0.0.1 -k "system.cpu.load[all,avg1]" --tls-connect=psk --tls-psk-identity="PSK 001" --tl
```

(To minimize downtime see how to change connection type in Connection encryption management).

Configure PSK encryption for this agent in Zabbix frontend:

1. Go to: *Data collection* > *Hosts*.
2. Select the host and click the *Encryption* tab.
3. Configure the PSK encryption details.

Example:

All mandatory input fields are marked with a red asterisk.

When configuration cache is synchronized with database the new connections will use PSK. Check server and agent logfiles for error messages.

Configuring PSK for server - active proxy communication (example) On the proxy, write the PSK value into a file, for example, `/home/zabbix/zabbix_proxy.psk`. The file must contain PSK in the first text string, for example:

```
e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d08327ba434e9
```

Set access rights to PSK file - it must be readable only by Zabbix user.

Edit TLS parameters in the Zabbix proxy configuration file (`zabbix_proxy.conf`). For example, set:

```
TLSConnect=psk
TLSPSKFile=/home/zabbix/zabbix_proxy.psk
TLSPSKIdentity=PSK 002
```

The proxy will connect to server using PSK. PSK identity will be "PSK 002".

(To minimize downtime see how to change connection type in Connection encryption management).

Configure PSK for this proxy in Zabbix frontend. Go to *Administration* > *Proxies*, select the proxy, go to *Encryption* tab. In "Connections from proxy" mark PSK. Paste into "PSK identity" field "PSK 002" and "e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d083 into "PSK" field. Click "Update".

Restart proxy. It will start using PSK-based encrypted connections to server. Check server and proxy logfiles for error messages.

For a passive proxy the procedure is very similar. The only difference - set `TLSAccept=psk` in the Zabbix proxy configuration file and set *Connections to proxy* in Zabbix frontend to PSK.

Troubleshooting PSK problems PSK contains an odd number of hex-digits

Proxy or agent does not start, message in the proxy or agent log:

```
invalid PSK in file "/home/zabbix/zabbix_proxy.psk"
```

PSK identity string longer than 128 bytes is passed to GnuTLS

In TLS client side log:

```
gnutls_handshake() failed: -110 The TLS connection was non-properly terminated.
```

In TLS server side log.

```
gnutls_handshake() failed: -90 The SRP username supplied is illegal.
```

Too long PSK value used with OpenSSL 1.1.1

In connecting-side log:

```
...OpenSSL library (version OpenSSL 1.1.1  11 Sep 2018) initialized
...
...In zbx_tls_connect(): psk_identity:"PSK 1"
...zbx_psk_client_cb() requested PSK identity "PSK 1"
...End of zbx_tls_connect():FAIL error:'SSL_connect() set result code to SSL_ERROR_SSL: file ssl\statem\ex
```

In accepting-side log:

```
...Message from 123.123.123.123 is missing header. Message ignored.
```

This problem typically arises when upgrading OpenSSL from 1.0.x or 1.1.0 to 1.1.1 and if the PSK value is longer than 512-bit (64-byte PSK, entered as 128 hexadecimal digits).

Secure connection to the database

Overview

This section provides Zabbix setup steps and configuration examples for secure TLS connections between:

Database	Zabbix components
MySQL	Zabbix frontend, Zabbix server, Zabbix proxy
PostgreSQL	Zabbix frontend, Zabbix server, Zabbix proxy

To set up connection encryption within the DBMS, see official vendor documentation for details:

- MySQL: source and replica replication database servers.
- MySQL: group replication, etc. database servers.
- PostgreSQL encryption options.

All examples are based on the GA releases of MySQL CE (8.0) and PgSQL (13) available through official repositories using CentOS 8.

Requirements

The following is required to set up encryption:

- Developer-supported operating system with OpenSSL >=1.1.X or alternative.

Note:
It is recommended to avoid OS in the end-of-life status, especially in the case of new installations

- Database engine (RDBMS) installed and maintained from the official repository provided by developer. Operating systems often shipped with outdated database software versions for which encryption support is not implemented, for example RHEL 7 based systems and PostgreSQL 9.2, MariaDB 5.5 without encryption support.

Terminology

Setting this option enforces to use TLS connection to database from Zabbix server/proxy and frontend to database:

- `required` - connect using TLS as transport mode without identity checks
- `verify_ca` - connect using TLS and verify certificate
- `verify_full` - connect using TLS, verify certificate and verify that database identity (CN) specified by DBHost matches its certificate

Zabbix configuration

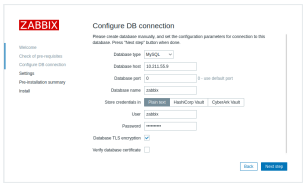
Frontend to the database

A secure connection to the database can be configured during frontend installation:

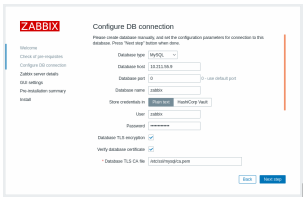
- Mark the *Database TLS encryption* checkbox in the Configure DB connection step to enable transport encryption.
- Mark the *Verify database certificate* checkbox that appears when *TLS encryption* field is checked to enable encryption with certificates.

Note:
For MySQL, the *Database TLS encryption* checkbox is disabled, if *Database host* is set to localhost, because connection that uses a socket file (on Unix) or shared memory (on Windows) cannot be encrypted.
 For PostgreSQL, the *TLS encryption* checkbox is disabled, if the value of the *Database host* field begins with a slash or the field is empty.

The following parameters become available in the TLS encryption in certificates mode (if both checkboxes are marked):



Parameter	Description
Database TLS CA file	Specify the full path to a valid TLS certificate authority (CA) file.
Database TLS key file	Specify the full path to a valid TLS key file.
Database TLS certificate file	Specify the full path to a valid TLS certificate file.
Database host verification	Mark this checkbox to activate host verification. Disabled for MySQL because the PHP MySQL library does not allow the peer certificate validation step to be skipped.
Database TLS cipher list	Specify a custom list of valid ciphers. The format of the cipher list must conform to the OpenSSL standard. Available for MySQL only.



Attention:
TLS parameters must point to valid files. If they point to non-existent or invalid files, it will lead to the authorization error.
 If certificate files are writable, the frontend generates a warning in the System information report that "TLS certificate files must be read-only." (displayed only if the PHP user is the owner of the certificate).
Certificates protected by passwords are not supported.

Use cases

Zabbix frontend uses GUI interface to define possible options: `required`, `verify_ca`, `verify_full`. Specify required options in the installation wizard step *Configure DB connections*. These options are mapped to the frontend configuration file (`zabbix.conf.php`) in the following manner:

GUI settings	Configuration file	Description	Result

	...
	// Used for TLS connection.
	`$DB['ENCRYPTION'] = true;`
	`$DB['KEY_FILE'] = '';`
	`$DB['CERT_FILE'] = '';`
	`$DB['CA_FILE'] = '';`
	`$DB['VERIFY_HOST'] = false;`
	`$DB['CIPHER_LIST'] = '';`
	...
		1. Check *Database TLS encryption*
		2. Leave *Verify database certificate* unchecked
			Enable `required` mode.

	...
	`$DB['ENCRYPTION'] = true;`
	`$DB['KEY_FILE'] = '';`
	`$DB['CERT_FILE'] = '';`
	`$DB['CA_FILE'] = '/etc/ssl/mysql/ca.pem';`
	`$DB['VERIFY_HOST'] = false;`
	`$DB['CIPHER_LIST'] = '';`
	...
		1. Check *Database TLS encryption* and *Verify database certificate*
		2. Specify path to *Database TLS CA file*
			Enable `verify_ca` mode.

GUI settings	Configuration file	Description	Result

	...
	// Used for TLS connection with strictly defined Cipher list.
	`$DB['ENCRYPTION'] = true;`
	`$DB['KEY_FILE'] = '<key_file_path>';`
	`$DB['CERT_FILE'] = '<key_file_path>';`
	`$DB['CA_FILE'] = '<key_file_path>';`
	`$DB['VERIFY_HOST'] = true;`
	`$DB['CIPHER_LIST'] = '<cipher_list>';`
	...
	
	Or:
	
	...
	// Used for TLS connection without Cipher list defined - selected by MySQL server
	`$DB['ENCRYPTION'] = true;`
	`$DB['KEY_FILE'] = '<key_file_path>';`
	`$DB['CERT_FILE'] = '<key_file_path>';`
	`$DB['CA_FILE'] = '<key_file_path>';`
	`$DB['VERIFY_HOST'] = true;`
	`$DB['CIPHER_LIST'] = '';`
	...
		1. Check *Database TLS encryption* and *Verify database certificate*
		2. Specify path to *Database TLS key file*
		3. Specify path to *Database TLS CA file*
		4. Specify path to *Database TLS certificate file*
		5. Specify *Database TLS cipher list* (optional)
			Enable `verify_full` mode for MySQL.

GUI settings	Configuration file	Description	Result

	...
	`$DB['ENCRYPTION'] = true;`
	`$DB['KEY_FILE'] = '<key_file_path>';`
	`$DB['CERT_FILE'] = '<key_file_path>';`
	`$DB['CA_FILE'] = '<key_file_path>';`
	`$DB['VERIFY_HOST'] = true;`
	`$DB['CIPHER_LIST'] = ' ';`
	...
		1. Check *Database TLS encryption* and *Verify database certificate*
		2. Specify path to *Database TLS key file*
		3. Specify path to *Database TLS CA file*
		4. Specify path to *Database TLS certificate file*
		5. Check *Database host verification*
			Enable `verify_full` mode for PostgreSQL.

See also: Encryption configuration examples for MySQL, Encryption configuration examples for PostgreSQL.

Zabbix server/proxy configuration

Secure connections to the database can be configured with the respective parameters in the Zabbix server and/or proxy configuration file.

Configuration	Result
None	Connection to the database without encryption.
Set `DBTLSConnect=required`	Server/proxy make a TLS connection to the database. An unencrypted connection is not allowed.
1. Set `DBTLSConnect=verify_ca` 2. Set `DBTLSCAFile` - specify the TLS certificate authority file	Server/proxy make a TLS connection to the database after verifying the database certificate.
1. Set `DBTLSConnect=verify_full` 2. Set `DBTLSCAFile` - specify TLS certificate authority file	Server/proxy make a TLS connection to the database after verifying the database certificate and the database host identity.
1. Set `DBTLSCAFile` - specify TLS certificate authority file 2. Set `DBTLSCertFile` - specify the client public key certificate file 3. Set `DBTLSKeyFile` - specify the client private key file	Server/proxy provide a client certificate while connecting to the database.
Set `DBTLSCipher` - the list of encryption ciphers that the client permits for connections using TLS protocols up to TLS 1.2 or `DBTLSCipher13` - the list of encryption ciphers that the client permits for connections using TLS 1.3 protocol	(MySQL) TLS connection is made using a cipher from the provided list. (PostgreSQL) Setting this option will be considered as an error.

MySQL encryption configuration

Overview

This section provides several encryption configuration examples for CentOS 8.2 and MySQL 8.4.0 and can be used as a quickstart guide for encrypting the connection to the database.

Attention:
If MySQL host is set to localhost, encryption options will not be available. In this case a connection between Zabbix frontend and the database uses a socket file (on Unix) or shared memory (on Windows) and cannot be encrypted.

Note:
List of encryption combinations is not limited to the ones listed on this page. There are a lot more combinations available.

Pre-requisites

Install MySQL database from the official repository.

See MySQL documentation for details on how to use MySQL repo.

MySQL server is ready to accept secure connections using a self-signed certificate.

To see which users are using an encrypted connection, run the following query (Performance Schema should be turned ON):

```
SELECT sbt.variable_value AS tls_version, t2.variable_value AS cipher, processlist_user AS user, processli
FROM performance_schema.status_by_thread  AS sbt
JOIN performance_schema.threads AS t ON t.thread_id = sbt.thread_id
JOIN performance_schema.status_by_thread AS t2 ON t2.thread_id = t.thread_id
WHERE sbt.variable_name = 'Ssl_version' and t2.variable_name = 'Ssl_cipher'
ORDER BY tls_version;
```

Transport-only encryption

MySQL configuration

Modern versions of the database are ready out-of-the-box for `required` encryption mode. A server-side certificate will be created after initial setup and launch.

Create users and roles for the main components (replace <strong_password> with a strong, unique password):

```
mysql> CREATE USER
 'zbx_srv'@'%' IDENTIFIED WITH caching_sha2_password BY '<strong_password>',
 'zbx_web'@'%' IDENTIFIED WITH caching_sha2_password BY '<strong_password>'
 REQUIRE SSL
 PASSWORD HISTORY 5;

mysql> CREATE ROLE 'zbx_srv_role', 'zbx_web_role';

mysql> GRANT SELECT, UPDATE, DELETE, INSERT, CREATE, DROP, ALTER, INDEX, REFERENCES ON zabbix.* TO 'zbx_sr
mysql> GRANT SELECT, UPDATE, DELETE, INSERT ON zabbix.* TO 'zbx_web_role';

mysql> GRANT 'zbx_srv_role' TO 'zbx_srv'@'%';
mysql> GRANT 'zbx_web_role' TO 'zbx_web'@'%';

mysql> SET DEFAULT ROLE 'zbx_srv_role' TO 'zbx_srv'@'%';
mysql> SET DEFAULT ROLE 'zbx_web_role' TO 'zbx_web'@'%';
```

Note that the X.509 protocol is not used to check identity, but the user is configured to use only encrypted connections. See MySQL documentation for more details about configuring users.

Run to check connection (socket connection cannot be used to test secure connections):

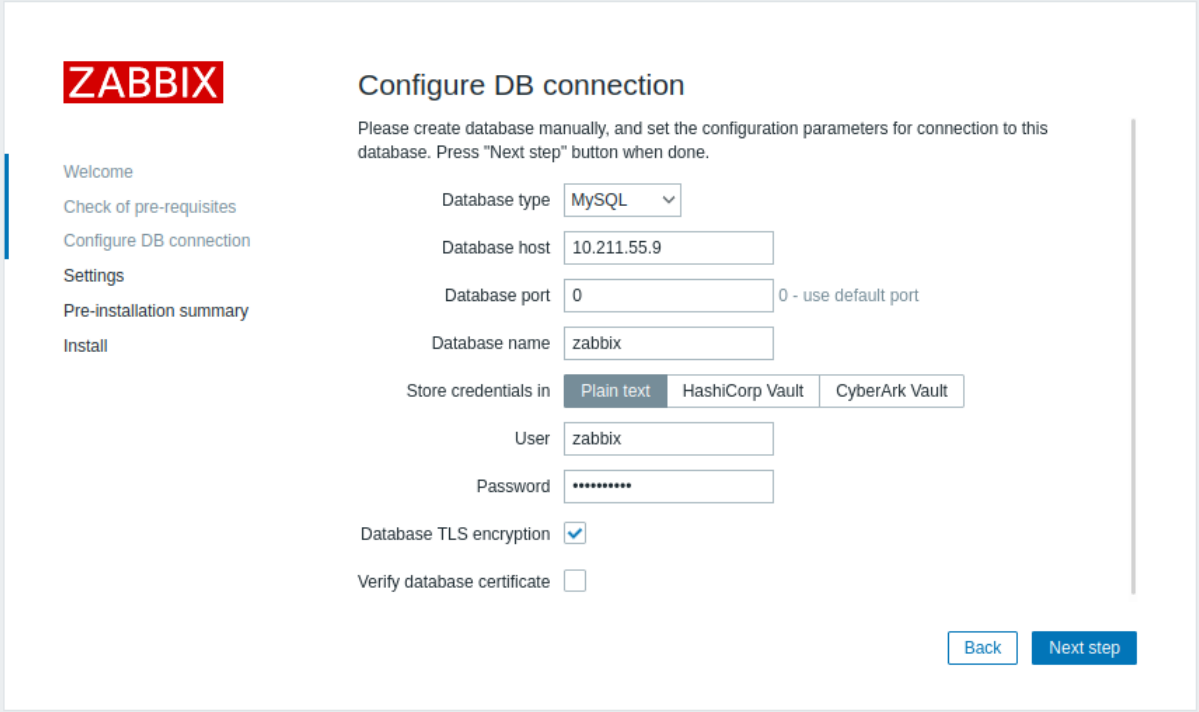
```
mysql -u zbx_srv -p -h 10.211.55.9 --ssl-mode=REQUIRED
```

Check current status and available cipher suites:

```
mysql> status
--------------
mysql Ver 8.4.0 for Linux on x86_64 (MySQL Community Server - GPL)

Connection id: 62
Current database:
Current user: zbx_srv@bfdb.local
SSL: Cipher in use is TLS_AES_256_GCM_SHA384

mysql> SHOW SESSION STATUS LIKE 'Ssl_cipher_list'\G;
*************************** 1. row ***************************
Variable_name: Ssl_cipher_list
Value: TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256:TLS_AES_128_CCM_SHA256:E
```



```
1 row in set (0.00 sec)

ERROR:
No query specified
```

Frontend

To enable transport-only encryption for connections between Zabbix frontend and the database:

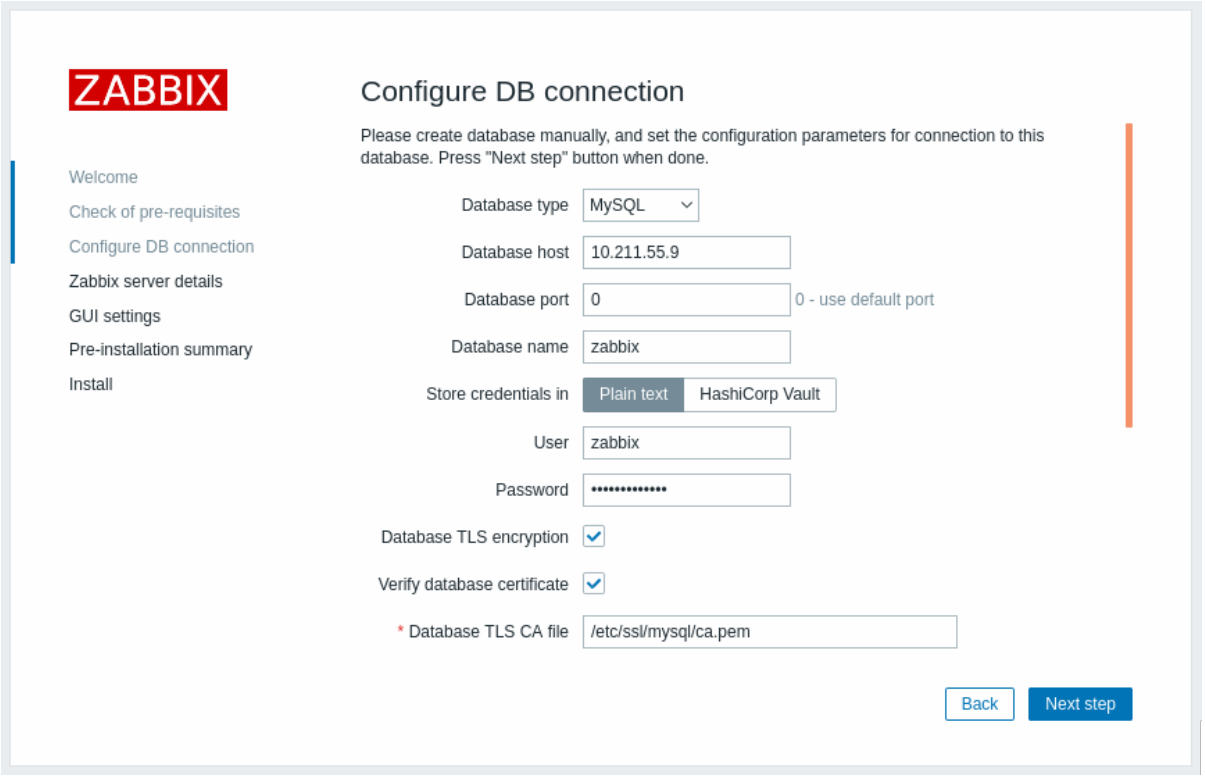
- Check *Database TLS encryption*
- Leave *Verify database certificate* unchecked

Server

To enable transport-only encryption for connections between server and the database, edit the server configuration file:

```
...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=required
...
```

Encryption with certificate authority verification



Copy required MySQL CA to the Zabbix frontend server, assign proper permissions to allow the webserver to read this file.

Note:
This mode doesn't work on RHEL 7 due to older MySQL libraries.

Frontend

To enable encryption with certificate verification for connections between Zabbix frontend and the database:

- Check *Database TLS encryption* and *Verify database certificate*
- Specify path to Database TLS CA file

Alternatively, this can be set in the frontend configuration file (`zabbix.conf.php`):

```
...
$DB['ENCRYPTION'] = true;
$DB['KEY_FILE'] = '';
$DB['CERT_FILE'] = '';
$DB['CA_FILE'] = '/etc/ssl/mysql/ca.pem';
$DB['VERIFY_HOST'] = false;
$DB['CIPHER_LIST'] = '';
...
```

Troubleshoot user using command-line tool to check if connection is possible for required user:

```
    mysql -u zbx_web -p -h 10.211.55.9 --ssl-mode=REQUIRED --ssl-ca=/var/lib/mysql/ca.pem
```

Server

To enable encryption with certificate verification for connections between Zabbix server and the database, edit the server configuration file:

```
...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=verify_ca
DBTLSCAFile=/etc/ssl/mysql/ca.pem
...
```

Encryption with full verification

MySQL configuration

Set MySQL CE server configuration option (*/etc/my.cnf.d/server-tls.cnf*) to:

```
[mysqld]
...
#### in this examples keys are located in the MySQL CE datadir directory
ssl_ca=ca.pem
ssl_cert=server-cert.pem
ssl_key=server-key.pem

require_secure_transport=ON
```

```
tls_version=TLSv1.3
...
```

Keys for the MySQL CE server and client (Zabbix frontend) should be created manually according to the MySQL CE documentation: Creating SSL and RSA certificates and keys using MySQL orCreating SSL certificates and keys using openssl

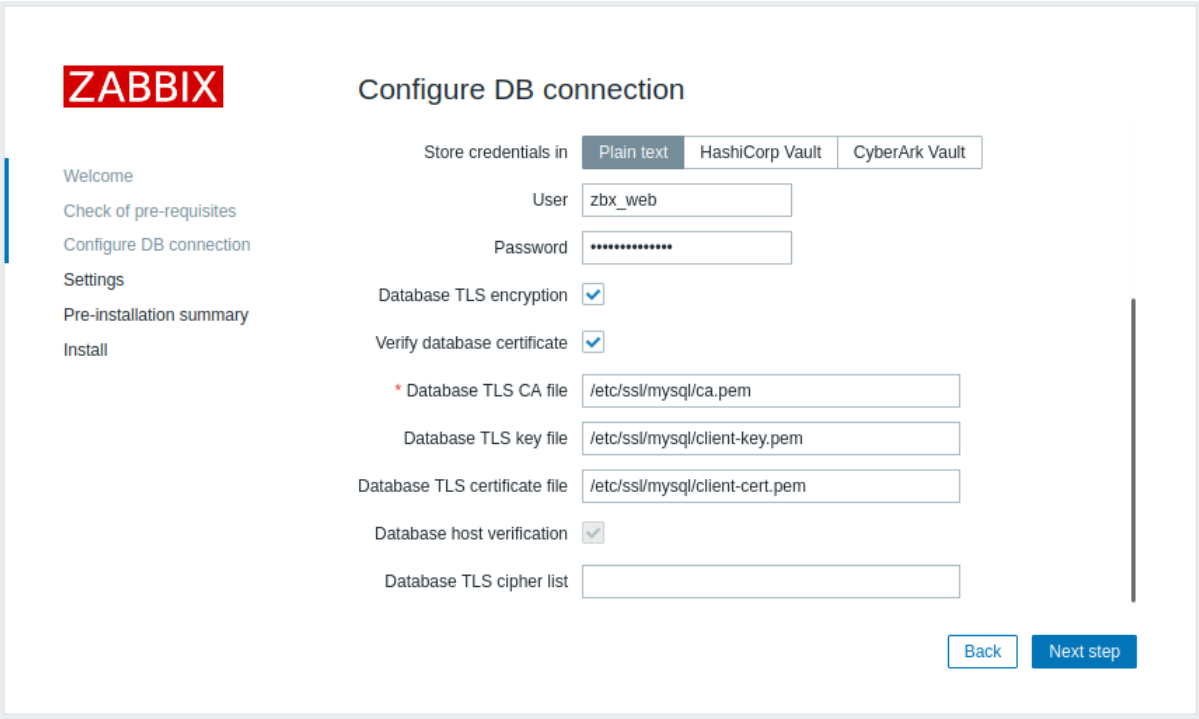
Attention:
MySQL server certificate should contain the Common Name field set to the FQDN name as Zabbix frontend will use the DNS name to communicate with the database or IP address of the database host.

Create MySQL user:

```
mysql> CREATE USER
  'zbx_srv'@'%' IDENTIFIED WITH caching_sha2_password BY '<strong_password>',
  'zbx_web'@'%' IDENTIFIED WITH caching_sha2_password BY '<strong_password>'
  REQUIRE X509
  PASSWORD HISTORY 5;
```

Check if it is possible to log in with that user:

```
mysql -u zbx_web -p -h 10.211.55.9 --ssl-mode=VERIFY_IDENTITY --ssl-ca=/var/lib/mysql/ca.pem --ssl-cert=/v
```



Frontend

To enable encryption with full verification for connections between Zabbix frontend and the database:

- Check *Database TLS encryption* and *Verify database certificate*
- Specify path to *Database TLS key file*
- Specify path to *Database TLS CA file*
- Specify path to *Database TLS certificate file*

Note that *Database host verification* is checked and grayed out - this step cannot be skipped for MySQL.

Warning:
If *Database TLS cipher list* field is left empty, the common ciphers permitted by both frontend (client) and server will be enabled. Alternatively, the ciphers can be set explicitly, in conformance with the cipher configuration requirements.

Alternatively, this can be set in the frontend configuration file (`zabbix.conf.php`):

```
...
// Used for TLS connection with strictly defined Cipher list.
$DB['ENCRYPTION'] = true;
$DB['KEY_FILE'] = '/etc/ssl/mysql/client-key.pem';
```

```
$DB['CERT_FILE'] = '/etc/ssl/mysql/client-cert.pem';
$DB['CA_FILE'] = '/etc/ssl/mysql/ca.pem';
$DB['VERIFY_HOST'] = true;
$DB['CIPHER_LIST'] = 'TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256:TLS_AES_1
...
// or
...
// Used for TLS connection without Cipher list defined - selected by MySQL server
$DB['ENCRYPTION'] = true;
$DB['KEY_FILE'] = '/etc/ssl/mysql/client-key.pem';
$DB['CERT_FILE'] = '/etc/ssl/mysql/client-cert.pem';
$DB['CA_FILE'] = '/etc/ssl/mysql/ca.pem';
$DB['VERIFY_HOST'] = true;
$DB['CIPHER_LIST'] = '';
...
```

Server

To enable encryption with full verification for connections between Zabbix server and the database, edit the server configuration file:

```
...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=verify_full
DBTLSCAFile=/etc/ssl/mysql/ca.pem
DBTLSCertFile=/etc/ssl/mysql/client-cert.pem
DBTLSKeyFile=/etc/ssl/mysql/client-key.pem
...
```

PostgreSQL encryption configuration

Overview

This section provides several encryption configuration examples for CentOS 8.2 and PostgreSQL 13.

> **Note:**
> Connection between Zabbix frontend and PostgreSQL cannot be encrypted (parameters in GUI are disabled), if the value of *Database host* field begins with a slash or the field is empty.

Pre-requisites

Install the PostgreSQL database using the official repository.

PostgreSQL is not configured to accept TLS connections out-of-the-box. Please follow instructions from PostgreSQL documentation for certificate preparation with postgresql.conf and also for user access control through `ph_hba.conf`.

By default, the PostgreSQL socket is bound to the localhost, for the network remote connections to allow listening on the real network interface.

PostgreSQL settings for all modes can look like this:

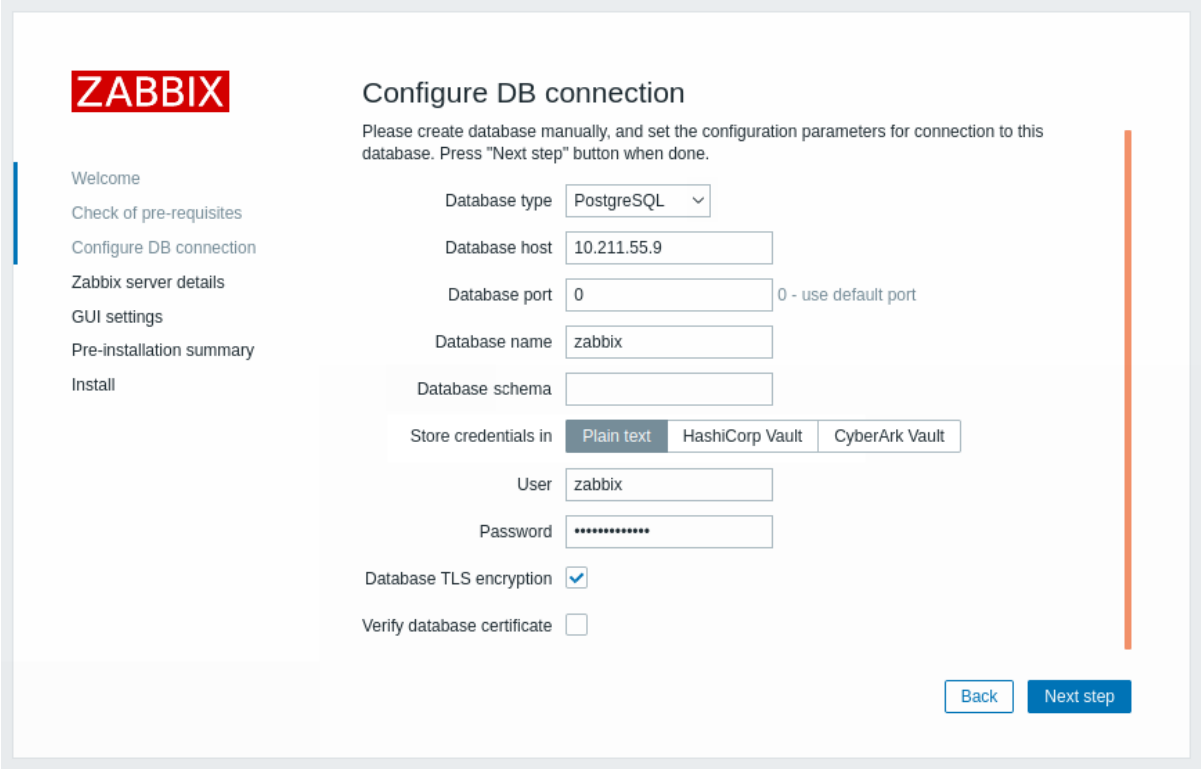
`/var/lib/pgsql/13/data/postgresql.conf`:

```
...
ssl = on
ssl_ca_file = 'root.crt'
ssl_cert_file = 'server.crt'
ssl_key_file = 'server.key'
ssl_ciphers = 'HIGH:MEDIUM:+3DES:!aNULL'
ssl_prefer_server_ciphers = on
ssl_min_protocol_version = 'TLSv1.3'
...
```

For access control adjust `/var/lib/pgsql/13/data/pg_hba.conf`:

```
...
### require
hostssl all all 0.0.0.0/0 md5

### verify CA
hostssl all all 0.0.0.0/0 md5 clientcert=verify-ca



### verify full
hostssl all all 0.0.0.0/0 md5 clientcert=verify-full
...
```

Transport-only encryption

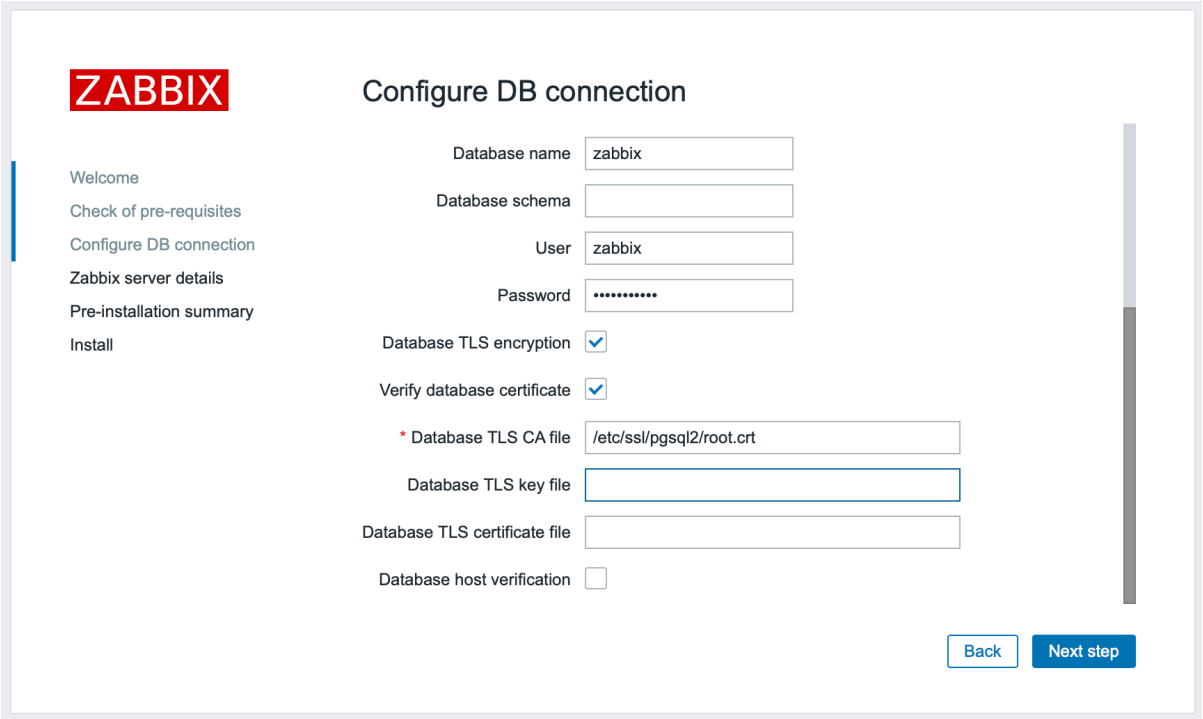
Frontend

To enable transport-only encryption for connections between Zabbix frontend and the database:

- Check *Database TLS encryption*
- Leave *Verify database certificate* unchecked

Server

To enable transport-only encryption for connections between server and the database, edit the server configuration file:



```
...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=required
...
```

Encryption with certificate authority verification

Frontend

To enable encryption with certificate authority verification for connections between Zabbix frontend and the database:

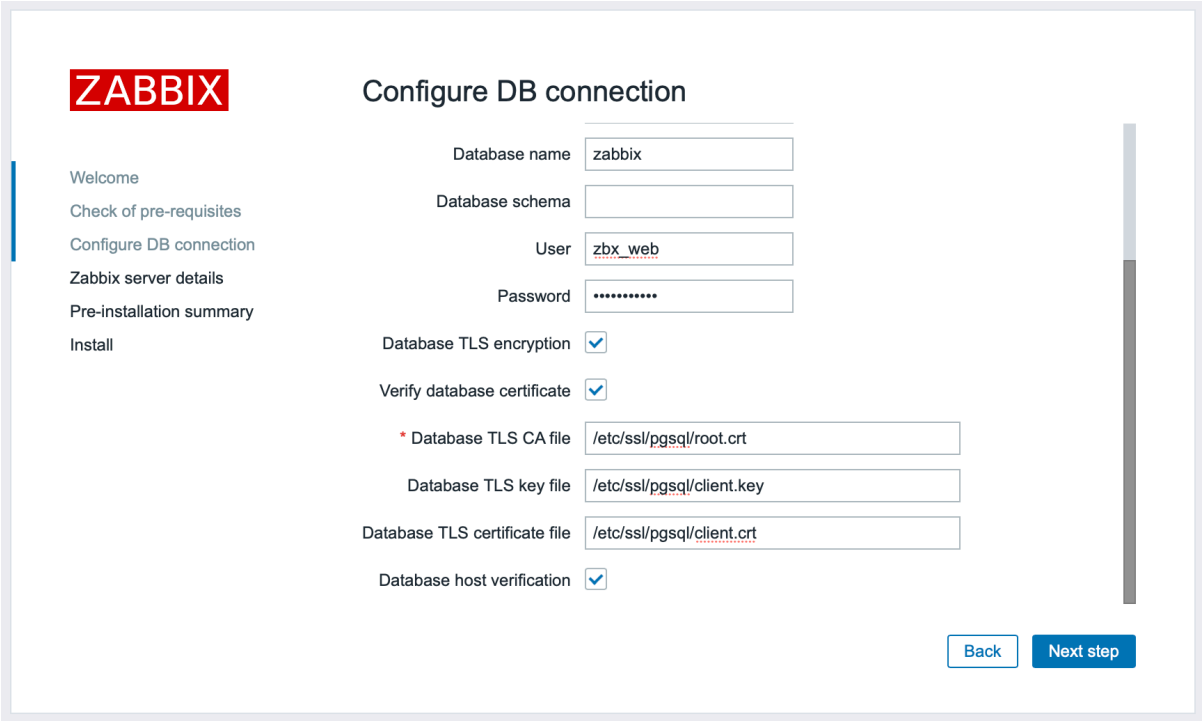
- Check *Database TLS encryption* and *Verify database certificate*
- Specify path to *Database TLS CA file*

Alternatively, this can be set in the frontend configuration file (`zabbix.conf.php`):

```
...
$DB['ENCRYPTION'] = true;
$DB['KEY_FILE'] = '';
$DB['CERT_FILE'] = '';
$DB['CA_FILE'] = '/etc/ssl/pgsql/root.crt';
$DB['VERIFY_HOST'] = false;
$DB['CIPHER_LIST'] = '';
...
```

Server

To enable encryption with certificate verification for connections between Zabbix server and the database, edit the server configuration file (replace `<strong_password>` with a strong, unique password):



```
...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=verify_ca
DBTLSCAFile=/etc/ssl/pgsql/root.crt
...
```

Encryption with full verification

Frontend

To enable encryption with certificate and database host identity verification for connections between Zabbix frontend and the database:

- Check *Database TLS encryption* and *Verify database certificate*
- Specify path to *Database TLS key file*
- Specify path to *Database TLS CA file*
- Specify path to *Database TLS certificate file*
- Check *Database host verification*

Alternatively, this can be set in the frontend configuration file (`zabbix.conf.php`):

```
$DB['ENCRYPTION'] = true;
$DB['KEY_FILE'] = '';
$DB['CERT_FILE'] = '';
$DB['CA_FILE'] = '/etc/ssl/pgsql/root.crt';
$DB['VERIFY_HOST'] = true;
$DB['CIPHER_LIST'] = '';
...
```

Server

To enable encryption with certificate and database host identity verification for connections between Zabbix server and the database, edit the server configuration file:

```
...
DBHost=10.211.55.9
DBName=zabbix
DBUser=zbx_srv
DBPassword=<strong_password>
DBTLSConnect=verify_full
DBTLSCAFile=/etc/ssl/pgsql/root.crt
DBTLSCertFile=/etc/ssl/pgsql/client.crt
DBTLSKeyFile=/etc/ssl/pgsql/client.key
...
```

Secure connection between frontend and server

Overview

This section provides Zabbix setup steps and configuration examples for secure TLS connections between Zabbix frontend and Zabbix server.

Configuration

By default, communication between Zabbix frontend and Zabbix server is unencrypted. For better security, enable TLS on both sides. Below is an example of the simplest way to do this.

1. Generate certificates and keys.

Create a working directory:

```
sudo mkdir -p /etc/zabbix/ssl && cd /etc/zabbix/ssl
```

Create a CA certificate (adjust the `MyZabbixCA` value to match the actual common name):

```
sudo openssl genrsa -out ca.key 4096
sudo openssl req -new -x509 -days 3650 -key ca.key -out ca.crt -subj "/CN=MyZabbixCA/"
```

Generate a private key and certificate for Zabbix server (adjust the `zabbix-server.example.com` value to match the actual common name):

```
sudo openssl genrsa -out server.key 2048
sudo openssl req -new -key server.key -out server.csr -subj "/CN=zabbix-server.example.com/"
sudo openssl x509 -req -days 365 -in server.csr -CA ca.crt -CAkey ca.key -CAcreateserial -sha256 -out serv
```

Generate a private key and certificate for Zabbix frontend (adjust the `zabbix-frontend-node` value to match the actual common name):

```
sudo openssl genrsa -out frontend.key 2048
sudo openssl req -new -key frontend.key -out frontend.csr -subj "/CN=zabbix-frontend-node/"
sudo openssl x509 -req -days 365 -in frontend.csr -CA ca.crt -CAkey ca.key -CAcreateserial -sha256 -out fr
```

2. Set proper permissions.

For Zabbix server (adjust ownership/group according to your distribution's Zabbix server daemon user):

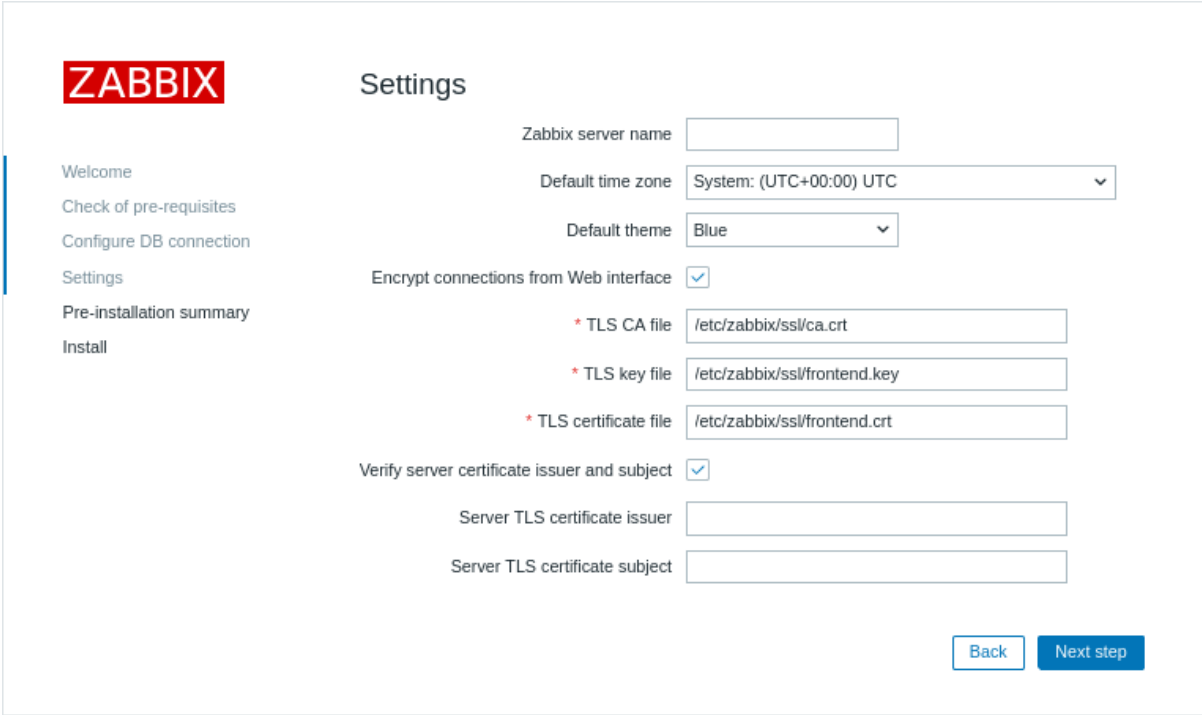
```
sudo chown root:zabbix /etc/zabbix/ssl/server.{crt,key} /etc/zabbix/ssl/ca.crt
sudo chmod 640 /etc/zabbix/ssl/server.key
sudo chmod 644 /etc/zabbix/ssl/server.crt /etc/zabbix/ssl/ca.crt
```

For frontend (adjust ownership/group according to your distribution's webserver user):

```
sudo chown root:www-data /etc/zabbix/ssl/frontend.{crt,key}
sudo chmod 640 /etc/zabbix/ssl/frontend.key
sudo chmod 644 /etc/zabbix/ssl/frontend.crt
```

3. Configure Zabbix server.

In the server configuration file (`zabbix_server.conf`) add:



```
TLSFrontendAccept=cert
TLSCertFile=/etc/zabbix/ssl/server.crt
TLSKeyFile=/etc/zabbix/ssl/server.key
TLSCAFile=/etc/zabbix/ssl/ca.crt
### Optionally:
### TLSFrontendCertIssuer=CN=MyZabbixCA
### TLSFrontendCertSubject=CN=zabbix-frontend-node
```

Then restart the server:

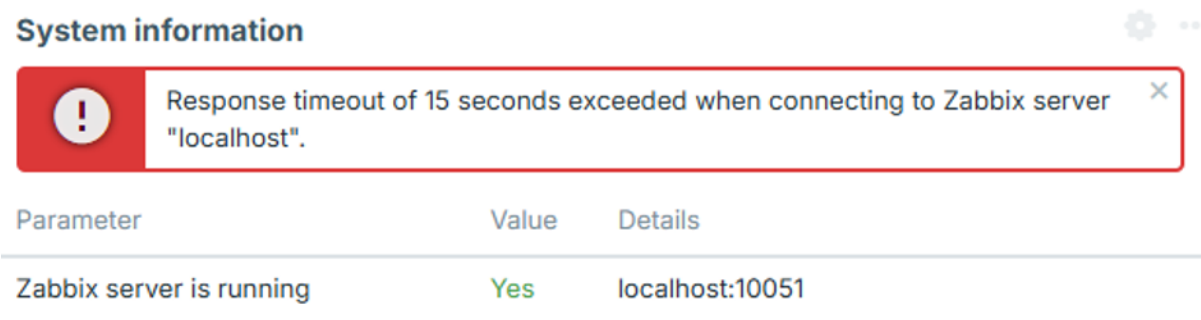
```
sudo systemctl restart zabbix-server
```

4. Configure Zabbix frontend.

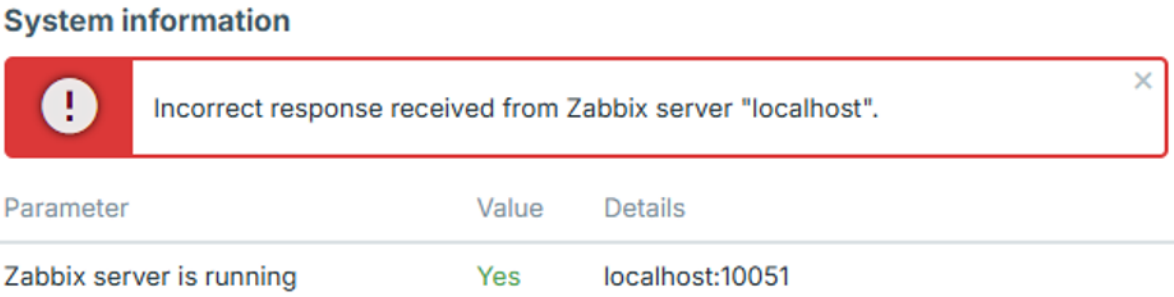
During web interface installation, enable the *Encrypt connections from Web interface* option (and *Verify server certificate issuer and subject* option, if necessary) and fill in the *TLS CA file*, *TLS key file*, *TLS certificate file* fields (and *Server TLS certificate issuer* and *Server TLS certificate subject* fields, if necessary):

Parameter	Description
TLS CA file	Specify the full path to the Certificate Authority (CA) certificate file used to verify the server's certificate.
TLS key file	Specify the full path to the client private key file corresponding to the client certificate.
TLS certificate file	Specify the full path to the client certificate file if mutual TLS authentication is required.
Server TLS certificate issuer	Specify a Distinguished Name (DN) of the issuer to match against the server's certificate.
Server TLS certificate subject	Specify a Distinguished Name (DN) of the subject to match against the server's certificate.

On existing installations, edit the following parameters in the frontend configuration file:



```
$ZBX_SERVER_TLS['ACTIVE'] = 'true';
$ZBX_SERVER_TLS['CA_FILE'] = '/etc/zabbix/ssl/ca.crt';
$ZBX_SERVER_TLS['KEY_FILE'] = '/etc/zabbix/ssl/frontend.key';
$ZBX_SERVER_TLS['CERT_FILE'] = '/etc/zabbix/ssl/frontend.crt';
// Optionally:
// $ZBX_SERVER_TLS['CERTIFICATE_ISSUER']  = 'CN=MyZabbixCA';
// $ZBX_SERVER_TLS['CERTIFICATE_SUBJECT'] = 'CN=zabbix-server.example.com';
```



5. Verify encryption by confirming there are no error messages in Zabbix frontend or Zabbix server log file:

```
tail -f /var/log/zabbix/zabbix_server.log
```

Troubleshooting

Incorrect or incomplete TLS configuration can cause errors in the Zabbix frontend or indicate that the Zabbix server is running but the connection is not established successfully:

To identify the exact configuration issue, set the Zabbix server log level to 4, reproduce the error in the frontend, and check the Zabbix server log for the corresponding error message.

The following cases describe common errors and their possible causes.

Frontend IP address is not allowed

The Zabbix server log contains an error similar to:

```
54283:20260819:105926.400 frontend connection from "127.0.0.1" is not allowed by FrontendAllowedIP
```

The connection is dropped after the TCP handshake because the frontend IP address is not authorized.

Add the frontend IP address to the `FrontendAllowedIP` parameter in `zabbix_server.conf` and restart the Zabbix server.

Unencrypted connection is not allowed

The Zabbix server log contains an error similar to:

```
56884:20260819:111154.285 frontend connection of type "unencrypted" is not allowed by TLSFrontendAccept
```

The Zabbix server is configured to accept only TLS connections, for example with `TLSFrontendAccept=cert`, but the frontend is attempting to connect without encryption.

Enable frontend encryption and configure the required TLS files in `zabbix.conf.php`, as described in step 4 of the Configuration.

Frontend attempts TLS while server expects unencrypted

The Zabbix server log contains an error similar to:

```
61091:20260819:115916.019 End of zbx_tls_accept():FAIL error:'TLS handshake set result code to 1: file ../
```

The exact error message depends on the OpenSSL version.

The Zabbix server is configured to accept only unencrypted connections, for example with `TLSFrontendAccept=unencrypted`, while the frontend is attempting to establish a TLS connection.

Configure the Zabbix server to accept TLS connections by setting `TLSFrontendAccept=cert` and defining `TLSCertFile` and `TLSKeyFile` in `zabbix_server.conf`. Alternatively, disable frontend encryption in `zabbix.conf.php`.

Frontend certificate is not trusted

The Zabbix server log contains an error similar to:

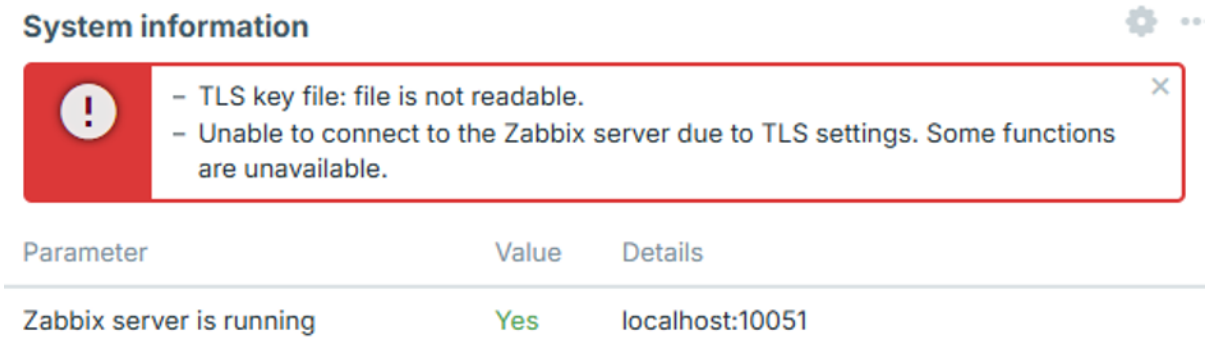
```
62248:20260819:124203.812 End of zbx_tls_accept():FAIL error:'self-signed certificate: TLS handshake set r
```

The frontend presented a certificate, but the Zabbix server does not trust the Certificate Authority (CA) that signed it.

The same problem can also appear in the frontend system information as:

```
fread(): SSL operation failed with code 1. OpenSSL Error messages:

error:0A000418:SSL routines::tlsv1 alert unknown ca [zabbix.php:17 → require_once() → ZBase->run() → ZBase
```



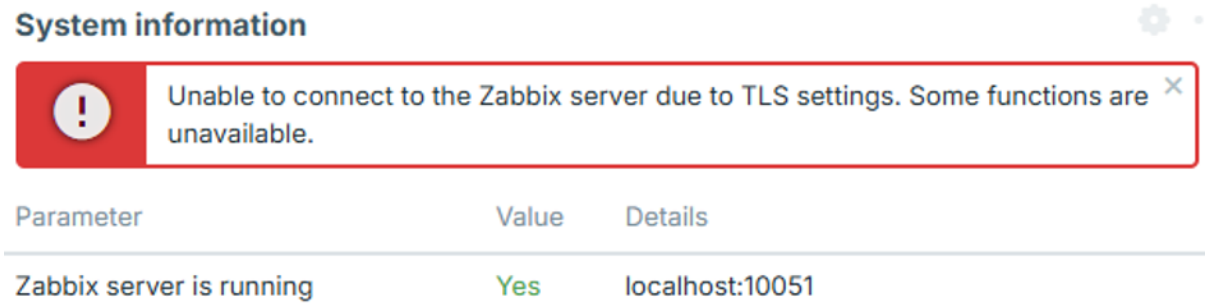
The frontend may also display ”Incorrect response received from Zabbix server ”localhost””.

Verify that the frontend certificate is signed by the CA specified by `TLSCAFile` in `zabbix_server.conf`.

TLS key file is not readable

The frontend may display ”TLS key file: file is not readable.”

It may also display ”Unable to connect to the Zabbix server due to TLS settings. Some functions are unavailable.”.



The web server user does not have sufficient permissions to read one or more certificate, key, or CA files configured in `zabbix.conf.php`. This can occur when certificate files are stored in a restricted directory, such as /root/ or a user's home directory.

Move the certificate files to a directory accessible to the web server and set appropriate permissions as described in step 2 of the Configuration.

TLS files are invalid or corrupted

The frontend may display "Unable to connect to the Zabbix server due to TLS settings. Some functions are unavailable.".

This can occur when the configured certificate or key files exist and are readable, but their contents are empty, corrupted, or otherwise invalid. In this case, the frontend does not establish a connection to the Zabbix server, and no corresponding connection attempt appears in the Zabbix server log.

Verify that the certificate and key files contain valid, properly formatted data and that the private key corresponds to the certificate.

Access control

Overview

This section contains best practices for setting up access control in a secure way.

Principle of least privilege

User accounts, at all times, should run with as few privileges as possible. This means that user accounts in Zabbix frontend, database users, or the user for Zabbix server/proxy/agent processes should only have the privileges that are essential for performing the intended functions.

Attention:
Giving extra privileges to the 'zabbix' user will allow it to access configuration files and execute operations that can compromise the infrastructure security.

When configuring user account privileges, Zabbix frontend user types should be considered. Note that although the *Admin* user type has fewer privileges than the *Super Admin* user type, it can still manage configuration and execute custom scripts.

Note:
Some information is available even for non-privileged users. For example, while *Alerts* → *Scripts* is available only for *Super Admin* users, scripts can also be retrieved through Zabbix API. In this case, limiting script permissions and excluding sensitive information from scripts (for example, access credentials) can help avoid exposing sensitive information available in global scripts.

Secure user for Zabbix agent

By default, Zabbix server, proxy, and agent (or agent 2) processes share one `zabbix` user. To prevent Zabbix agent/agent 2 (running on the same machine as server/proxy) from accessing sensitive details in the server/proxy configuration (for example, database credentials), the agent should be run under a different user:

For Zabbix agent:

1. Create a secure group and user (e.g., `zabbix-agent`).
2. Set this user in the agent configuration file User parameter.
3. Restart agent to drop privileges to the new user.

For Zabbix agent 2, the configuration must be applied at the service level, because the agent 2 configuration file does not support the `User` parameter. For an example, see ZBX-26442.

Revoke write access to SSL configuration (Windows)

If you have compiled Zabbix agent on Windows, with OpenSSL located in an unprotected directory (e.g., `C:\zabbix`, `c:\openssl-64bit`, `C:\OpenSSL-Win64-111-static`, or `C:\dev\openssl`), make sure to revoke write access from non-administrator users to this directory. Otherwise, the agent loads SSL settings from a path that can be modified by unprivileged users, resulting in a potential security vulnerability.

Hardening security of Zabbix components

Some functionality can be switched off to harden the security of Zabbix components:

- Global script execution on Zabbix server can be disabled by setting `EnableGlobalScripts=0` in server configuration.
- Global script execution on Zabbix proxy is disabled by default (can be enabled by setting `EnableRemoteCommands=1` in proxy configuration).
- Global script execution on Zabbix agents is disabled by default (can be enabled by adding an `AllowKey=system.run[<command>,*]` or `AllowKeyRegexp=^system\.run\[.*\]$` parameter for each allowed command in agent configuration).
- Access to the configuration of user HTTP authentication is enabled by default; can be disabled by setting `$ZBX_FEATURE_FLAGS['http` `= false` in frontend configuration.
- Access to the modules configuration is enabled by default; can be disabled by setting `$ZBX_FEATURE_FLAGS['modules_config_ena` `= false` in frontend configuration.
- Editing of specific media types can be restricted by setting `$ZBX_FEATURE_FLAGS['media_type_denylist'] = [<value1>, <value2>, ...]` in frontend configuration. Possible values: `'email'`, `'script'`, `'sms'`, `'webhook'`, and `'push'`. One or more values can be specified.

Reinstalling the frontend by running `setup.php` is restricted if the `zabbix.conf.php` configuration file exists.

UNC path access on Windows by Zabbix agent

Zabbix agents on Windows follow UNC paths (SMB shares like `\\server\share\file.txt`) in items like `vfs.file.*`, `vfs.dir.*`, `modbus.get`, and `perf_counter*`. This can be a security risk in some contexts.

When Windows is asked to access a UNC path, it tries to authenticate on that server. This means that a malicious request to Zabbix agent can expose the NTLM hash to the requesters server. Users can mitigate this by configuring the AllowKey, AllowKeyRegexp, DenyKey, and DenyKeyRegexp configuration parameters as needed.

Securing MySQL/MariaDB

Overview

This section contains best practices for securing a MySQL/MariaDB database.

> **Note:**
> For a basic setup, see the default MySQL/MariaDB database creation instructions, which include creating the 'zabbix' user with full privileges on the Zabbix database. This user is the database owner that also has the necessary privileges for modifying the database structure when upgrading Zabbix.

To improve security, creating additional database roles and users with minimal privileges is recommended. These roles and users should be configured based on the principle of least privilege, that is, they should only have privileges that are essential for performing the intended functions.

Creating user roles

Create the following roles with the corresponding privileges:

- **zbx_srv** - role for running Zabbix server and proxy:

```
CREATE ROLE 'zbx_srv';
GRANT DELETE, INSERT, SELECT, UPDATE ON zabbix.* TO 'zbx_srv';
FLUSH PRIVILEGES;
```

- **zbx_web** - role for running Zabbix frontend and API:

```
CREATE ROLE 'zbx_web';
GRANT DELETE, INSERT, SELECT, UPDATE ON zabbix.* TO 'zbx_web';
FLUSH PRIVILEGES;
```

- **zbx_bckp** - role for table backup:

```
CREATE ROLE 'zbx_bckp';
GRANT LOCK TABLES, TRIGGER, SELECT ON zabbix.* TO 'zbx_bckp';
GRANT process ON *.* TO 'zbx_bckp';
FLUSH PRIVILEGES;
```

Note:
Table restoration and upgrade should be performed by the database owner.

- **zbx_part** - role with a reduced set of privileges for database partitioning; note that this role can be created only after the database has been created, as it grants privileges on specific database tables:

```
CREATE ROLE 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.history TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.history_uint TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.history_str TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.history_text TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.history_log TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.trends TO 'zbx_part';
GRANT SELECT, ALTER, DROP ON zabbix.trends_uint TO 'zbx_part';
-- For MariaDB: skip the next line (GRANT session_variables_admin ON *.* TO 'zbx_part';)
GRANT session_variables_admin ON *.* TO 'zbx_part';
GRANT SELECT ON zabbix.dbversion TO 'zbx_part';
GRANT SELECT, DELETE ON zabbix.housekeeper TO 'zbx_part';
FLUSH PRIVILEGES;
```

After creating roles, they can be assigned to users.

Assigning user roles

To assign the created user roles, create users and assign the relevant roles to them. Replace <user>, <host>, <role>, and <password> with the appropriate values. Ensure that <password> is strong and unique.

```
CREATE USER '<user>'@'<host>' IDENTIFIED BY '<password>';
GRANT '<role>' TO '<user>'@'<host>';
SET DEFAULT ROLE '<role>' TO '<user>'@'<host>';
-- For MariaDB: SET DEFAULT ROLE '<role>' FOR '<user>'@'<host>'
FLUSH PRIVILEGES;
```

For example, to create and assign the role for running Zabbix server and proxy:

```
CREATE USER 'usr_srv'@'localhost' IDENTIFIED BY 'strong-password';
GRANT 'zbx_srv' TO 'usr_srv'@'localhost';
SET DEFAULT ROLE ALL TO 'usr_srv'@'localhost';
FLUSH PRIVILEGES;
```

Securing PostgreSQL/TimescaleDB

Overview

This section contains best practices for securing a PostgreSQL database.

Note:
For a basic setup, see the default PostgreSQL database creation instructions, which include creating the 'zabbix' user with full privileges on the Zabbix database. This user is the database owner that also has the necessary privileges for modifying the database structure when upgrading Zabbix.

To improve security, configuring a secure schema usage pattern, as well as creating additional database roles and users with minimal privileges is recommended. These roles and users should be configured based on the principle of least privilege, that is, they should only have privileges that are essential for performing the intended functions.

Database setup

Create the user that will be the database owner, and create the Zabbix database; the database owner is the user that is specified on database creation:

```
createuser -U postgres -h localhost --pwprompt usr_owner
createdb -U postgres -h localhost -O usr_owner -E Unicode -T template0 zabbix
```

Note:
A clean install or upgrade of the database has to be performed by the database owner. This is because the right to drop a database object or alter its definition is a privilege that is inherent to the database owner and cannot be granted or revoked.

Attention:
The following commands on this page must be executed while the connection to PostgreSQL is made specifically to the `zabbix` database.

Create the `zabbix` schema and set the database owner (`usr_owner`) to be the owner of this schema:

```
CREATE SCHEMA zabbix AUTHORIZATION usr_owner;
```

Configure a secure schema usage pattern:

```
REVOKE CREATE ON SCHEMA public FROM PUBLIC;
REVOKE ALL ON DATABASE zabbix FROM PUBLIC;
-- Note: search_path should point to the "zabbix" schema:
ALTER ROLE ALL IN DATABASE zabbix SET search_path = "zabbix";
```

After setting up the database, proceed to creating user roles.

Creating user roles

Create the following roles with the corresponding privileges:

- **zbx_srv** - role for running Zabbix server and proxy:

```
CREATE ROLE zbx_srv;
GRANT CONNECT ON DATABASE zabbix TO zbx_srv;
GRANT USAGE ON SCHEMA zabbix TO zbx_srv;
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT DELETE, INSERT, SELECT, UPDATE ON TABLE
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT SELECT, UPDATE, USAGE ON sequences TO z
```

- **zbx_web** - role for running Zabbix frontend and API:

```
CREATE ROLE zbx_web;
GRANT CONNECT ON DATABASE zabbix TO zbx_web;
GRANT USAGE ON SCHEMA zabbix TO zbx_web;
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT DELETE, INSERT, SELECT, UPDATE ON TABLE
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT SELECT, UPDATE, USAGE ON sequences TO z
```

- **zbx_bckp** - role for table backup:

```
CREATE ROLE zbx_bckp;
GRANT CONNECT ON DATABASE zabbix TO zbx_bckp;
GRANT USAGE ON SCHEMA zabbix TO zbx_bckp;
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT SELECT ON TABLES TO zbx_bckp;
ALTER DEFAULT PRIVILEGES FOR ROLE usr_owner IN SCHEMA zabbix GRANT SELECT, UPDATE, USAGE ON sequences TO z
```

> **Note:**
> Table restoration is possible only by the database owner.

After creating roles, they can be assigned to users.

Assigning user roles

To assign the created user roles, create users and assign the relevant roles to them. Replace <user>, <role>, and <password> with the appropriate values. Ensure that <password> is strong and unique.

```
CREATE USER <user> WITH ENCRYPTED password '<password>';
GRANT <role> TO <user>;
```

For example, to create and assign the role for running Zabbix server and proxy:

```
CREATE USER usr_srv WITH ENCRYPTED password 'strong-password';
GRANT zbx_srv TO usr_srv;
```

Database partitioning with TimescaleDB

Database partitioning is facilitated by TimescaleDB. To utilize TimescaleDB, Zabbix server requires database owner privileges.

If the PostgreSQL zabbix schema has already been created in the zabbix database, you can enable TimescaleDB with the following command:

```
echo "CREATE EXTENSION IF NOT EXISTS timescaledb WITH SCHEMA zabbix CASCADE;" | sudo -u postgres psql zabb
```

Cryptography

Overview

This section contains best practices for setting up cryptography in a secure way.

Setting up SSL for Zabbix frontend

On RHEL-based systems, install the mod_ssl package:

```
dnf install mod_ssl
```

Create a directory for SSL keys:

```
mkdir -p /etc/httpd/ssl/private
chmod 700 /etc/httpd/ssl/private
```

Create the SSL certificate:

```
openssl req -x509 -nodes -days 365 -newkey rsa:2048 -keyout /etc/httpd/ssl/private/apache-selfsigned.key -
```

Fill out the prompts appropriately. The most important line is the one that requests the Common Name. You must enter the domain name you want to be associated with your server. You can enter the public IP address instead if you do not have a domain name.

```
Country Name (2 letter code) [XX]:
State or Province Name (full name) []:
Locality Name (eg, city) [Default City]:
Organization Name (eg, company) [Default Company Ltd]:
Organizational Unit Name (eg, section) []:
Common Name (eg, your name or your server's hostname) []:example.com
Email Address []:
```

Edit the Apache SSL configuration file (/etc/httpd/conf.d/ssl.conf):

```
DocumentRoot "/usr/share/zabbix"
ServerName example.com:443
SSLCertificateFile /etc/httpd/ssl/apache-selfsigned.crt
SSLCertificateKeyFile /etc/httpd/ssl/private/apache-selfsigned.key
```

Restart the Apache service to apply the changes:

```
systemctl restart httpd.service
```

Securing web server

Overview

This section contains best practices for setting up the web server in a secure way.

Enforcing root URL redirect to Zabbix SSL

On RHEL-based systems, add a virtual host to Apache configuration (`/etc/httpd/conf/httpd.conf`) and set a permanent redirect for document root to Zabbix SSL URL. Note that `example.com` should be replaced with the actual name of the server.

```
### Add lines:

<VirtualHost *:*>
    ServerName example.com
    Redirect permanent / https://example.com
</VirtualHost>
```

Restart the Apache service to apply the changes:

```
systemctl restart httpd.service
```

Enabling HTTP Strict Transport Security (HSTS) on the web server

To protect Zabbix frontend against protocol downgrade attacks, we recommend enabling the HSTS policy on the web server.

To enable the HSTS policy for your Zabbix frontend in Apache configuration, follow these steps:

1. Locate your virtual host's configuration file:

- `/etc/httpd/conf/httpd.conf` on RHEL-based systems
- `/etc/apache2/sites-available/000-default.conf` on Debian/Ubuntu

2. Add the following directive to your virtual host's configuration file:

```
<VirtualHost *:*>
    Header set Strict-Transport-Security "max-age=31536000"
</VirtualHost>
```

3. Restart the Apache service to apply the changes:

```
### On RHEL-based systems:
systemctl restart httpd.service

### On Debian/Ubuntu
systemctl restart apache2.service
```

Enforcing Secure and SameSite session cookies in Zabbix

When configuring Zabbix, it is essential to enforce secure and SameSite attributes for session cookies to enhance security and prevent cross-site request forgery (CSRF) attacks. However, enforcing `SameSite=Strict` may cause issues in certain scenarios, such as:

- Dashboard URL widgets displaying "user not logged in" when embedding same-domain iframes.
- Users accessing the dashboard via HTTP instead of HTTPS may face login issues.
- Inability to share URLs to specific Zabbix menu sections or hosts.

To mitigate these issues, users should have a way to adjust the SameSite policy.

1. Secure cookies

Setting the `secure` flag ensures that cookies are only transmitted over HTTPS, preventing exposure over unencrypted connections.

To enable secure cookies in Zabbix, add or modify the following setting in the web server configuration:

For Apache:

```
Header always edit Set-Cookie ^(.*)$ $1;Secure
```

For Nginx:

```
proxy_cookie_path / "/; Secure";
```

Ensure that your Zabbix frontend is accessed via HTTPS; otherwise, cookies with the `Secure` flag will not be sent.

2. Configuring the SameSite attribute

Web server settings can also enforce the SameSite attribute:

For Apache:

```
<IfModule mod_headers.c>
    Header onsuccess edit Set-Cookie (.*) "$1; SameSite=Strict"
</IfModule>
```

For Nginx (version 1.19.3+):

```
proxy_cookie_flags ~ samesite=Strict; # Replace ~ with 'zbx_session' for specificity
```

Enabling Content Security Policy (CSP) on the web server

To protect Zabbix frontend against Cross Site Scripting (XSS), data injection, and similar attacks, we recommend enabling Content Security Policy on the web server. To do so, configure the web server to return the HTTP header.

> **Attention:**
> The following CSP header configuration is only for the default Zabbix frontend installation and for cases when all content originates from the site's domain (excluding subdomains). A different CSP header configuration may be required if you are, for example, configuring the *URL* widget to display content from the site's subdomains or external domains, switching from *OpenStreetMap* to another map engine, or adding external CSS or widgets. If you're using the Duo Universal Prompt multi-factor authentication method, make sure to add "duo.com" to the CSP directive in your virtual host's configuration file.

To enable CSP for your Zabbix frontend in Apache configuration, follow these steps:

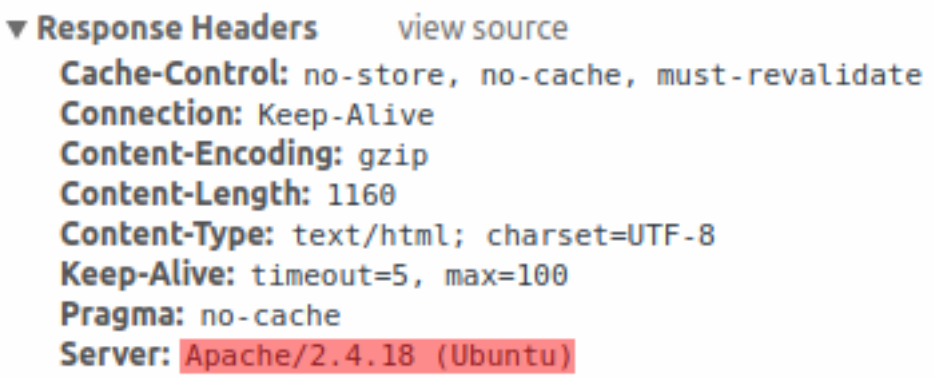
1. Locate your virtual host's configuration file:

- `/etc/httpd/conf/httpd.conf` on RHEL-based systems
- `/etc/apache2/sites-available/000-default.conf` on Debian/Ubuntu

2. Add the following directive to your virtual host's configuration file:

```
<VirtualHost *:*>
    Header set Content-Security-Policy: "default-src 'self' *.openstreetmap.org; script-src 'self' 'unsafe
</VirtualHost>
```

3. Restart the Apache service to apply the changes:



```
### On RHEL-based systems:
systemctl restart httpd.service

### On Debian/Ubuntu
systemctl restart apache2.service
```

Disabling web server information exposure

To improve security, disabling all web server signatures is recommended.

By default, the web server is exposing the software signature:

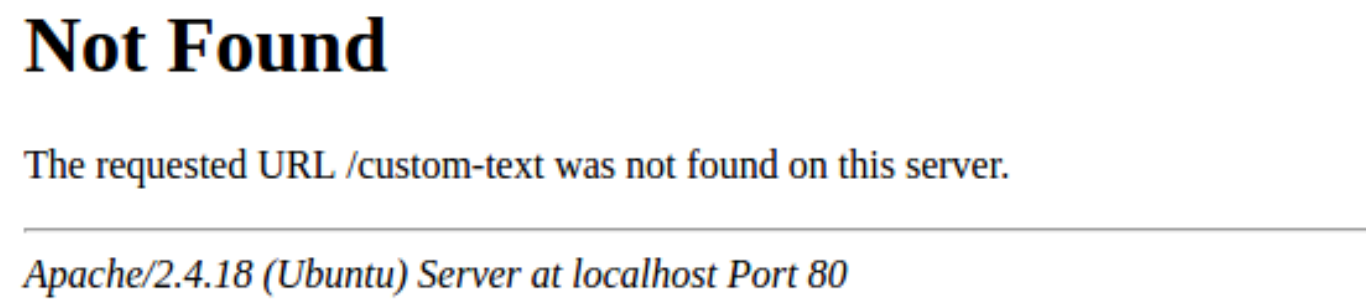
The signature can be disabled by adding the following parameters to the Apache configuration file:

```
ServerSignature Off
ServerTokens Prod
```

PHP signature (X-Powered-By HTTP header) can be disabled by changing the `php.ini` configuration file (by default, the signature is disabled):

```
expose_php = Off
```

Web server restart is required for configuration file changes to be applied.



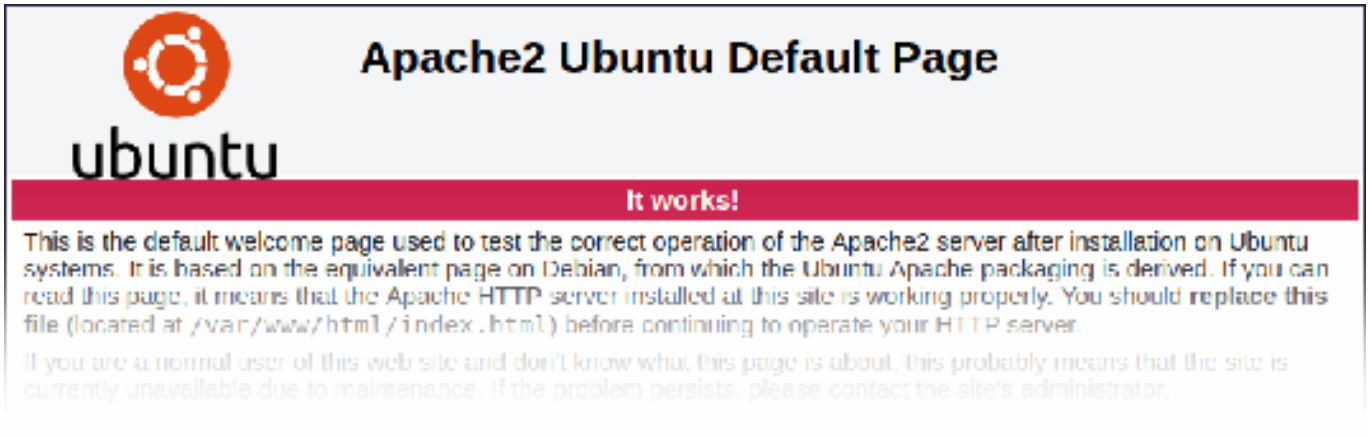
For additional security, you can use the *mod_security* tool with Apache (package *libapache2-mod-security2*). This tool allows removing the server signature instead of removing only the version from the server signature. The server signature can be changed to any value by setting "SecServerSignature" to any desired value after installing *mod_security*.

Please refer to the documentation of your web server to find help on how to remove/change software signatures.

Disabling web server default error pages

To avoid information exposure, disabling the default error pages is recommended.

By default, a web server uses built-in error pages:



These default error pages should be replaced/removed. For example, the "ErrorDocument" directive can be used to define a custom error page/text for the Apache web server.

Please refer to the documentation of your web server to find help on how to replace/remove default error pages.

Removing web server test page

To avoid information exposure, removing the web server test page is recommended.

By default, the Apache web server webroot contains the `index.html` test page:

Please refer to the documentation of your web server to find help on how to remove default test pages.

Set X-Frame-Options HTTP response header

By default, Zabbix is configured with the *Use X-Frame-Options HTTP header* parameter set to `SAMEORIGIN`. This means that content can only be loaded in a frame that has the same origin as the page itself.

Zabbix frontend elements that pull content from external URLs (namely, the URL dashboard widget) display retrieved content in a sandbox with all sandboxing restrictions enabled.

These settings enhance the security of the Zabbix frontend and provide protection against XSS and clickjacking attacks. *Super admin* users can modify the *Use iframe sandboxing* and *Use X-Frame-Options HTTP header* parameters as needed. Please carefully weigh the risks and benefits before changing default settings. Turning iframe sandboxing or X-Frame-Options HTTP header off completely is not recommended.

Hiding the file with list of common passwords

To increase the complexity of password brute force attacks, limiting access to the `ui/data/top_passwords.txt` file is recommended. This file contains a list of the most common and context-specific passwords and prevents users from setting such passwords (if the *Avoid easy-to-guess passwords* parameter is enabled in the password policy).

To limit access to the `top_passwords.txt` file, modify your web server configuration.

On Apache, file access can be limited using the `.htaccess` file:

```
<Files "top_passwords.txt">
    Order Allow,Deny
    Deny from all
</Files>
```

On NGINX, file access can be limited using the `location` directive:

```
location = /data/top_passwords.txt {
    deny all;
    return 404;
}
```

Storage of secrets

Overview Zabbix can be configured to retrieve sensitive information from a secure vault. The following secret management services are supported: HashiCorp Vault KV Secrets Engine - Version 2, CyberArk Vault CV12.

Secrets can be used for retrieving:

- user macro values
- database access credentials

Zabbix provides read-only access to the secrets in a vault, assuming that secrets are managed by someone else.

For information about specific vault provider configuration, see:

- HashiCorp configuration
- CyberArk configuration

Caching of secret values By default, vault secret macro values are retrieved by Zabbix server on every refresh of configuration data and then stored in the configuration cache. Zabbix proxy receives values of vault secret macros from Zabbix server on each configuration sync and stores them in its own configuration cache.

> **Attention:**
> Encryption must be enabled between Zabbix server and proxy; otherwise, a server warning message is logged.

It is also possible to configure that macro values are retrieved by Zabbix server and Zabbix proxy independently.

To manually trigger refresh of cached secret values from a vault, use the 'secrets_reload' command-line option.

For Zabbix frontend database credentials caching is disabled by default, but can be enabled by setting the option `$DB['VAULT_CACHE'] = true` in the frontend configuration file. The credentials will be stored in a local cache using the filesystem temporary file directory. The web server must allow writing in a private temporary folder (for example, for Apache the configuration option `PrivateTmp=True` must be set). To control how often the data cache is refreshed/invalidated, use the `ZBX_DATA_CACHE_TTL` constant .

TLS configuration To configure TLS for communication between Zabbix components and the vault, add a certificate signed by a certificate authority (CA) to the system-wide default CA store. To use another location, specify the directory in the SSLCALocation Zabbix server/proxy configuration parameter, place the certificate file inside that directory, then run the CLI command:

```
c_rehash .
```

CyberArk configuration

This section explains how to configure Zabbix to retrieve secrets from CyberArk Vault CV12.

The vault should be installed and configured as described in the official CyberArk documentation.

To learn about configuring TLS in Zabbix, see *Storage of secrets*.

Database credentials

Access to a secret with database credentials is configured for each Zabbix component separately.

Server and proxies

To obtain database credentials from the vault for Zabbix server or proxy, specify the following configuration parameters in the configuration file:

- `Vault` - which vault provider should be used;
- `VaultURL` - vault server HTTP(S) URL;
- `VaultDBPath` - query to the vault secret containing database credentials which will be retrieved by keys "Content" and "UserName" (this option can only be used if DBUser and DBPassword are not specified);
- `VaultTLSCertFile`, `VaultTLSKeyFile` - SSL certificate and key file names; setting up these options is not mandatory, but highly recommended;
- `VaultPrefix` - custom prefix for the vault path or query, depending on the vault; if not specified, the most suitable default will be used.

Attention:
`Vault`, `VaultURL`, `VaultTLSCertFile`, `VaultTLSKeyFile`, and `VaultPrefix` configuration parameters are also used for vault authentication when processing secret vault macros by Zabbix server (and Zabbix proxy, if configured). Zabbix server and proxies will not open vault secret macros that contain DB credentials from VaultDBPath.

Zabbix server and Zabbix proxy read the vault-related configuration parameters from `zabbix_server.conf` and `zabbix_proxy.conf` files upon startup.

Example

1. In `zabbix_server.conf`, specify the following parameters:

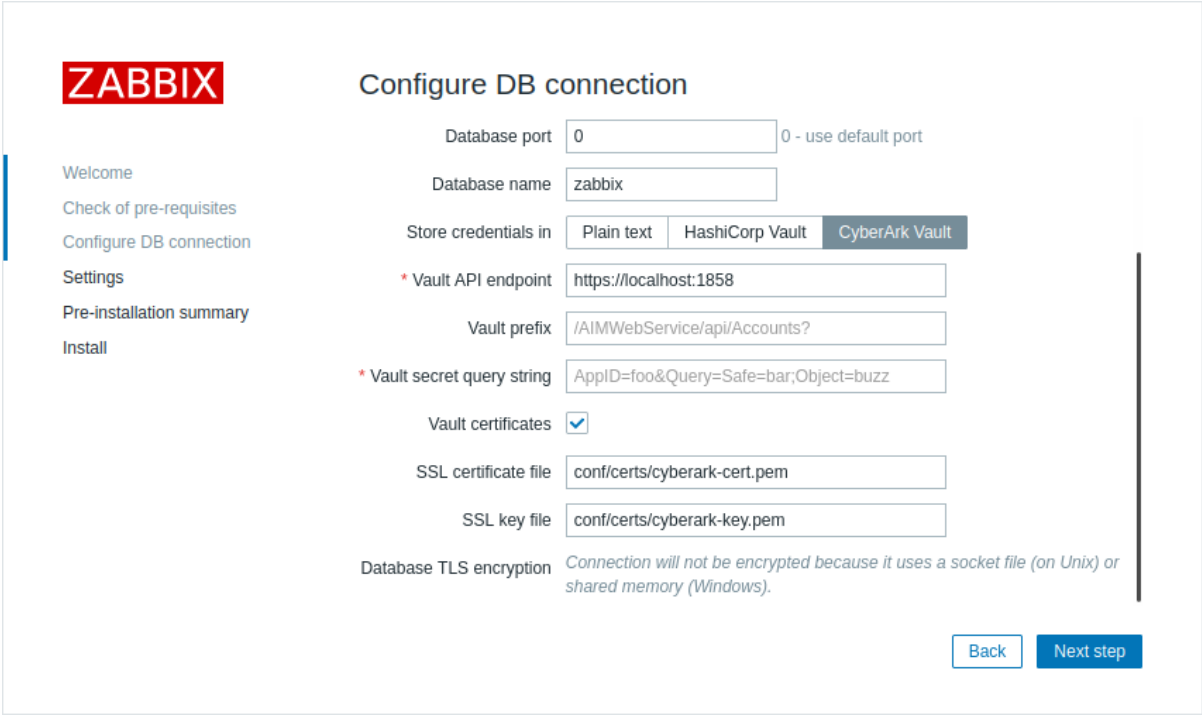
```
Vault=CyberArk
VaultURL=https://127.0.0.1:1858
VaultDBPath=AppID=zabbix_server&Query=Safe=passwordSafe;Object=zabbix_server_database
VaultTLSCertFile=cert.pem
VaultTLSKeyFile=key.pem
VaultPrefix=/AIMWebService/api/Accounts?
```

2. Zabbix will send the following API request to the vault:

```
curl \
--header "Content-Type: application/json" \
--cert cert.pem \
--key key.pem \
https://127.0.0.1:1858/AIMWebService/api/Accounts?AppID=zabbix_server&Query=Safe=passwordSafe;Object=zabbi
```

3. The vault response will contain the keys "Content" and "UserName":

```
{
    "Content": <password>,
    "UserName": <username>,
    "Address": <address>,
    "Database": <Database>,
    "PasswordChangeInProcess":<PasswordChangeInProcess>
}
```



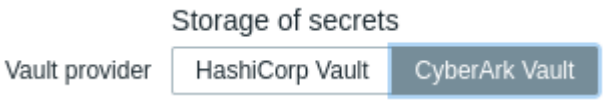
4. As a result, Zabbix will use the following credentials for database authentication:

- Username: <username>
- Password: <password>

Frontend

To obtain database credentials from the vault for Zabbix frontend, specify the following parameters during frontend installation.

1. At the *Configure DB Connection* step, set the *Store credentials in* parameter to *CyberArk Vault*.



2. Then, fill in the additional parameters:

Parameter	Mandatory	Default value	Description
Vault API endpoint	yes	https://localhost:1858	Specify the URL for connecting to the vault in the format `scheme://host:port`
Vault prefix	no	/AIMWebService/api/Accounts?	Provide a custom prefix for the vault path or query. If not specified, the default is used.
Vault secret query string	yes		A query, which specifies from where database credentials should be retrieved. Example: `AppID=foo&Query=Safe=bar;Object=buzz`
Vault certificates	no		After marking the checkbox, additional parameters will appear, allowing you to configure client authentication. While this parameter is optional, it is highly recommended to enable it for communication with the CyberArk Vault.
SSL certificate file	no	conf/certs/cyberark-cert.pem	Path to the SSL certificate file. The file must be in PEM format. If the certificate file also contains the private key, leave the SSL key file parameter empty.
SSL key file	no	conf/certs/cyberark-key.pem	Name of the SSL private key file used for client authentication. The file must be in PEM format.

User macro values

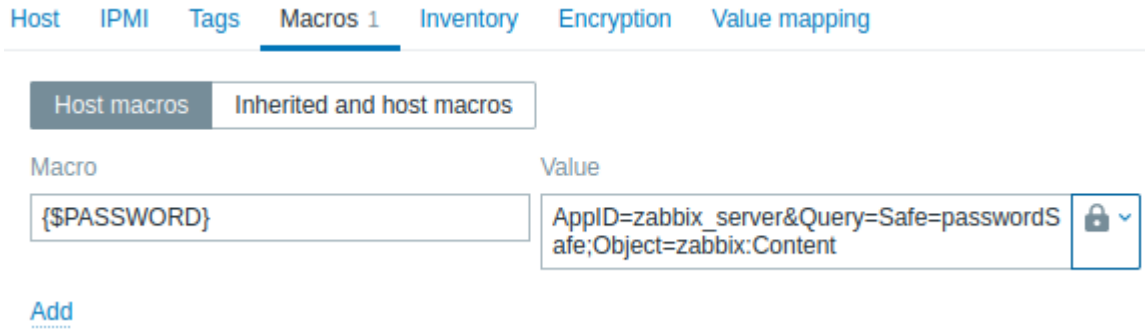
To use CyberArk Vault for storing *Vault secret* user macro values, make sure that:

- Zabbix server is configured to work with CyberArk Vault;
- the *Vault provider* parameter in *Administration > General > Other* is set to "CyberArk Vault".

Note:
Zabbix server (and Zabbix proxy, if configured) require access to *Vault secret* macro values from the vault. Zabbix frontend does not need such access.

The macro value should contain a query (as `query:key`).

See *Vault secret macros* for detailed information on macro value processing by Zabbix.



Query syntax

The colon symbol (`:`) is reserved for separating the query from the key.

If a query itself contains a forward slash or a colon, these symbols should be URL-encoded (`/` is encoded as `%2F`, `:` is encoded as `%3A`).

Example

1. In Zabbix, add a user macro `{$PASSWORD}` of type *Vault secret* and with the value `AppID=zabbix_server&Query=Safe=passwordS`

2. Zabbix will send the following API request to the vault:

```
curl \
--header "Content-Type: application/json" \
--cert cert.pem \
--key key.pem \
https://127.0.0.1:1858/AIMWebService/api/Accounts?AppID=zabbix_server&Query=Safe=passwordSafe;Object=zabbi
```

3. The vault response will contain the key `Content`:

```
{
    "Content": <password>,
    "UserName": <username>,
    "Address": <address>,
    "Database" :<Database>,
    "PasswordChangeInProcess":<PasswordChangeInProcess>
}
```

4. As a result, Zabbix will resolve the macro `{$PASSWORD}` to the value - `<password>`

Update existing configuration

To update an existing configuration for retrieving secrets from a CyberArk Vault:

1. Update the Zabbix server or proxy configuration file parameters as described in the *Database credentials* section.
2. Update the Zabbix frontend configuration file parameters:

```
$DB['VAULT']                    = 'CyberArk';
$DB['VAULT_URL']                = 'https://127.0.0.1:1858';
$DB['VAULT_DB_PATH']            = 'AppID=foo&Query=Safe=bar;Object=buzz';
$DB['VAULT_TOKEN']              = '';
$DB['VAULT_CERT_FILE']          = 'conf/certs/cyberark-cert.pem';
$DB['VAULT_KEY_FILE']           = 'conf/certs/cyberark-key.pem';
$DB['VAULT_PREFIX']             = '';
```

3. Configure user macros as described in the *User macro values* section, if necessary.

To update an existing configuration for retrieving secrets from a HashiCorp Vault, see *HashiCorp configuration*.

HashiCorp configuration

Overview

This section explains how to configure Zabbix for retrieving secrets from HashiCorp Vault KV Secrets Engine - Version 2.

The vault should be deployed and configured as described in the official HashiCorp documentation.

To learn about configuring TLS in Zabbix, see *Storage of secrets*.

Retrieving database credentials

To retrieve a secret with database credentials successfully, it is required to configure both:

- Zabbix server/proxy
- Zabbix frontend

Server/proxy

To configure Zabbix server or proxy, specify the following configuration parameters in the configuration file:

- `Vault` - which vault provider should be used.
- `VaultToken` - vault authentication token (see Zabbix server/proxy configuration file for details); cannot be used with `VaultAppRoleID`.
- `VaultAppRoleID` and `VaultAppSecretID` - vault authentication role ID and secret ID (see Zabbix server/proxy configuration file for details); cannot be used with `VaultToken`.
- `VaultURL` - vault server HTTP(S) URL.
- `VaultDBPath` - path to the vault secret containing database credentials (this option can only be used if DBUser and DBPassword are not specified). Zabbix server or proxy will retrieve the credentials by keys "password" and "username".
- `VaultPrefix` - custom prefix for the vault path or query, depending on the vault; if not specified, the most suitable default will be used. Note that the prefix must start and end with `/`.

Attention:
`Vault`, `VaultToken` (or `VaultAppRoleID`/`VaultAppSecretID`), `VaultURL`, and `VaultPrefix` configuration parameters are also used for vault authentication when processing secret vault macros by Zabbix server (and Zabbix proxy, if configured). Zabbix server and proxies will not open vault secret macros that contain DB credentials from VaultDBPath.

Using different tokens for different proxies is strongly recommended.

Zabbix server and Zabbix proxy read the vault-related configuration parameters from `zabbix_server.conf` and `zabbix_proxy.conf` upon startup. Additionally, Zabbix server and Zabbix proxy will read the `VAULT_TOKEN` environment variable once during startup and will unset it so that it would not be available through forked scripts; it is an error if both `VaultToken` and `VAULT_TOKEN` parameters contain a value.

Example

1. In `zabbix_server.conf`, specify the following parameters.

Using VaultToken:

```
Vault=HashiCorp
VaultToken=hvs.CAESIIG_PILmULFYOsEyWHxkZ2mF2a8VPKNLE8eHqd4autYGGh4KHGh2cy5aeTY0NFNSaUp3ZnpWbDF1RUNjUkNTZEg
VaultURL=https://127.0.0.1:8200
VaultDBPath=database
VaultPrefix=/v1/secret/data/zabbix/
```

Or, using VaultAppRoleID:

```
Vault=HashiCorp
VaultAppRoleID=6f1567f1-538d-7d70-e8e4-5d3e59471b2e
VaultAppSecretID=89dac8b1-f7d6-96a7-2ecf-f94d2de3d6f1
VaultURL=https://127.0.0.1:8200
VaultDBPath=database
VaultPrefix=/v1/secret/data/zabbix/
```

2. Run the following CLI commands to create the required secret in the vault:

```
#### Enable "secret/" mount point if not already enabled; note that "kv-v2" must be used.
vault secrets enable -path=secret/ kv-v2

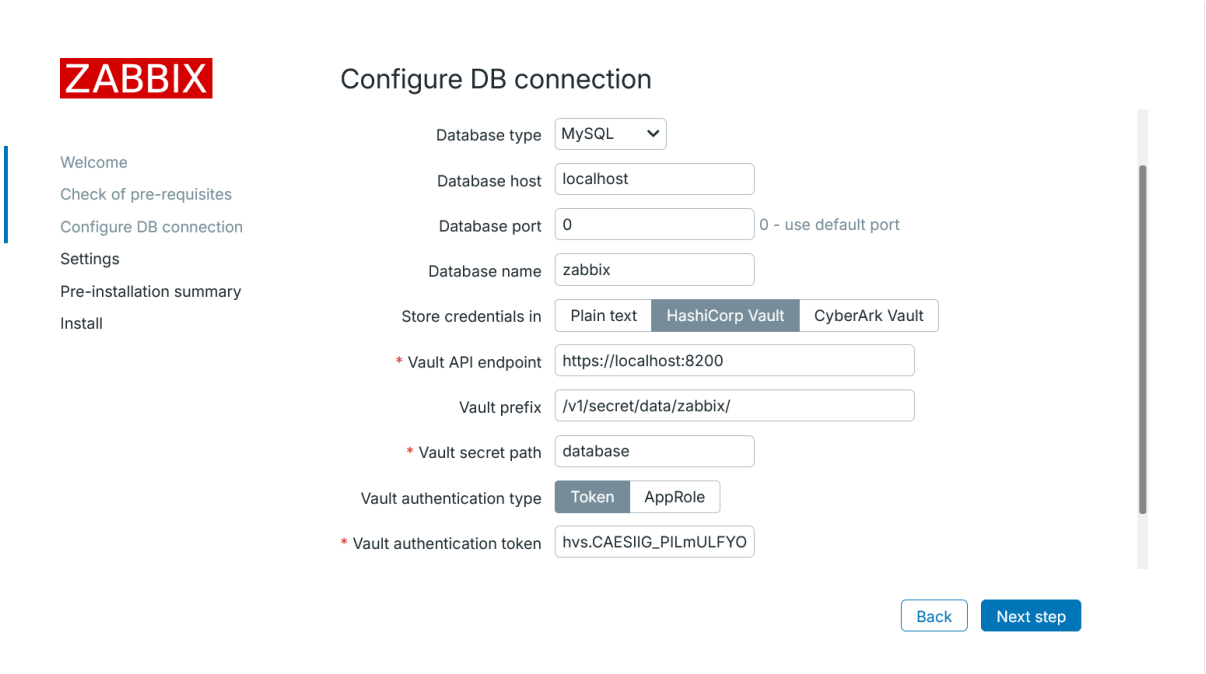
#### Put new secrets with keys username and password under mount point "secret/" and path "zabbix/database
vault kv put -mount=secret zabbix/database username=zabbix password=<password>

#### Test that secret is successfully added.
vault kv get secret/zabbix/database
```

```
#### Finally test with Curl; note that "data" need to be manually added after mount point and "/v1" before
curl --header "X-Vault-Token: <VaultToken>" https://127.0.0.1:8200/v1/secret/data/zabbix/database
```

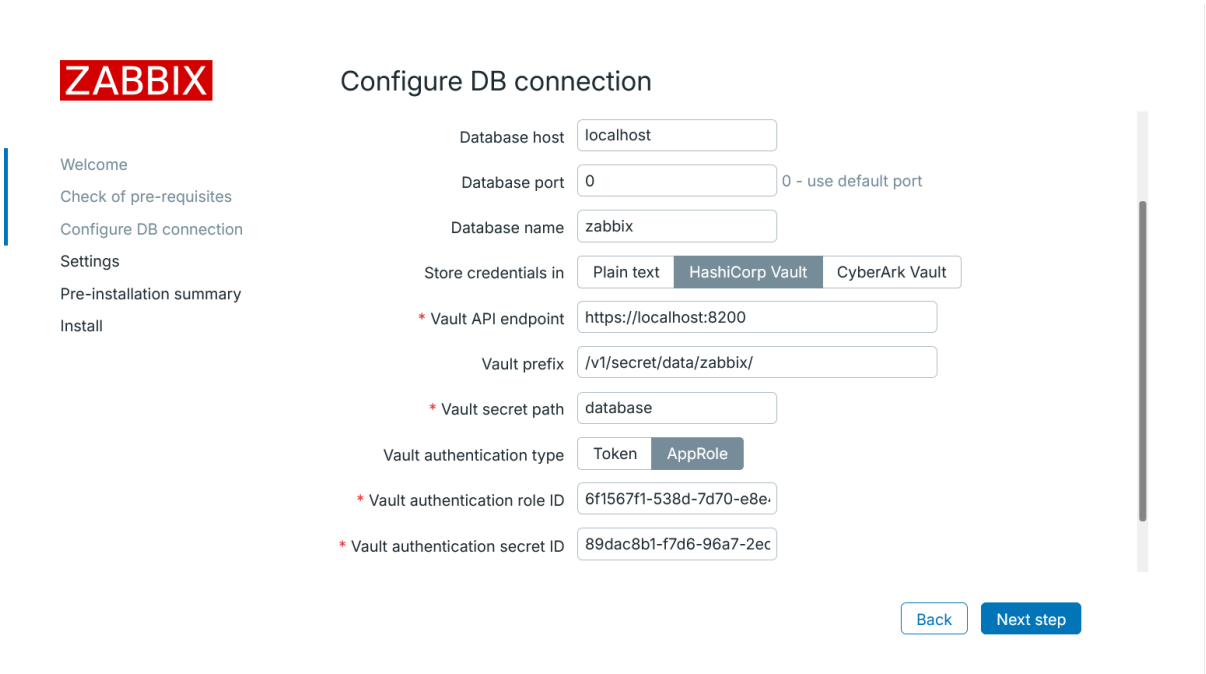
3. As a result, Zabbix server will retrieve the following credentials for database authentication:

- Username: zabbix
- Password: <password>



Frontend

Zabbix frontend can be configured to retrieve database credentials from the vault either during frontend installation or by updating the frontend configuration file (`zabbix.conf.php`).

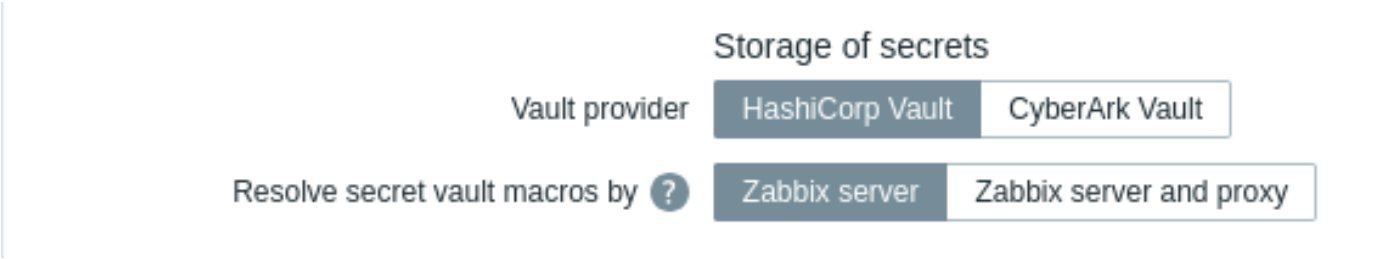


Attention:
If the vault credentials have changed since the previous frontend installation, update existing configuration.

During **frontend installation** the connection parameters must be specified at the *Configure DB Connection* step.

Configuration example using token authentication:

Configuration example using AppRole authentication:



Parameter	Mandatory	Default value	Description
Store credentials in	no		Select **HashiCorp Vault**.
Vault API endpoint	yes	https://localhost:8200	Specify the URL for connecting to the vault in the format `scheme://host:port`
Vault prefix	no	/v1/secret/data/	Provide a custom prefix for the vault path or query. If not specified, the default is used. Example: `/v1/secret/data/zabbix/`
Vault secret path	yes		A path to the secret from where credentials for the database shall be retrieved by the keys ”password” and ”username”. Example: `database`
Vault authentication type	no		Select vault authentication type: **Token** - use token authentication; **AppRole** - use AppRole authentication method.
Vault authentication token	yes		Provide an authentication token for read-only access to the secret path. See HashiCorp documentation for information about creating tokens and vault policies. This field is only available if *Token* is selected as the vault authentication type.
Vault authentication role ID	yes		Provide the role ID of the AppRole. See HashiCorp documentation for information about AppRoles. This field is only available if *AppRole* is selected as the vault authentication type.
Vault authentication secret ID	yes		Provide the secret ID issued against the AppRole. See HashiCorp documentation for information about AppRoles. This field is only available if *AppRole* is selected as the vault authentication type.

Retrieving user macro values

To use HashiCorp Vault for storing *Vault secret* user macro values, make sure that:

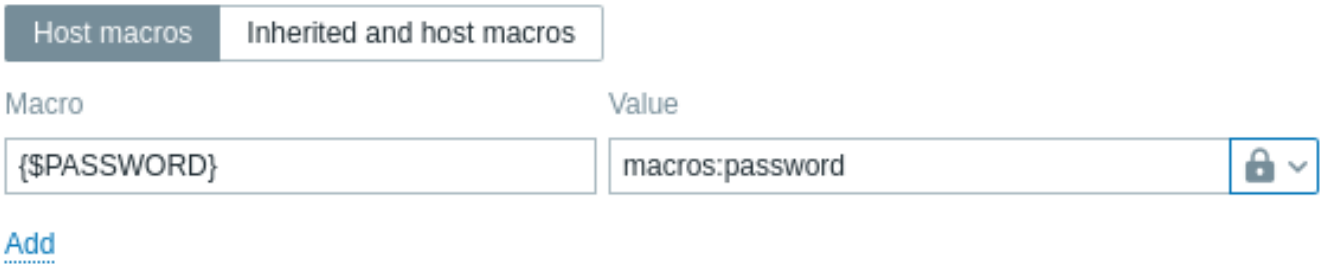
- Zabbix server/proxy is configured to work with HashiCorp Vault.
- The *Vault provider* parameter in *Administration > General > Other* is set to ”HashiCorp Vault” (default).

Note:
Zabbix server (and Zabbix proxy, if configured) require access to *Vault secret* macro values from the vault. Zabbix frontend does not need such access.

The macro value should contain a reference path (as `path:key`, for example, `macros:password`). The authentication token specified during Zabbix server/proxy configuration (by the `VaultToken` parameter) must provide read-only access to this path.

See *Vault secret macros* for detailed information on macro value processing by Zabbix.

Path syntax



The symbols forward slash (”/”) and colon (”:”) are reserved.

A forward slash can only be used to separate a mount point from a path (e.g., *secret/zabbix* where the mount point is ”secret” and the path is ”zabbix”). In the case of Vault macros, a colon can only be used to separate a path/query from a key.

It is possible to URL-encode the forward slash and colon symbols if there is a need to create a mount point with the name that is separated by a forward slash (e.g., *foo/bar/zabbix*, where the mount point is ”foo/bar” and the path is ”zabbix”, can be encoded as ”foo%2Fbar/zabbix”) and if a mount point name or path need to contain a colon.

Example

1. In Zabbix, add a user macro `{$PASSWORD}` of type ”Vault secret” and with the value `macros:password`

2. Run the following CLI commands to create required secret in the vault:

```
#### Enable "secret/" mount point if not already enabled; note that "kv-v2" must be used.
vault secrets enable -path=secret/ kv-v2

#### Put new secret with key "password" under mount point "secret/" and path "zabbix/macros".
vault kv put -mount=secret zabbix/macros password=<password>

#### Test that secret is successfully added.
vault kv get secret/zabbix/macros

#### Finally test with Curl; note that "data" need to be manually added after mount point and "/v1" before
curl --header "X-Vault-Token: <VaultToken>" https://127.0.0.1:8200/v1/secret/data/zabbix/macros
```

3. As a result, Zabbix will resolve the macro {$PASSWORD} to the value: <password>

Updating existing configuration

To update an existing configuration for retrieving secrets from a HashiCorp Vault:

1. Update the Zabbix server or proxy configuration file parameters as described in the *Database credentials* section.
2. Update the Zabbix frontend configuration file parameters:

Using Vault token:

```
$DB['VAULT']                    = 'HashiCorp';
$DB['VAULT_URL']                = 'https://localhost:8200';
$DB['VAULT_DB_PATH']            = 'database';
$DB['VAULT_TOKEN']              = 'hvs.CAESIIG_PILmULFYOsEyWHxkZ2mF2a8VPKNLE8eHqd4autYGGh4KHGh2cy5aeTYONFN
$DB['VAULT_PREFIX']             = '/v1/secret/data/zabbix/';
```

Or, using Vault AppRole method:

```
$DB['VAULT']                    = 'HashiCorp';
$DB['VAULT_URL']                = 'https://localhost:8200';
$DB['VAULT_DB_PATH']            = 'database';
$DB['VAULT_APP_ROLE_ID']        = '6f1567f1-538d-7d70-e8e4-5d3e59471b2e';
$DB['VAULT_APP_SECRET_ID']      = '89dac8b1-f7d6-96a7-2ecf-f94d2de3d6f1';
$DB['VAULT_PREFIX']             = '/v1/secret/data/zabbix/';
```

3. Configure user macros as described in the *User macro values* section, if necessary.

To update an existing configuration for retrieving secrets from a CyberArk Vault, see *CyberArk configuration*.

Troubleshooting

1. In Zabbix server/proxy log file:

```
237839:20260729:130916.425 Vault token renew started to fail: cannot login into HashiCorp vault with AppRo
```

Probable cause: HashiCorp Vault has been (re)started, but has not been unsealed (required in default configuration, not required if Auto Unseal is configured).

2. In Zabbix server/proxy log file:

```
235545:20260729:125617.944 Vault token renew started to fail: cannot login into HashiCorp vault with AppRo
```

or

```
235545:20260729:125718.537 Vault token renew failed: cannot login into HashiCorp vault with AppRole method
```

Probable cause: VaultAppSecretID has expired or reached its usage limit in HashiCorp vault.

Google Chrome TLS certificate trust

Overview

This page provides Zabbix setup steps and configuration examples for using Google Chrome with Zabbix frontend or zabbix-web-service endpoints secured by a self-signed certificate or a private certificate authority.

These instructions assume that the target web server is already configured for HTTPS. For configuring TLS on the Zabbix frontend, see Secure connection to the frontend.

Configuration

Google Chrome on Linux uses a per-user NSS certificate database for trusted certificates. To make Chrome trust a self-signed certificate or a private certificate authority, add the required certificates to the NSS database of the user account that runs Chrome.

1. Install required packages.

For Debian/Ubuntu:

```
sudo apt install ca-certificates libnss3-tools
```

For RHEL-based systems:

```
sudo dnf install ca-certificates nss-tools
```

Or:

```
sudo yum install ca-certificates nss-tools
```

2. Prepare certificate files.

For each certificate needed: create a PEM-based `.crt` file for the self-signed certificate, or create separate PEM-based `.crt` files for the root certificate authority certificate and, if required, each intermediate certificate.

3. Create the NSS database directory.

Use the home directory of the user that runs Chrome.

For example:

```
sudo mkdir -p /var/lib/zabbix/.pki/nssdb
sudo -u zabbix certutil -N -d sql:/var/lib/zabbix/.pki/nssdb
sudo chown -R zabbix:zabbix /var/lib/zabbix/.pki/nssdb
```

If Chrome on the target system uses a different NSS database location, use that directory instead.

Make sure the certificate files are readable by the user that runs Google Chrome. If necessary, copy them to a location accessible to that user.

4. Import the certificates.

If using a self-signed certificate:

```
sudo -u zabbix certutil -d sql:/var/lib/zabbix/.pki/nssdb \
  -A -t "P,," \
  -n "Zabbix self-signed certificate" \
  -i /path/to/self-signed.crt
```

If using a private certificate authority, import the root certificate authority certificate into the database:

```
sudo -u zabbix certutil -d sql:/var/lib/zabbix/.pki/nssdb \
  -A -t "C,," \
  -n "Zabbix root certificate authority" \
  -i /path/to/root-ca.crt
```

If any intermediate certificates are used, import each one separately:

```
sudo -u zabbix certutil -d sql:/var/lib/zabbix/.pki/nssdb \
  -A -t ",," \
  -n "Zabbix intermediate certificate" \
  -i /path/to/intermediate-ca.crt
```

5. Verify the certificate database.

```
sudo -u zabbix certutil -d sql:/var/lib/zabbix/.pki/nssdb -L
```

6. Test Chrome.

Google Chrome uses the certificate database of the user account that launches it. If the user account does not have a writable home directory, configure a writable home and XDG directories before running the test.

Example (replace `google-chrome` with `chromium` if Chromium is used.):

```
sudo -u zabbix env \
  HOME=/var/lib/zabbix-home \
  XDG_CONFIG_HOME=/var/lib/zabbix-home/.config \
  XDG_DATA_HOME=/var/lib/zabbix-home/.local/share \
  XDG_CACHE_HOME=/var/lib/zabbix-home/.cache \
  google-chrome --headless --disable-gpu \
  --user-data-dir=/var/lib/zabbix-home/chrome-profile \
  --dump-dom https://FQDN_OF_ZABBIX_SERVER
```

If the configuration is correct, the command returns the HTML of the requested page.

If Chrome does not trust the certificate, the command returns a certificate error page containing messages such as `NET::ERR_CERT_AUTHORITY_INVALID`.

Troubleshooting

Error	Possible cause
`NET::ERR_CERT_AUTHORITY_INVALID`	The certificate was imported into the wrong user profile, the root certificate authority certificate is missing, or an intermediate certificate is missing.
`NET::ERR_CERT_COMMON_NAME_INVALID`	The certificate does not match the hostname used in the browser URL.
`NET::ERR_CERT_DATE_INVALID`	The certificate is expired, not yet valid, or the system clock is incorrect.
Chrome still shows a certificate warning after import	Chrome is using a different NSS database for the current user, or the certificate trust flags are incorrect.

Security best practices

Overview This section contains best practices for setting up Zabbix in a secure way.

The practices in this section are not required for the functioning of Zabbix but are recommended for better system security.

For best practices on keeping Zabbix mobile app and Zabbix bridge adapter secure, see Secure mobile access.

UTF-8 encoding UTF-8 is the only encoding supported by Zabbix. It is known to work without any security flaws. Users should be aware that there are known security issues if using some of the other encodings.

Windows installer paths When using Windows installers, it is recommended to use the default paths provided by the installer. Using custom paths without proper permissions could compromise the security of the installation.

Macros in user-defined global scripts To enhance security, it is recommended to use macro functions instead of plain macros in user-defined global scripts, as macros are not automatically escaped.

Zabbix Security Advisories and CVE database See *Zabbix Security Advisories and CVE database*.

HTML email templates When creating or editing message templates used for HTML emails, always wrap every macro with the `htmlencode()` macro function. For example:

```
<b>Problem started</b> at {{EVENT.TIME}.htmlencode()} on {{EVENT.DATE}.htmlencode()}<br><b>Problem name:</
{{EVENT.NAME}.htmlencode()}<br><b>Host:</b> {{HOST.NAME}.htmlencode()}
<br><b>Severity:</b>
{{EVENT.SEVERITY}.htmlencode()}<br><b>Operational
data:</b> {{EVENT.OPDATA}.htmlencode()}<br><b>Original problem ID:</b> {{EVENT.ID}.htmlencode()}<br>{{TRIG
```

Using `htmlencode()` ensures that any HTML characters in macro values are escaped and prevents injection of HTML into notifications (for example, an attacker inserting a malicious/phishing link into a notification).

Note: the default HTML email messages provided by Zabbix already apply `htmlencode()` to macros. This guidance applies when editing existing templates or creating new ones—verify that macros are encoded before using a template to send HTML email.

Web interface

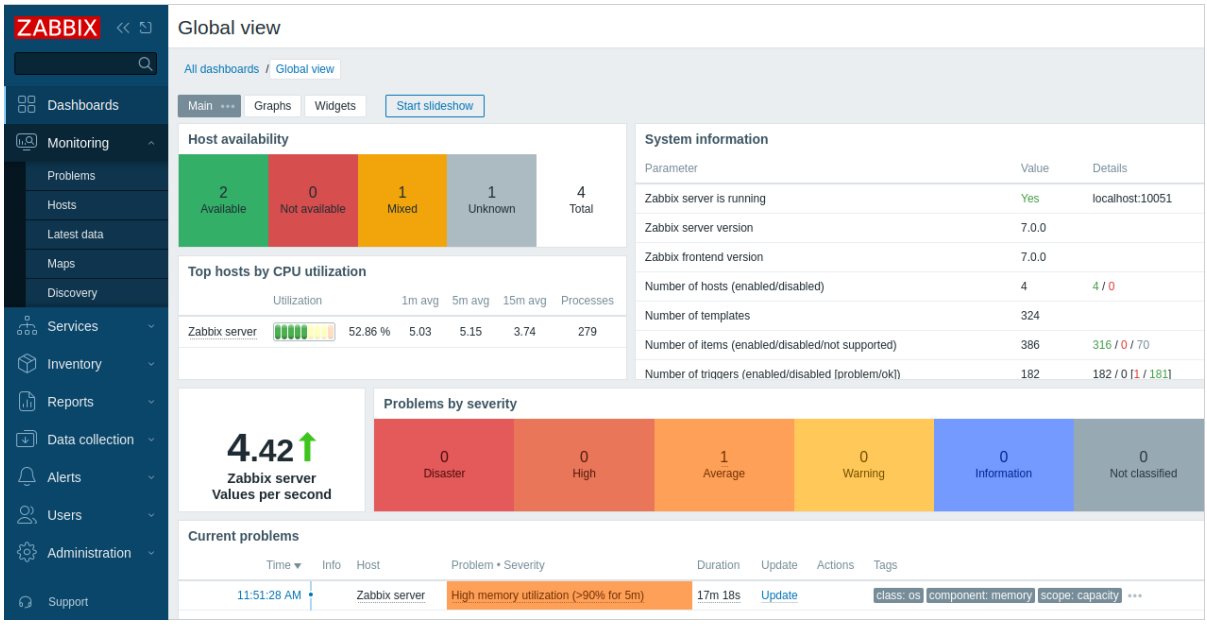
Overview For an easy access to Zabbix from anywhere and from any platform, the web-based interface is provided.

> **Note:**
> If using more than one frontend instance make sure that the locales and libraries (LDAP, SAML etc.) are installed and configured identically for all frontends.

Frontend help A help link is provided in Zabbix frontend sections and forms in the upper-right corner, linking directly to the corresponding parts of the documentation.

For form fields with a help icon, hovering over the icon displays the corresponding hint.

Kiosk mode For frontend sections with the *Kiosk mode* button (located in the upper-right corner), click the button to switch the section to kiosk mode. In kiosk mode, only the section content is displayed.



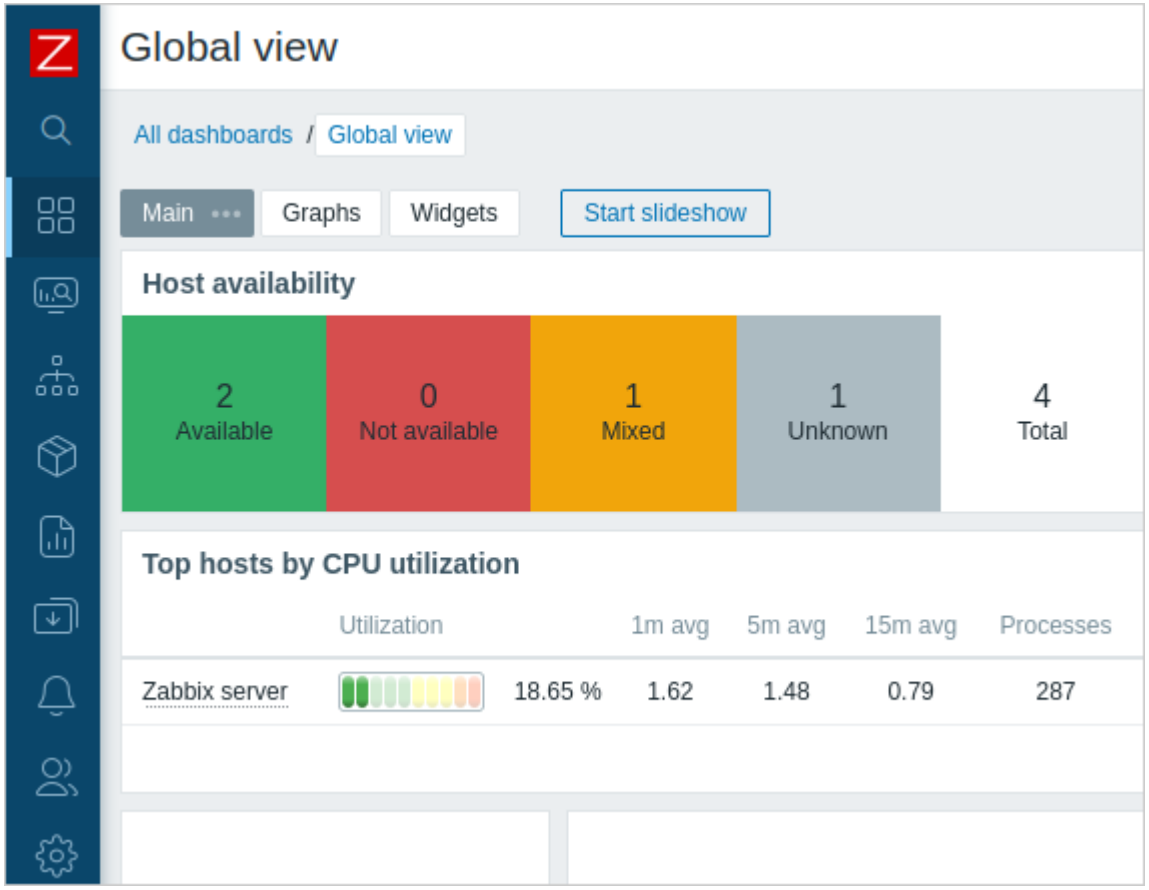
To exit kiosk mode, hover over the content and click the *Normal view* button that appears in the upper-right corner.

Menu

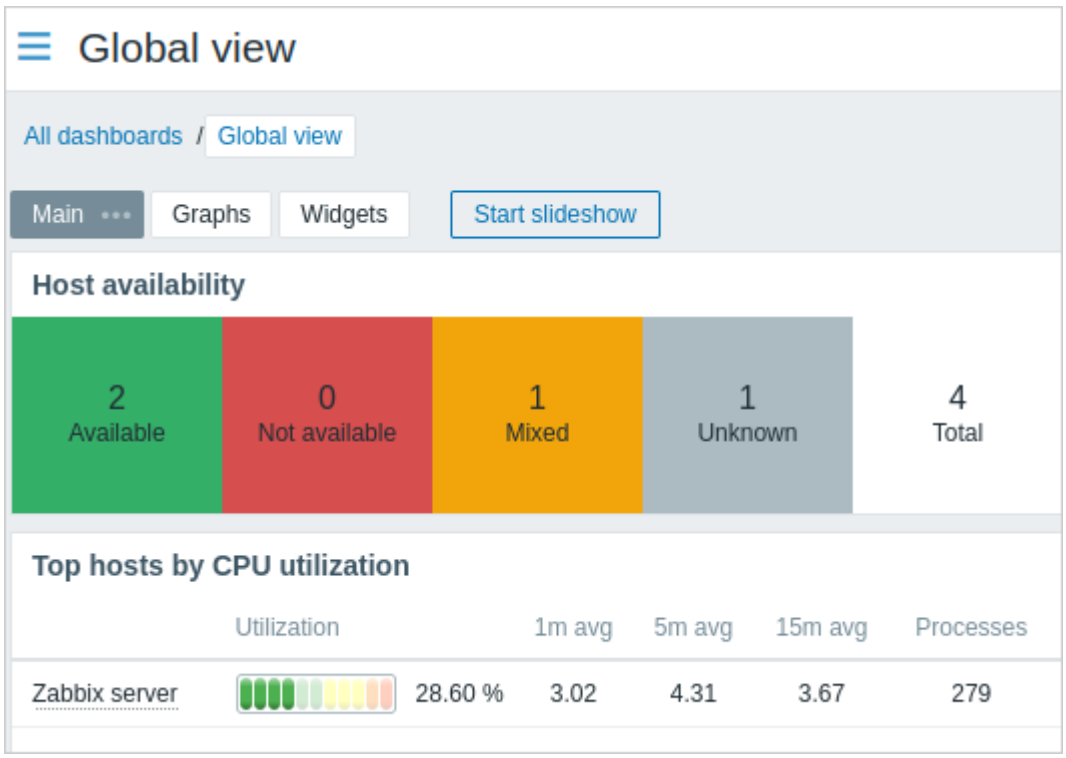
Overview

A vertical menu in a sidebar provides access to various Zabbix frontend sections.

The menu is dark blue in the default theme.



Working with the menu



A global search box is located below the Zabbix logo.

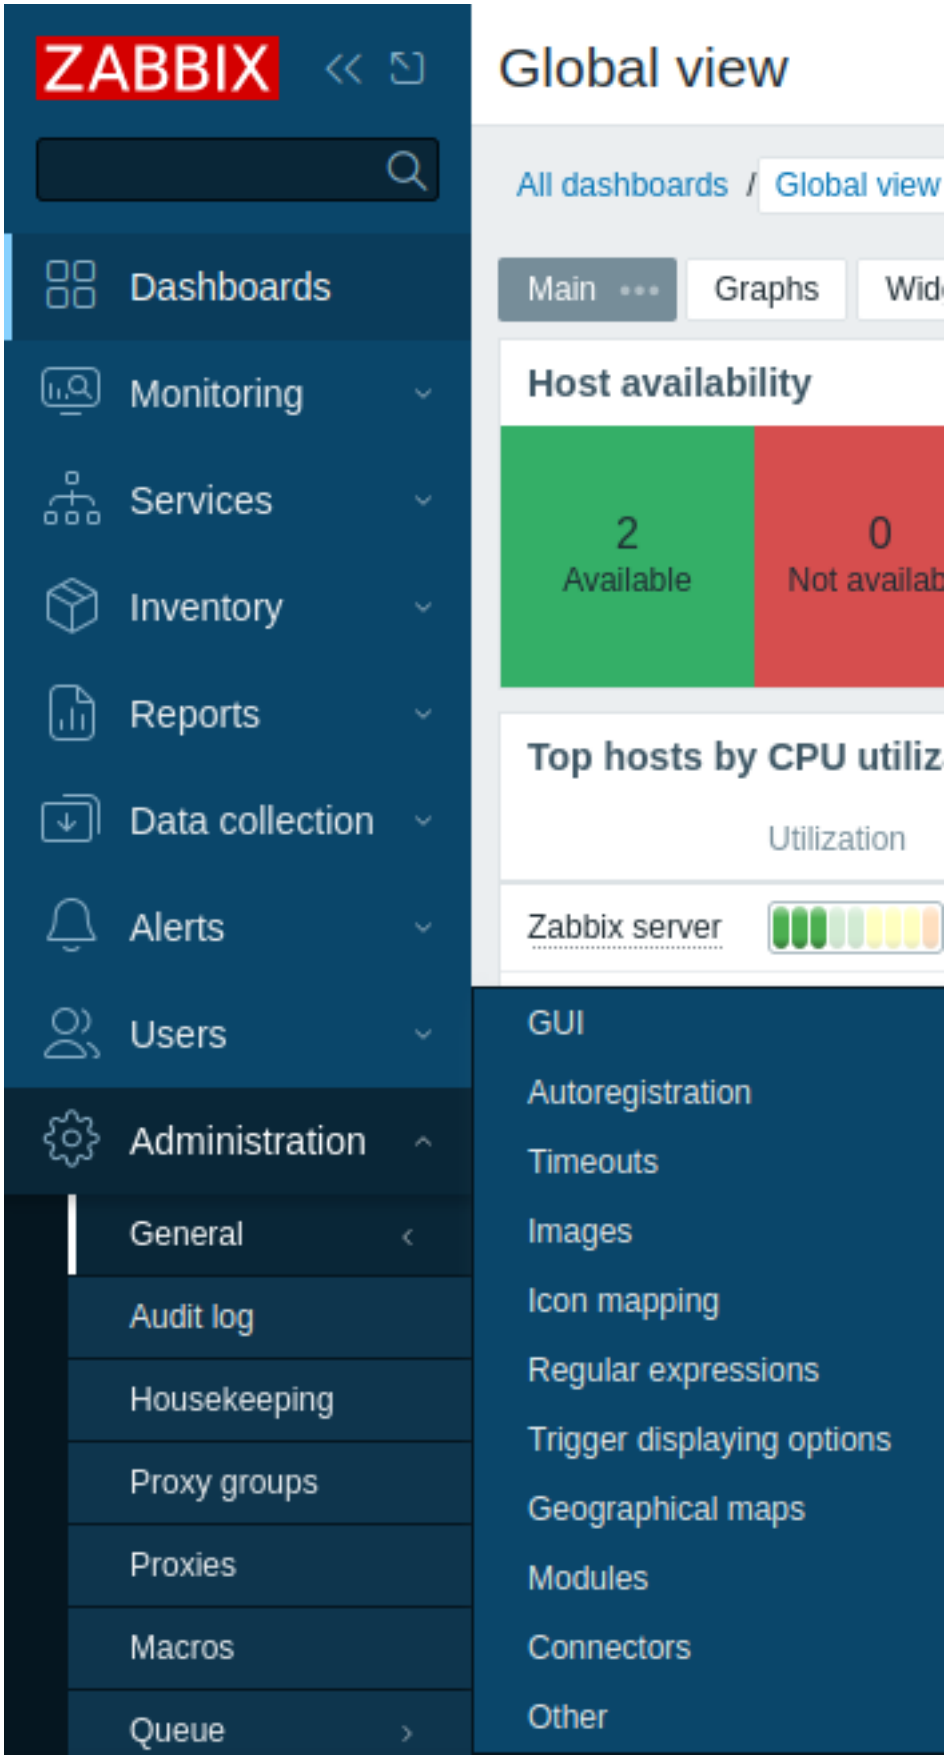
The menu can be collapsed or hidden completely:

- To collapse, click  next to Zabbix logo. In the collapsed menu only the icons are visible.

- To hide, click  next to Zabbix logo. In the hidden menu everything is hidden.

Collapsed menu

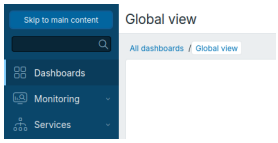
When the menu is collapsed to icons only, a full menu reappears as soon as the mouse cursor is placed upon it. Note that it reappears over page content; to move page content to the right you have to click the expand button. If the mouse cursor again is placed outside the full menu, the menu will collapse again after two seconds.



You can also make a collapsed menu reappear fully by hitting the Tab key. Hitting the Tab key repeatedly allows you to focus on the next menu element.

Hidden menu

Even when the menu is hidden completely, a full menu is just one mouse click away, by clicking the burger icon . Note that it reappears over page content; to move page content to the right you have to unhide the menu by clicking the show sidebar button.



Menu levels

There are up to three levels in the menu.

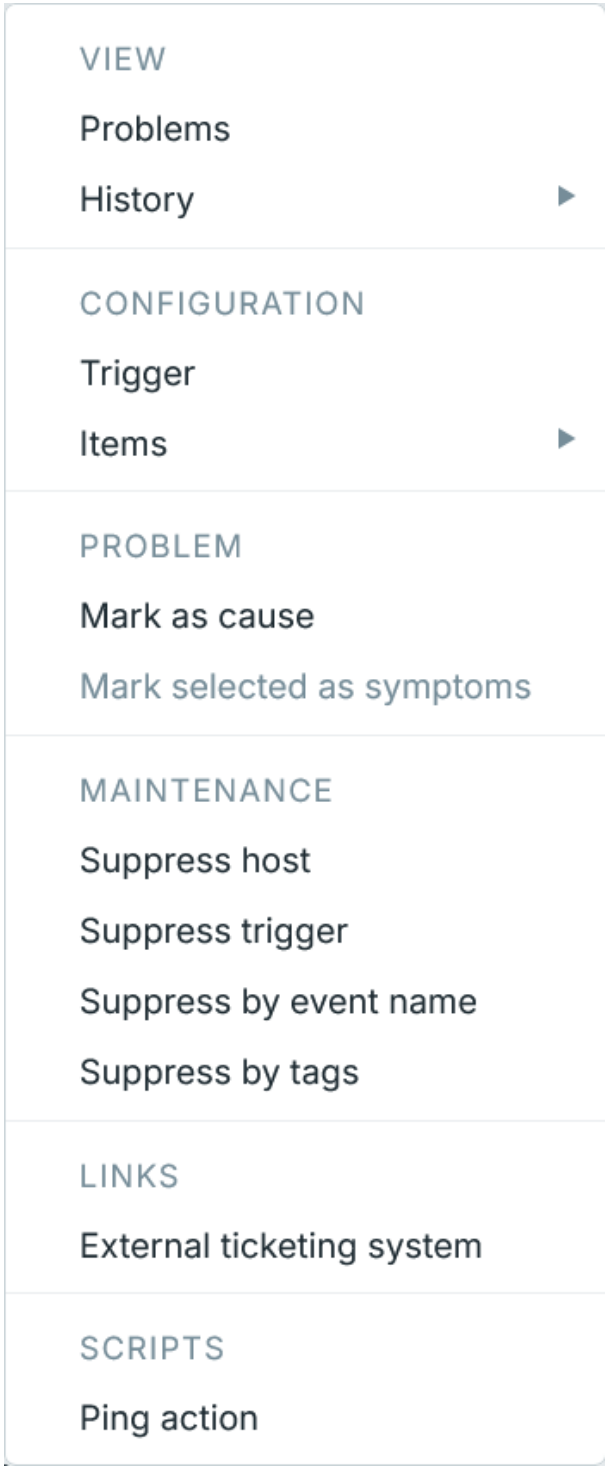
Accessibility: Skip navigation

The *Skip to main content* link allows keyboard and screen reader users to skip repetitive sidebar navigation and move directly to the main content.

It remains hidden during normal use and appears only when focused, such as when the Tab key is pressed after the page loads or when it is accessed using a screen reader.

Context menus

In addition to the main menu, Zabbix provides context menus for host, item, and event for quick access to frequently used entities, such as the latest values, simple graph, configuration form, related scripts or external links.



The context menus are accessible by clicking the host, item or problem/trigger name in supported locations.

Event menu

Overview

The event menu contains shortcuts to actions or frontend sections that are frequently required for an event.

The event menu can be opened by clicking the event name.

Content

The event context menu has several sections: *View*, *Actions*, *Configuration*, *Problem*, *Maintenance*, *Links*, and *Scripts*. For the entities that are not configured, links are disabled and displayed in gray. The sections *Scripts* and *Links* are displayed if their entities are configured.

The *View* section contains links to:

- **Problems** - opens the list of unresolved problems of the underlying trigger;
- **History** - leads to the *Latest data* graph/item history for the underlying item(s). If a trigger uses several items, links will be available for each of them.

The *Actions* section is available in *Trigger overview* widgets only. It contains a link to:

- **Update problem** - opens the problem update screen.

The *Configuration* section contains links to the configuration of:

- **Trigger** that fired the problem;
- **Items** used in the trigger expression.

Note:
Note that configuration section is available only for Admin and Super admin users.

The *Problem* section contains the options to:

- **Mark as cause** - mark the problem as cause;
- **Mark selected as symptoms** - mark the selected problems as symptoms of this problem.

The *Maintenance* section contains options to start ad-hoc maintenance:

- **Suppress host** - start a maintenance period for the host;
- **Suppress trigger** - start a maintenance period for the trigger;
- **Suppress by event name** - start a maintenance period for the event name;
- **Suppress by tags** - start a maintenance period for events with the corresponding tags.

When you select the respective option, a maintenance period configuration form will open.

A one-time maintenance period of one hour (configurable in user settings and profile), starting from now, will be pre-selected. The respective host/trigger/event name/tags will be preselected, too. The maintenance name will be pre-filled, in the format `Ad-hoc: <event name>`.

The *Links* section contains links to:

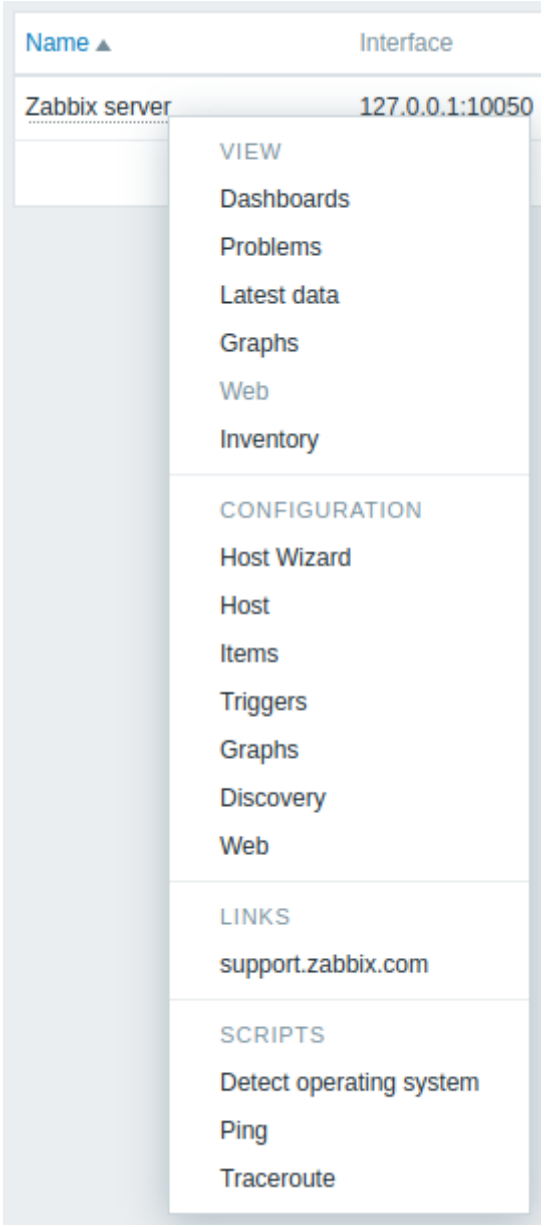
- access a configured trigger URL;
- access custom links configured in Global scripts (with scope 'Manual event action' and type 'URL');
- access a configured external ticket for the problem (see the *Include event menu entry* option when configuring webhooks).

The *Scripts* section contains links to execute a global script (with scope *Manual event action*). This feature may be handy for running scripts used for managing problem tickets in external systems.

Supported locations

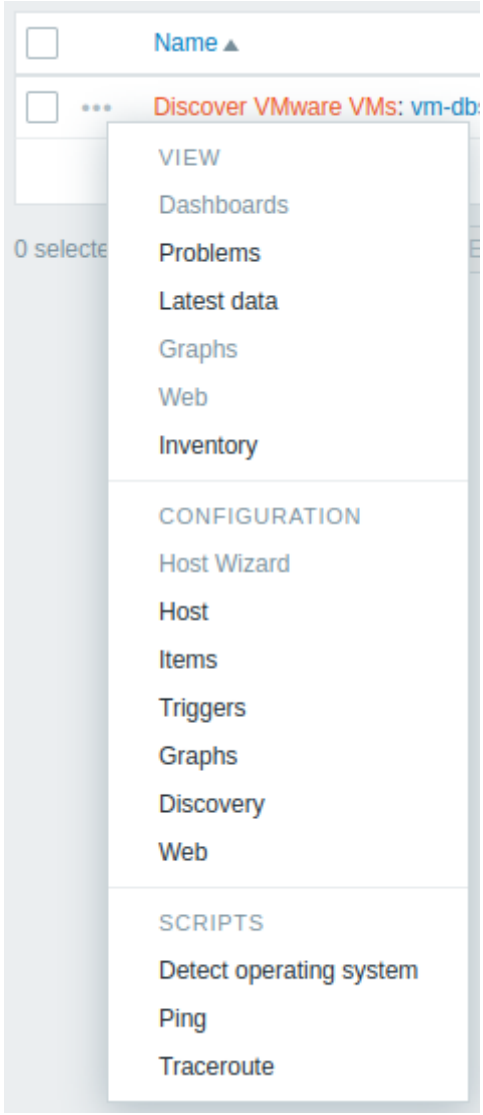
The event context menu is accessible by clicking a problem or event name in various frontend sections, for example:

- Dashboards widgets, such as *Problems* widget, *Trigger overview* widget, etc.
- *Monitoring* > *Problems*
- *Monitoring* > *Problems* > Event details
- *Reports* > *Top 100 triggers* (global scripts and access to external ticket are not supported in this location)



Host menu

Overview



The host menu contains shortcuts to actions or frontend sections that are frequently required for a host.

The host menu can be opened by clicking the host name or the three dots icon, depending on the frontend section, for example:

Monitoring > *Latest data*

Data collection > *Hosts*

Content

The host context menu has four sections: *View*, *Configuration*, *Links*, and *Scripts*. For the entities that are not configured, links are disabled and displayed in gray. The sections *Scripts* and *Links* are displayed if their entities are configured.

View section contains links to:

- **Dashboards** - opens widgets and graphs.
- **Problems** - opens the *Problems* section with the list of unresolved problems of the underlying trigger.
- **Latest data** - opens the *Latest data* section with the list of all the latest data of the current host.
- **Graphs** - opens simple graphs of the current host.
- **Web**- opens the link to the configured web scenarios.
- **Inventory** - opens the link to the inventory of the current host.

Configuration section contains links to:

- **Host Wizard** - opens Host Wizard for the current host (disabled for discovered hosts).
- **Host** - configuration form of the current host.
- **Items** - the list of the current host items.
- **Triggers** - the list of the current host triggers.
- **Graphs** - simple graphs of the current host.
- **Discovery** - the list of low-level discovery rules of the current host.
- **Web** - the list of web scenarios of the current host.

Note:
Note that configuration section is available only for Admin and Super admin users.

Links section contains links to:

- access a configured trigger URL.
- access custom links configured in Global scripts (with scope *Manual host action* and type 'URL').

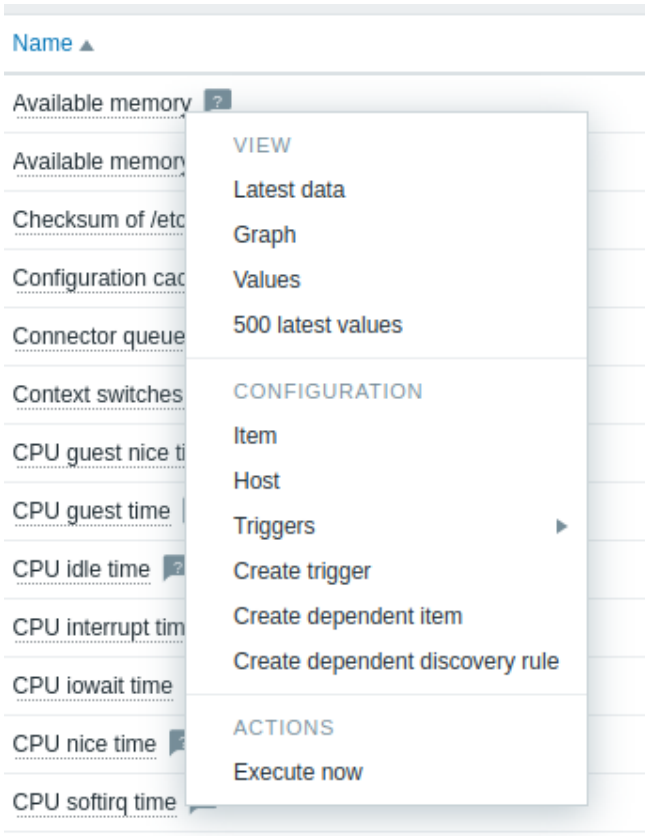
Scripts section allows execution of global scripts configured for the current host. These scripts need to have their scope defined as *Manual host action* to be available in the host menu.

Supported locations

The host menu is accessible by clicking a host name in various frontend sections, for example:

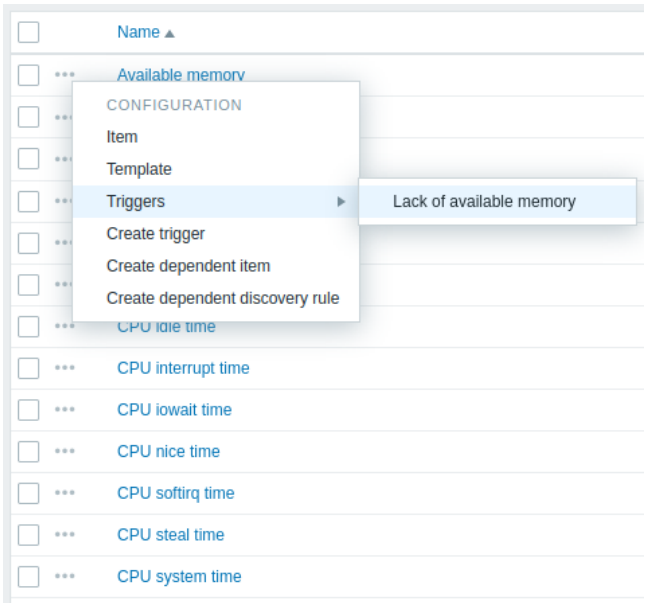
- Dashboards widgets, such as *Problems*, *Top items*, *Trigger overview*, etc.
- *Monitoring* > *Problems*
- *Monitoring* > *Problems* > Event details
- *Monitoring* > *Hosts*
- *Monitoring* > *Hosts* > *Web Monitoring*
- *Monitoring* > *Latest data*
- *Monitoring* > *Maps*
- *Inventory* > *Hosts*
- *Reports* > *Top 100 triggers*

The host menu is accessible by clicking the three dots icon in Data collection > Hosts.



Item menu

Overview



The item menu contains shortcuts to actions or frontend sections that are frequently required for an item.

The item menu can be opened by clicking the item name or the three-dot icon, depending on the frontend section, for example:

Monitoring > *Latest data*

Data Collection > *Templates* > *Items*

Content

The item menu has three sections: *View*, *Configuration*, and *Actions*.

The *View* section contains the following options:

- **Latest data** - opens the *Latest data* section filtered by the current host and item;
- **Graph** - opens a simple graph of the current item;
- **Values** - opens the list of all values received for the current item within the past 60 minutes;
- **500 latest values** - opens the list of 500 latest values for the current item.

The *Configuration* section (available only for *Admin* and *Super admin* type users) contains the following options:

- **Item** - opens the item configuration form of the current item;
- **Template** - opens the template configuration form of the template that the item belongs to (available only when the item menu is accessed from *Data collection* > *Templates* > *Items*);
- **Host** - opens the host configuration form of the host that the item belongs to;
- **Triggers** - on mouseover, opens a list of item's triggers, if any; clicking a trigger opens its trigger configuration form;
- **Create trigger** - opens the trigger configuration form to create a trigger for this item;
- **Create dependent item** - opens the item configuration form to create a dependent item, with the current item as the master item;
- **Create dependent discovery rule** - opens the discovery rule configuration form to create a dependent discovery rule, with the current item as the master item.

The *Actions* section contains the following option:

- **Execute now** - executes a check for a new item value immediately.

Supported locations

The item menu is accessible by clicking an item name in various frontend sections, for example:

- *Monitoring* > *Latest data*
- *Data collection* > *Hosts* > *Items*
- *Data collection* > *Hosts* > *Discovery rules* > *Item prototypes*

The item menu is accessible by clicking an item value in the *Top items* dashboard widget.

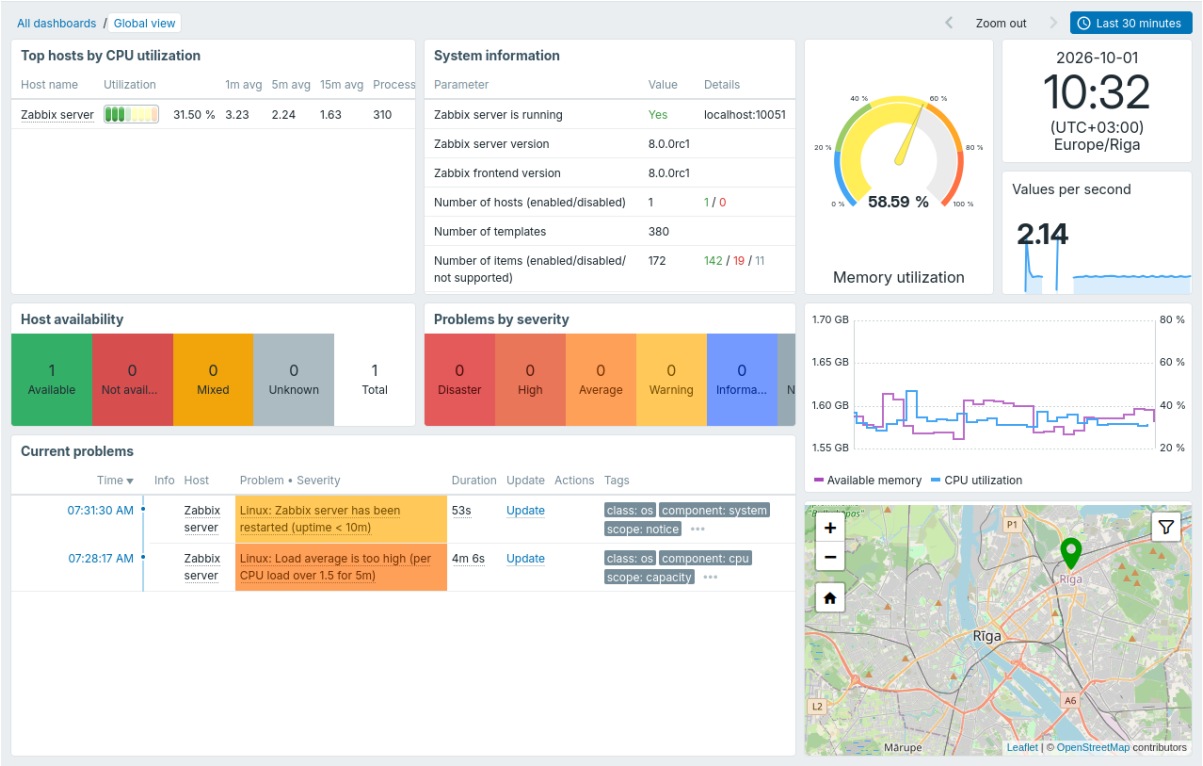
Frontend sections

Menu structure The Zabbix frontend menu has the following structure:

- Dashboards
- Monitoring
  - Problems
  - Hosts
  - Latest data
  - Maps
  - Discovery
- APM
  - Traces
  - Metrics
  - Logs
- Services
  - Services
  - SLA
  - SLA report
- Inventory
  - Overview
  - Hosts
- Reports
  - System information
  - Scheduled reports
  - Availability report
  - Top 100 triggers
  - Audit log
  - Action log
  - Notifications

- Data collection
  - Template groups
  - Host groups
  - Templates
  - Hosts
  - Maintenance
  - Event correlation
  - Discovery
- Alerts
  - Actions
    - Trigger actions
    - Service actions
    - Discovery actions
    - Autoregistration actions
    - Internal actions
  - Media types
  - Scripts
- Users
  - User groups
  - User roles
  - Users
  - API tokens
  - Authentication
  - Devices
- Administration
  - General
    - GUI
    - Autoregistration
    - Timeouts
    - Images
    - Icon mapping
    - Regular expressions
    - Trigger displaying options
    - Geographical maps
    - Modules
    - Connectors
    - Other
  - Audit log
  - Housekeeping
  - Proxy groups
  - Proxies
  - Macros
  - Queue
    - Queue overview
    - Queue overview by proxy
    - Queue details

Dashboards



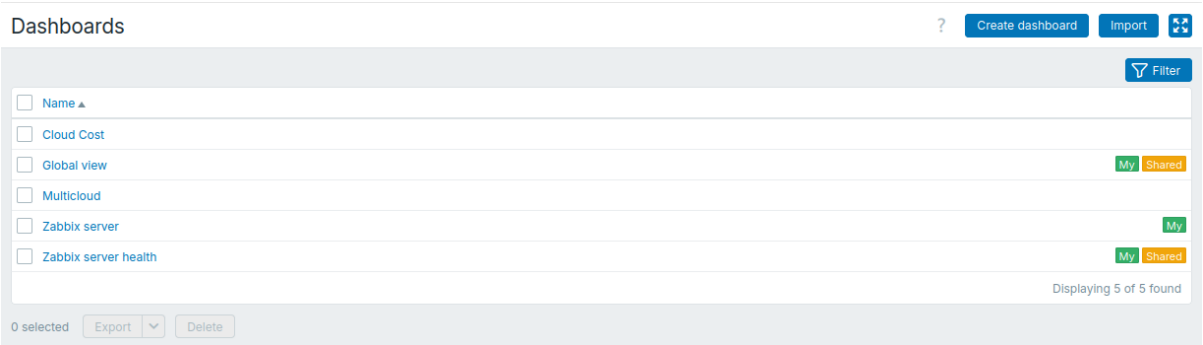
Dashboards give you an overview of your monitored environment. You can build and customize them to meet your needs.

The building blocks are widgets: a graph, a map, a list of recent problems, and so on, each designed to display a particular type of information.

Widgets can be organized into multiple dashboard pages. Such pages can be viewed as a slideshow. You can also navigate to any page by clicking its tab.

You can create several dashboards, though only one is shown at a time.

Zabbix comes with some default dashboards. One of them is the *Global view* dashboard, which shows the health and status of your monitored hosts, including the Zabbix server:



You can find more dashboards in the Dashboards repository. These dashboards are designed to work with existing Zabbix templates and can be downloaded and imported into your Zabbix environment. A detailed description of each dashboard, including prerequisites, is available in the dashboard's README file.

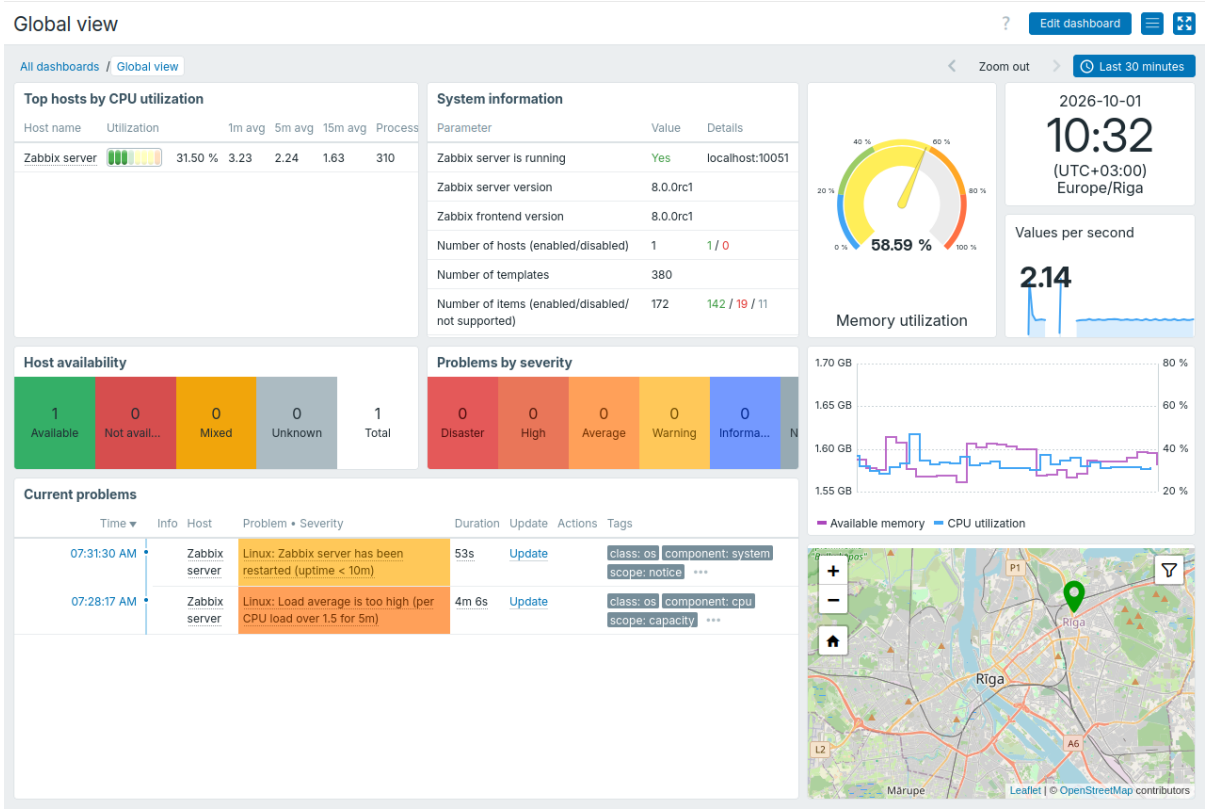
Dashboard list

To open the list of dashboards, either:

- Click *Dashboards* in the menu.
- Click *All dashboards* while viewing a dashboard to open the dashboard list.

Access to the *Dashboards* menu depends on the user role and the *Dashboard* permission under *Access to UI elements*.

From here, you can: - Create dashboards. - Delete dashboards. You can delete a dashboard by selecting its checkbox and clicking the *Delete* button. - Import dashboards. - Export dashboards.



Dashboards have tags indicating their ownership and sharing settings:

- *My* - the dashboard is owned by you and visible only to you.
- *My + Shared* - the dashboard is owned by you but is public or shared with specific users or user groups.
- Dashboards without tags are owned by other users but are public or shared with you.

You can filter the list by dashboard name and owner.

View dashboard

Click a dashboard's name in the dashboard list to view the dashboard:

The Zabbix user interface remembers the last opened dashboard for the next session.

Note:
The data you can see on a dashboard depends on your access to hosts.

For widgets that show graphs, the time period selector above the widgets sets the time range. It shows the current time range as a label. Click the label to open or close the selector.

From here, you can manage dashboards as follows:

- Edit the dashboard.
- Perform the following actions from the dashboard *Actions* menu :
  - *Sharing* - edit the sharing settings for the dashboard.
  - *Create new* - create a new dashboard.
  - *Clone* - create a new dashboard by cloning the current one. You can edit the dashboard properties before saving.
  - *Delete* - delete the dashboard.
  - *Export* - export the dashboard.
  - *Create new report* - create a scheduled report. This option is disabled if you do not have permission to manage scheduled reports.
  - *View related reports* - view a list of existing reports for the current dashboard. This option is disabled if there are no related reports or you do not have permission to manage scheduled reports.
- Switch to kiosk mode.
- Start or stop the dashboard slideshow.

In dashboard view mode, the following options are available for widgets:

- Edit the widget.
- Perform the following actions from the widget *Actions* menu ...:
  - *Copy* - copy the widget.
  - *Download image* - download the widget as a PNG image. This option is available for widgets that support this feature (see individual widget pages).
  - *Refresh interval* - select the frequency of refreshing the widget contents.

For dashboards with multiple pages, the following actions are available in the page *Actions* menu in dashboard view mode:

- *Copy* - copy the page.
- *Properties* - customize the page properties, including the name and the slideshow interval.

Slideshow

If the *Start slideshow* checkbox is selected in the dashboard properties, the slideshow starts automatically when the dashboard has more than one page. Otherwise, you can start the slideshow by clicking the *Start slideshow* button.

The pages change according to the intervals specified in the dashboard and individual page properties. If the *Slideshow interval* property is defined for an individual page, the interval specified for that page is applied. Otherwise, the dashboard's *Default slideshow interval* is applied.

To stop the slideshow, click *Stop slideshow*.

In kiosk mode, use the following buttons:

-  to start the slideshow;
-  to stop the slideshow;
-  to navigate to the previous page;
-  to navigate to the next page.

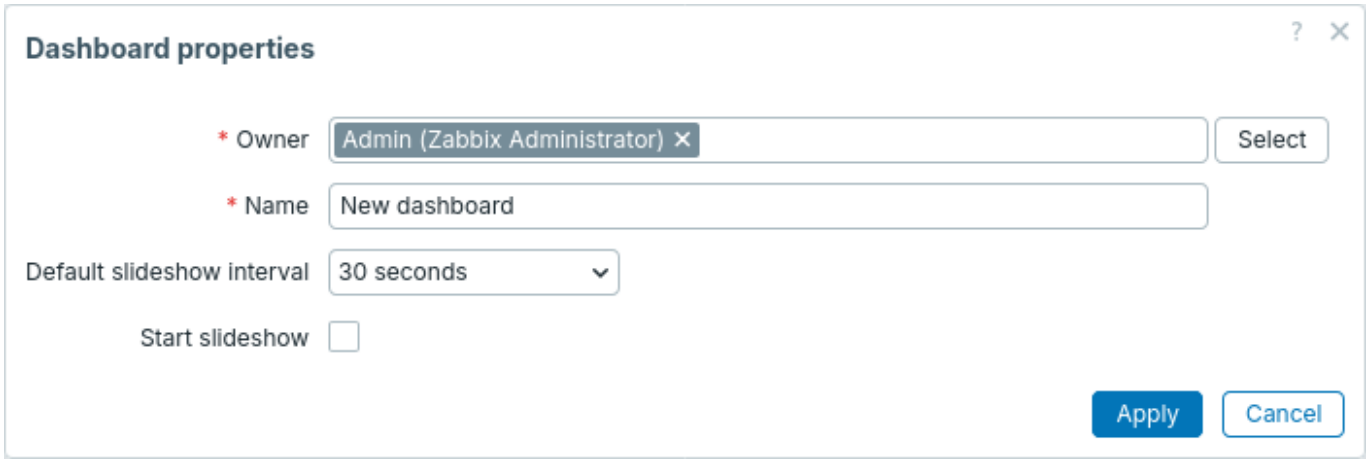
Share dashboard

Dashboards can be public or private.

Public dashboards are visible to all users. Private dashboards are visible only to their owners and to the users or user groups they are shared with.

To change the sharing settings of a dashboard, click *Sharing* in the dashboard *Actions* menu while viewing the dashboard:

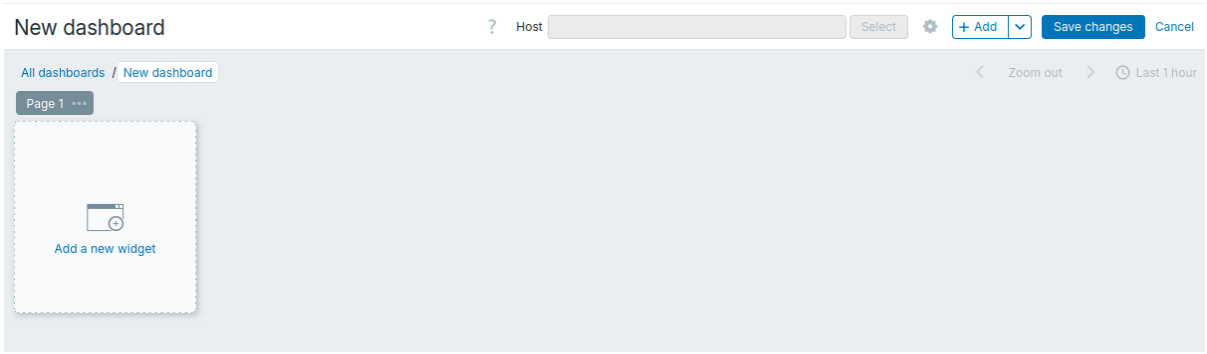
Parameter	Description
Type	Select the dashboard type: **Private** - the dashboard is visible only to selected user groups and users. **Public** - the dashboard is visible to all users.
List of user group shares	Select the user groups that can access the dashboard. You can grant read-only or read-write access.
List of user shares	Select the users that can access the dashboard. You can grant read-only or read-write access.



See Permissions to dashboards to find out how sharing options limit the actions available to users.

Create dashboard

You can create a dashboard in two ways:



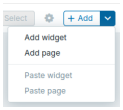
- In the dashboard list, click the *Create dashboard* button.
- In the dashboard view mode, click *Create new* in the dashboard *Actions* menu.

Then, specify the dashboard properties:

Parameter	Description
Owner	Select the user that will own the dashboard.
Name	Enter the dashboard name.
Default slideshow interval	Select how long each dashboard page is displayed before the slideshow moves to the next page.
Start slideshow	Mark this checkbox to start the slideshow automatically once the dashboard has more than one page.

Then, click *Apply*. The new dashboard opens in edit mode:

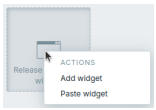
From here, you can add dashboard widgets and pages.



Note that the minimum width of a dashboard is 1200 pixels; in narrower windows, a horizontal scrollbar appears. A wider dashboard always fills the browser window; its widgets cannot extend beyond the window edges.

Click the *Save changes* button to save the dashboard, or *Cancel* to return to the previous screen.

Add widgets



In dashboard edit mode, you can add widgets can be added in two ways:

- Click the *Add* button. Alternatively, click the drop-down arrow on the *Add* button and select *Add widget*.

  The widget placeholder is added at its default size to the first available empty space on the dashboard, with the widget configuration form open.

- Move the mouse pointer over an empty area of the dashboard. Then click the widget placeholder to open the widget configuration form. Alternatively, click and drag the placeholder to resize it, then release to open the widget configuration form; if a widget is copied to the clipboard, you will first be prompted to choose *Add widget* or *Paste widget*.

Then, follow these steps:

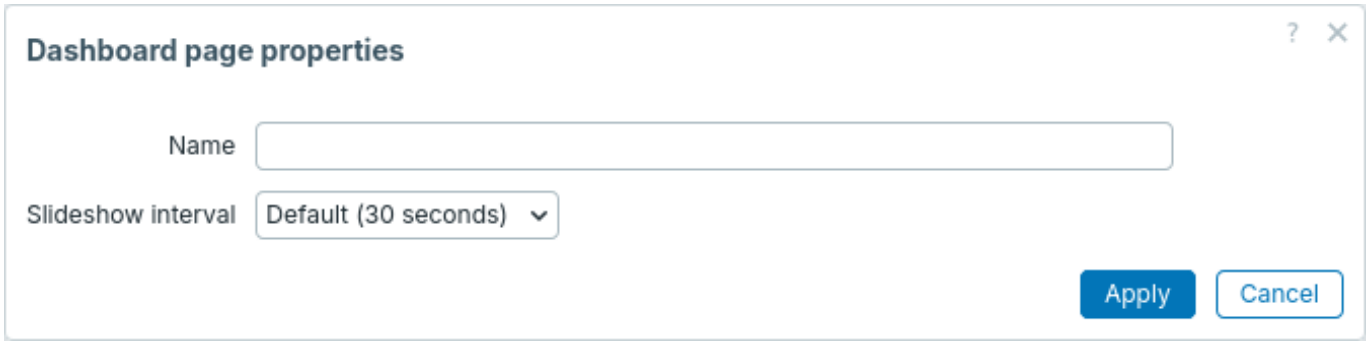
1. In the widget configuration form, select the widget type.
2. Configure widget parameters.
3. Click *Add* to add the widget to the dashboard.

The widget is added at its default size or resized to fit the available space. You can resize and reposition widgets as described in the *Edit widgets* section.

You can also copy and paste widgets to create new widgets with the same configuration, either within the same dashboard or between dashboards opened in different browser tabs.

Copy/paste widgets

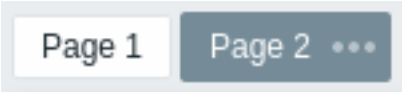
To copy and paste a widget:



1. In the widget *Actions* menu ⋮, select *Copy*.
2. In dashboard edit mode, click the drop-down arrow on the *Add* button and select *Paste widget*. Alternatively, click an empty area in the dashboard and select *Paste widget*.

You can also paste a copied widget over an existing one using the *Paste* option in its *Actions* menu.

Add pages



To add a new page to a dashboard:

1. In dashboard edit mode, click the drop-down arrow on the *Add* button and select *Add page*.
2. Fill in the page properties:
   - *Name* - enter the name of the page. If you leave the name empty, the page is added with a *Page N* name, where 'N' is the incremental page number.
   - *Slideshow interval* - select how long the page is displayed before the slideshow moves to the next page.

3. Click *Apply*.

A new tab (e.g., *Page 2*) is added for the new page.

You can also copy and paste pages to create new pages with the same properties, either within the same dashboard or between dashboards opened in different tabs.

Copy/paste pages

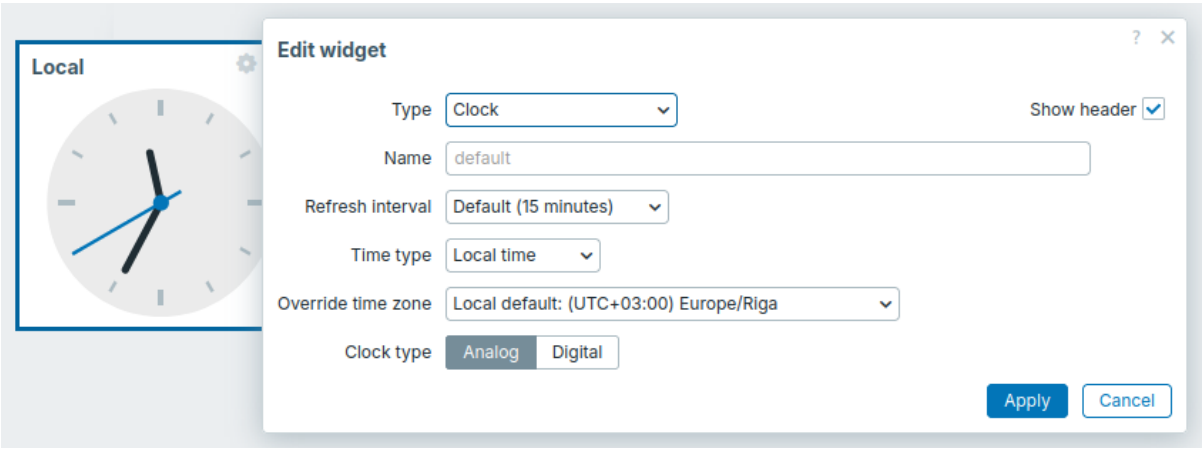
To copy and paste a page:

1. In the page *Actions* menu , select *Copy*.
2. In dashboard edit mode, click the drop-down arrow on the *Add* button and select *Paste page*.

Edit dashboard

To edit a dashboard, click the *Edit dashboard* button in the upper-right corner. Alternatively, click the *Edit* button for a widget. The dashboard opens in edit mode.

From here, you can manage dashboards as follows:



- Edit the dashboard properties by clicking the gear button .
- Edit dashboard widgets.
- Access the following dashboard actions by clicking the drop-down arrow on the *Add* button:
  - *Add widget* - add a widget to the dashboard.
  - *Add page* - add a page to the dashboard.
  - *Paste widget* - paste a copied widget. This option is grayed out if no widget has been copied. Only one widget can be copied at a time.
  - *Paste page* - paste a copied page. This option is grayed out if no page has been copied. Only one page can be copied at a time.

After editing the dashboard, click the *Save changes* button to save the dashboard, or *Cancel* to return to the previous screen.

Edit widgets

A widget can be edited in dashboard edit mode by clicking its *Edit* button . Alternatively, when viewing a dashboard, you can hover over a widget and click the *Edit* button.

While a widget is being edited, it is highlighted, and changes are previewed in real time.

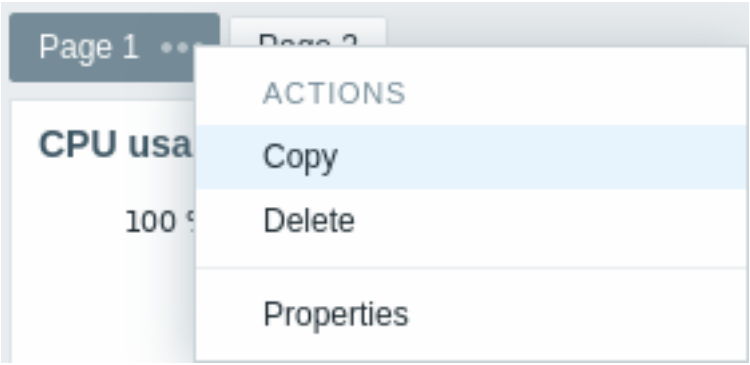
You can reposition the widget and its configuration form by dragging their title bars and resize the widget by dragging its resize handles.

The following actions are available from the widget *Actions* menu ... when editing a widget:

- *Copy* - copy the widget.
- *Paste* - paste a copied widget over this widget. This option is grayed out if no widget has been copied.
- *Delete* - delete the widget.

If mandatory widget parameters are not configured, the widget enters the *Widget is not fully configured* state.

After editing, click *Apply* in the widget configuration form, then *Save changes* in the upper-right corner of the dashboard to apply your changes.



Edit pages

Pages can be edited in dashboard edit mode.

The pages can be reordered by dragging and dropping the page tabs. Reordering does not rename pages, except for pages with automatically assigned names (*Page N*), which are renumbered.

The following actions are available from the page *Actions* menu when editing a page:

- *Copy* - copy the page.
- *Delete* - delete the page.
- *Properties* - customize the page properties.

Permissions to dashboards

Permissions to dashboards for regular users and users of the *Admin* type are limited as described below, provided that access to dashboards and the *Create and edit dashboards* option are enabled for their assigned user role:

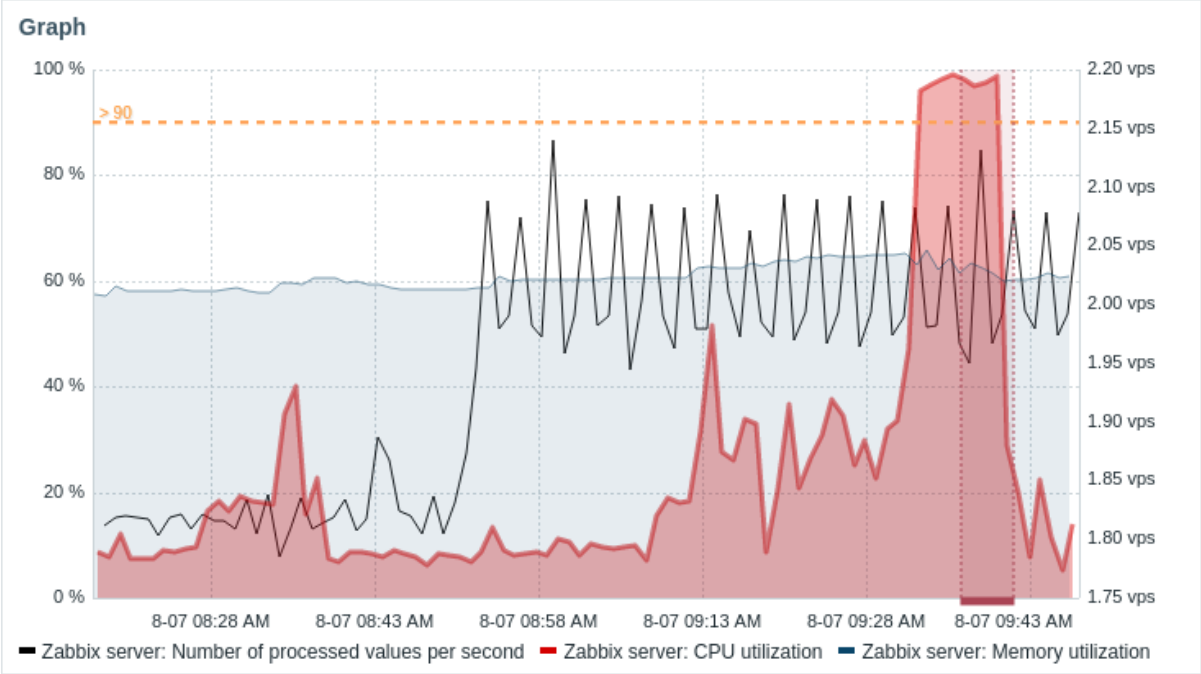
- They can see and clone a public dashboard even when no users or user groups are added to the dashboard's sharing preferences.
- They can see and clone a private dashboard if they have at least *Read* rights to it, as specified in the sharing preferences.
- They can edit and delete a dashboard only if they have *Read-write* rights to it, as specified in the sharing preferences.
- They cannot change the dashboard owner.

Dashboard widgets

Overview

Zabbix provides a variety of dashboard widgets that visualize and summarize monitoring data, giving you a clear overview of system performance and availability.

Below is an overview of all widgets, grouped by their primary purpose.



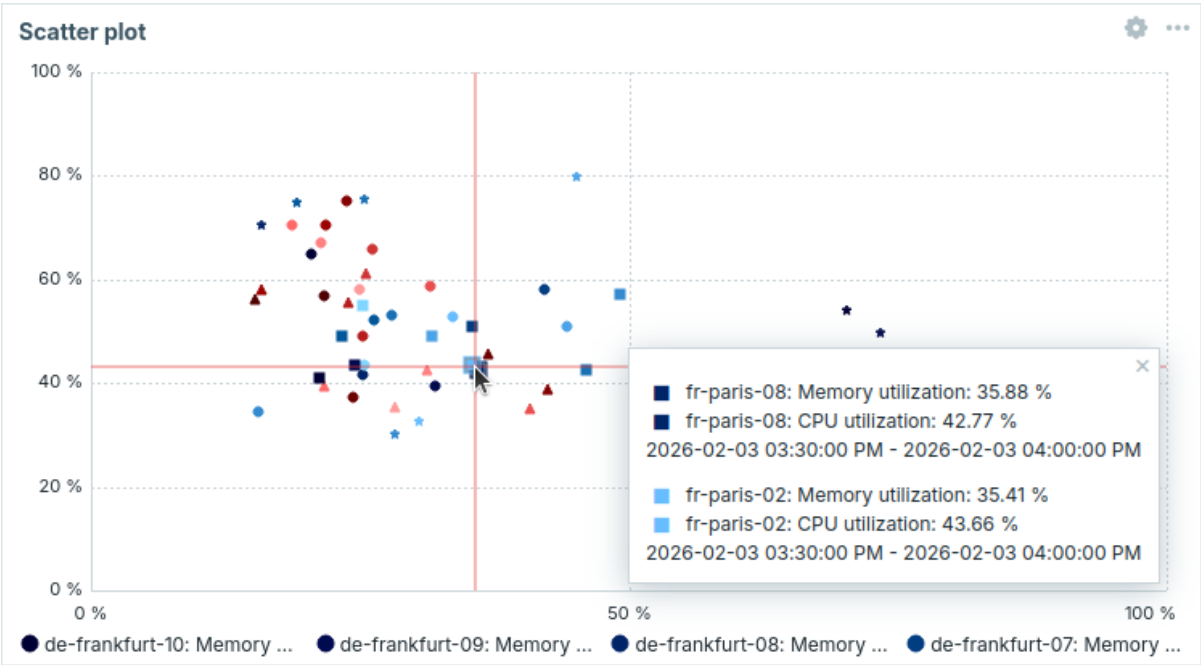
For widget configuration details, see Dashboard widget parameters.

Data visualization

These widgets present data in various visual formats, helping you monitor data and problems in different ways.

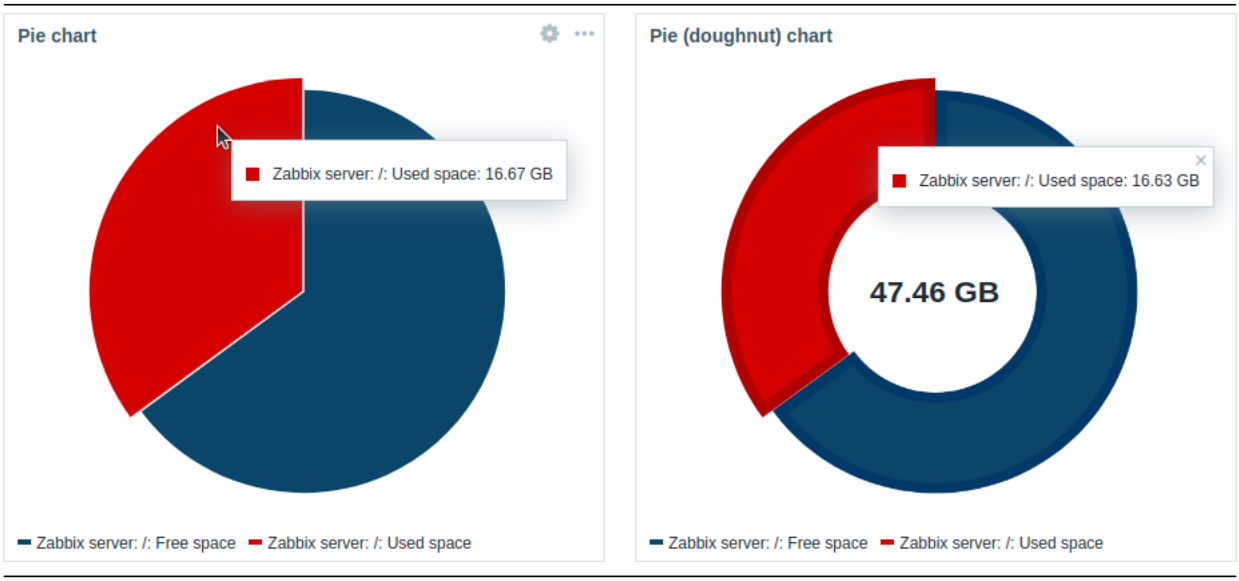
Graph

The Graph widget displays numeric item data as a vector-based graph. It can help you track metrics, spot issues, and compare values over time and across hosts.



See also:

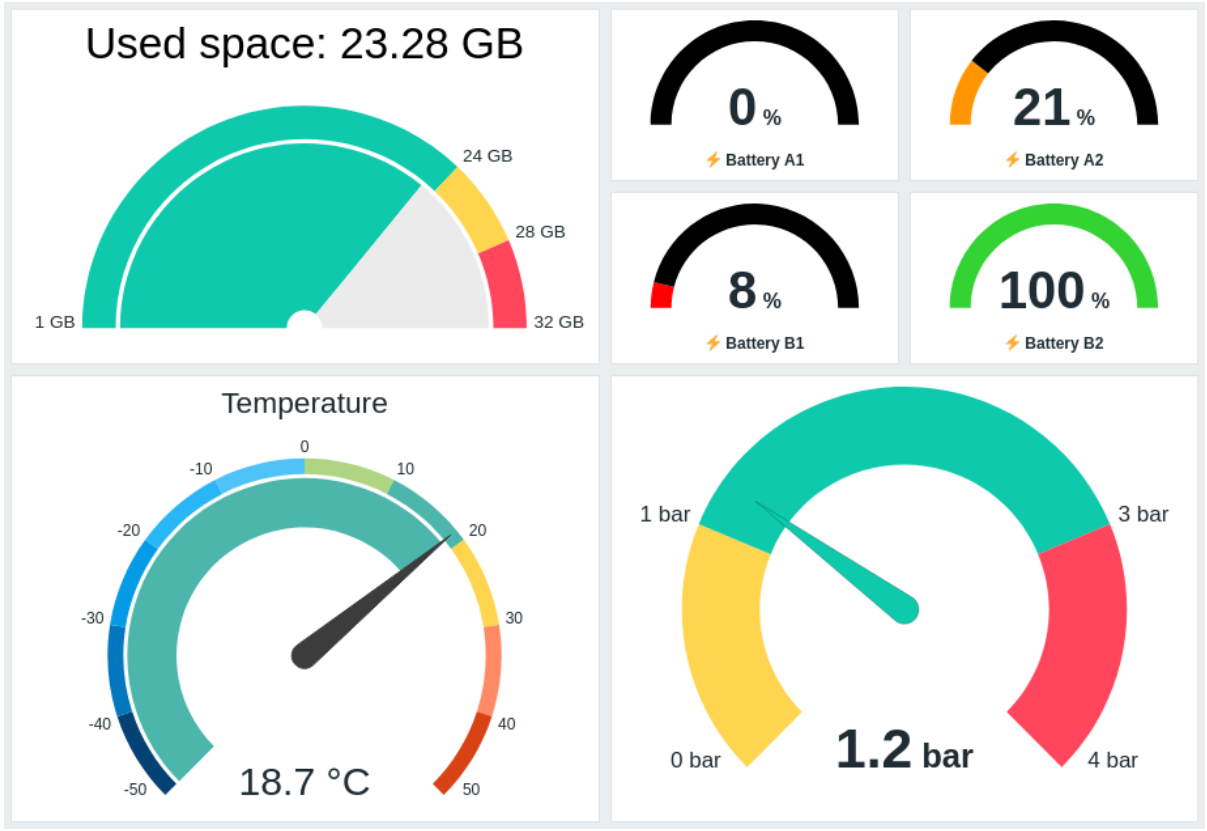
- Graph (classic) - the legacy Graph widget that displays numeric item data as an image-based graph.
- Graph prototype - displays a grid of automatically created custom graphs based on low-level discovery rule graph prototypes or item prototypes.
- Favorite graphs - displays an alphabetical list of shortcuts to graphs marked as favorites by the current user.



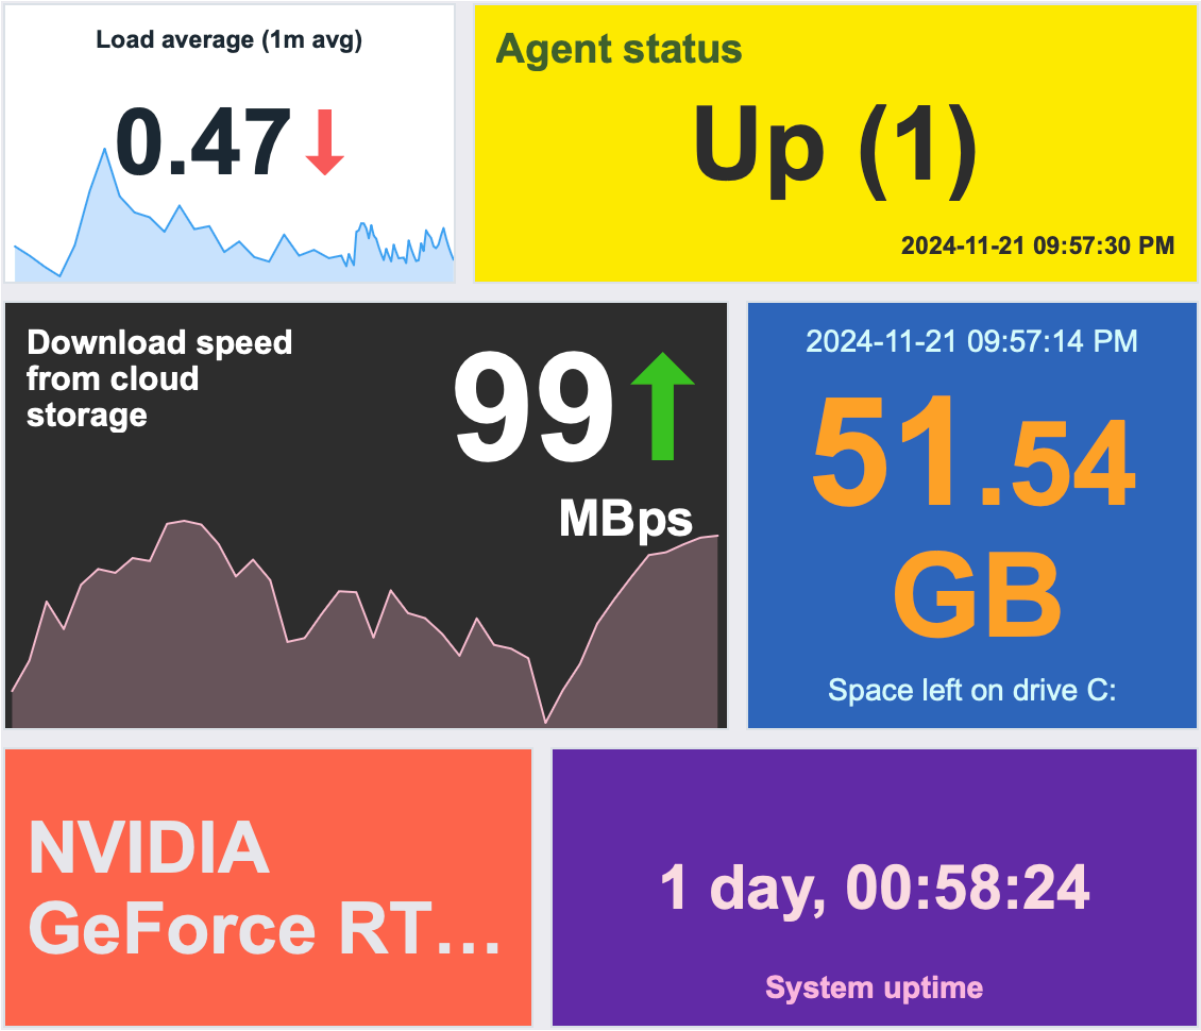
Scatter plot

The Scatter plot widget displays the relationship between two metrics by plotting individual data points along an X and Y axis. This helps reveal patterns, clusters, correlations, and outliers in the data set.

Pie chart



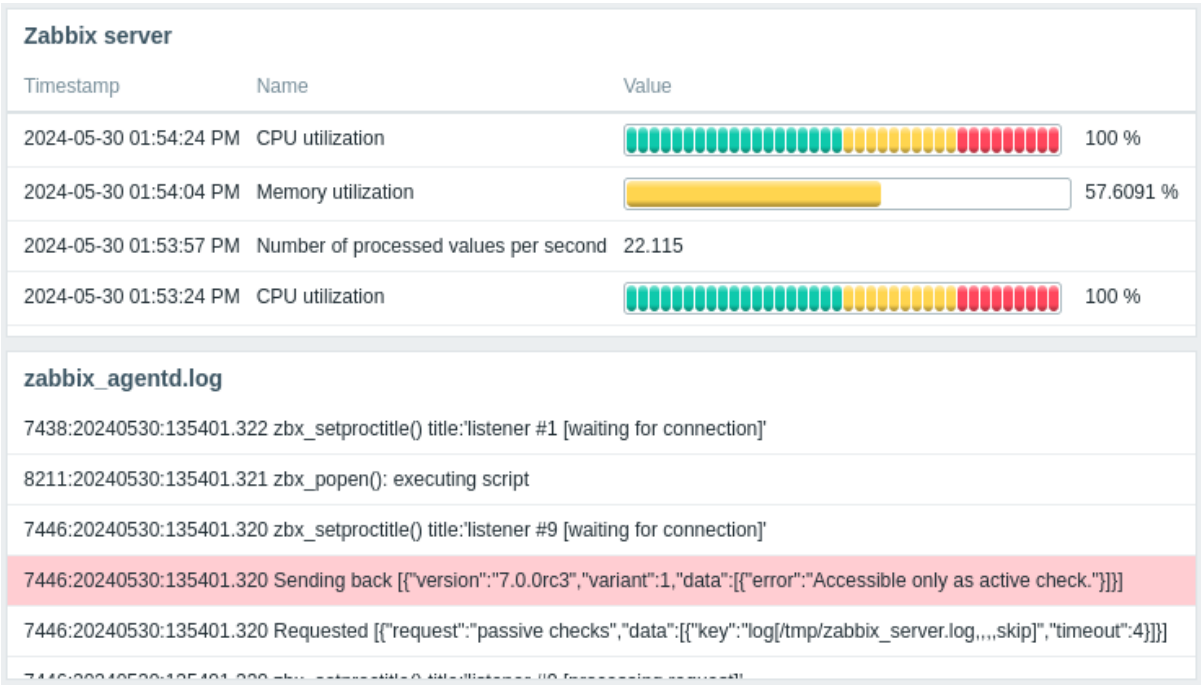
The Pie chart widget displays numeric item data as a vector-based pie or doughnut chart. This widget can help you visualize how items or hosts contribute to the overall dataset.



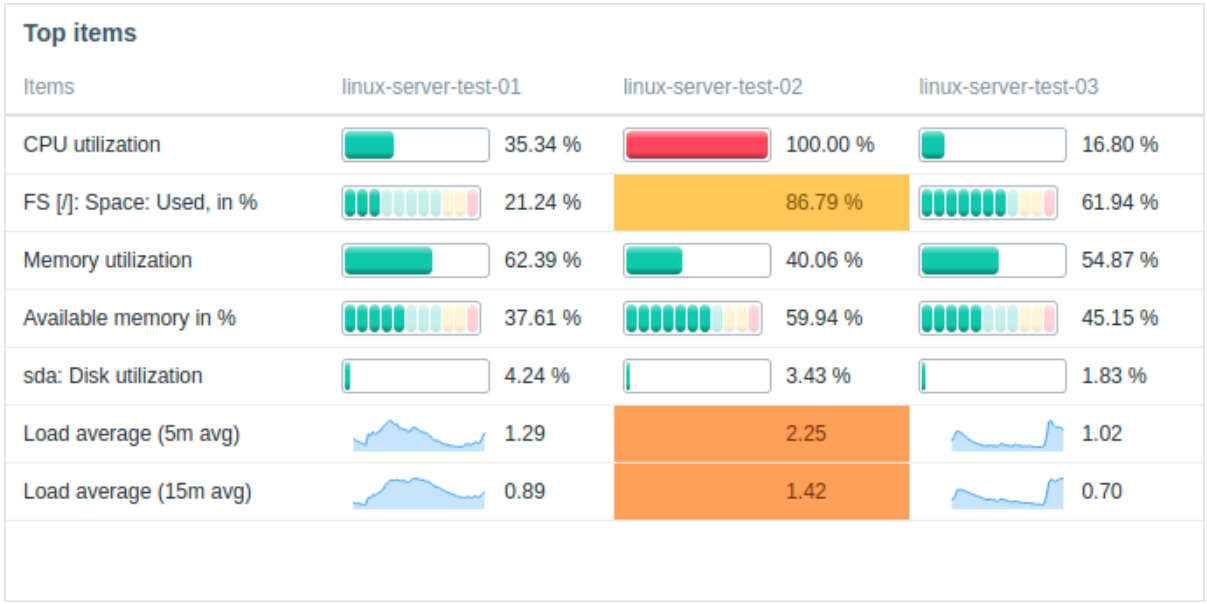
Gauge/Item value

The Gauge/Item value widgets display the value of a single item, useful for keeping an eye on important metrics, visualizing thresholds, and detecting sudden changes in the data.

Gauge widget:



Item value widget:

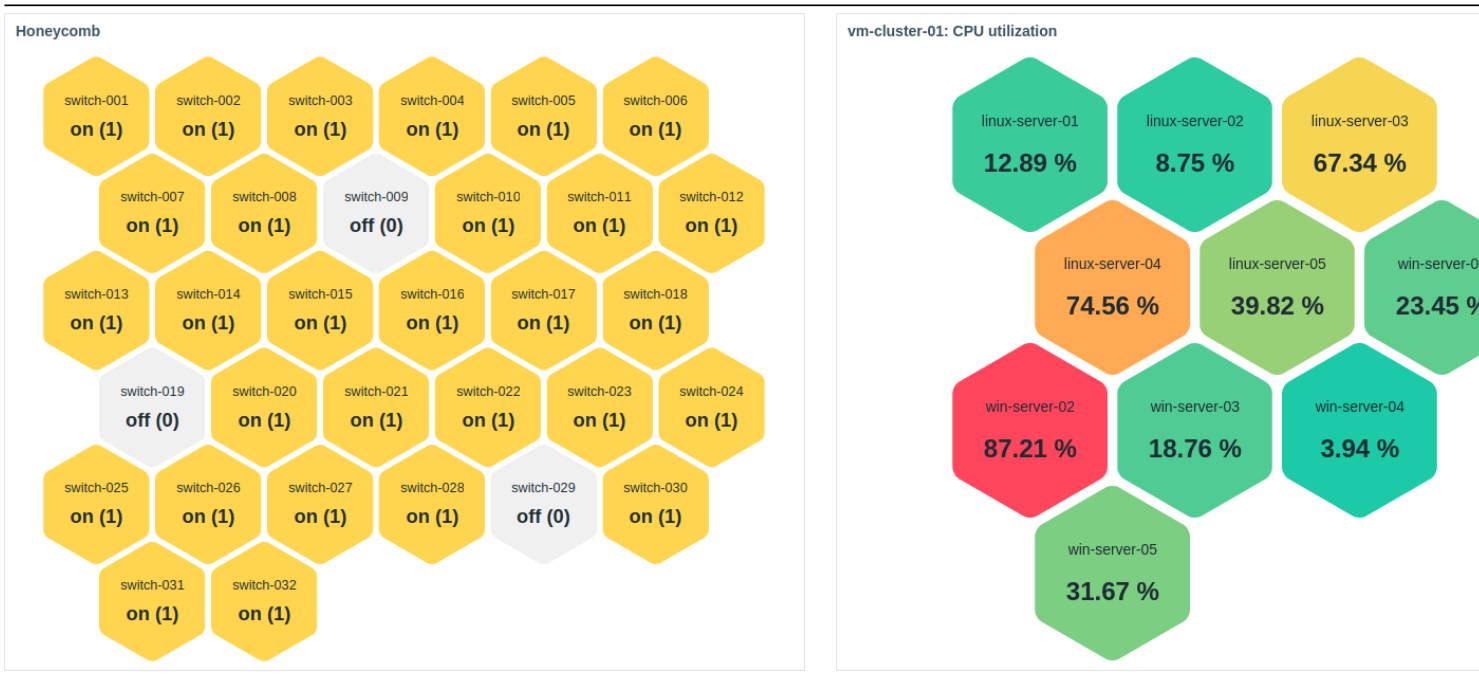


Item history

The Item history widget displays the latest data for all item types (numeric, text, etc.) in a table format. It can show progress bars and images (useful for browser items) and can highlight values (useful for log file monitoring).

Top items

The Top items widget displays the top/bottom values for selected items, providing a quick overview of their performance.

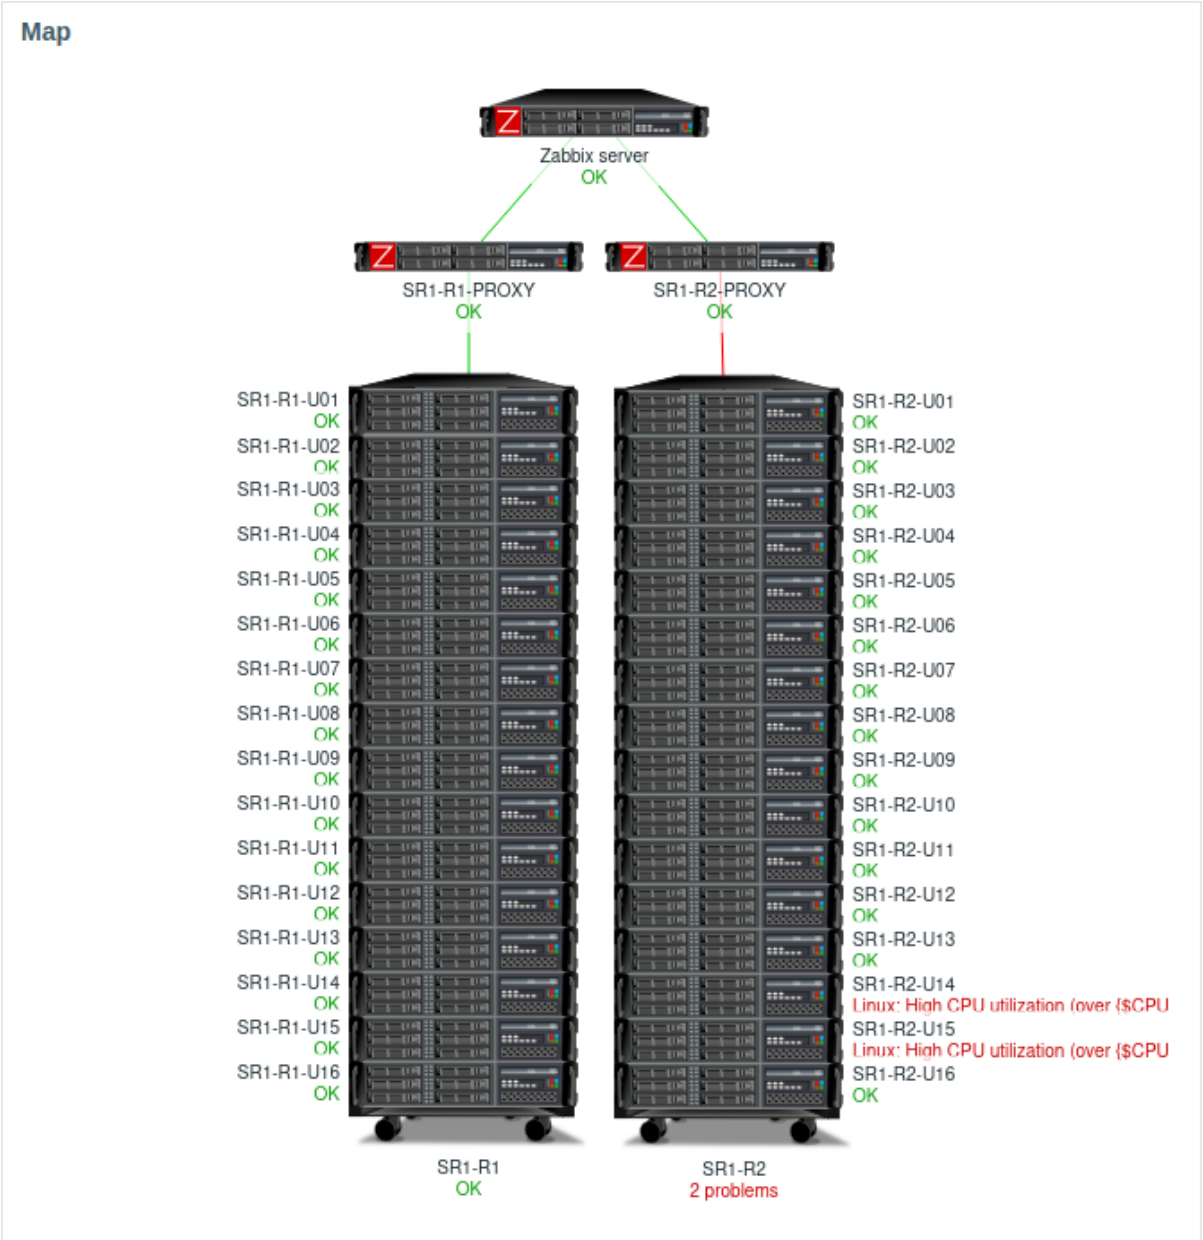


See also:

- Top hosts - displays the top/bottom values for selected items from multiple hosts.
- Top triggers - displays triggers with the highest number of problems.

Honeycomb

The Honeycomb widget displays hosts or items as hexagonal cells in a grid. This layout makes it easy to detect problem hosts/items, spot clusters of issues, compare groups at a glance, and more.

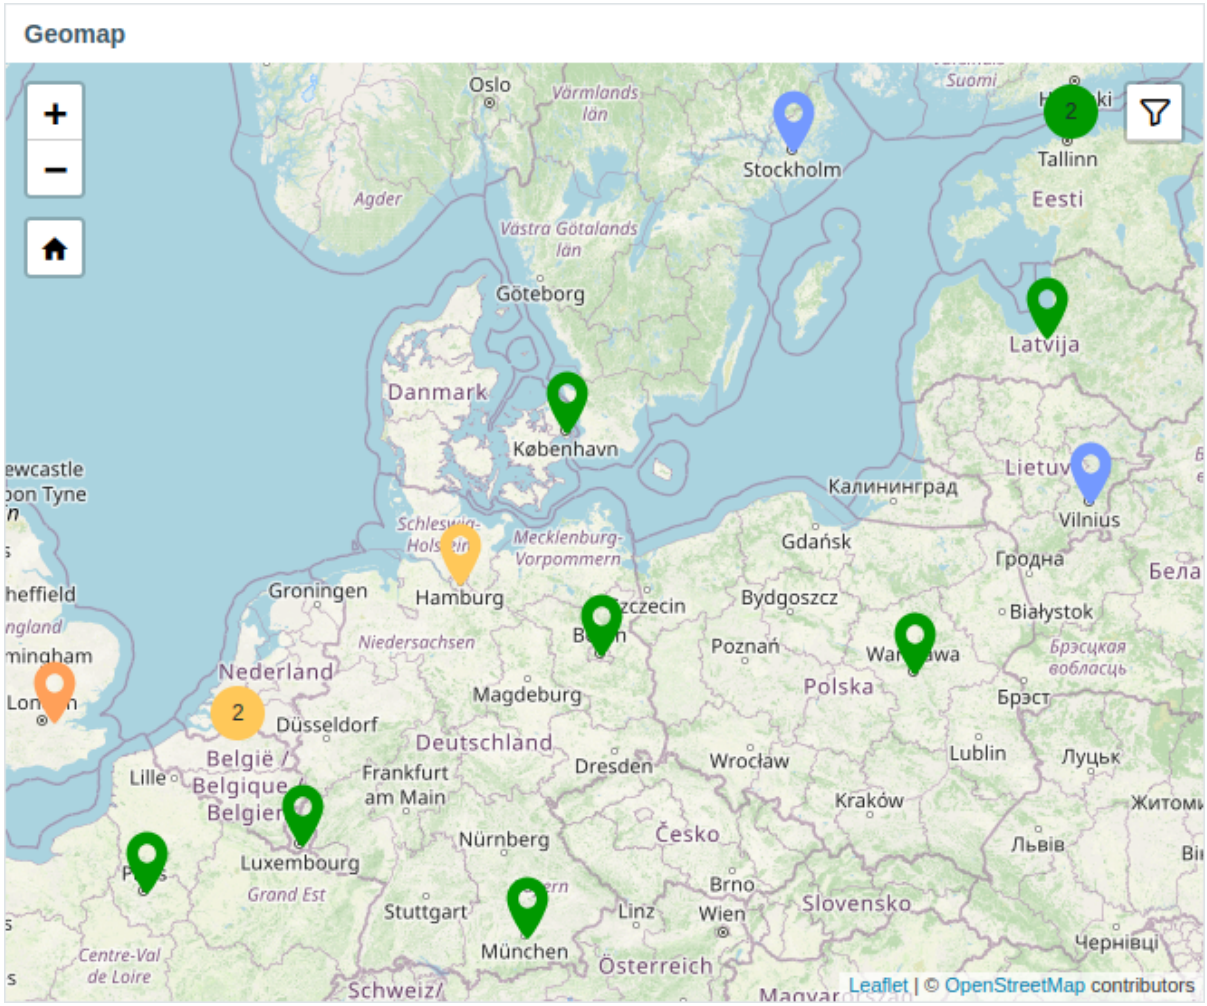


Maps

Map widgets visualize network topology or host locations, helping assess overall and location-specific health.

Map

The Map widget can display a network map or a similar visualization, providing you a dynamic overview of your network.

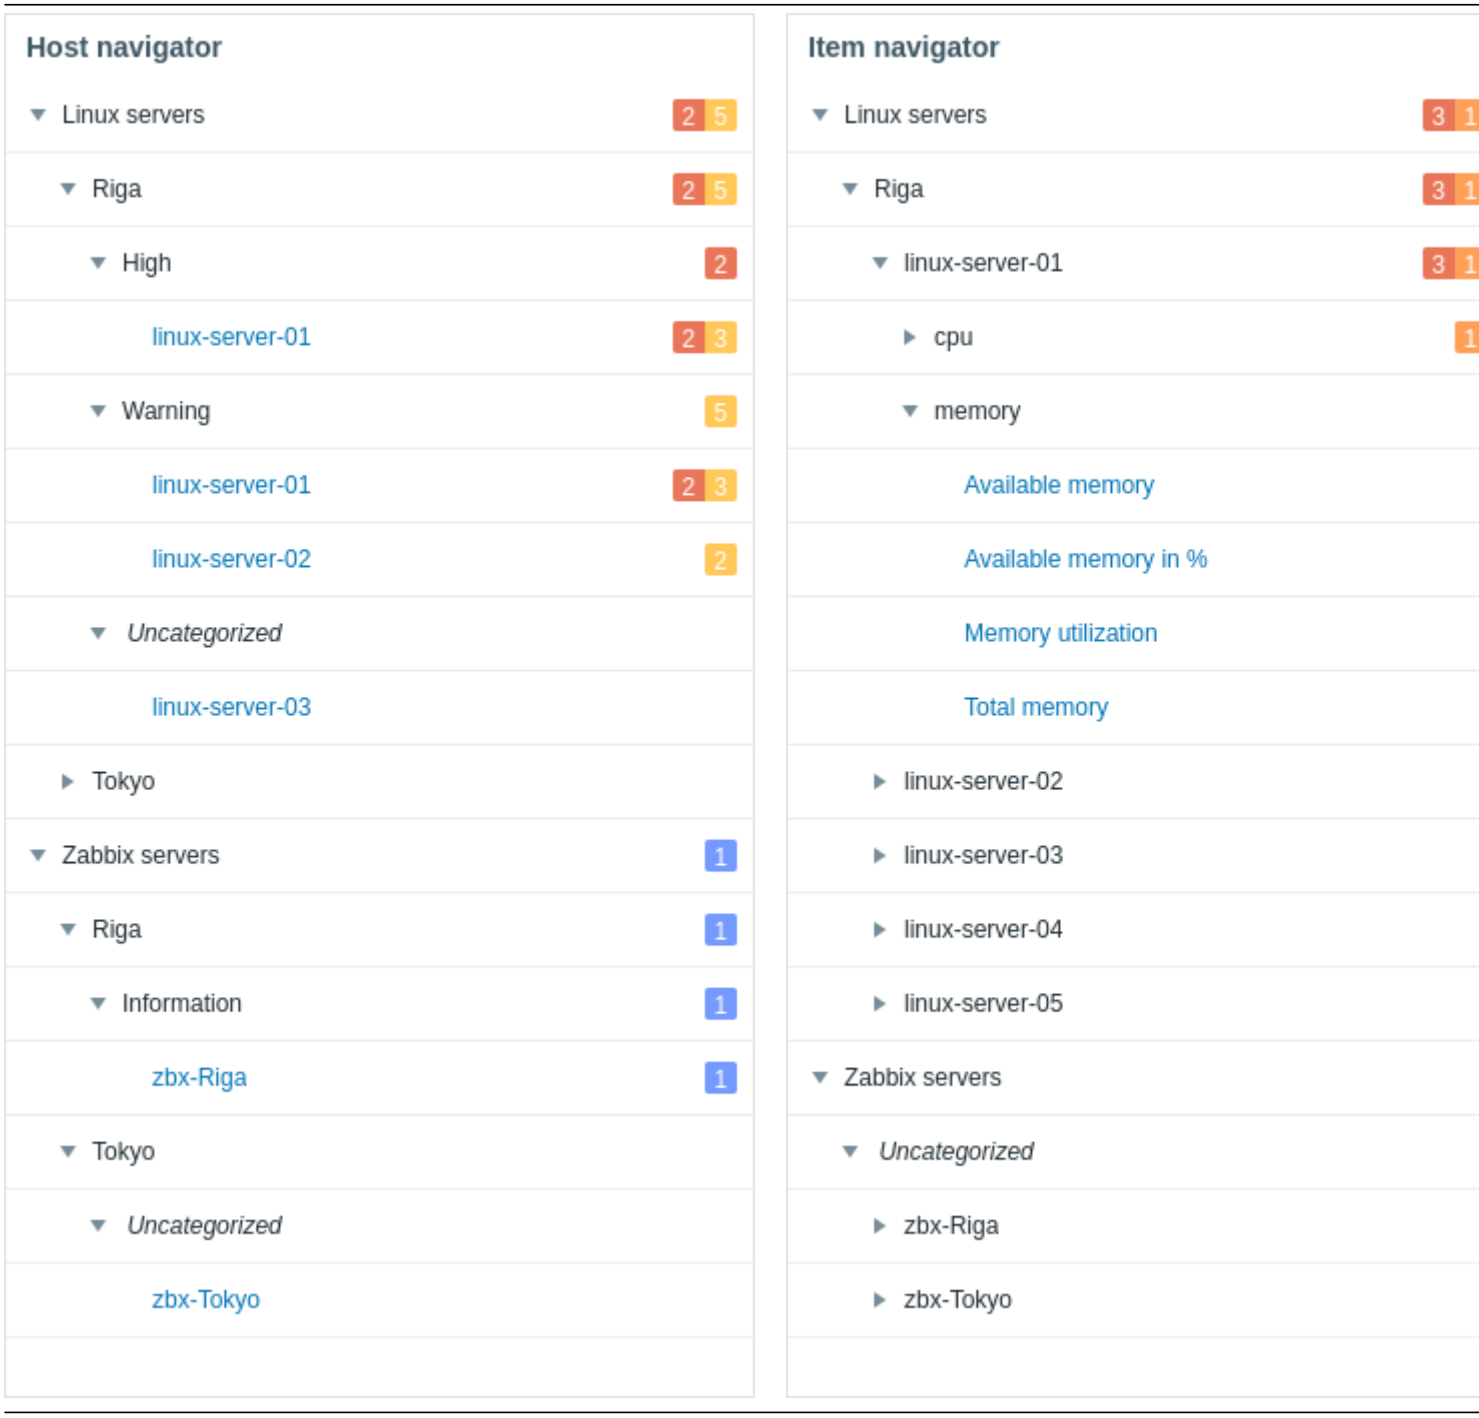


See also:

- Map navigation tree - displays a hierarchy of existing maps and the problem count for each map and map group.
- Favorite maps - displays a list of shortcuts to maps marked as favorites by the current user, sorted alphabetically.

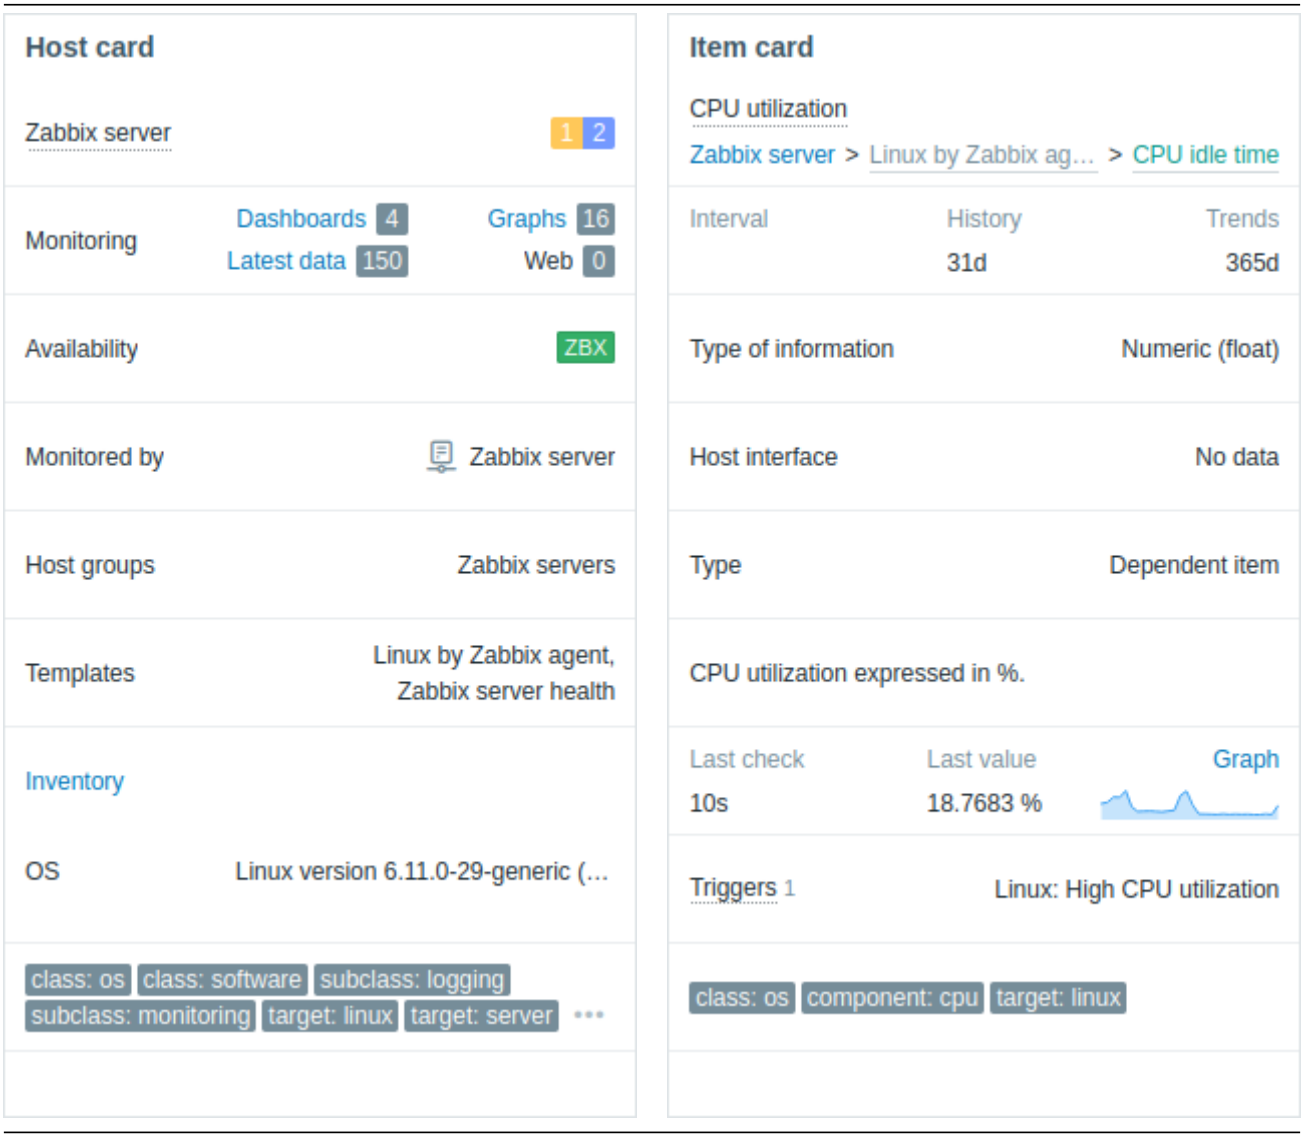
Geomap

The Geomap widget displays hosts as markers on an interactive Leaflet-based map, with marker colors indicating each host's most severe problem.



Host/Item details

These widgets provide lists and detailed views of hosts or items.



Host/Item navigator

The Host navigator/Item navigator widgets display a list of hosts/items based on various filtering and grouping options. These widgets are most useful for controlling what other widgets display based on the selected host/item.

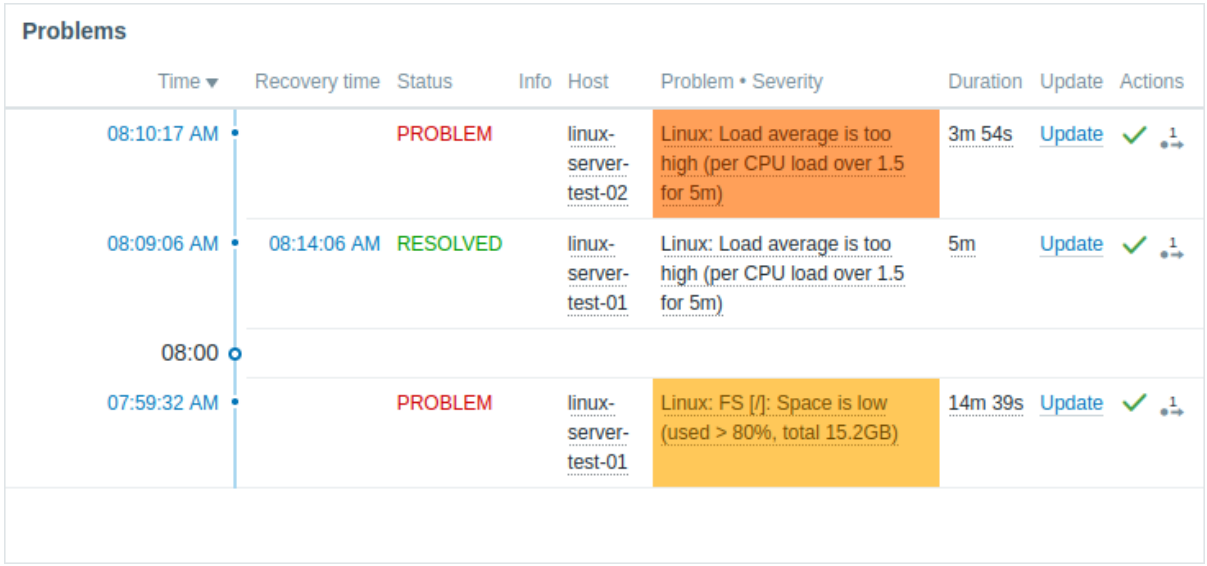
Host/Item card

The Host card/Item card widgets display details of a single host/item, allowing you to quickly assess the status and configuration of a host or item (host availability, problems, inventory, item latest data, errors, description, etc.).

Status and reports

These widgets display status data (e.g., availability, triggers, problems) as well as reports.

Host availability



The Host availability widget displays host availability across selected host groups, allowing you to monitor the number of hosts that are up or down.

Host availability

	Total Hosts	Agent (active)	Agent (passive)	SNMP	JMX	IPMI
Available	10	3	8	2	0	0
Not available	2	0	3	0	0	0
Mixed	1	-	0	0	0	0
Unknown	4	0	4	0	0	0
Total	17	3	15	2	0	0

Problems

The Problems widget displays current problems filtered by different parameters (host groups, hosts, problem names, etc.), giving you a clear view of what needs attention.

See also:

- Problems by severity - displays the number of cause problems grouped by severity.
- Problem hosts - displays the number of cause problems per host group and shows the highest problem severity in each group.

Trigger overview

The Trigger overview widget displays the current states of host triggers as a table of colored blocks. It provides a quick visual snapshot of trigger health and activity on different hosts.

Action log

The Action log widget displays details of operations (notifications, remote commands) executed within an action. The detailed log helps with auditing, troubleshooting, and monitoring each action's execution.

Action log

Time ▾	Action	Media type	Recipient	Message	Status	Info
2025-08-15 07:58:30 AM	Report problems to Zabbix administrators	Email	Admin (Zabbix Administrator) *admin@example.com*	**Resolved in 1m 59s: Linux: Load average is too high (per CPU load over 1.5 for 5m)** Problem has been resolved at 10:58:30 on 2025.08.15 Problem name: Linux: Load average is too high (per CPU load over 1.5 for 5m) Problem duration: 1m 59s Host: Linux server Severity: Average Original problem ID: 45	Sent

Web monitoring

The Web monitoring widget displays the status of active web scenarios.

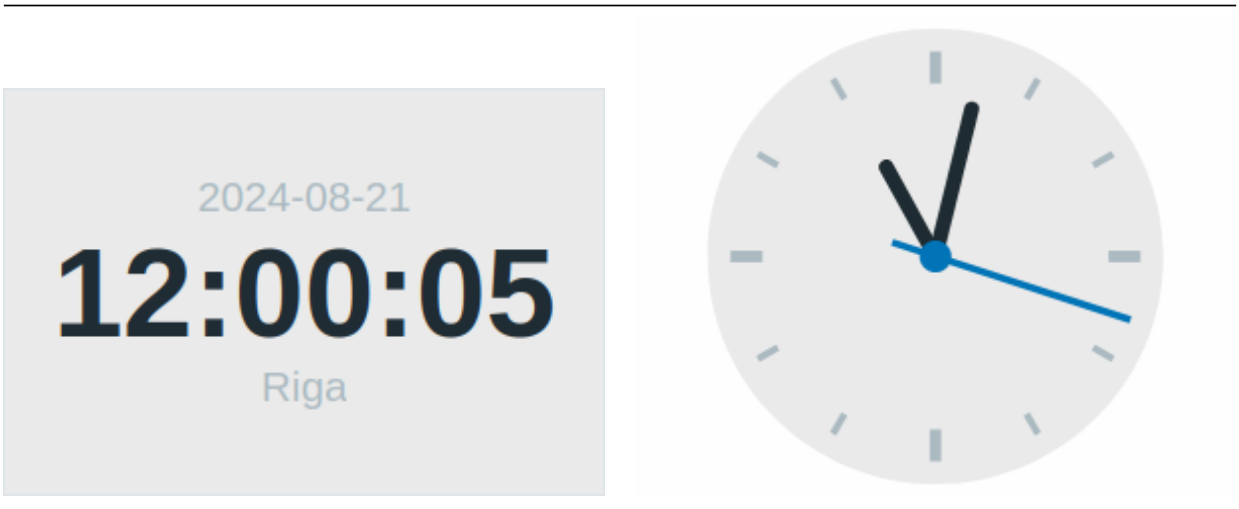
Discovery status

The Discovery status widget displays the status of devices discovered by enabled network discovery rules. It helps you monitor whether network discovery is working correctly and the number of devices that are up or down.

Dashboard utilities and system information

These widgets provide supplementary information and tools to enhance your dashboards.

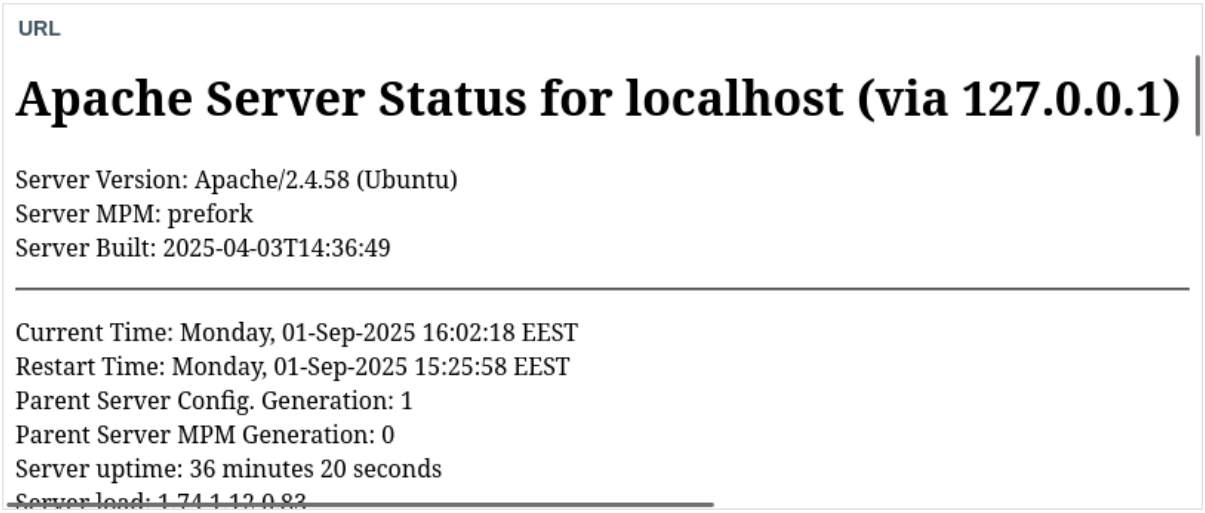
System information



The System information widget displays a summary of key Zabbix server and system data or details of high availability nodes.

System information

Parameter	Value	Details
Zabbix server is running	Yes	localhost:10051
Zabbix server version	8.0.0	Up to date
Zabbix frontend version	8.0.0	Up to date
Software update last checked	2025-08-30	
Latest release	8.0.0	Release notes
Number of hosts (enabled/disabled)	2	2 / 0
Number of templates	312	
Number of items (enabled/disabled/not supported)	176	165 / 0 / 11
Number of triggers (enabled/disabled [problem/ok])	89	89 / 0 [4 / 85]
Number of users (online)	2	1
Required server performance, new values per second	2.68	
Global scripts on Zabbix server	Disabled	
High availability cluster	Disabled	



Clock

The Clock widget displays local, server, or host time in analog or digital format.

URL

The URL widget displays the content retrieved from a URL.

Dashboard widget parameters

Overview

This page describes parameters that are common to all dashboard widgets, as well as dynamic parameters that allow multiple widgets to exchange configuration data with each other or with the dashboard.

To see specific parameters for each widget, please use the sidebar to navigate to the corresponding widget page.

Common parameters

The following parameters are common for every single widget:

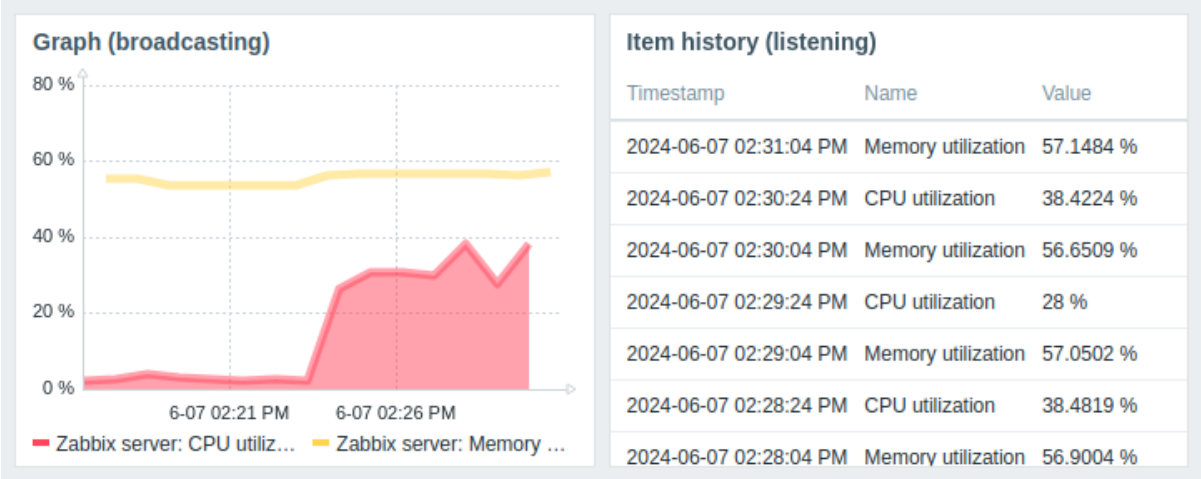
Name	Enter a widget name.
Refresh interval	Configure the default refresh interval. Default refresh intervals for widgets range from *No refresh* to *15 minutes* depending on the type of the widget. For example: - *No refresh* for *URL* widget; - *1 minute* for *Action log* widget; - *15 minutes* for *Clock* widget. Refresh intervals can be set to a default value for all users. Switch the dashboard to edit mode, click the edit a widget button and select the desired refresh interval from the dropdown list. Each user can also set their own widget refresh interval. In the dashboard view mode, click the three dots button on a widget and select the desired refresh interval from the dropdown list. Note that a user's unique refresh interval takes priority over the widget setting and is preserved even when the widget's setting is modified.
Show header	Mark the checkbox to permanently display the widget header. When unmarked, the header is hidden to save space and becomes visible only on widget mouseover (both in view and edit modes). The header is also semi-visible when dragging a widget to a new place.

Dynamic parameters

Multiple widget parameters (e.g., *Hosts*, *Override host*, *Time period*) support dynamic data sources. Instead of configuring static values, you can link these parameters to other widgets or the dashboard itself. Widgets are then automatically updated based on selections or broadcasts from other parts of the dashboard.

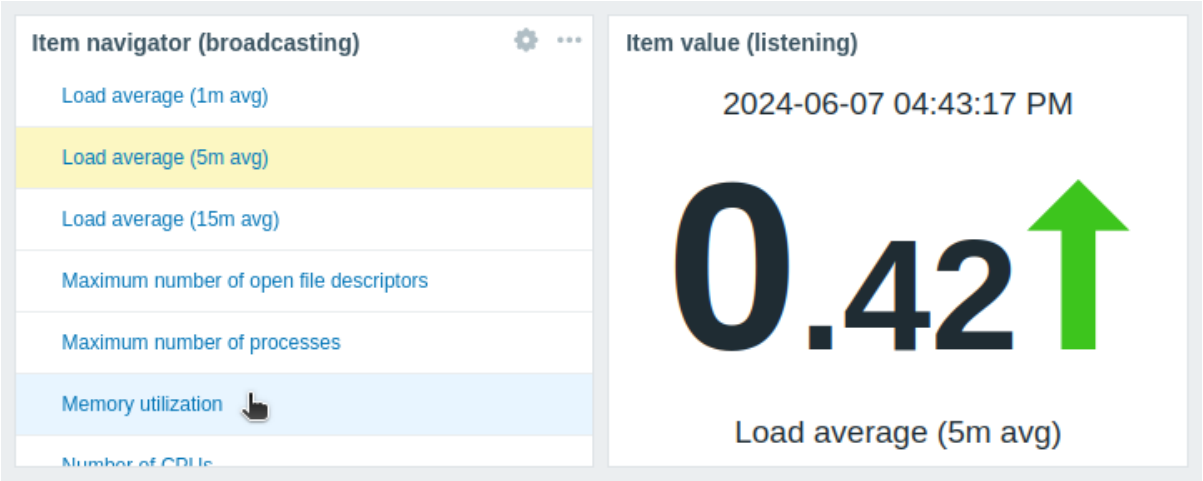
Widget compatibility

Some widgets can broadcast configuration data to other widgets, some can listen for data, and some can do both. For example:



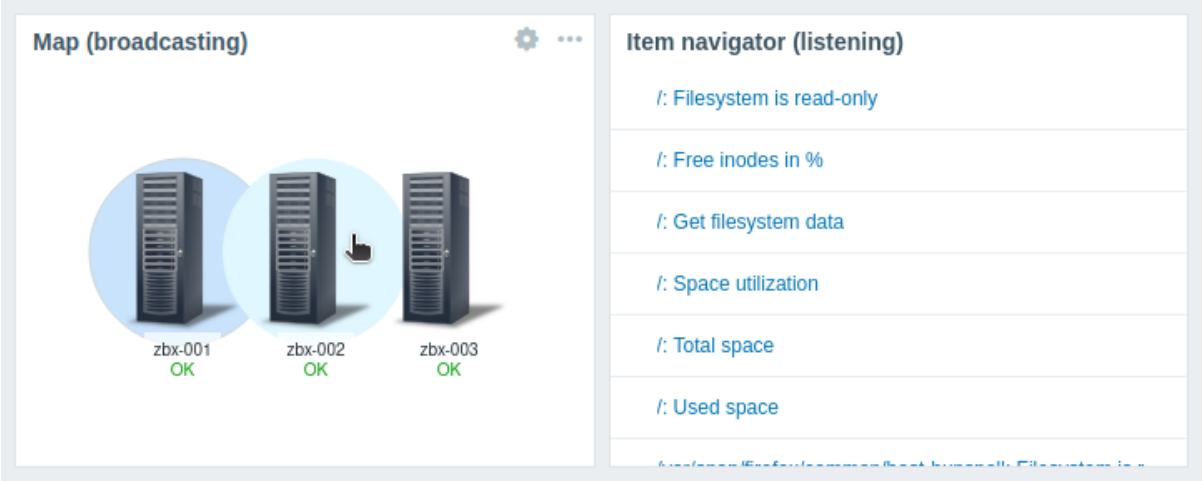
- The *Action log* widget can only retrieve time period data from *Graph*, *Graph (classic)*, and *Graph prototype* widgets.
- The *Geomap* widget can broadcast host data to widgets that listen for it (*Honeycomb*, *Top items*, etc.) and can also listen for host group and host data from widgets that broadcast it (*Honeycomb*, *Problem hosts*, etc.).
- The *Clock* widget cannot broadcast or listen for any data.

The following table outlines the broadcasting and listening capabilities of each widget.

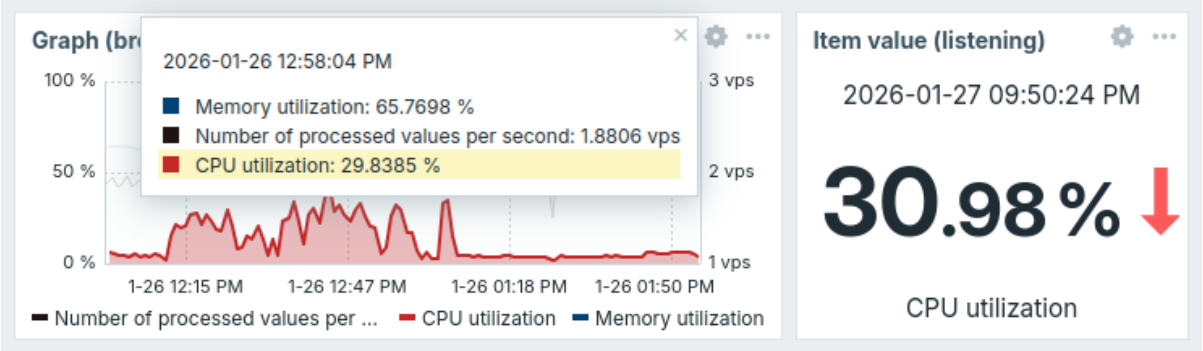


Widget	Broadcasts	Listens
Action log	-	Time period
Clock	-	-
Discovery status	-	-
Favorite graphs	-	-
Favorite maps	-	-
Gauge	-	Hosts, Items
Geomap	Hosts	Host groups, Hosts
Graph	Time period, Items	Hosts, Items, Time period
Graph (classic)	Time period	Hosts, Items, Graphs, Time period
Graph prototype	Time period	Hosts, Time period
Honeycomb	Hosts, Items	Host groups, Hosts
Host availability	-	Host groups
Host card	-	Hosts
Host navigator	Hosts	Host groups
Item card	-	Hosts, Items, Time period
Item history	Items	Hosts, Time period
Item navigator	Items	Host groups, Hosts
Item value	-	Hosts, Items, Time period
Map	Host groups, Hosts	Maps
Map navigation tree	Maps	-
Pie chart	-	Items, Time period
Problem hosts	Host groups	Host groups, Hosts
Problems	Events	Host groups, Hosts
Problems by severity	Host groups	Host groups, Hosts
Scatter plot	Time period, Items	Hosts, Items, Time period
SLA report	-	-
System information	-	-
Top hosts	Hosts	Host groups, Hosts
Top items	-	Host groups, Hosts
Top triggers	-	Time period
Trigger overview	-	Host groups, Hosts
URL	-	Hosts
Web monitoring	Host groups	Host groups, Hosts

Widgets differ in how they **broadcast** data to other widgets.

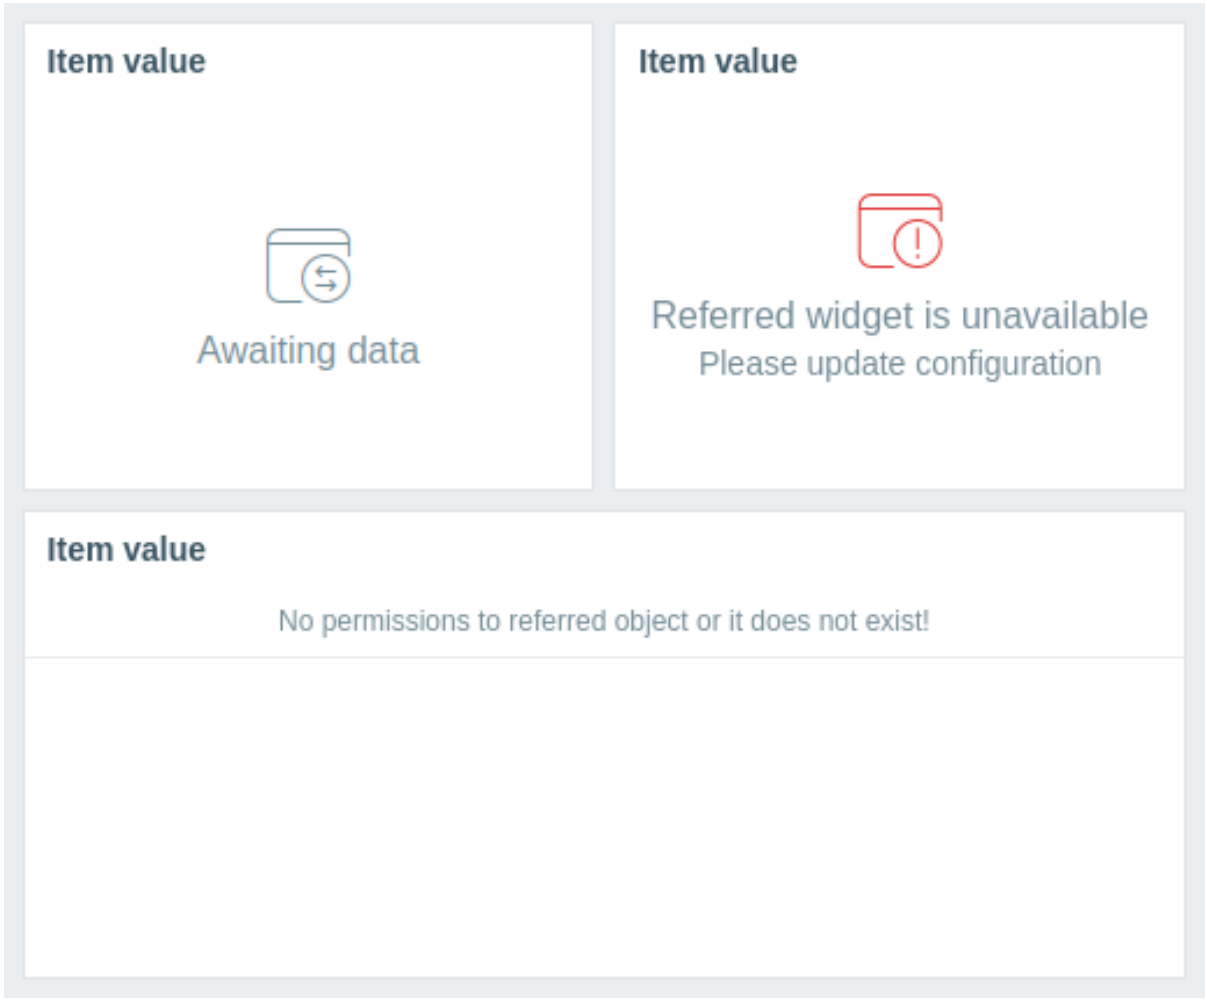


Widgets that support broadcasting start doing it automatically when created. For example, the *Graph* widget immediately broadcasts time period data to listening widgets.



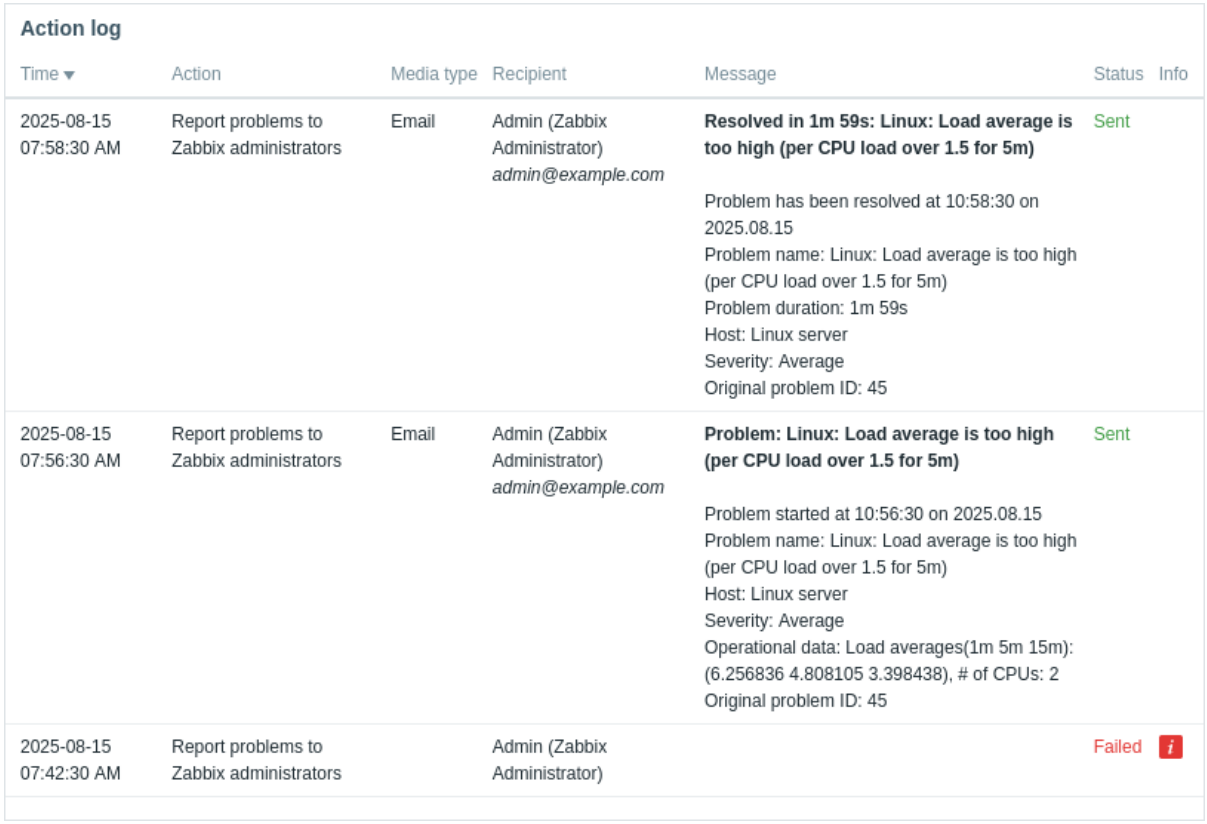
Widgets that support entity selection automatically broadcast data for the first available entity. For example, the *Item navigator* widget broadcasts data for the first item in its item list. When a different item is selected, it broadcasts data for that item. On mouseover, the item is highlighted in light blue; on selection, it is highlighted in yellow.

The *Map* widget behaves similarly, broadcasting data for the first element closest to the upper-left corner of the widget's visible area (for the *Geomap* widget, closest to the center). When a different element is selected, it broadcasts data for that element. On mouseover, the element is highlighted in light blue; on selection, it is highlighted in dark blue.



Widgets such as the *Graph* and *Scatter plot* can broadcast item data when an item is selected in their tooltips:

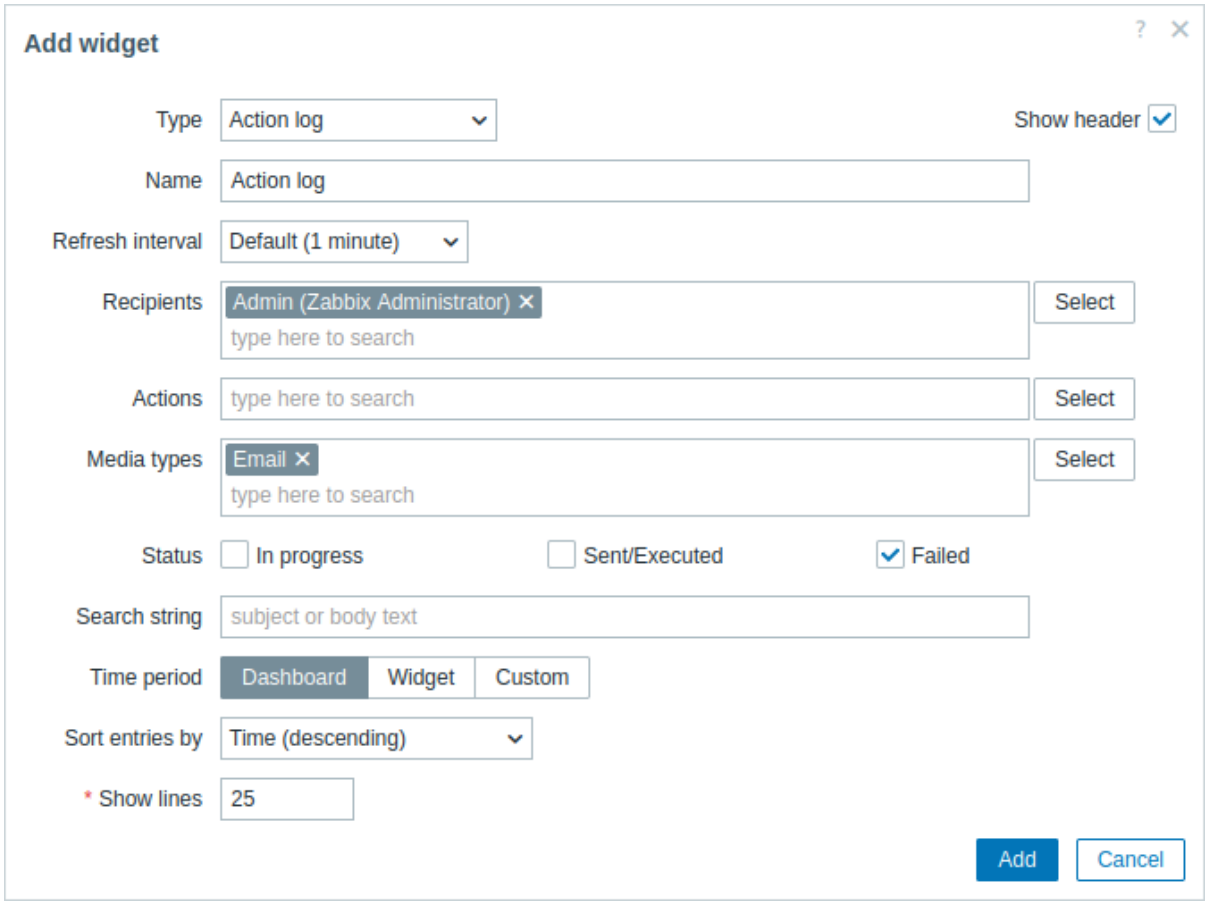
Widgets also have specific behaviors when **listening** for data from other widgets:



- If the data source widget is not broadcasting data, the listening widget enters the *Awaiting data* state.
- If the data source widget has been deleted, replaced with an incompatible widget, or moved to another dashboard page, the listening widget enters the *Referred widget is unavailable* state.
- If the specified host in the data source (widget or dashboard) lacks the entity configured in the listening widget (item, graph, map, etc.) or if the user lacks permissions to access the host, the listening widget displays the following message: *"No permissions to referred object or it does not exist!"*

Action log

Overview

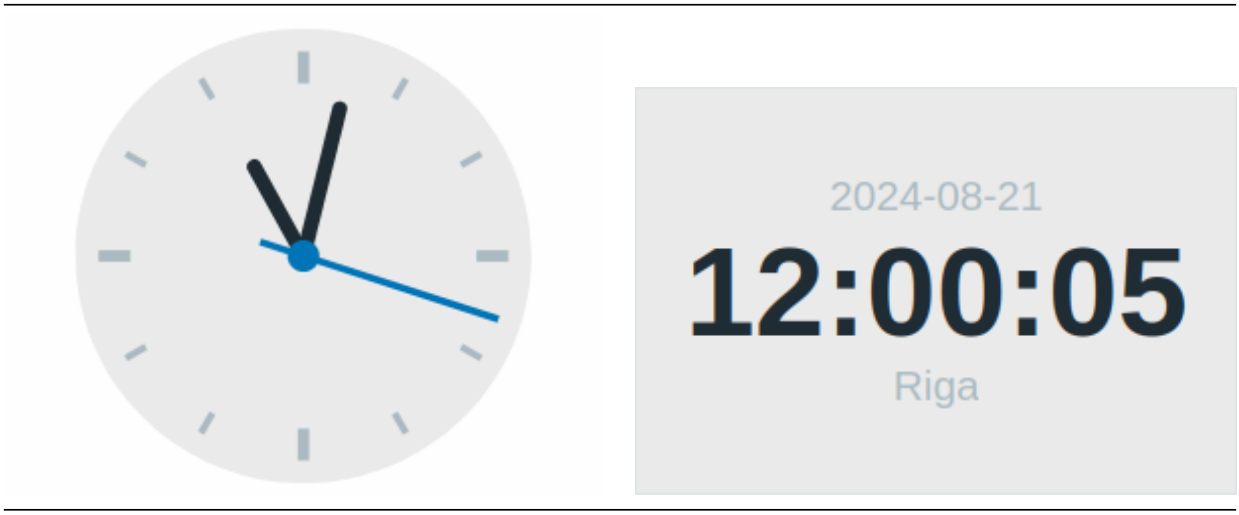


The *Action log* widget displays details of operations (notifications, remote commands) executed within an action. The detailed log helps with auditing, troubleshooting, and monitoring each action's execution.

It displays the same data as *Reports* > *Action log* and can display up to 1000 records.

Configuration

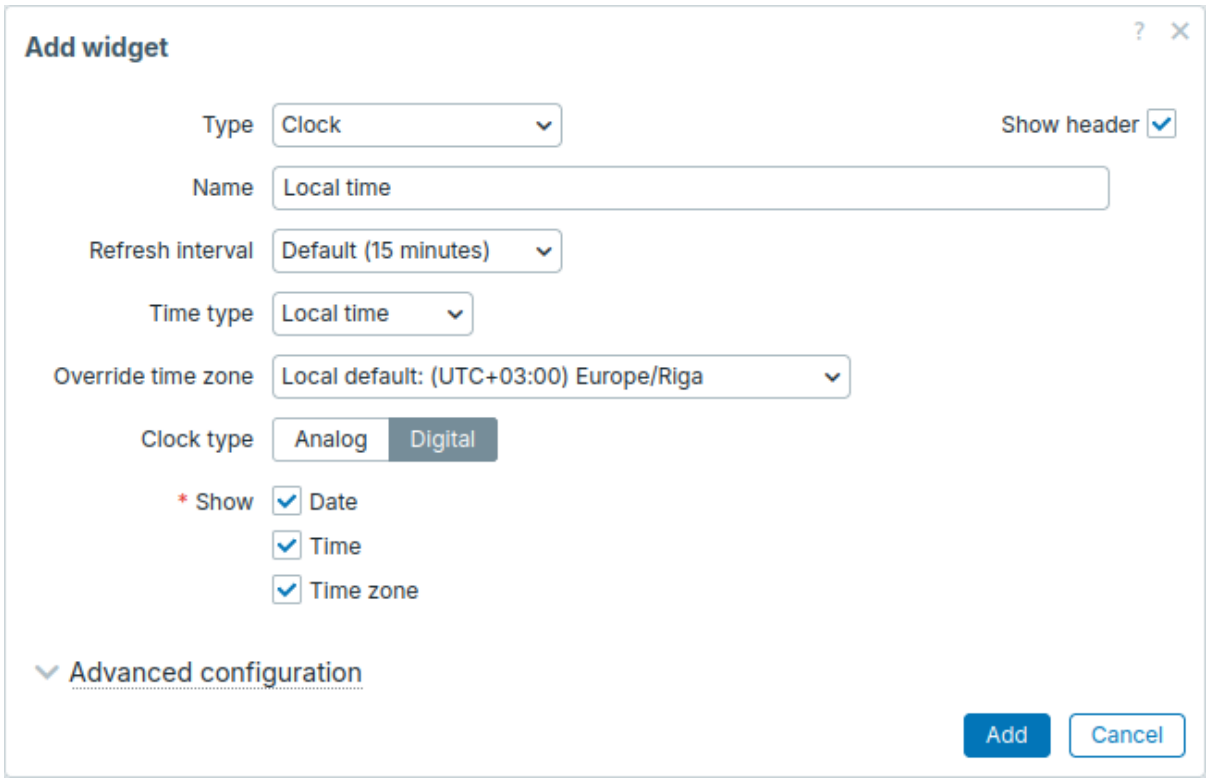
To configure, select *Action log* as type:



In addition to the parameters that are common for all widgets, you may set the following specific options:

Recipients	Filter entries by recipients. This field is auto-complete, so starting to type the name of a recipient will offer a dropdown of matching recipients. If no recipients are selected, details of action operations for all recipients will be displayed.
Actions	Filter entries by actions. This field is auto-complete, so starting to type the name of an action will offer a dropdown of matching actions. If no actions are selected, details of action operations for all actions will be displayed.
Media types	Filter entries by media types. This field is auto-complete, so starting to type the name of a media type will offer a dropdown of matching media types. If no media types are selected, details of action operations for all media types will be displayed.
Status	Mark the checkbox to filter entries by the respective status: **In progress** - action operations that are in progress are displayed; **Sent/Executed** - action operations that have sent a notification or have been executed are displayed; **Failed** - action operations that have failed are displayed.
Search string	Filter entries by the content of the message/remote command. If you enter a string here, only those action operations whose message/remote command contains the entered string will be displayed. Macros are not resolved.
Time period	Filter entries by time period. Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period.
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
Sort entries by	Sort entries by: **Time** (descending or ascending); **Type** (descending or ascending); **Status** (descending or ascending); **Recipient** (descending or ascending).
Show lines	Set how many action log lines will be displayed in the widget.

Clock



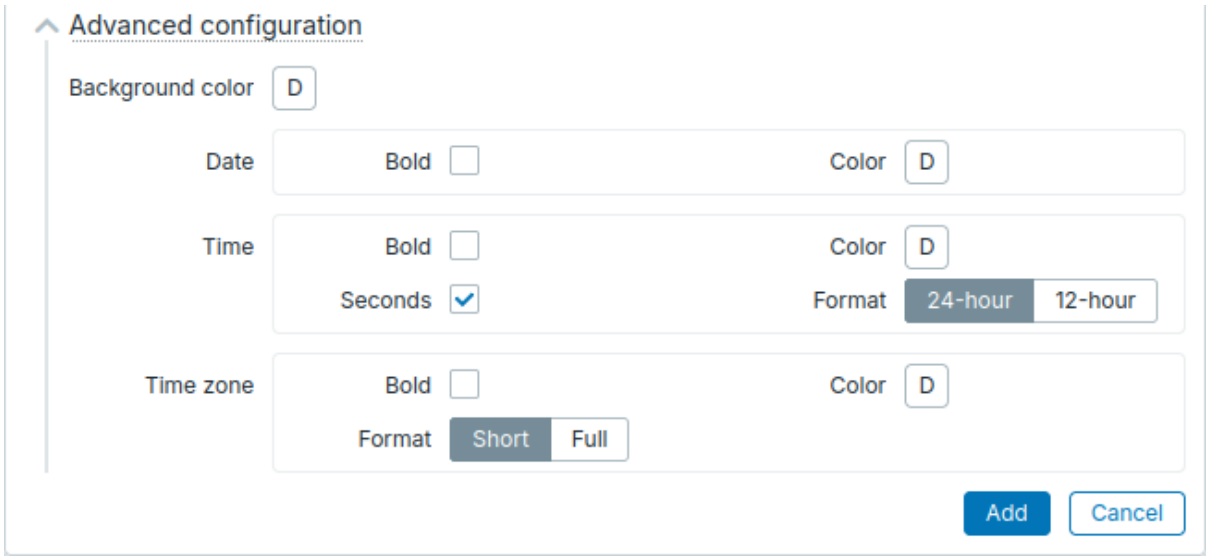
Overview

The *Clock* widget displays local, server, or host time in analog or digital format.

Configuration

To configure, select *Clock* as type:

In addition to the parameters that are common for all widgets, you may set the following specific options:



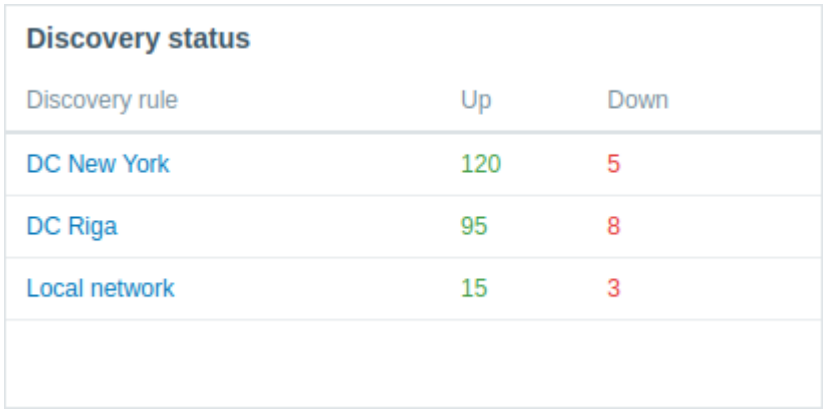
Time type	Select the time source: **Local time** - system time of the device running the browser; **Server time** - time zone set globally or for the Zabbix user; **Host time** - time retrieved from a host item.
Item	Select the item with the `system.localtime[local]` item key to display the host time. This parameter is available if *Time type* is set to "Host time".
Clock type	Select the clock type (analog or digital).
Override time zone	Select the time zone. This parameter is available for the *Local time* and *Server time* time types.
Show	Select one or more information units (date, time, time zone) to display in the digital clock. The unit size automatically adapts to the displayed units, widget size, and display scaling. This parameter is available if *Clock type* is set to "Digital".

Advanced configuration	Click the *Advanced configuration* header to display advanced configuration options for the digital clock. This section is available if *Clock type* is set to ”Digital”.

Advanced configuration

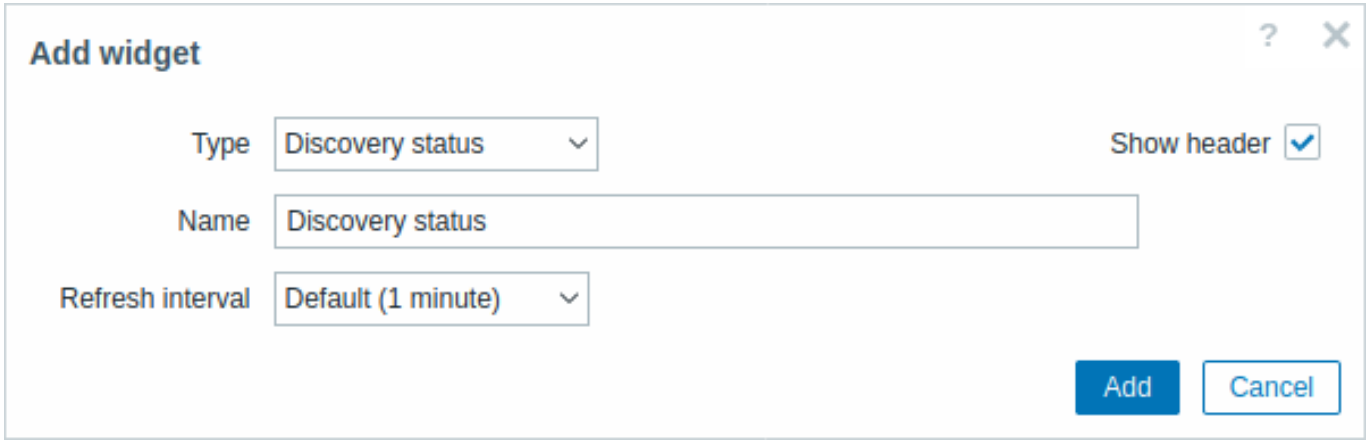
Advanced configuration options are available in the collapsible *Advanced configuration* section, and only for those elements that are selected in the *Show* field (see above).

Additionally, advanced configuration allows you to change the background color for the whole widget.



Background color		Select the background color from the color picker. D stands for default color (depends on the frontend theme). To return to the default value, click the *Use default* button in the color picker.
Date		This section is available when the *Date* checkbox is selected for the *Show* parameter.
	Bold	Mark the checkbox to display date in bold type.
	Color	Select the date color from the color picker. D stands for default color (depends on the frontend theme). To return to the default value, click the *Use default* button in the color picker.
Time		This section is available when the *Time* checkbox is selected for the *Show* parameter.
	Bold	Mark the checkbox to display time in bold type.
	Color	Select the time color from the color picker. D stands for default color (depends on the frontend theme). To return to the default value, click the *Use default* button in the color picker.
	Seconds	Mark the checkbox to display seconds. Otherwise, only hours and minutes will be displayed.
	Format	Select to display a 24-hour or 12-hour time.
Time zone		This section is available when the *Time zone* checkbox is selected for the *Show* parameter.
	Bold	Mark the checkbox to display time zone in bold type.
	Color	Select the time zone color from the color picker. D stands for default color (depends on the frontend theme). To return to the default value, click the *Use default* button in the color picker.
	Format	Select to display time zone in short format (e.g., `New York`) or full format (e.g.,`(UTC-04:00) America/New York`).

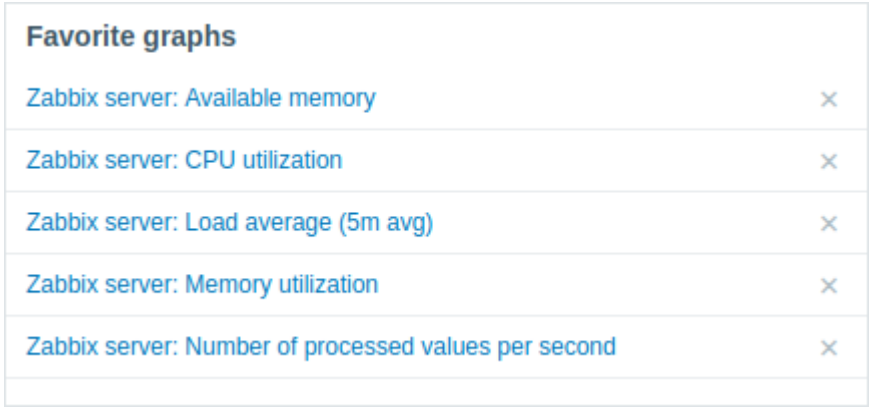
Discovery status



Overview

The *Discovery status* widget displays the status of devices discovered by enabled network discovery rules. It helps monitor whether network discovery is working correctly and the number of devices that are up or down.

Configuration

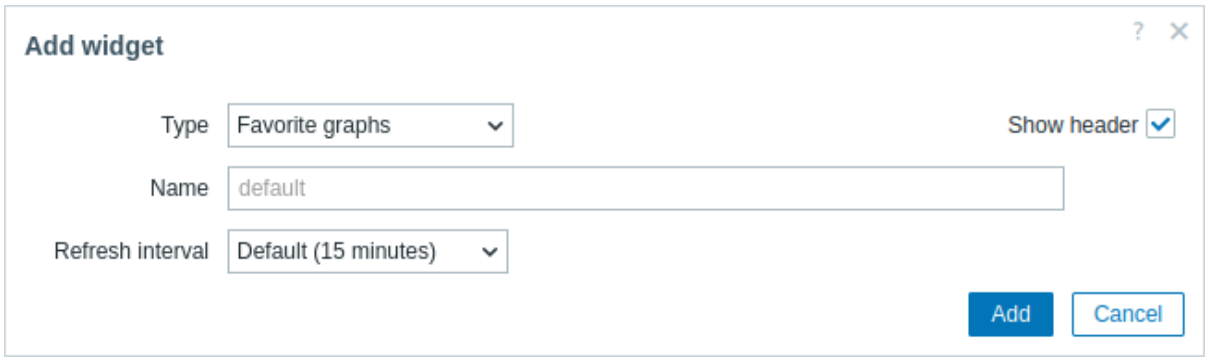


All configuration parameters for this widget are common to all widgets.

Favorite graphs

Overview

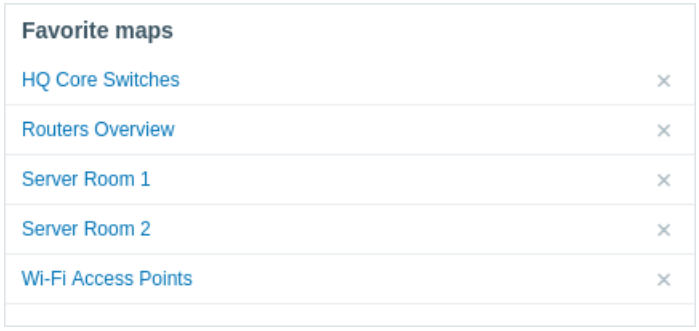
The *Favorite graphs* widget displays an alphabetical list of shortcuts to graphs marked as favorites by the current user.



Clicking x removes the graph from the list and from favorites.

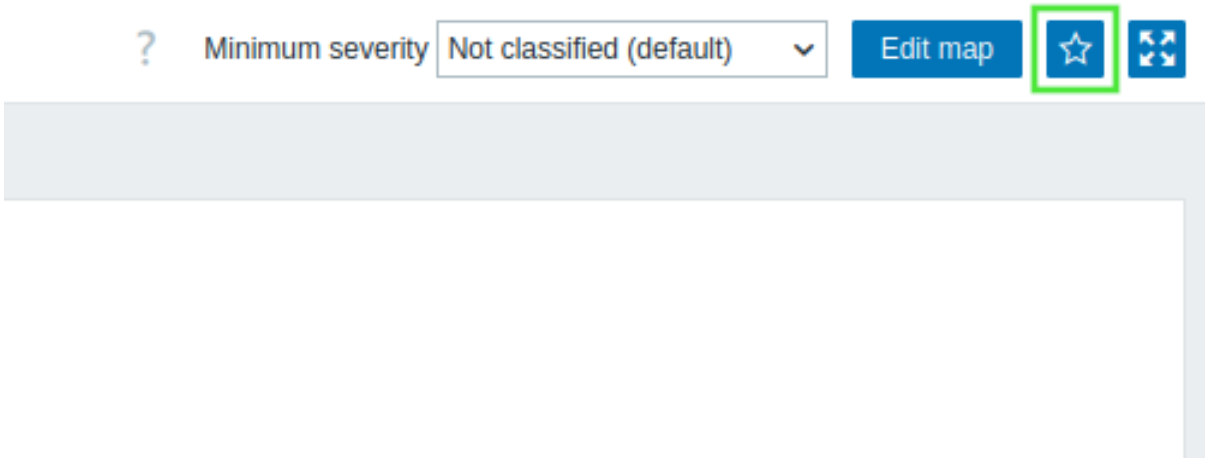
Graphs are marked as favorites by clicking the  *Add to favorites* button when viewing item graphs in *Monitoring* > *Latest data*.

Configuration



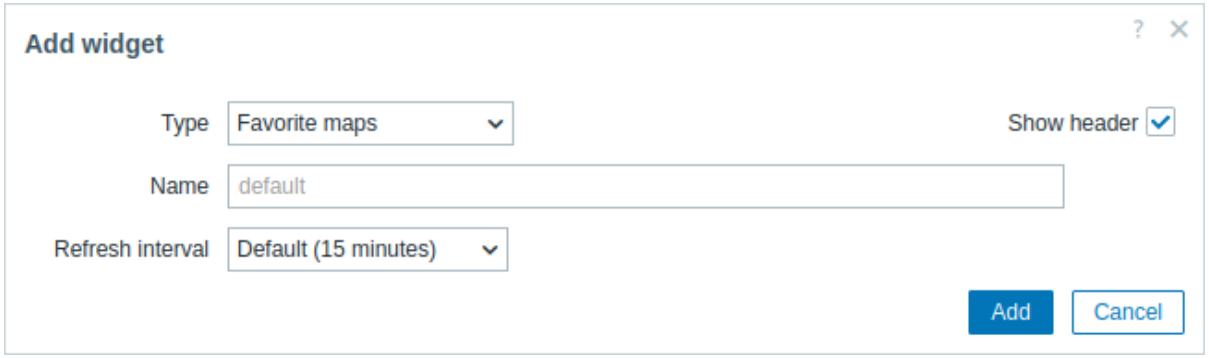
All configuration parameters for this widget are common to all widgets.

Favorite maps



Overview

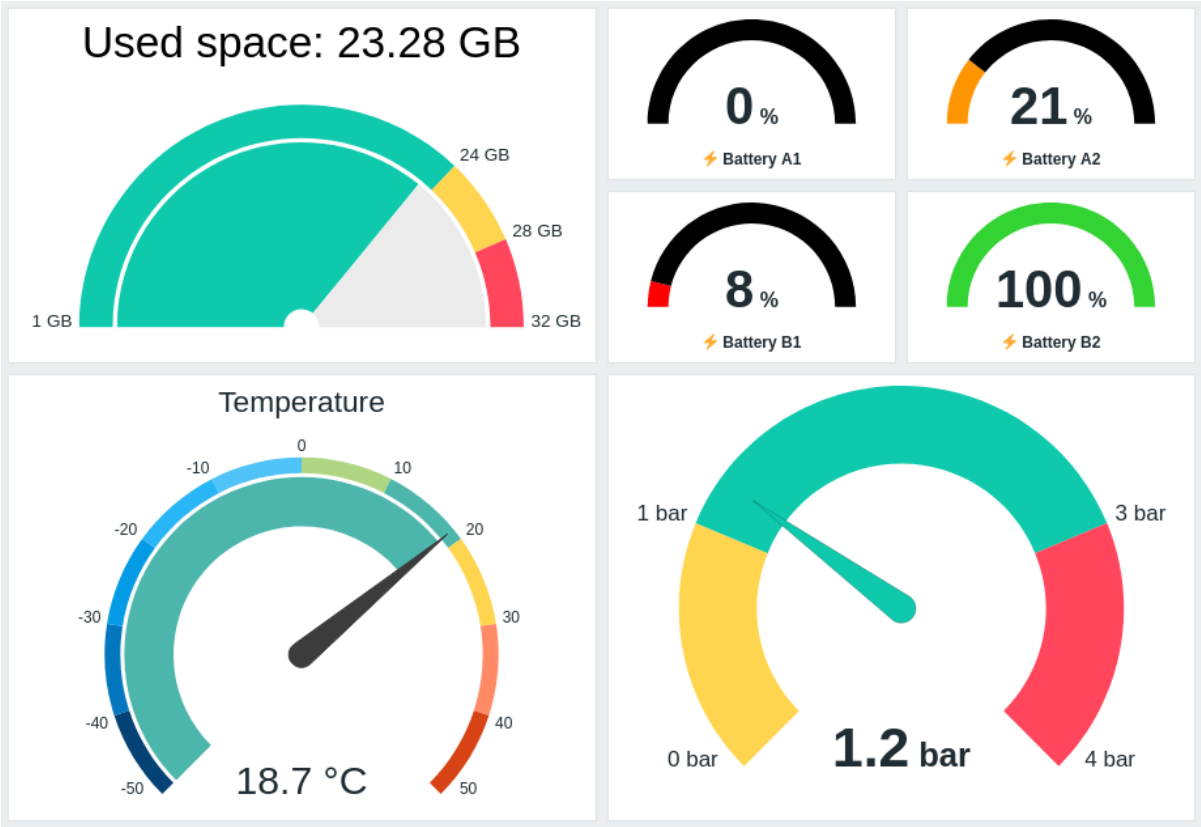
The *Favorite maps* widget displays a list of shortcuts to maps marked as favorites by the current user, sorted alphabetically.



Clicking x removes the map from favorites.

Maps are marked as favorites by clicking the *Add to favorites* button when viewing maps in *Monitoring* > *Maps*.

Configuration



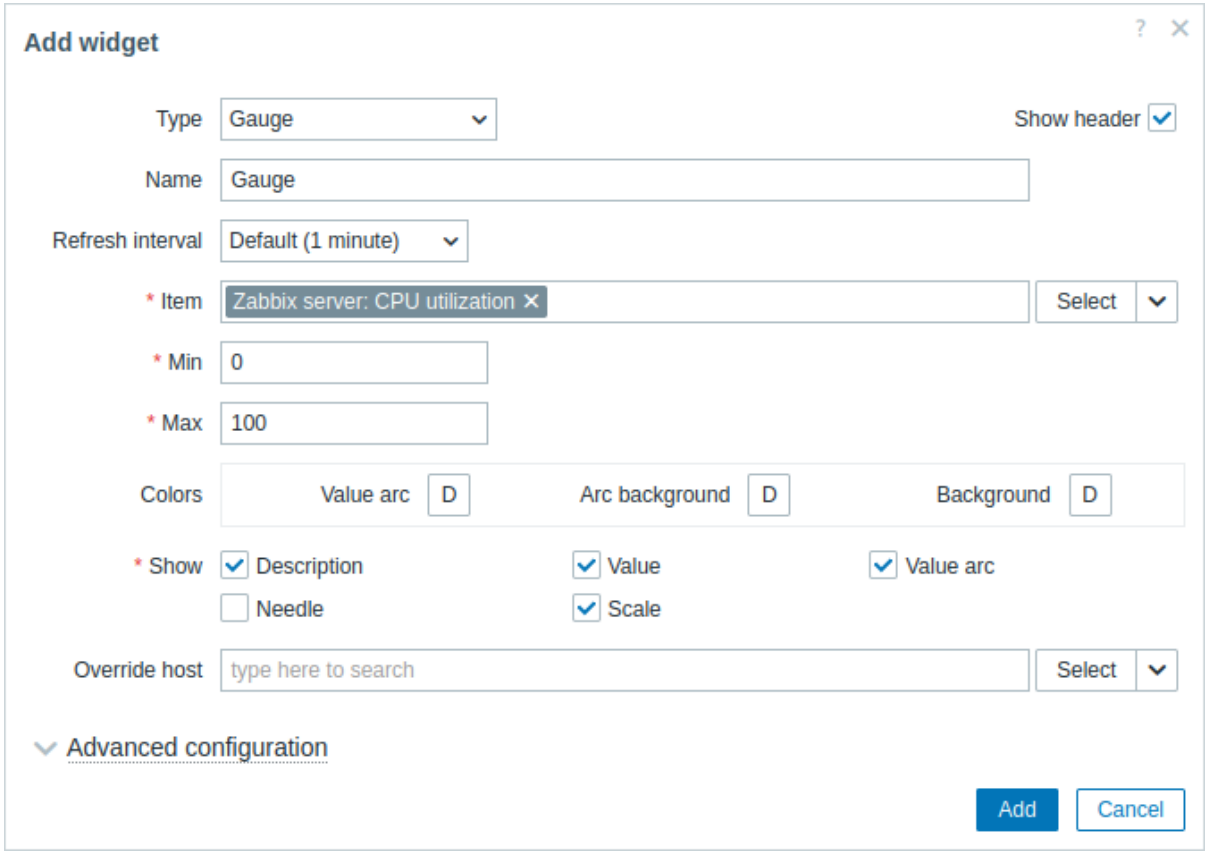
All configuration parameters for this widget are common to all widgets.

Gauge

Overview

The *Gauge* widget displays the value of a single numeric item as a gauge. It is useful for keeping an eye on important metrics, visualizing thresholds, and detecting sudden changes.

You can configure the widget to display the following:



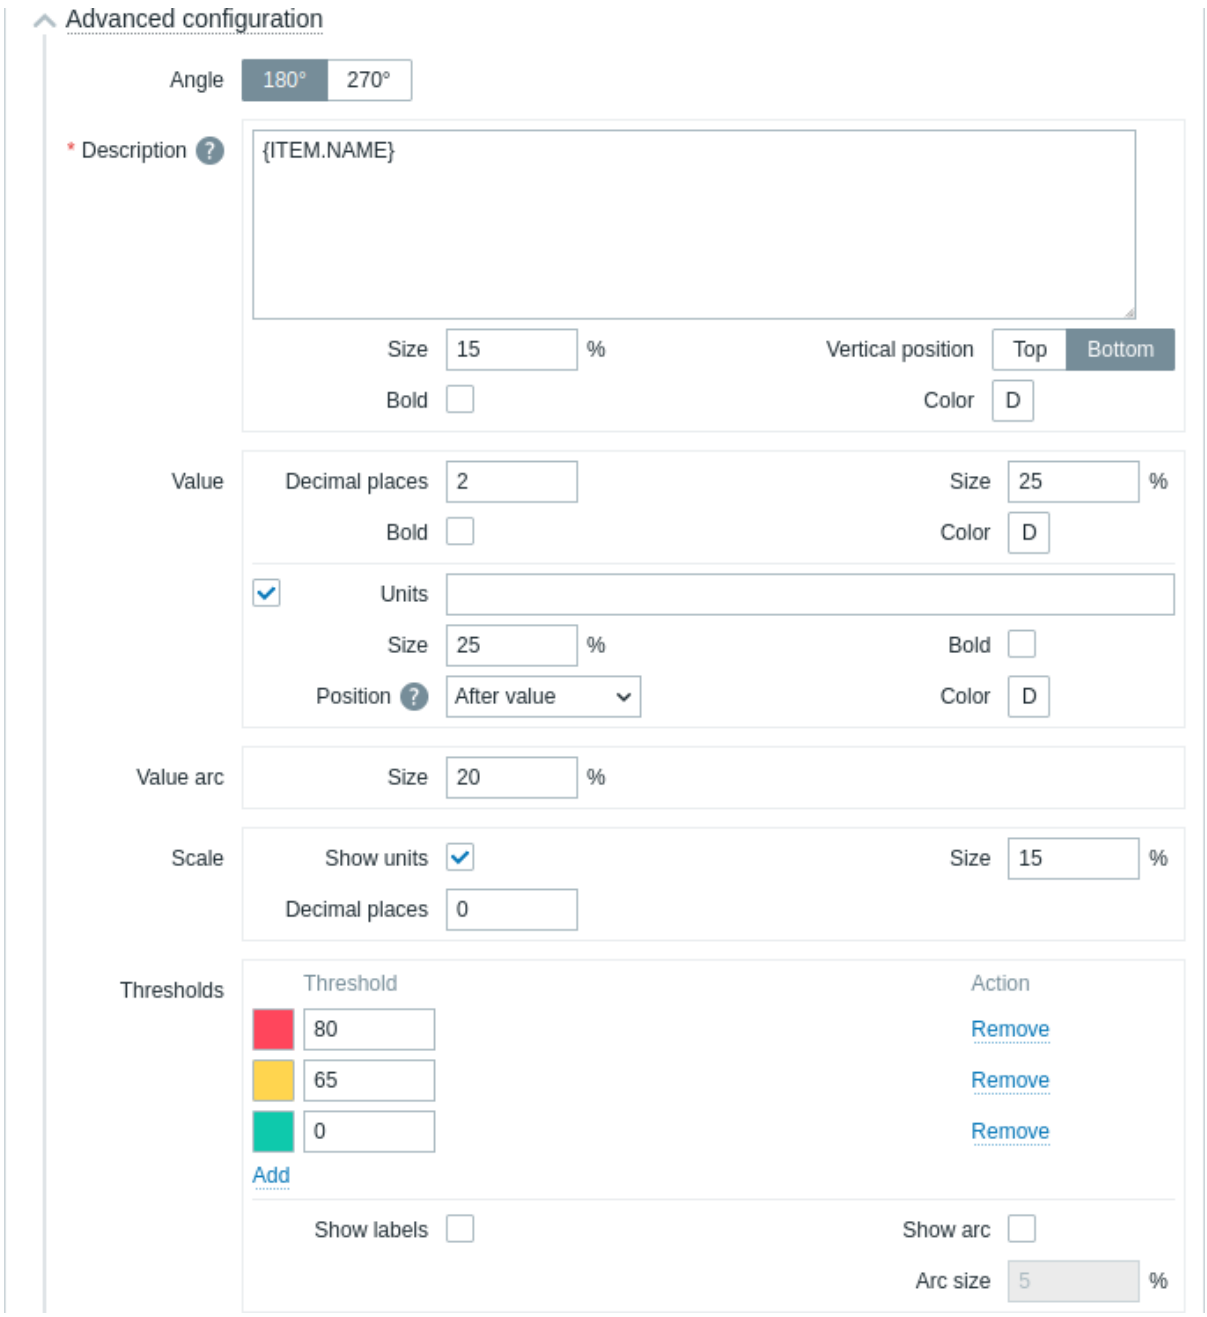
- Item description (Used space: {ITEM.LASTVALUE}, Temperature)
- Item value and units (21 %, 18.7 °C, 1.2 bar)
- Gauge scale (1GB/24GB/28GB/32GB, -50/-40/-30/etc.)
- Gauge arc (gauge value arc and gauge thresholds arc)
- Gauge needle

Clicking the widget opens a simple graph for the item.

The information displayed in the *Gauge* widget can be downloaded as a PNG image by selecting the *Download image* option in the widget *Actions* menu ... that appears when you hover over the widget. Depending on your browser settings, the image is either automatically saved to the `Downloads` folder, or a *Save* dialog opens, allowing you to choose the location.

Configuration

To configure, select *Gauge* as type:

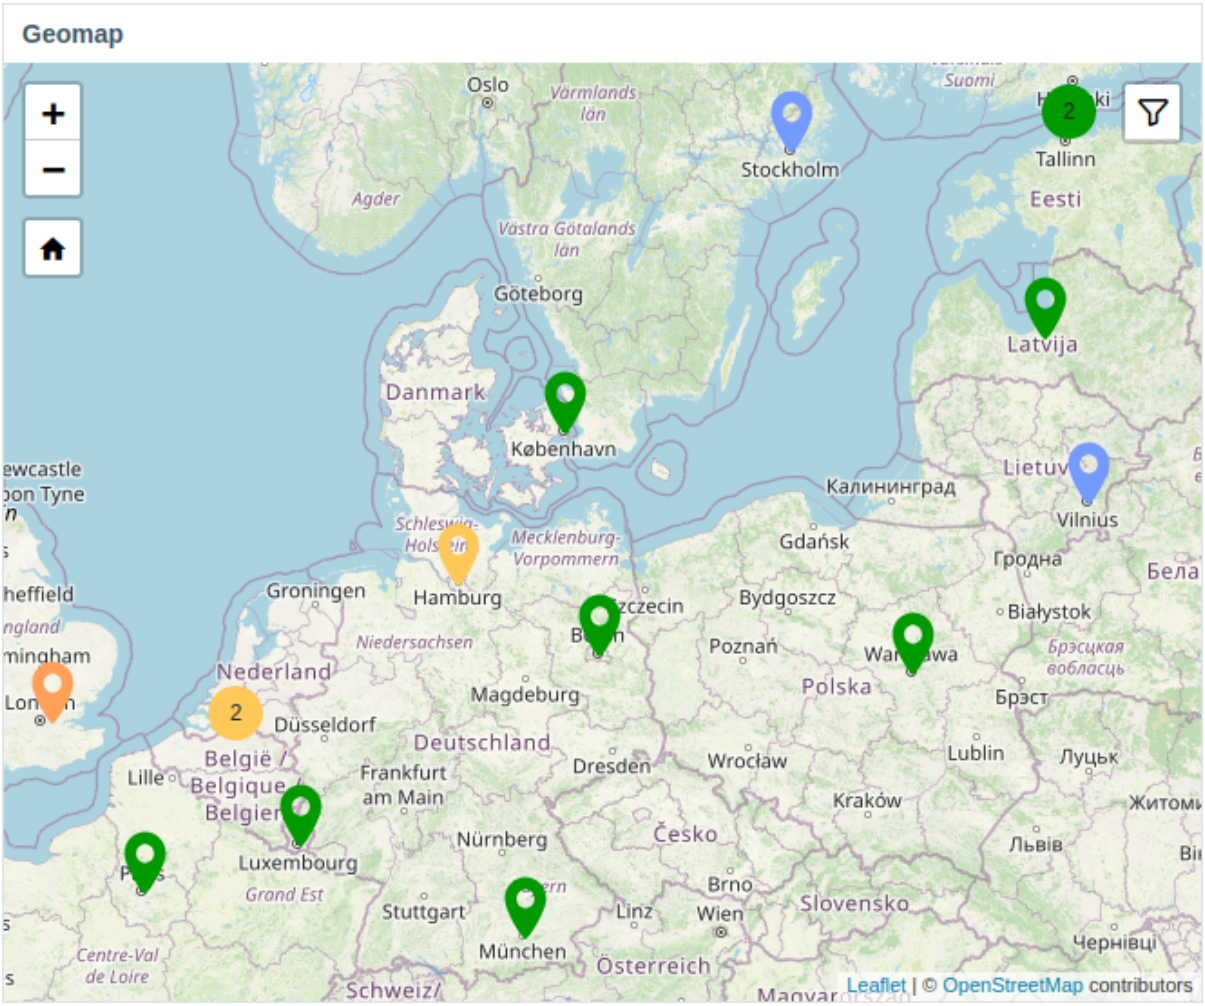


In addition to the parameters that are common for all widgets, you may set the following specific options:

Item	Select the item. Alternatively, select a compatible widget as the data source for items. This field is auto-complete, so starting to type the name of an item will offer a dropdown of matching items. Note that you can select only items that return numeric data (except binary data).
Min	Enter the minimum value of the gauge. Suffixes (for example, ”1d”, ”2w”, ”4K”, ”8G”) are supported. Value mappings are supported.
Max	Enter the maximum value of the gauge. Suffixes (for example, ”1d”, ”2w”, ”4K”, ”8G”) are supported. Value mappings are supported.
Colors	Select the color from the color picker: **Value arc** - select the gauge value arc color; **Arc background** - select the gauge value arc and gauge thresholds arc background color; **Background** - select the widget background color. ”D” stands for the default color, which depends on the frontend theme. If *Thresholds* are set, the default color for **Value arc** depends on the threshold color. To return to the default color, click the *Use default* button in the color picker.
Show	Mark the checkbox to display the respective gauge element - description, value, value arc, needle, scale (the minimum and maximum value of the gauge at the beginning and end of the gauge arc). Unmark to hide. At least one element must be selected. Note that the gauge needle and scale can be displayed if the gauge value arc or gauge thresholds arc (see advanced configuration options) is displayed. Also note that if the gauge needle is displayed, the value is placed under the needle; if the needle is hidden, the value is aligned with the bottom of the gauge arc.
Override host	Select a compatible widget or the dashboard host selector as the data source for hosts. This parameter is not available when configuring the widget on a template dashboard.
Advanced configuration	Click the *Advanced configuration* header to display advanced configuration options. This is also where you’ll be able to adjust the gauge elements selected in the *Show* field.

Advanced configuration

Advanced configuration options are available in the collapsible *Advanced configuration* section:



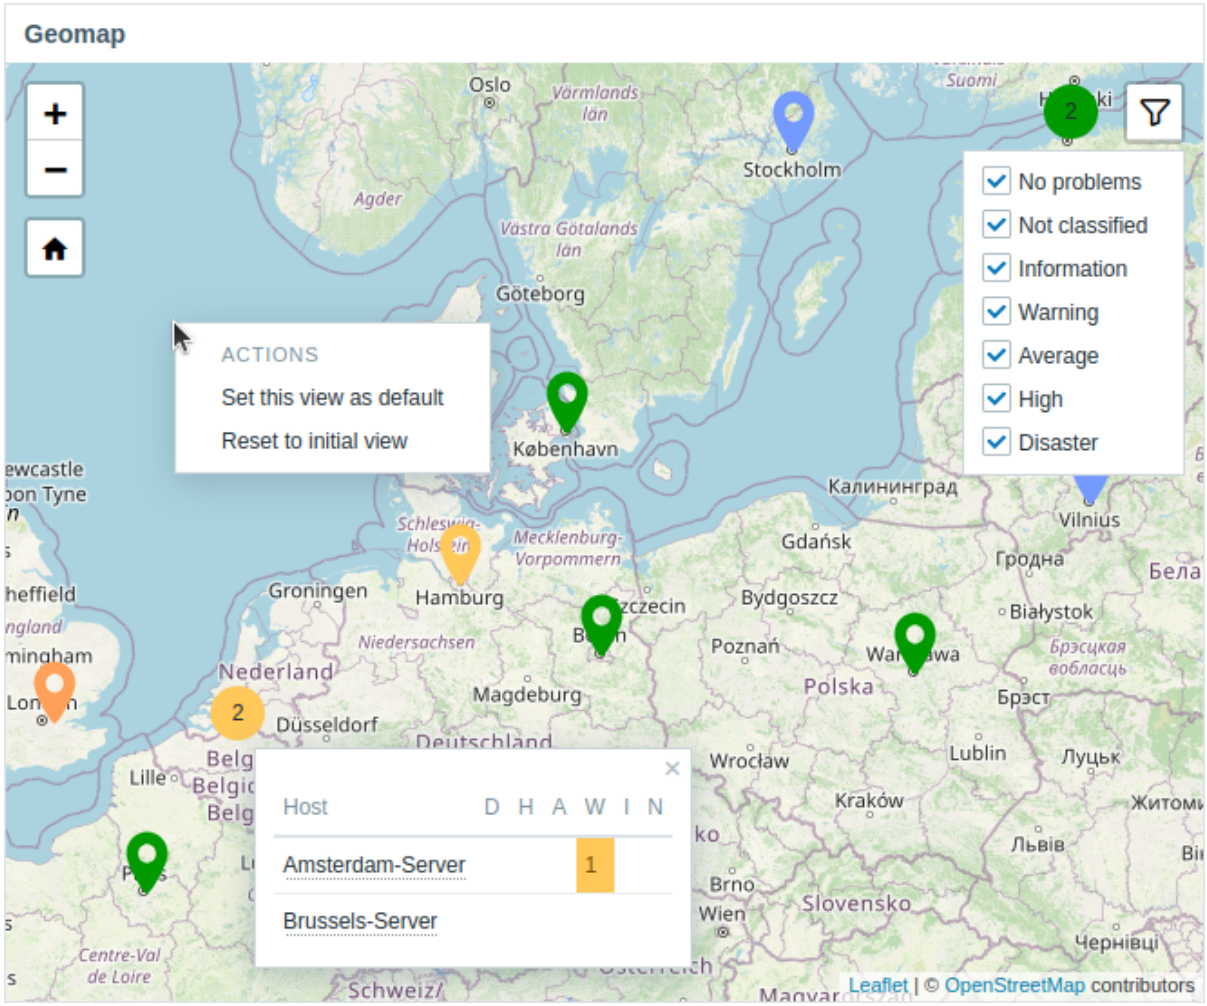
Angle	Select the gauge angle (180° or 270°).
Description	
Description	Enter the item description. This description may override the default item name. Multiline descriptions are supported. A combination of text and supported macros is possible. {HOST.*}, {ITEM.*}, {INVENTORY.*} and user macros are supported.
Size	Enter the font size height for the item description (in percent, relative to the total widget height).
Vertical position	Select the vertical position of the item description (top or bottom, relative to the gauge arc).
Bold	Mark the checkbox to display the item description in bold.
Color	Select the item description color from the color picker. "D" stands for the default color, which depends on the frontend theme. To return to the default color, click the *Use default* button in the color picker.
Value	
Decimal places	Enter the number of decimal places to display with the value. This option affects only items that return numeric (float) data.
Size	Enter the font size height for the value (in percent, relative to the gauge arc height).
Bold	Mark the checkbox to display the value in bold.
Color	Select the value color from the color picker. "D" stands for the default color, which depends on the frontend theme. To return to the default color, click the *Use default* button in the color picker.
Units	

Units	Mark the checkbox to display units with the item value. If you enter a unit name, it will override the units set in the item configuration.
Size	Enter the font size height for the item units (in percent, relative to the gauge arc height).
Bold	Mark the checkbox to display item units in bold.
Position	Select the position of the item units (above, below, before or after, relative to the item value). This option is ignored for the following time-related units: unixtime, uptime, s.
Color	Select the item units color from the color picker. ”D” stands for the default color, which depends on the frontend theme. To return to the default color, click the *Use default* button in the color picker.
Value arc	
Arc size	Enter the size height of the gauge value arc (in percent, relative to the gauge arc radius).
Needle	
Color	Select the gauge needle color from the color picker. ”D” stands for the default color, which depends on the frontend theme. If *Thresholds* are set, the default color for the needle depends on the threshold color. To return to the default color, click the *Use default* button in the color picker.
Scale	
Show units	Mark the checkbox to display units with the minimum and maximum value of the gauge.
Size	Enter the font size height for the minimum and maximum value of the gauge (in percent, relative to the gauge arc height).
Decimal places	Enter the number of decimal places to display with the minimum and maximum value of the gauge. This option affects only items that return numeric (float) data.
Thresholds	
Thresholds	Click *Add* to add a threshold, select a threshold color from the color picker, and specify a numeric value. The thresholds list will be sorted in ascending order when saved. Note that the colors configured as thresholds will be displayed correctly only for numeric items. Suffixes (for example, ”1d”, ”2w”, ”4K”, ”8G”) are supported. Value mappings are supported.
Show labels	Mark the checkbox to display threshold values as labels on the gauge scale.
Show arc	Mark the checkbox to display the gauge thresholds arc.
Arc size	Enter the size height of the gauge thresholds arc (in percent, relative to the gauge arc radius).

Geomap

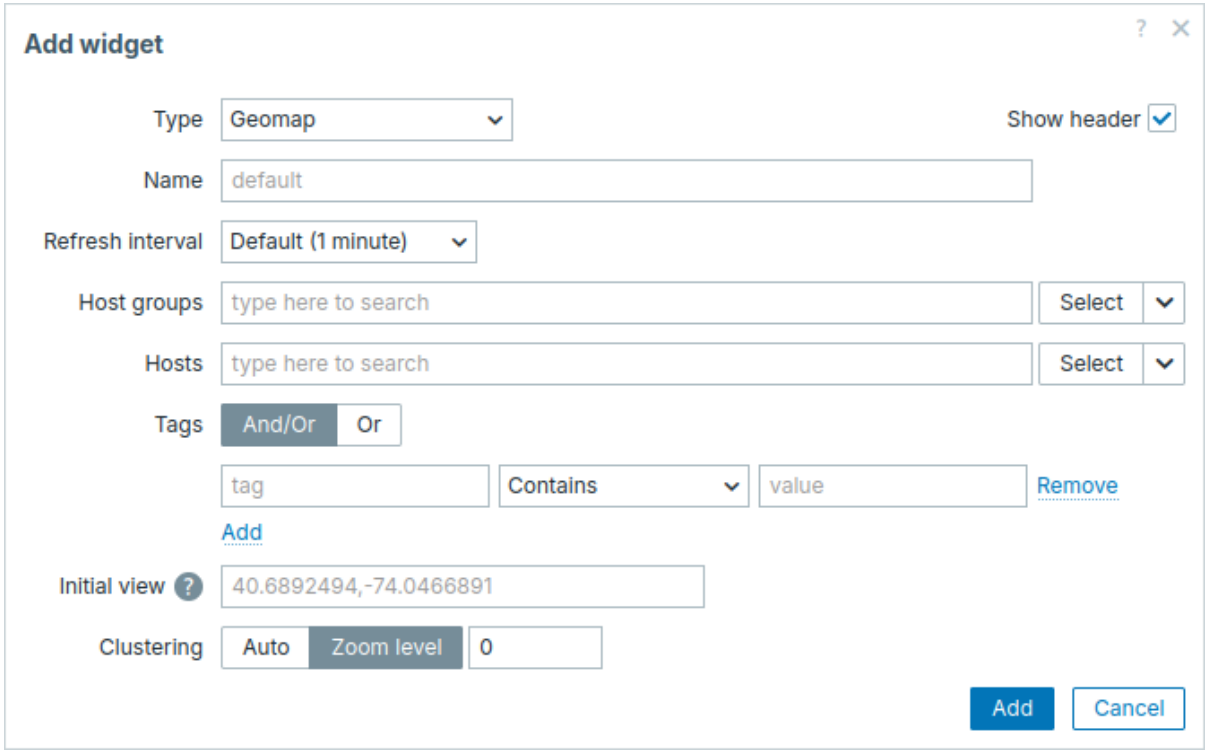
Overview

The *Geomap* widget displays hosts as markers on an interactive Leaflet-based map, with marker colors indicating each host’s most severe problem.



Note:
Zabbix offers multiple predefined map tile providers and lets you add custom ones in *Administration* > *General* > *Geographical maps*.

By default, the widget displays all enabled hosts that have valid coordinates (latitude -90 to 90, longitude -180 to 180) in their inventory.

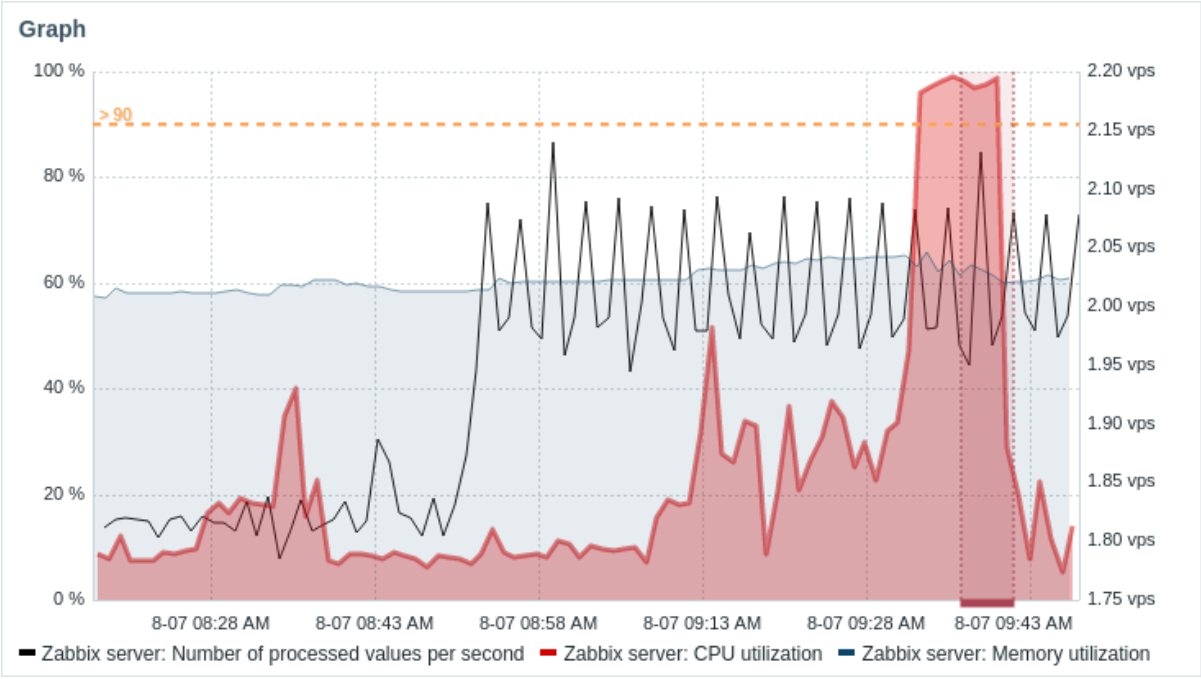


Use the following options to interact with the widget:

- Clicking a marker shows the host name and unresolved problems; clicking the host name opens the host menu.
- Filter hosts by problem severity using the filter icon in the upper-right corner.
- Right-click the map to set or reset the default view; use the home icon to return to the default view.

Configuration

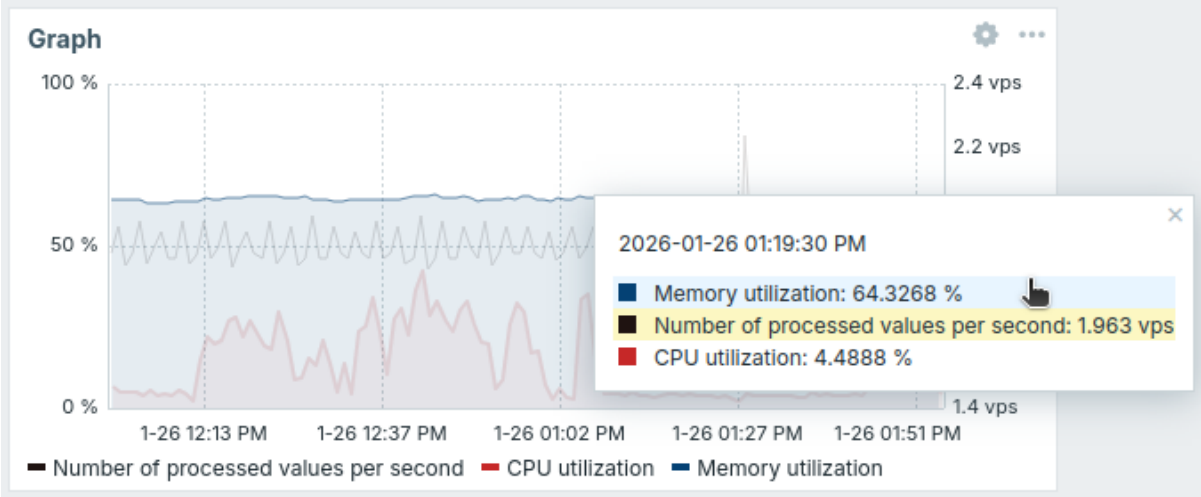
To add the widget, select *Geomap* as type.



In addition to the parameters that are common for all widgets, you may set the following specific options:

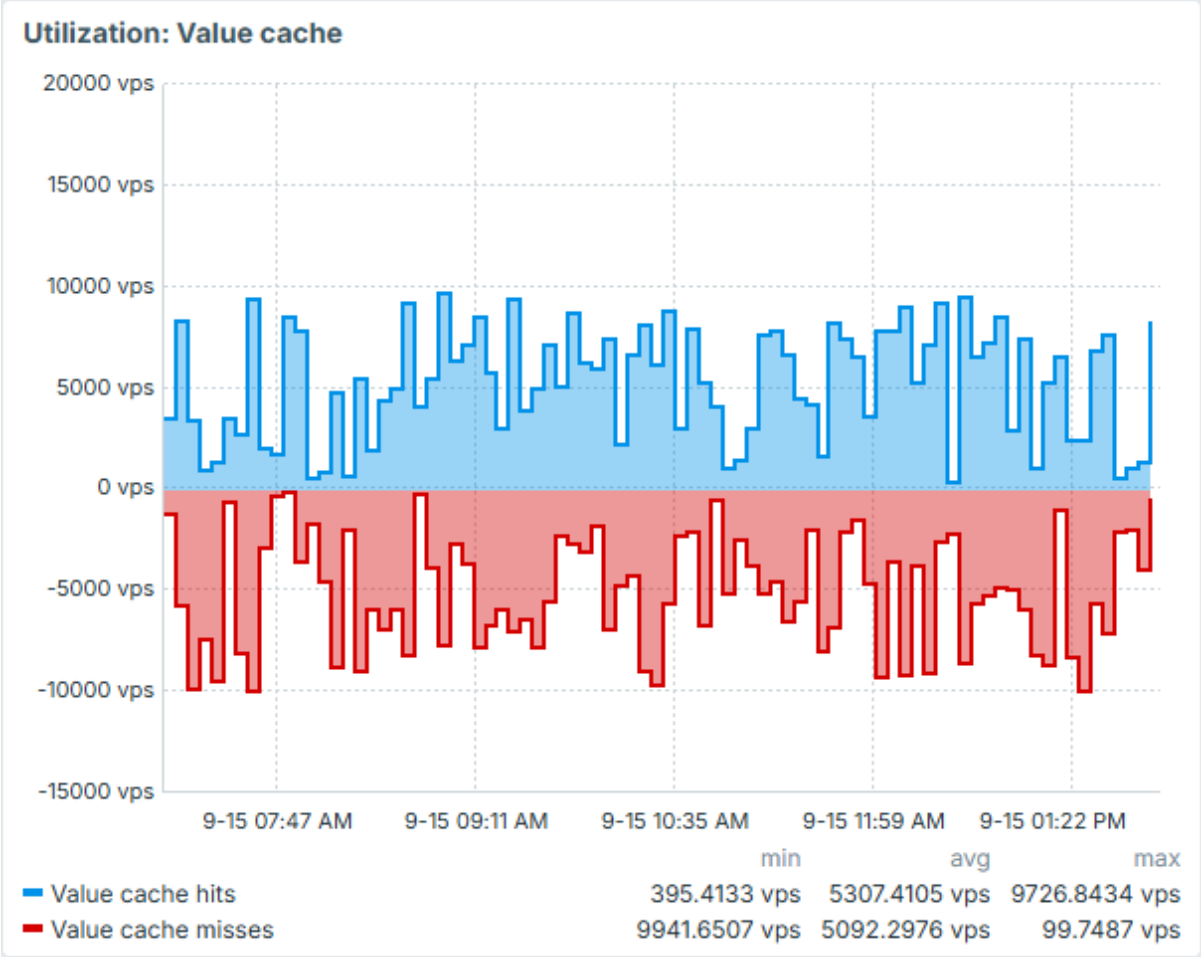
Host groups	Select host groups to be displayed on the map. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. If nothing is selected in both *Host groups* and *Hosts* fields, all hosts with valid coordinates will be displayed. This parameter is not available when configuring the widget on a template dashboard.
Hosts	Select hosts to be displayed on the map. Alternatively, select a compatible widget or the dashboard as the data source for hosts. This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts. If nothing is selected in both *Host groups* and *Hosts* fields, all hosts with valid coordinates will be displayed. This parameter is not available when configuring the widget on a template dashboard.
Tags	Specify tags to limit the number of hosts displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the *Or* condition; **Or** - enough if one condition is met. This parameter is not available when configuring the widget on a template dashboard.
Initial view	Comma-separated center coordinates and an optional zoom level to display when the widget is initially loaded in the format `<latitude>,<longitude>,<zoom>` If initial zoom is specified, the Geomap widget is loaded at the given zoom level. Otherwise, initial zoom is calculated as half of the max zoom for the particular tile provider. The initial view is ignored if the default view is set (see below). Examples: 40.6892494,-74.0466891 40.6892494,-122.0466891
Clustering	Specify how nearby host markers are combined into a single marker with a count: **Auto** - markers are combined automatically; **Zoom level** - markers are combined based on the specified zoom level (0 - maximum zoom-out, 30 - maximum zoom-in). For example, if the parameter is set to 0, markers are not combined at any zoom level; if set to 15, markers are combined starting from maximum zoom-out down to zoom level 15; if set to 30, markers are combined at all zoom levels. Note that the maximum zoom-in level is determined by the map tile provider.

Graph



Overview

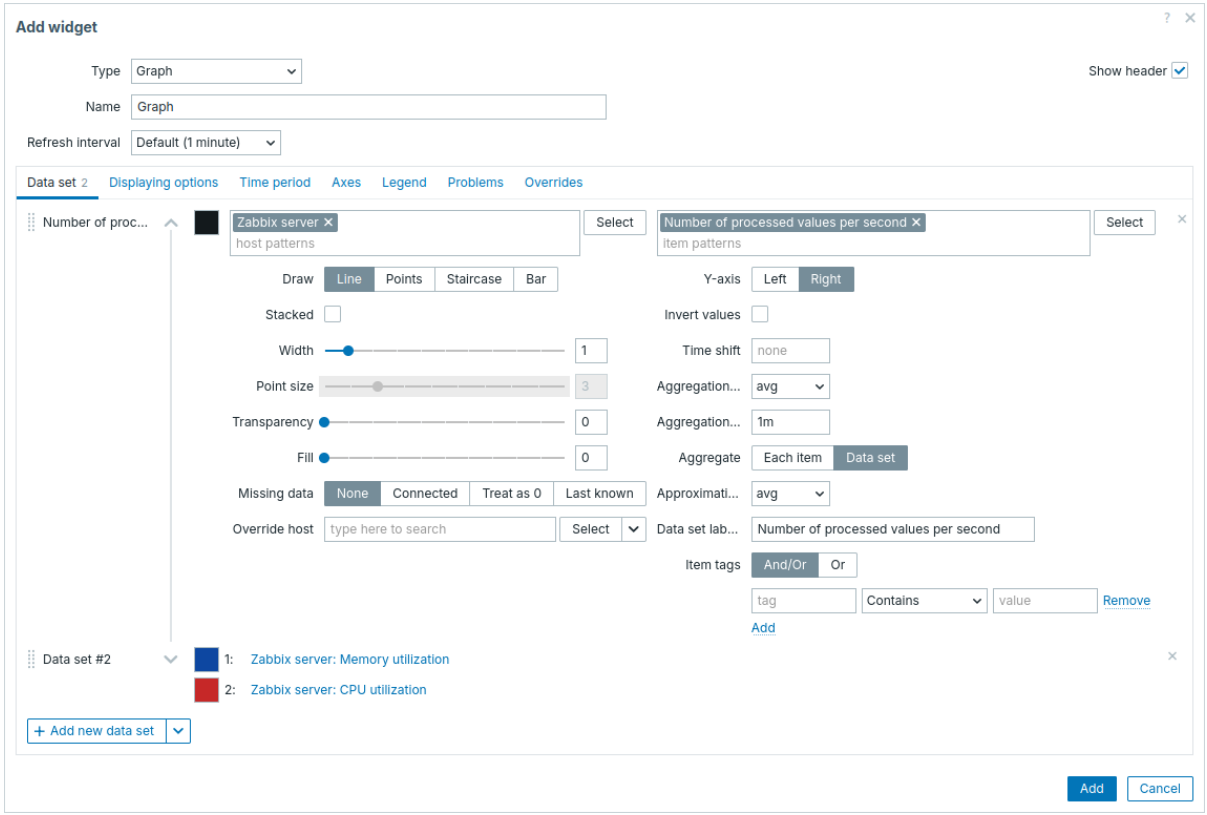
The *Graph* widget displays numeric item data as a vector-based graph. It can help you track trends, spot problems, and compare values over time and across hosts.



Hovering over the graph displays a tooltip with a list of items sorted by value in descending order.

Hovering over an item in the tooltip highlights its graph (others are dimmed); selecting the item broadcasts its data to other widgets.

The graph can be displayed with inverted Y-axis values; this only affects the visual representation and does not alter the original values.



The legacy Graph (classic) widget is also available.

The information displayed in the *Graph* widget can be downloaded as a PNG image by selecting the *Download image* option in the widget *Actions* menu ... that appears when you hover over the widget. Depending on your browser settings, the image is either automatically saved to the `Downloads` folder, or a *Save* dialog opens, allowing you to choose the location.

Configuration

To configure, select *Graph* as type:

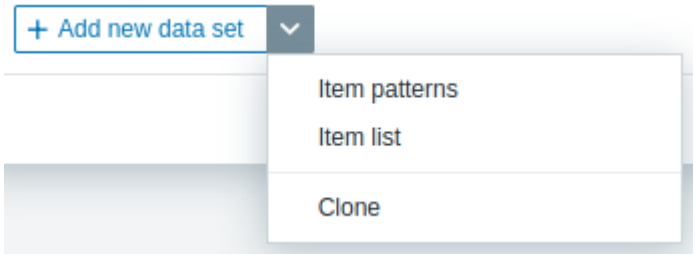
Data set

The **Data set** tab allows selecting data for the graph by adding data sets. Two types of data sets can be added:

- *Item patterns* - data from matching items is displayed. You can pick a single base color or select a palette row to assign distinct colors to each matched item.
- *Item list* - data from selected items is displayed. You can choose each item's color individually from the picker.

By default, an *Item patterns* data set is added.

Data set	For **Item patterns** data set: Select or enter host and item patterns; data of items that match these patterns will be displayed on the graph; up to 50 items may be displayed. Wildcard patterns may be used for selection (for example, ∗ will return results that match zero or more characters). To specify a wildcard pattern, enter the string manually and press *Enter*. The wildcard symbol is always interpreted, so it is not possible to add, for example, an item named *item** individually if there are other matching items (for example, *item2*, *item3*). Specifying host and item patterns is mandatory for "Item patterns" data sets. See also: Data set configuration details. For **Item list** data set: Select items for the graph by clicking the *Add item* button. You may also select compatible widgets as the data source for items by clicking the *Add widget* button. Specifying items or widgets is mandatory for "Item list" data sets. See also: Data set configuration details. Note that only numeric item types are allowed. When configuring the widget on a template dashboard, the parameter for specifying host patterns is not available, and the parameter for specifying an item list allows only the selection of items configured on the template.
Draw	Choose the draw type of the metric. Possible draw types: *Line* (set by default), *Points*, *Staircase*, and *Bar*. Note that if there is only one data point in the line/staircase graph, it is drawn as a point regardless of the draw type. The point size is calculated from the line width, but it cannot be smaller than 3 pixels, even if the line width is less.



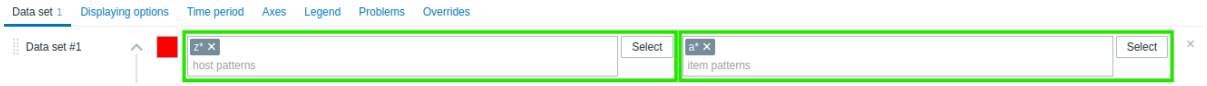
Stacked	Mark the checkbox to display data as stacked (filled areas displayed). This option is disabled when *Points* draw type is selected.
Width	Set the line width. This option is available when *Line* or *Staircase* draw type is selected.
Point size	Set the point size. This option is available when *Points* draw type is selected.
Transparency	Set the transparency level.
Fill	Set the fill level. This option is available when *Line* or *Staircase* draw type is selected.
Missing data	Select the option for displaying missing data: **None** - the gap is left empty; **Connected** - two border values are connected; **Treat as 0** - the missing data is displayed as 0 values; **Last known** - the missing data is displayed with the same value as the last known value; not applicable for the *Points* and *Bar* draw type.
Override host	Select a compatible widget or the dashboard host selector as the data source for hosts. This parameter is not available when configuring the widget on a template dashboard.
Y-axis	Select the side of the graph where the Y-axis will be displayed.
Invert values	Mark the checkbox to multiply all Y-axis values by -1 before displaying them on the graph. This affects only visual representation; the original data remains unchanged. This option does not affect the tooltip, legend, or percentile line. If the *Simple triggers* option is selected for the axis, the trigger thresholds will be displayed inverted.
Time shift	Specify time shift if required. You may use time suffixes in this field. Negative values are allowed.
Aggregation function	Specify which aggregation function to use for each item or for an entire data set within the selected *Aggregation interval*: **min** - display the smallest value; **max** - display the largest value; **avg** - display the average value; **sum** - display the sum of values; **count** - display the count of values; **first** - display the first value; **last** - display the last value. If **not used** is selected, all values are displayed (no aggregation). Only numeric data can be displayed for *min*, *max*, *avg* and *sum*. For *count*, non-numeric data will be changed to numeric. See also: Aggregation in graphs.
Aggregation interval	Specify the interval for aggregating values. You may use time suffixes in this field. A numeric value without a suffix will be regarded as seconds. Note that if the widget is configured to display historical data based on trends (*History data selection* is set to *Trends* or *Auto*), it is recommended to use an aggregation interval that is a multiple of 1 hour (e.g., 3600, 60m, 1h, 3h, etc.). Trends store hourly aggregated values, so using an aggregation interval that is not a multiple of 1 hour (e.g., 100s, 7min, 15min, 90min, etc.) may lead to results that are hard to interpret.
Aggregate	Specify whether to aggregate: **Each item** - each item in the dataset will be aggregated and displayed separately; **Data set** - all dataset items will be aggregated and displayed as one value.
Approximation	Specify what value to display when more than one value exists per vertical graph pixel: **all** - display the smallest, the largest and the average values; **min** - display the smallest value; **max** - display the largest value; **avg** - display the average value. This setting is useful when displaying a graph for a large time period with frequent update interval (such as one year of values collected every 10 minutes).

Data set label	Specify the data set label that is displayed in graph *Data set* configuration and in graph *Legend* (for aggregated data sets). All data sets are numbered including those with a specified *Data set label*. If no label is specified, the data set will be labeled automatically according to its number (e.g., ”Data set #2”, ”Data set #3”, etc.). Data set numbering is recalculated after reordering/dragging data sets. Data set labels that are too long will be shortened to fit where displayed (e.g., ”Number of proc...”).
Item tags	Specify tags to filter the items displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met.

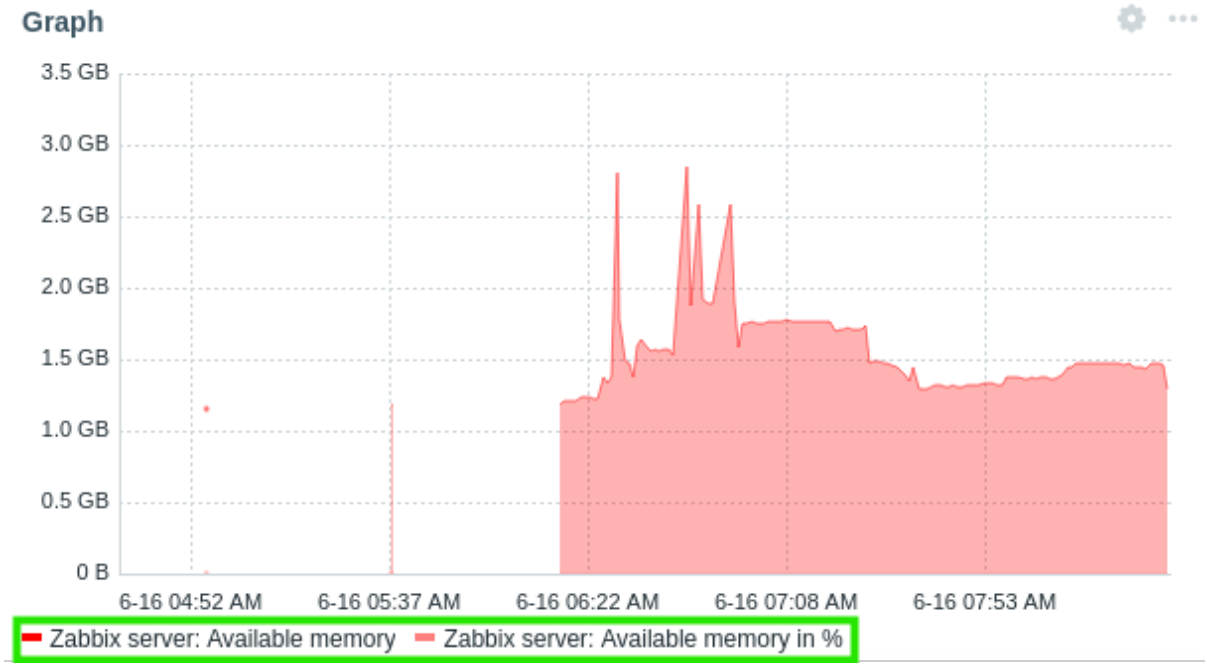
Data set configuration details

Existing data sets are displayed in a list. You may:

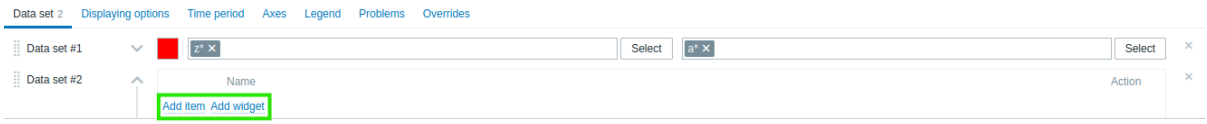
- Click the move icon and drag a data set to a new place in the list.
- Click the expand icon to expand data set details. When expanded, this icon turns into a collapse icon.
- Click the color icon to open the picker. You can enter a hex code, choose a solid swatch, or switch to the *Palette* tab and select a row of predefined colors. The chosen color applies directly for *Item list* data sets or as the base for generated shades in *Item patterns*. Use Tab to move between dialog controls, arrow keys to navigate swatches or palette rows, Enter to select, and Esc to cancel.
- Click the *Add new data set* button to add an empty data set that allows you to select host and item patterns. If you click the downward pointing icon next to the *Add new data set* button, a drop-down menu appears, allowing you to add a new *Item patterns* or *Item list* data set or allowing you to *Clone* the currently open data set. If all data sets are collapsed, the *Clone* option is not available.



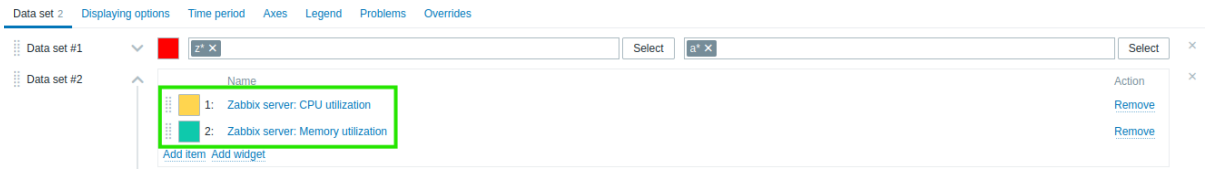
The **Item patterns** data set contains *Host patterns* and *Item patterns* fields that both recognize full names or patterns containing a wildcard symbol (*). This functionality allows you to select all the host names and item names containing the selected pattern. While typing the item name or item pattern in the *Item patterns* field, only items belonging to the selected host name(s) are displayed in the dropdown list.



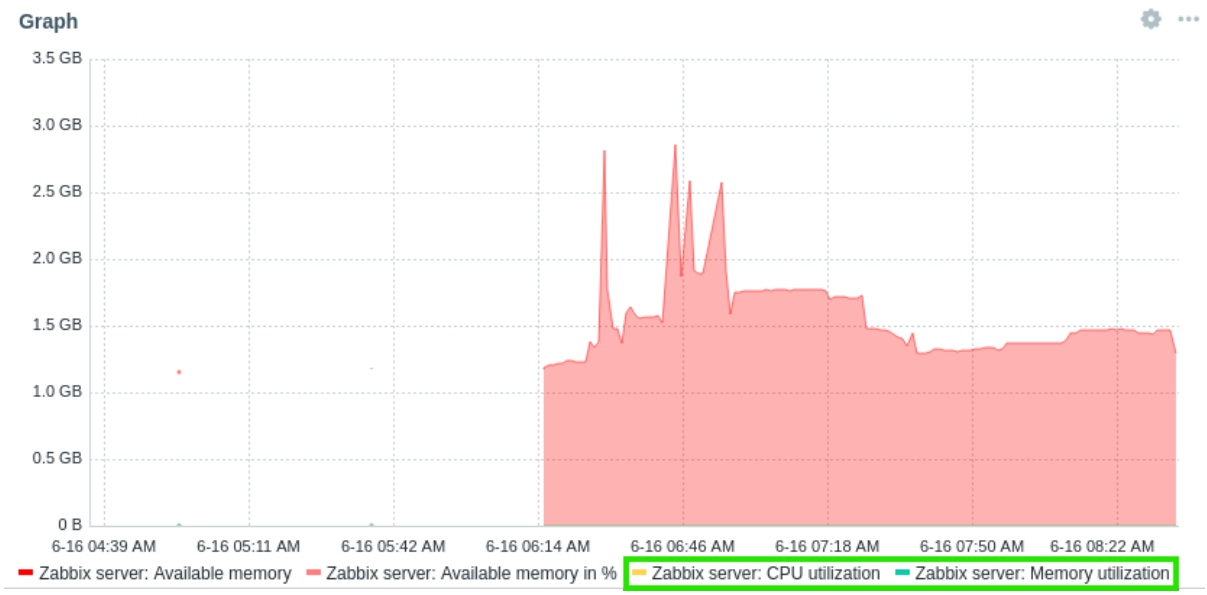
For example, having typed a pattern **z*** in the *Host patterns* field, the dropdown list displays all host names containing this pattern: **z*, Zabbix server, Zabbix proxy**. After pressing *Enter*, this pattern is accepted and is displayed as **z***. Similarly, having typed the pattern **a*** in the *Item patterns* field, the dropdown list displays all item names containing this pattern: **a*, Available memory, Available memory in %**.



After pressing *Enter*, the pattern is accepted and shown as **a***.



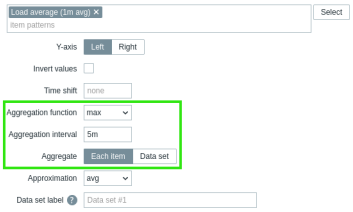
The graph then displays all items belonging to the selected host name(s).



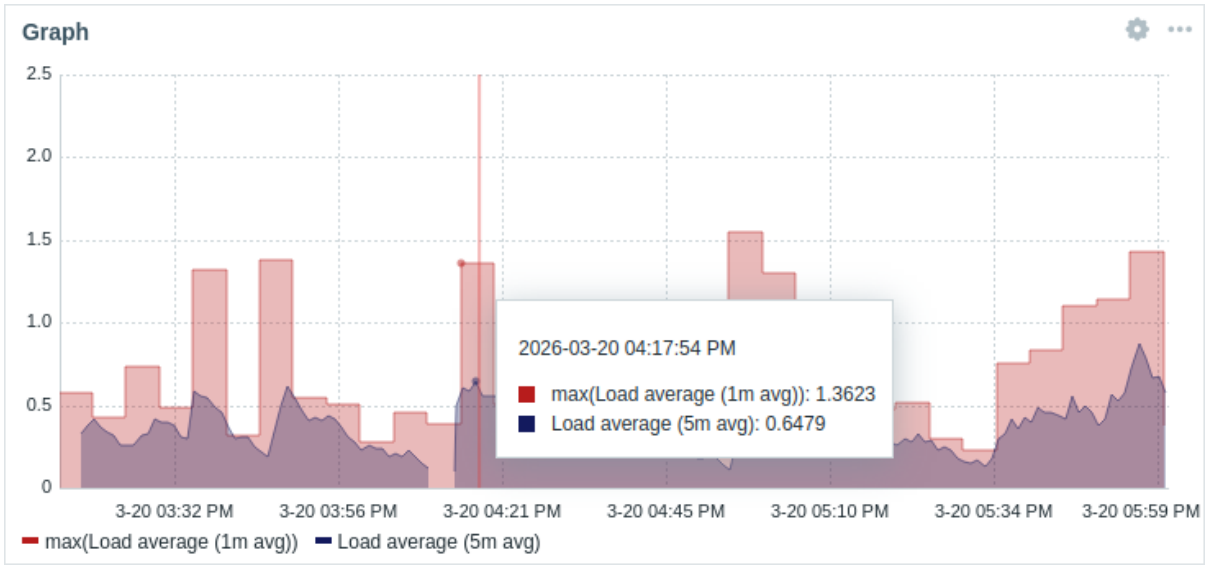
The **Item list** data set contains the *Add item* button that allows you to add items to be displayed on the graph. You can also add compatible widgets as the data source for items by clicking the *Add widget* button.

For example, clicking the *Add item* button opens a pop-up window containing a *Host* parameter. Having selected a host, all its items that are available for selection are displayed in a list.

After selecting one or more items, they will be displayed in the data set item list and in the graph.



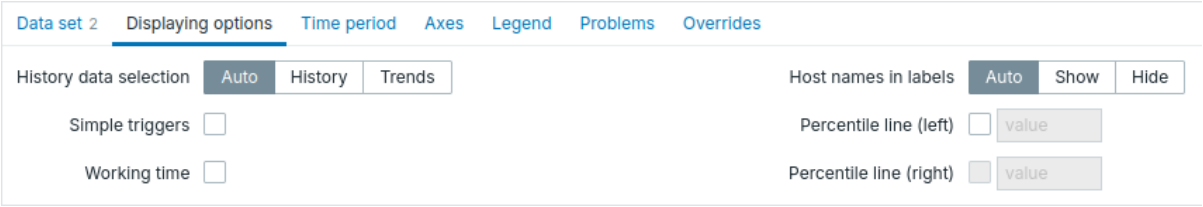
Aggregation in graphs



Aggregation allows an aggregated value (minimum, maximum, average, etc.) to be displayed for the specified interval (5 minutes, an hour, a day, etc.) instead of all individual values. Within a data set, aggregation can be applied either to each item separately or to the entire data set.

Some use cases for the aggregation function can be as follows: - The average request count to an NGINX server per day. - The lowest disk space among clusters per week.

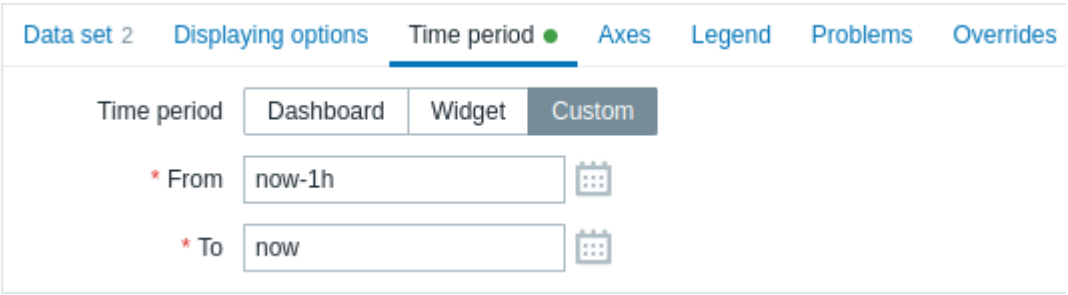
In the following example, the ”max” aggregation function is applied to the item with an aggregation interval of five minutes:



The example demonstrates the maximum CPU load over five minutes (aggregated from one-minute average values), compared to the average CPU load over five minutes.

When *Show aggregation function* is selected for the legend, items are displayed in parentheses, prefixed by the aggregation function in the legend and the tooltip. If *Data set label* is specified for a graph, the label is displayed in parentheses, prefixed by the aggregation function.

Displaying options

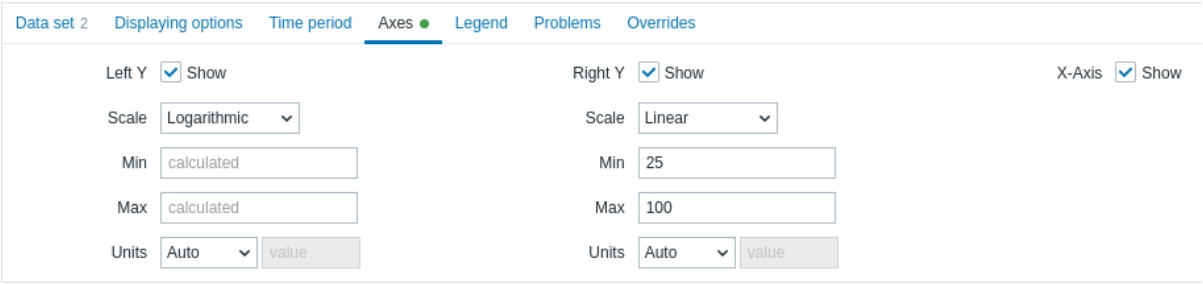


The **Displaying options** tab allows you to define history data selection:

History data selection	Set the source of graph data: **Auto** - data is sourced according to the classic graph algorithm (default); **History** - data from history; **Trends** - data from trends.
Simple triggers	Mark the checkbox to show the trigger thresholds for simple triggers. The thresholds will be drawn as dashed lines using the trigger severity color. A simple trigger is a trigger with one function (only `last`, `max`, `min`, `avg`) for one item in the expression. A maximum of three triggers can be drawn. Note that the trigger has to be within the drawn range to be visible.
Working time	Mark the checkbox to show working time on the graph. Working time (working days) is displayed in graphs as a white background, while non-working time is displayed in gray (with the *Original blue* default frontend theme).
Host names in labels	Choose whether to display host names in the graph legend and in the tooltip that appears when hovering over the graph data: **Auto** - host names are displayed only if more than one host is present across the data sets (default). **Show** - host names are displayed. **Hide** - host names are hidden. This parameter is not available when configuring the widget on a template dashboard.
Percentile line (left)	Mark the checkbox and enter the percentile value to show the specified percentile as a line on the left Y-axis of the graph. If, for example, a 95% percentile is set, then the percentile line will be at the level where 95 percent of the values fall under.
Percentile line (right)	Mark the checkbox and enter the percentile value to show the specified percentile as a line on the right Y-axis of the graph. If, for example, a 95% percentile is set, then the percentile line will be at the level where 95 percent of the values fall under.

Time period

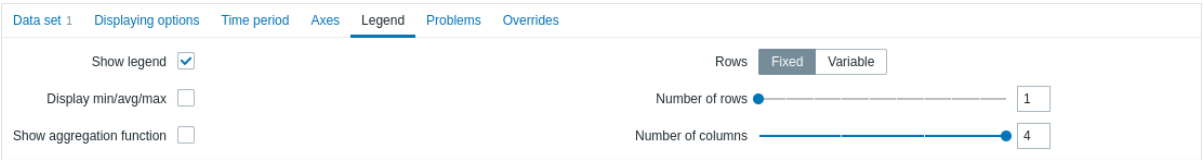
The **Time period** tab allows you to set a time period for which to display data in the graph:



Time period	Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period.
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".

To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".

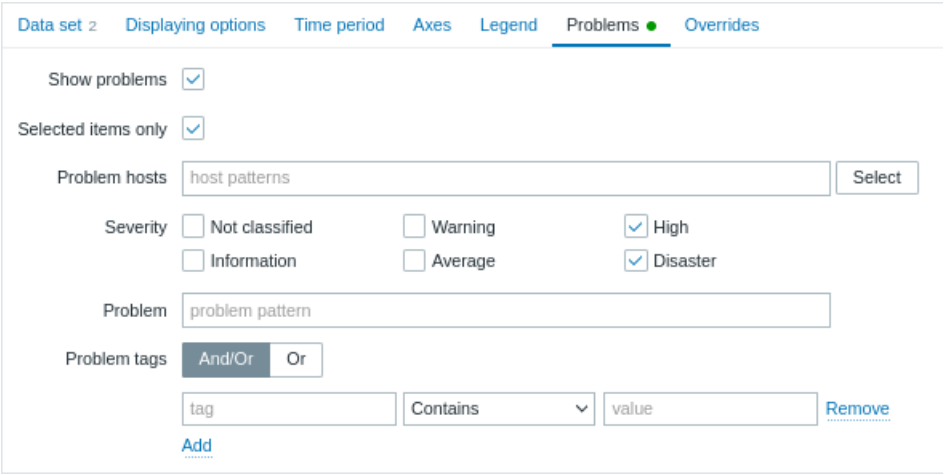
Axes



The **Axes** tab allows you to customize how axes are displayed:

Left Y	Mark this checkbox to make left Y-axis visible. The checkbox may be disabled if unselected either in *Data set* or in *Overrides* tab.
Right Y	Mark this checkbox to make right Y-axis visible. The checkbox may be disabled if unselected either in *Data set* or in *Overrides* tab.
X-Axis	Unmark this checkbox to hide X-axis (marked by default).
Scale	Choose the scale for the graph axis values from the dropdown: **Linear** - axis values increase by a fixed amount (e.g., 10, 20, 30), suitable for data that changes steadily or covers a small to moderate range; **Logarithmic** - axis values increase exponentially (e.g., 10, 100, 1000), suitable for data that changes rapidly or covers a large range.
Min	Set the minimum value of the corresponding axis. Visible range minimum value of Y-axis is specified.
Max	Set the maximum value of the corresponding axis. Visible range maximum value of Y-axis is specified.
Units	Choose the unit for the graph axis values from the dropdown: **Auto** - axis values are displayed using the unit of the first item in the data set; **Static** - axis values are displayed using the unit specified in the *value* input field; if the field is left blank, only numeric values are displayed.

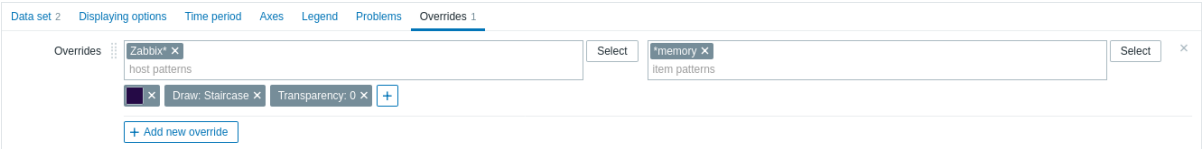
Legend



The **Legend** tab allows you to customize the graph legend:

Show legend	Unmark this checkbox to hide the legend on the graph (marked by default).
Display min/avg/max	Mark this checkbox to display the minimum, average, and maximum values of the item in the legend.
Show aggregation function	Mark this checkbox to show the aggregation function in the legend.
Rows	Select the display mode for legend rows: **Fixed** - the number of rows displayed is determined by the *Number of rows* parameter value; **Variable** - the number of rows displayed is determined by the amount of configured items while not exceeding the *Maximum number of rows* parameter value.
Number of rows/ Maximum number of rows	If *Rows* is set to "Fixed", set the number of legend rows to be displayed (1-10). If *Rows* is set to "Variable", set the maximum number of legend rows to be displayed (1-10).
Number of columns	Set the number of legend columns to be displayed (1-4). This parameter is available if *Display min/avg/max* is unmarked.

Problems



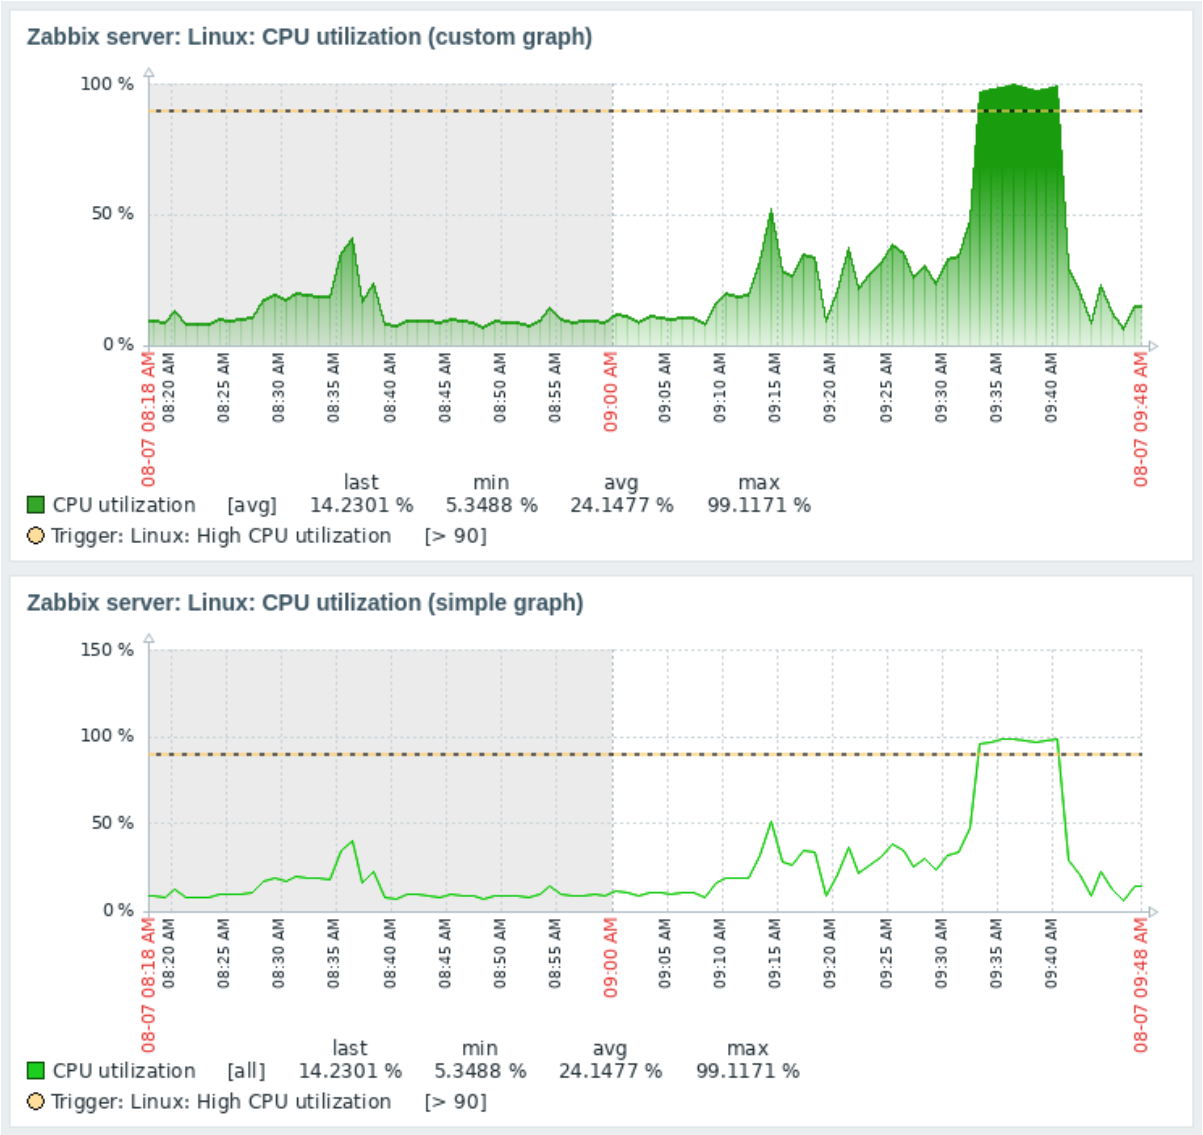
The **Problems** tab allows you to customize the problem display:

Show problems	Mark this checkbox to enable problem displaying on the graph (unmarked, i.e., disabled by default).
Selected items only	Mark this checkbox to include problems for the selected items only to be displayed on the graph.
Problem hosts	Select the problem hosts to be displayed on the graph. Wildcard patterns may be used (for example, * will return results that match zero or more characters). To specify a wildcard pattern, just enter the string manually and press *Enter*. While you are typing, note how all matching hosts are displayed in the dropdown. This parameter is not available when configuring the widget on a template dashboard.
Severity	Mark problem severities to filter problems to be displayed on the graph. If no severities are marked, all problems will be displayed.
Problem	Specify the problem's name to be displayed on the graph.
Problem tags	Specify problem tags to limit the number of problems displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the *Or* condition; **Or** - enough if one condition is met.

Overrides

The **Overrides** tab allows you to add custom overrides for data sets:

Overrides are useful when several items are selected for a data set using the * wildcard and you want to change how the items are displayed by default (e.g., default base color or any other property).

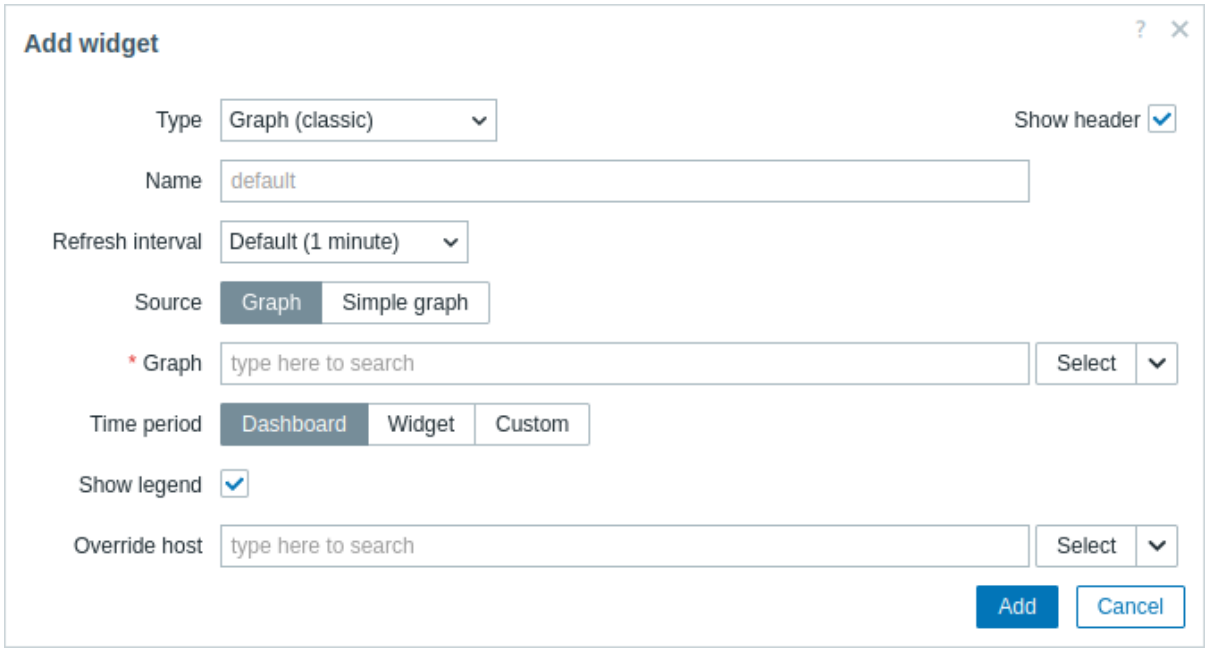


Existing overrides (if any) are displayed in a list. To add a new override:

- Click the + Add new override button
- Select hosts and items for the override. Alternatively, you may enter host and item patterns. Wildcard patterns may be used (for example, * will return results that match zero or more characters). To specify a wildcard pattern, just enter the string manually and press *Enter*. While you are typing, note how all matching hosts are displayed in the dropdown. The wildcard symbol is always interpreted, therefore it is not possible to add, for example, an item named "item*" individually if there are other matching items (e.g., item2, item3). Host pattern and item pattern parameters are mandatory. The parameter for specifying host patterns is not available when configuring the widget on a template dashboard. The parameter for specifying an item list allows only the selection of items configured on the template when configuring the widget on a template dashboard.
- Click +, to select override parameters. At least one override parameter should be selected. For parameter descriptions, see the *Data set* tab above.

Graph (classic)

Overview



The *Graph (classic)* widget displays numeric item data as an image-based custom graph or simple graph. It supports time period selection, trigger lines, and optional legend display.

The information displayed in the *Graph (classic)* widget can be downloaded as a PNG image by selecting the *Download image* option in the widget *Actions* menu ... that appears when you hover over the widget. Depending on your browser settings, the image is either automatically saved to the `Downloads` folder, or a *Save* dialog opens, allowing you to choose the location.

Configuration

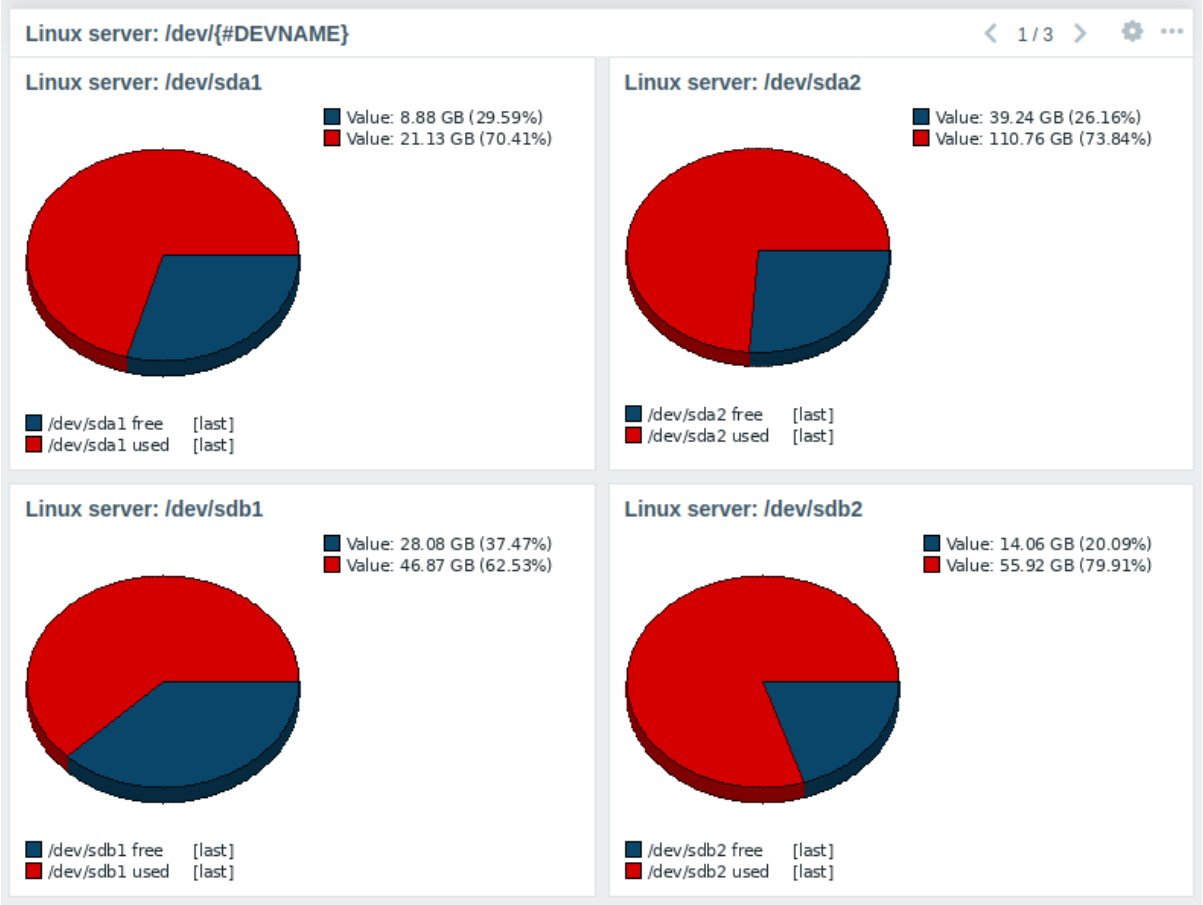
To configure, select *Graph (classic)* as type:

In addition to the parameters that are common for all widgets, you may set the following specific options:

Source	Select the graph type: **Graph** - custom graph; **Simple graph** - simple graph.
Graph	Select the custom graph to display. Alternatively, select a compatible widget as the data source for graphs. This parameter is available if *Source* is set to "Graph".
Item	Select the item to display in a simple graph. Alternatively, select a compatible widget as the data source for items. This parameter is available if *Source* is set to "Simple graph".
Time period	Set a time period for which to display data in the graph. Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period.
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
Show legend	Unmark this checkbox to hide the legend on the graph (marked by default).
Override host	Select a compatible widget or the dashboard host selector as the data source for hosts. This parameter is not available when configuring the widget on a template dashboard.

The legend of the graph consists of three sections:

- Items and their aggregated values
- Percentiles (if configured)
- Triggers (if any are associated with the displayed items)

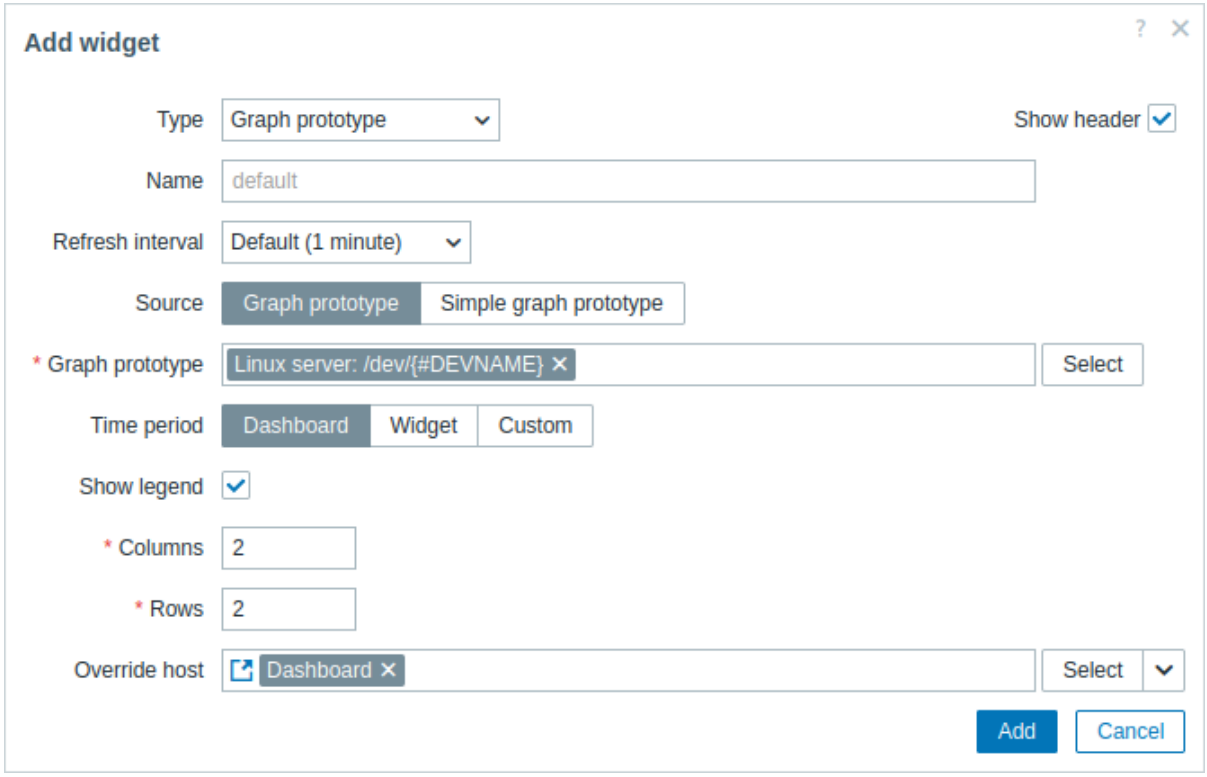


If the height of the graph within the widget is insufficient, the legend may not be displayed or may be displayed only partially. Triggers and percentiles are hidden first, followed by the item legend. To display the full legend, increase the widget's vertical size.

Note:
No more than 3 trigger lines can be displayed. If there are more triggers then the triggers with lower severity are prioritized for display.

Graph prototype

Overview



The *Graph prototype* widget displays a grid of automatically created custom graphs based on low-level discovery rule graph prototypes or item prototypes.

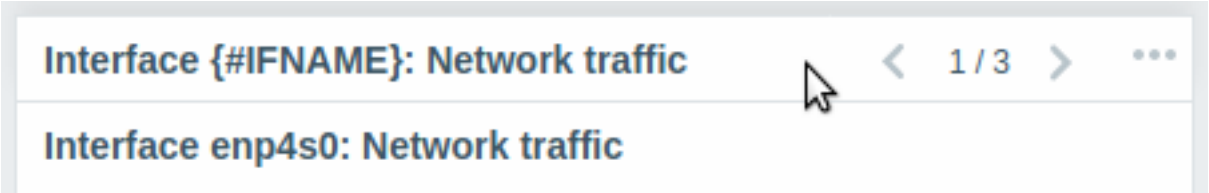
Graphs are arranged in a configurable grid layout; if the number of graphs exceeds the layout, paging is enabled in the widget.

Configuration

To configure, select *Graph prototype* as widget type:

In addition to the parameters that are common for all widgets, you may set the following specific options:

Source	Select the source of the graphs: **Graph prototype** or **Simple graph prototype**.
Graph prototype	Select a graph prototype to display graphs discovered by the graph prototype. This parameter is available if *Source* is set to "Graph prototype".
Item prototype	Select an item prototype to display simple graphs for items discovered by the item prototype. This parameter is available if *Source* is set to "Simple graph prototype".
Time period	Set a time period for which to display data in the graphs. Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period.
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
Show legend	Unmark this checkbox to hide the legend on the graphs (marked by default).
Override host	Select a compatible widget or the dashboard host selector as the data source for hosts. This parameter is not available when configuring the widget on a template dashboard.
Columns	Enter the number of columns of graphs to display within a graph prototype widget.
Rows	Enter the number of rows of graphs to display within a graph prototype widget.

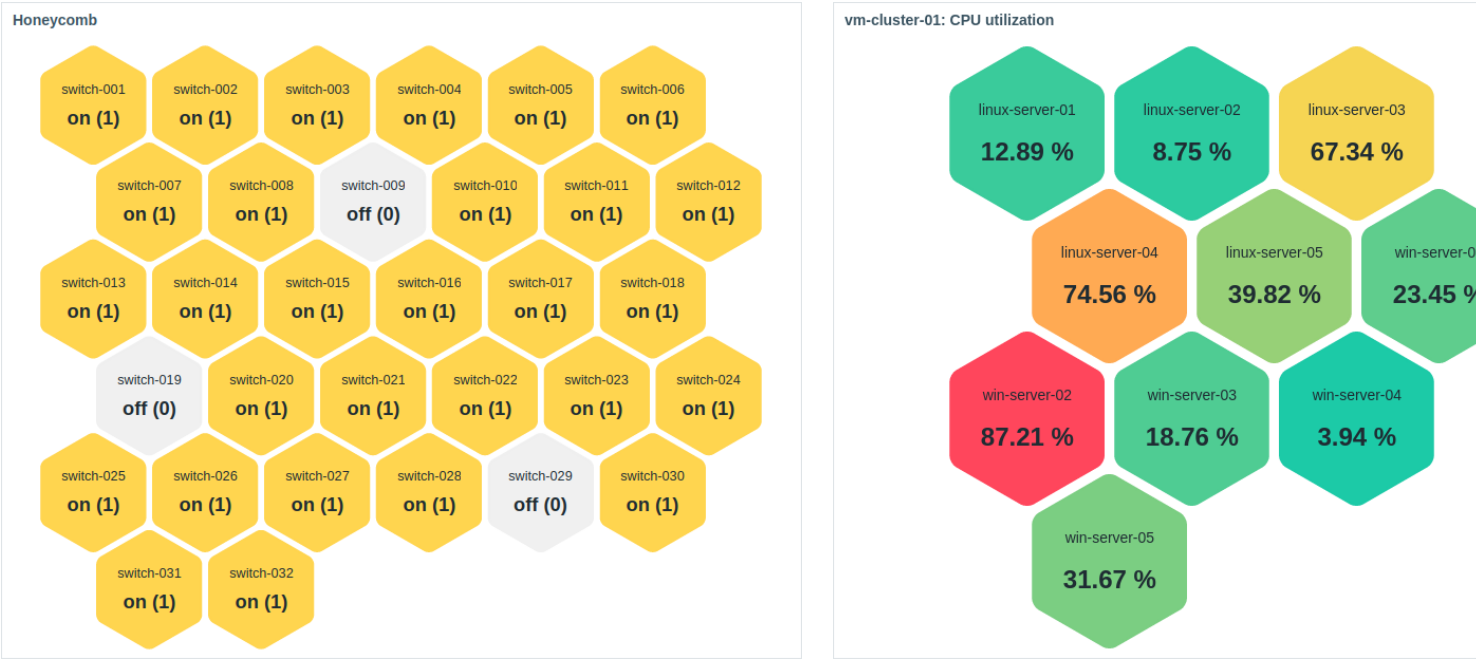


The legend of the graph consists of three sections:

- Items and their aggregated values
- Percentiles (if configured)
- Triggers (if any are associated with the displayed items)

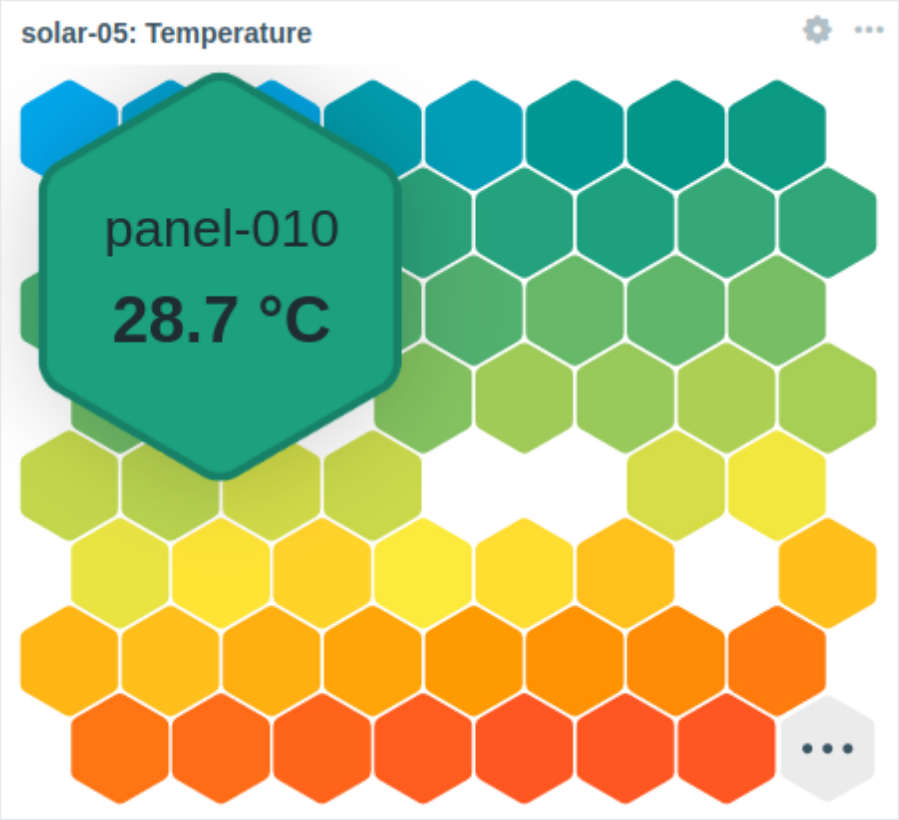
If the height of the graph within the widget is insufficient, the legend may not be displayed or may be displayed only partially. Triggers and percentiles are hidden first, followed by the item legend. To display the full legend, increase the widget's vertical size.

Note:
No more than 3 trigger lines can be displayed. If there are more triggers then the triggers with lower severity are prioritized for display.



While the *Columns* and *Rows* parameters allow fitting more than one graph in the widget, there still may be more discovered graphs than there are columns/rows in the widget. In this case, paging becomes available in the widget, and a slide-up header allows you to switch between pages using the left and right arrows:

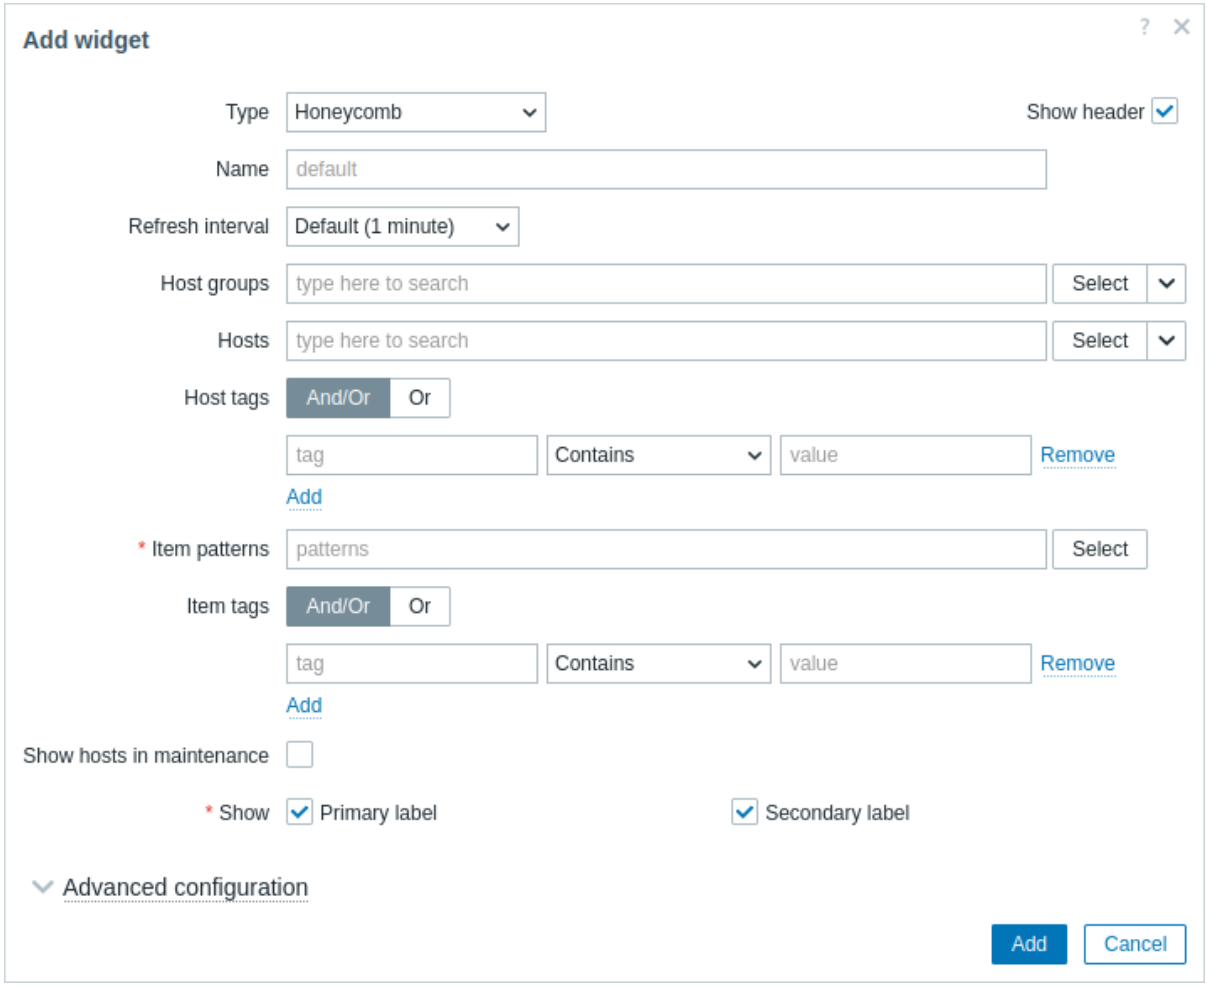
Honeycomb



Overview

The *Honeycomb* widget displays hosts or items as hexagonal cells in a grid. This layout makes it easy to detect problem hosts/items, spot clusters of issues, compare groups at a glance, and more.

The number of displayed cells is limited by the widget size and minimum cell size (32px). If all cells do not fit, the last cell shows an ellipsis. The widget can be resized, with cell count, size, and positioning adjusting dynamically.

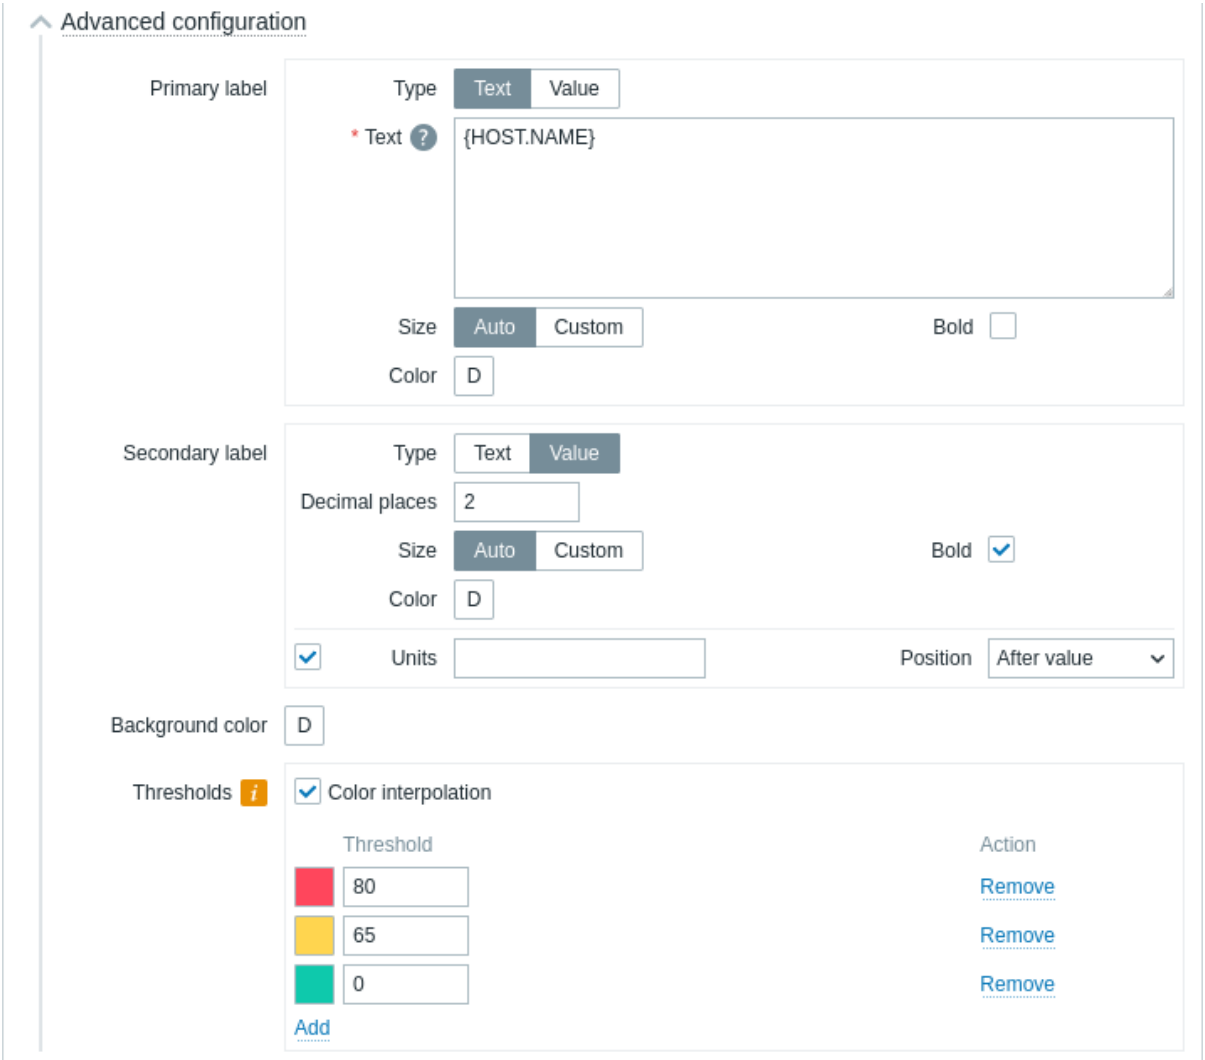


On mouseover, the focused cell enlarges for improved visibility. Clicking a cell highlights its border until another cell is selected.

The information displayed in the *Honeycomb* widget can be downloaded as a PNG image by selecting the *Download image* option in the widget *Actions* menu ⋯ that appears when you hover over the widget. Depending on your browser settings, the image is either automatically saved to the `Downloads` folder, or a *Save* dialog opens, allowing you to choose the location.

Configuration

To configure, select *Honeycomb* as type:



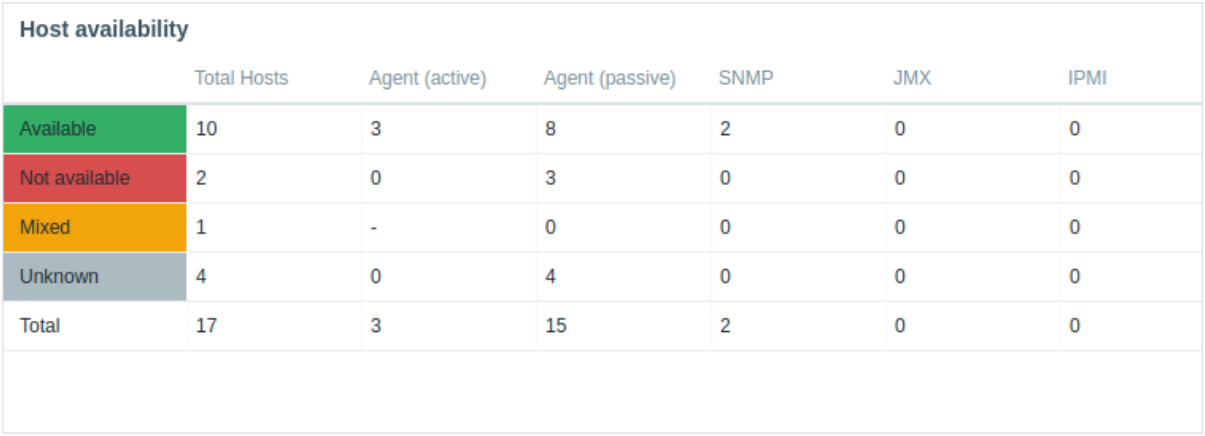
In addition to the parameters that are common for all widgets, you may set the following specific options:

Host groups	Select host groups. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Selecting a parent host group implicitly selects all nested host groups; if no host groups are selected, the widget will display all host groups containing hosts with items matching the selected *Item pattern* (see below). This parameter is not available when configuring the widget on a template dashboard.
Hosts	Select hosts. Alternatively, select a compatible widget or the dashboard as the data source for hosts. This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts. If no hosts are selected, the widget will display all hosts with items matching the selected *Item pattern* (see below). This parameter is not available when configuring the widget on a template dashboard.

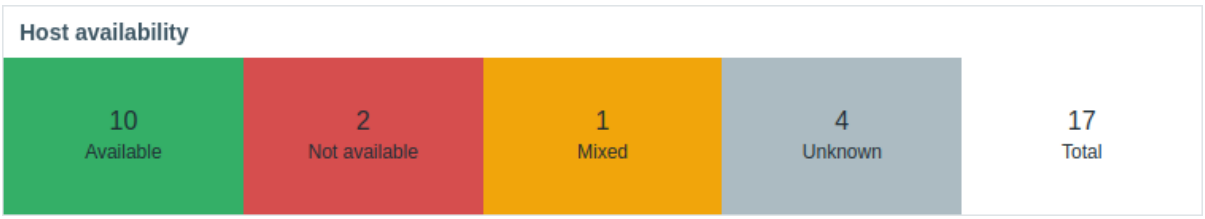
Host tags	Specify tags to limit the number of hosts displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met. This parameter is not available when configuring the widget on a template dashboard.
Item patterns	Enter item patterns or select existing items as item patterns. Data of items that match the entered or selected patterns will be displayed on the honeycomb. The *Item patterns* parameter is mandatory. Wildcard patterns may be used for selection (for example, `*` will return items that match zero or more characters; `Zabbix*` will return items that start with "Zabbix"). To specify a wildcard pattern, enter the string manually and press *Enter*. When you start typing, a dropdown list will show matching items limited to those belonging to selected *Hosts* or hosts within selected *Host groups*, if any. The wildcard symbol is always interpreted, therefore, it is not possible to add, for example, an item named *item** individually, if there are other matching items (e.g., item2, item3). When configuring the widget on a template dashboard, this parameter allows selecting only items configured on the template.
Item tags	Specify tags to limit the number of items displayed in the widget. For more information, see *Host tags* above.
Show hosts in maintenance	Mark this checkbox to display hosts in maintenance (in this case, maintenance icon will be shown next to the host name). This parameter is labeled *Show data in maintenance* when configuring the widget on a template dashboard.
Show	Mark this checkbox to display the respective honeycomb cell element - primary label, secondary label. At least one element must be selected.
Advanced configuration	Click the *Advanced configuration* header to display advanced configuration options.

Advanced configuration

Advanced configuration options are available in the collapsible *Advanced configuration* section and only for elements selected in the *Show* field (see above) and the background color or thresholds for honeycomb cells.



Primary/Secondary label	
Type	Select the label type: **Text** - the label will display the text specified for the *Text* parameter; **Value** - the label will display the item value with decimal places as specified for the *Decimal places* parameter.
Text	Enter the label text. This text may override the default item name. Multiline text is supported. A combination of text and supported macros is possible. `{HOST.\*}`, `{ITEM.\*}`, `{INVENTORY.\*}`, and user macros are supported. Honeycomb cells are ordered alphabetically by host name, and, within each host, by item name. This parameter is available if *Type* is set to *Text*.
Decimal places	Enter the number of decimal places to display with the value. This parameter is available if *Type* is set to *Value*, and affects only items that return numeric (float) data.
Size	Select the label size: **Auto** - use automatically adjusted label size; **Custom** - enter a custom label size (in percent, relative to the honeycomb cell size). Note that labels that do not fit the honeycomb cell size are truncated.
Bold	Mark the checkbox to display labels in bold.
Color	Select the label color from the color picker. "D" stands for the default color, which depends on the frontend theme. To return to the default color, click the *Use default* button in the color picker.
Units	
Units	Mark the checkbox to display units with the item value. If you enter a unit name, it will override the units set in the item configuration. This parameter is available if *Type* is set to *Value*.
Position	Select the position of the item units (before or after the item value). This parameter is ignored for the following time-related units: unixtime, uptime, s. This parameter is available if *Type* is set to *Value* and the *Units* option is selected.

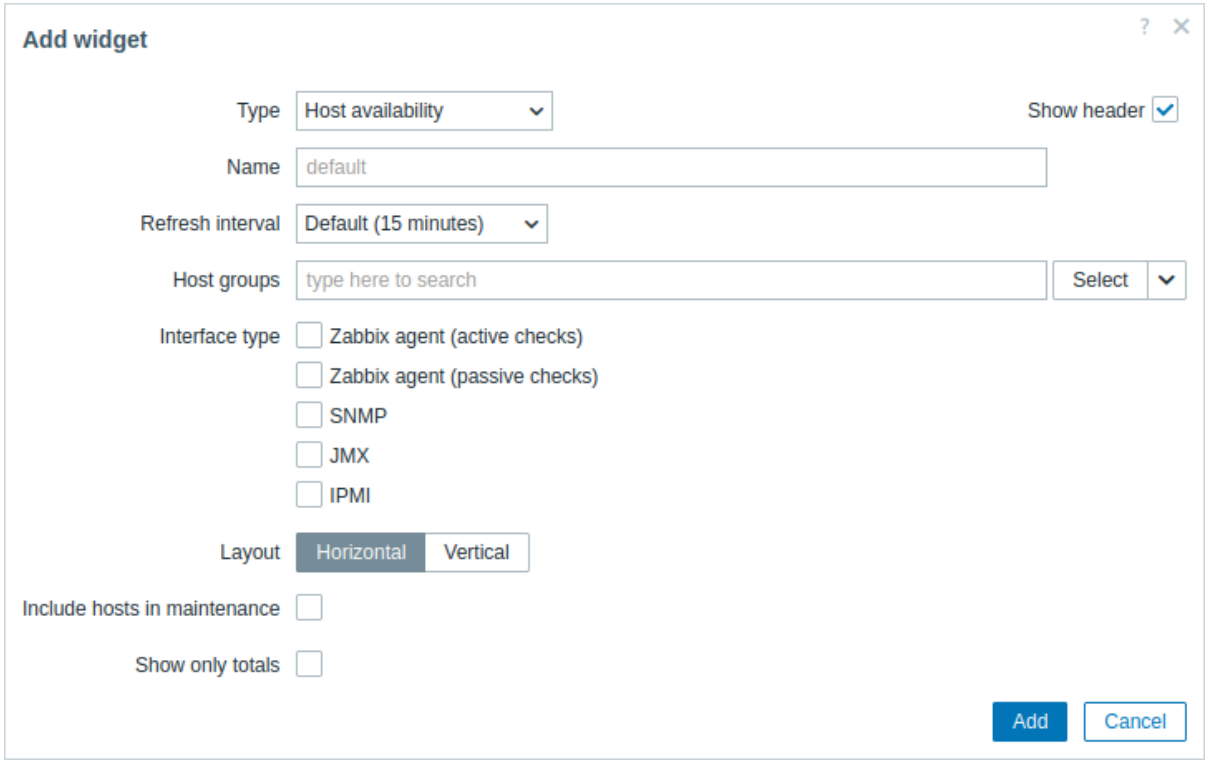


Background color	
Background color	Select the honeycomb cells background color from the color picker. "D" stands for the default color, which depends on the frontend theme. To return to the default color, click the *Use default* button in the color picker.
Thresholds	
Color interpolation	Mark the checkbox to enable smooth transitioning between threshold colors for honeycomb cells. This parameter is available if two or more thresholds are set.
Threshold	Click *Add* to add a threshold, select a threshold color from the color picker, and specify a numeric value. The thresholds list will be sorted in ascending order when saved. Note that the colors configured as thresholds will be displayed correctly only for numeric items. Suffixes (for example, "1d", "2w", "4K", "8G") are supported. Value mappings are supported.

Host availability

Overview

The *Host availability* widget displays host availability across selected host groups, allowing you to monitor the number of hosts that are up or down.

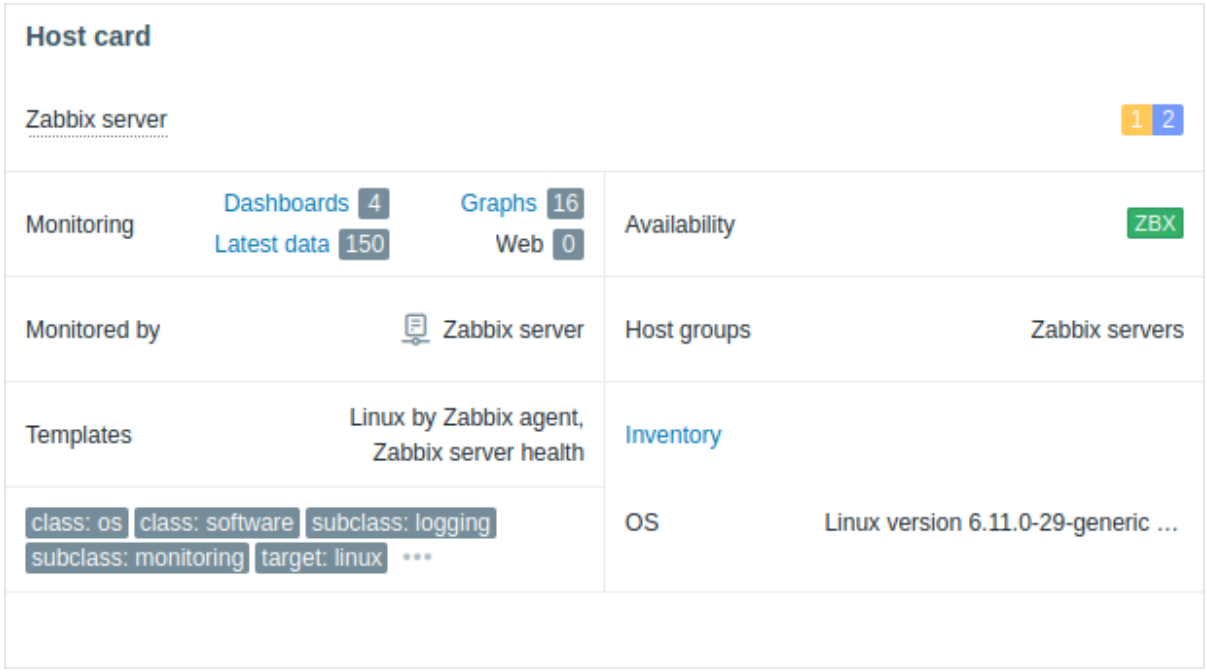


Host availability is counted as follows:

- *Available* - hosts with all interfaces available
- *Not available* - hosts with all interfaces not available
- *Mixed* - hosts with at least one interface not available and at least one available or unknown
- *Unknown* - hosts with at least one interface unknown, but none not available
- *Total* - total of all hosts

Configuration

To configure, select *Host availability* as type:



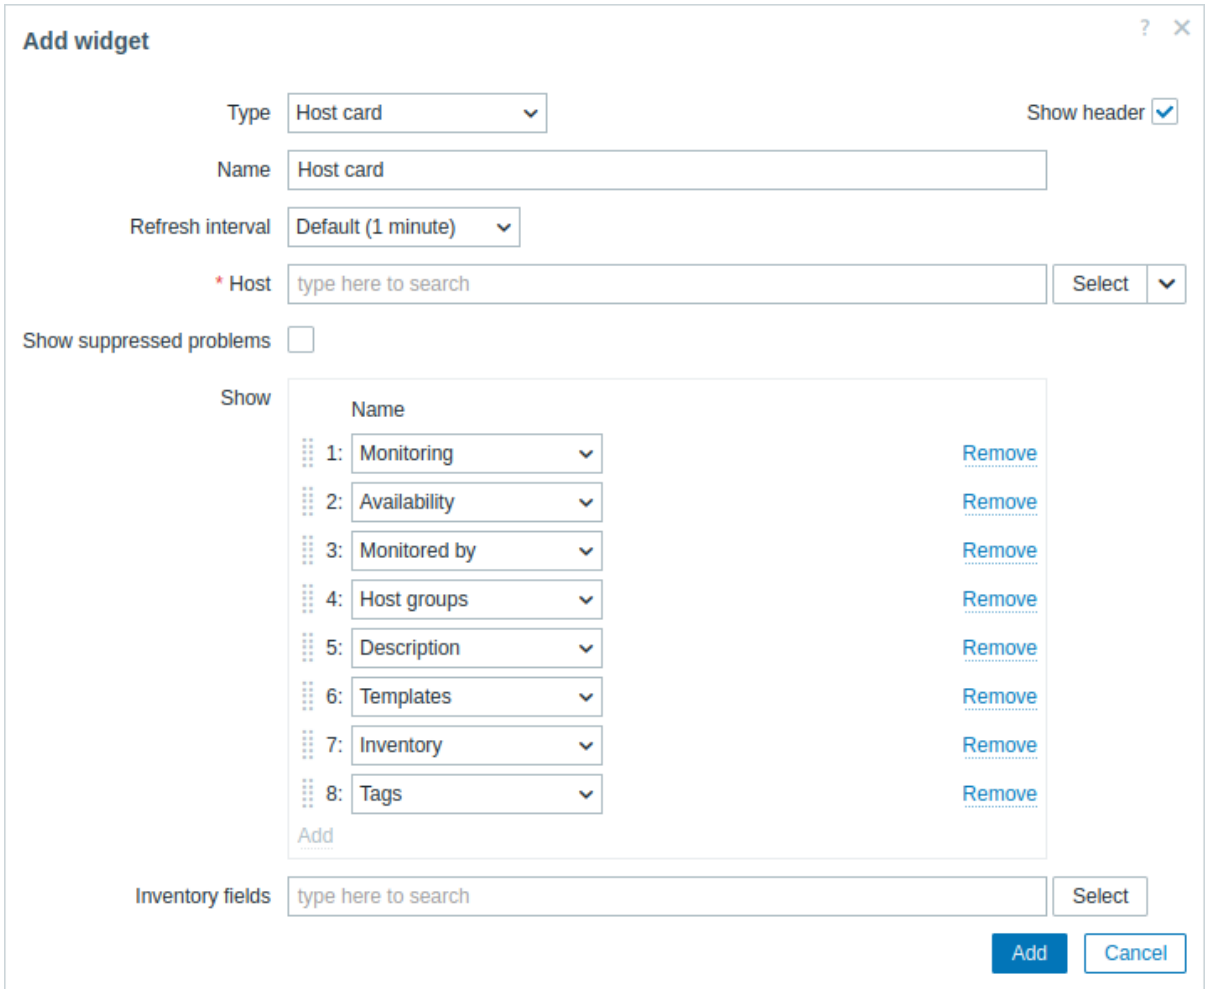
In addition to the parameters that are common for all widgets, you may set the following specific options:

Host groups	Select host groups. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. This parameter is not available when configuring the widget on a template dashboard.
Interface type	Select which host interfaces you want to see availability data for—*Zabbix agent (active checks)*, *Zabbix agent (passive checks)*, *SNMP*, *JMX*, *IPMI*. For *Zabbix agent (active checks)*, the *Mixed* cell will always be empty since this type of items cannot have multiple interfaces. Availability of all interfaces is displayed by default if nothing is selected.
Layout	Select horizontal display (columns) or vertical display (lines).
Include hosts in maintenance	Include hosts that are in maintenance in the statistics. This parameter is labeled *Show data in maintenance* when configuring the widget on a template dashboard.
Show only totals	If checked, the total of hosts, without breakdown by interfaces, is displayed. This option is disabled if only one interface is selected.

Host card

Overview

The *Host card* widget displays details of a single host, allowing you to quickly assess the status and configuration of a host (availability, problems, inventory, etc.).

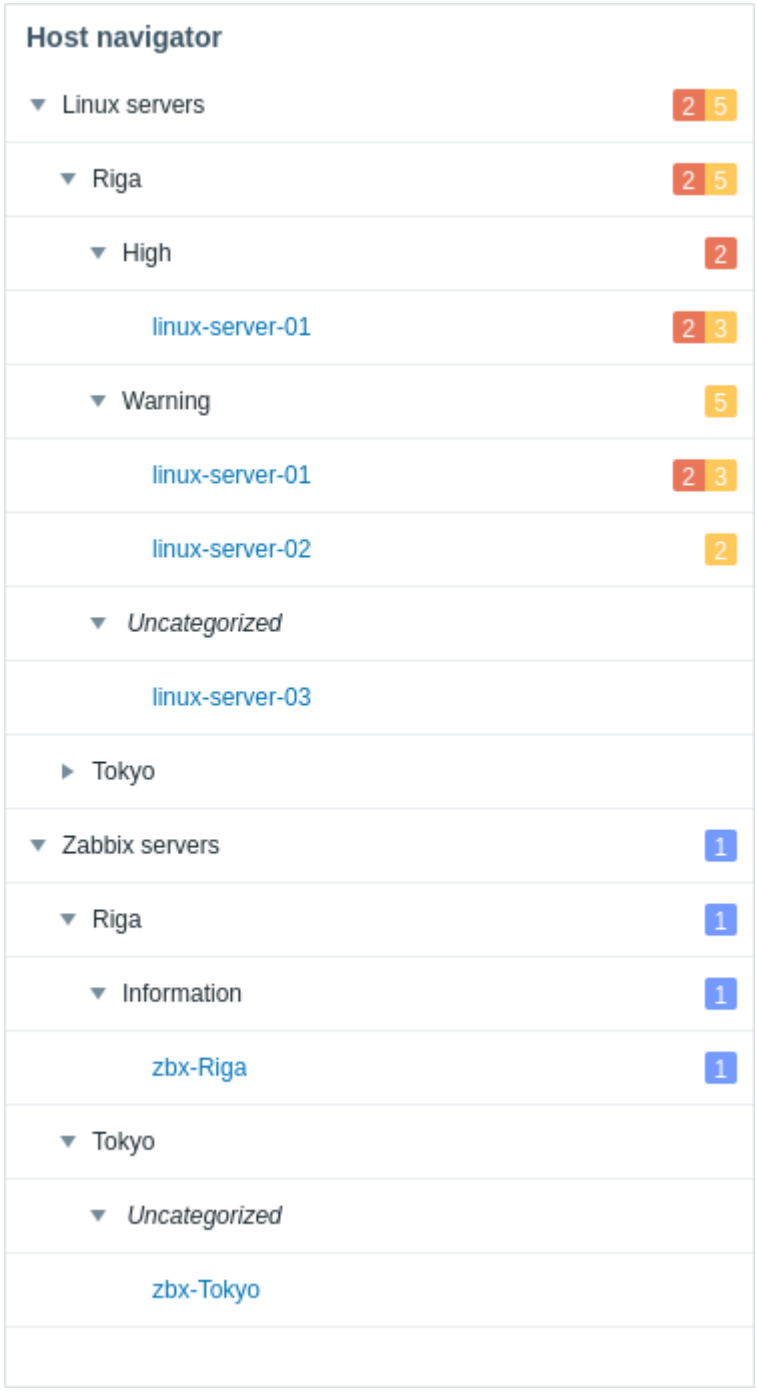


The host can be set directly in the widget configuration or selected from either a compatible widget or the host selector on the dashboard.

The widget can display multiple sections, each showing different information. The section layout is adjusted automatically based on the widget width; when expanded horizontally, sections are automatically rearranged into multiple columns.

Configuration

To configure, select *Host card* as type:



In addition to the parameters that are common for all widgets, you may set the following specific parameters:

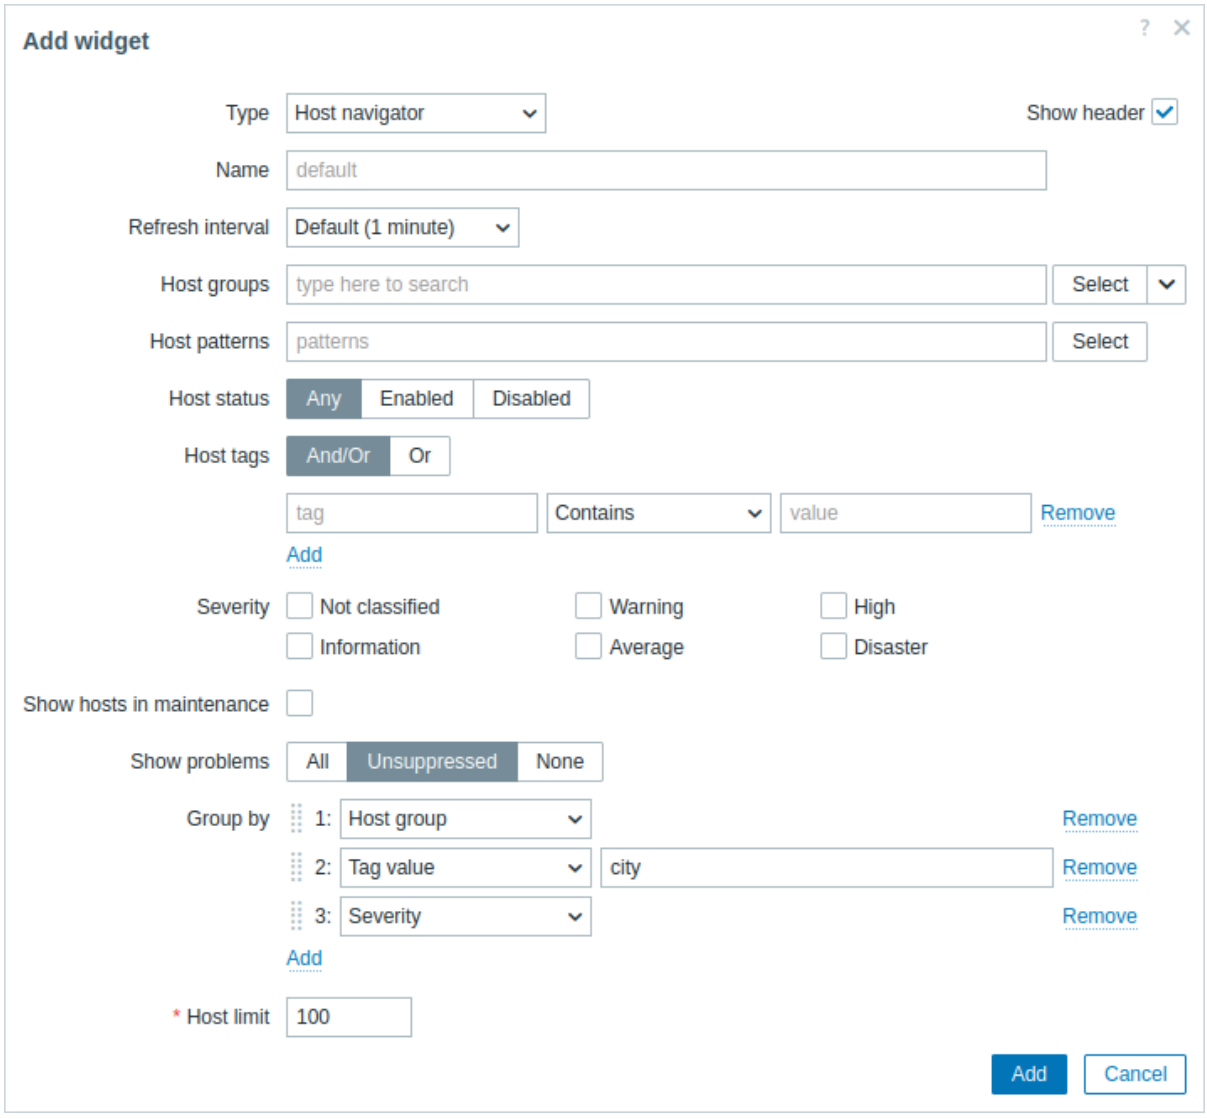
Host	Select the host. Alternatively, select a compatible widget or the dashboard as the data source for hosts. Matching suggestions appear as you type. The top section of the widget always displays the **host name** (clicking it opens the host menu): - If the host is disabled, a red *Disabled* label is displayed next to the host name. - If the host is in maintenance, the maintenance icon is displayed next to the host name. The top section of the widget also displays the number of **host problems** grouped by severity (clicking them opens host problems). This parameter is not available when configuring the widget on a template dashboard.
Show suppressed problems	Mark this checkbox to include suppressed problems into problem calculation.
Show	Add sections to display in the widget. Sections can be rearranged by dragging and dropping.
Host groups	Displays host groups the host belongs to.
Description	Displays host description.
Monitoring	Displays quick links for navigating to host Dashboards, Latest data, Graphs, and Web scenarios. The number next to each link indicates the number of respective entities.
Availability	Displays host availability by interface.
Monitored by	Displays whether the host is monitored by Zabbix server or a specific proxy or proxy group.
Templates	Displays templates linked to the host.
Inventory	Displays host inventory fields.
Tags	Displays host tags.
Inventory fields	Select inventory fields to be displayed. Matching suggestions appear as you type. If no inventory fields are specified, all populated inventory fields will be displayed. This parameter is available if *Show* contains *Inventory*.

Host navigator

Overview

The *Host navigator* widget displays a list of hosts based on various filtering and grouping options.

Groups by which hosts are organized can be expanded or collapsed.



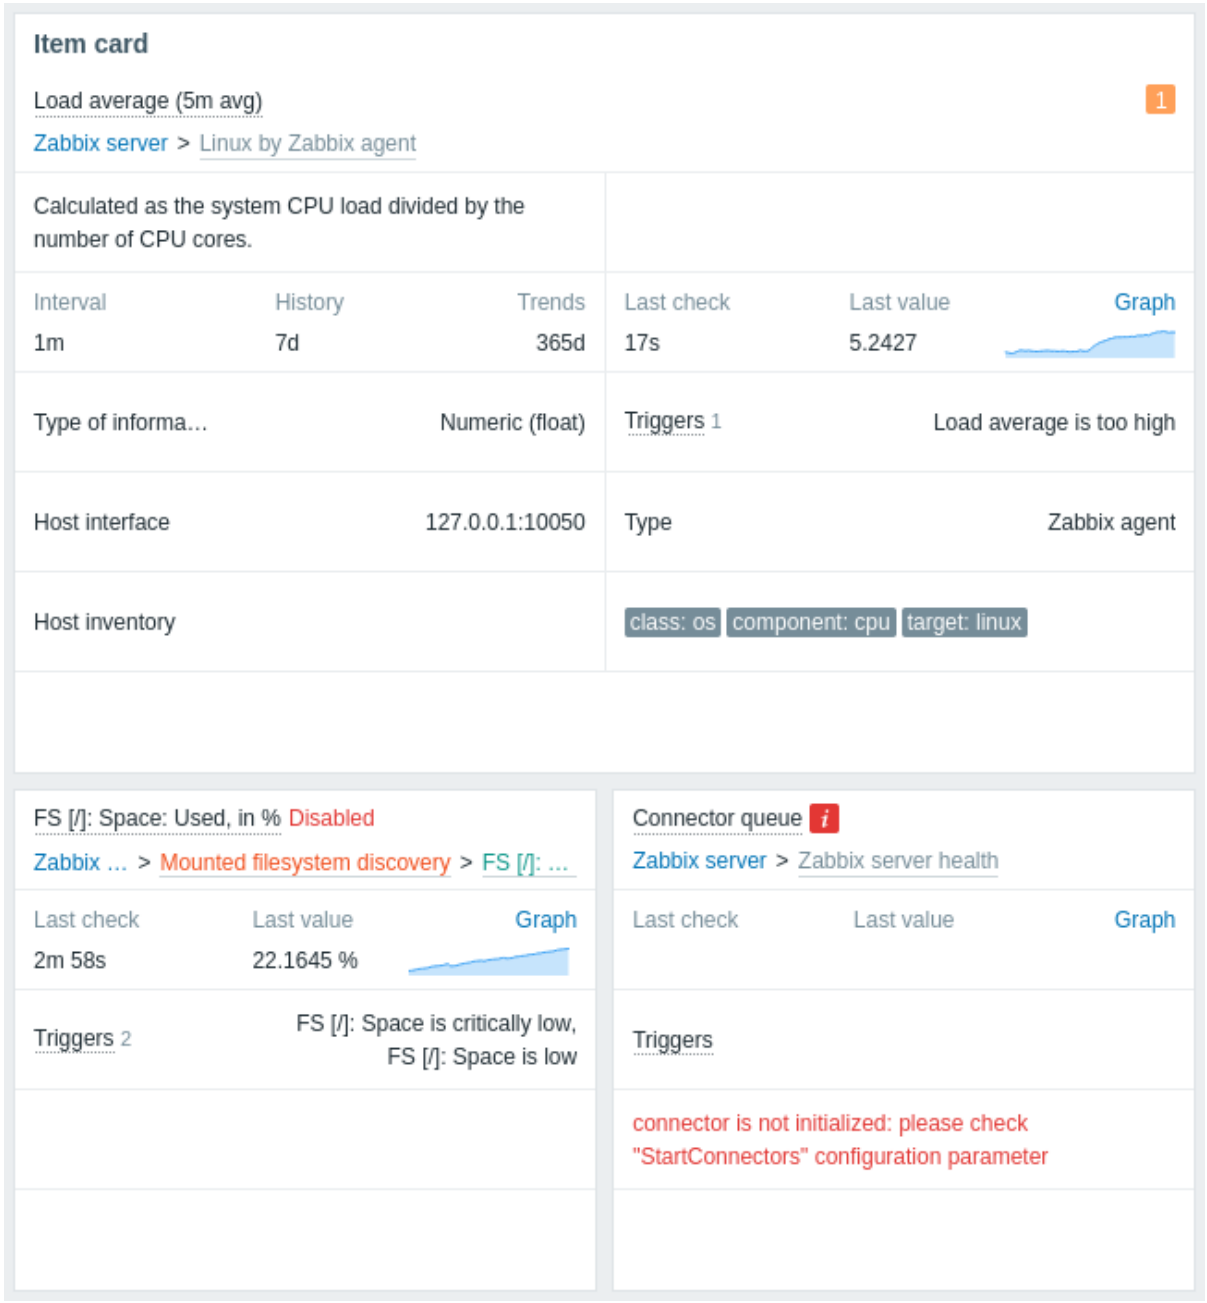
For groups, problems, and hosts in maintenance, additional details are accessible by mouseover hints.

The widget is most useful for controlling what other widgets display based on the selected host.

Configuration

To configure, select *Host navigator* as type:

In addition to the parameters that are common for all widgets, you may set the following specific options:



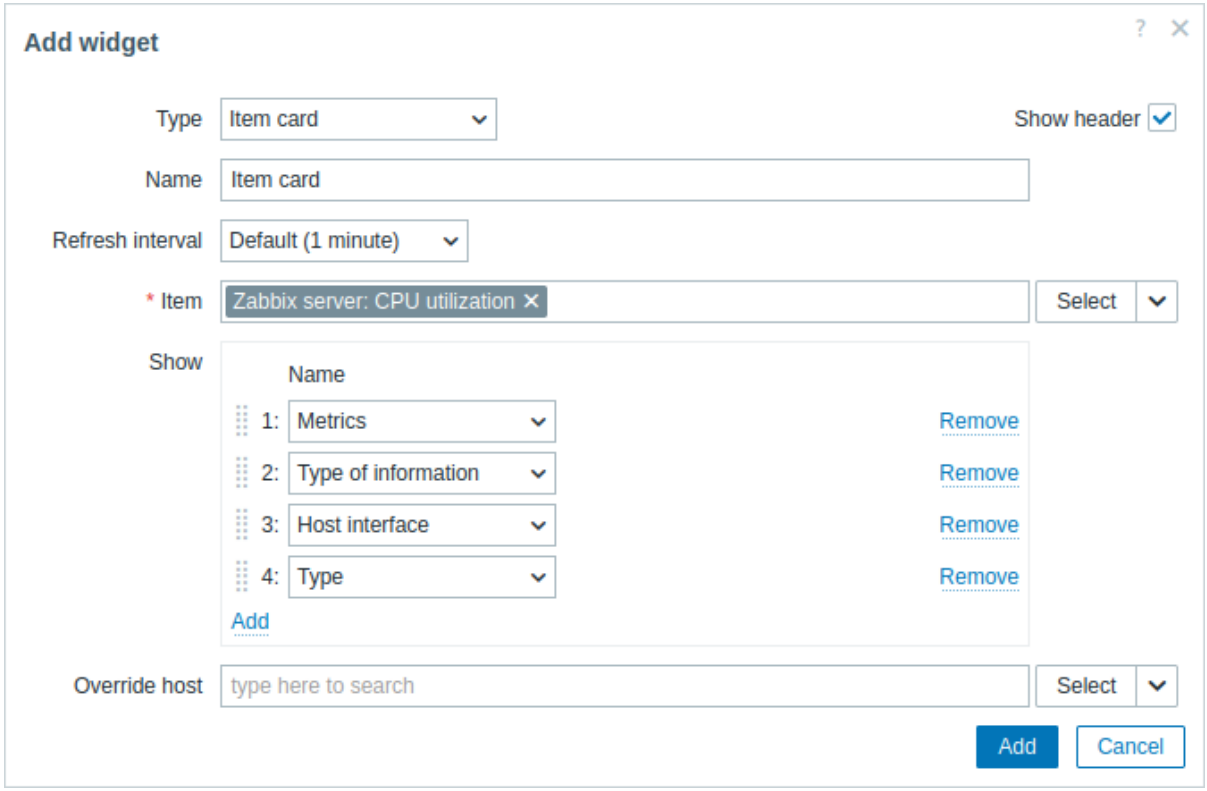
Host groups	Select host groups. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Selecting a parent host group implicitly selects all nested host groups; if no host groups are selected, the widget will display all hosts from all host groups. This parameter is not available when configuring the widget on a template dashboard.
Host patterns	Enter host patterns or select existing hosts as host patterns. Hosts that match the specified patterns will be displayed on the host navigator. This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts. If no hosts are selected, the widget will display all hosts. Wildcard patterns may be used for selection (for example, `*` will return hosts that match zero or more characters; `Zabbix*` will return hosts that start with "Zabbix"). To specify a wildcard pattern, enter the string manually and press *Enter*. When you start typing, a dropdown list will show matching hosts limited to those belonging to hosts within selected *Host groups*, if any. This parameter is not available when configuring the widget on a template dashboard.
Host status	Filter which hosts to display based on their status (any, enabled, disabled). This parameter is not available when configuring the widget on a template dashboard.
Host tags	Specify tags to filter the hosts displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met. This parameter is not available when configuring the widget on a template dashboard.
Severity	Mark problem severities to filter hosts with problems to be displayed in the widget. If no severities are marked, all hosts with all problems will be displayed.
Show hosts in maintenance	Mark this checkbox to display hosts in maintenance (in this case, maintenance icon will be shown next to the host name). This parameter is labeled *Show data in maintenance* when configuring the widget on a template dashboard.
Show problems	Filter which problems to display based on their status (all, unsuppressed, none). Problems are indicated with colored blocks at the end of the host row. Colors are based on problem severity, which can be customized in *Administration* > *General* > *Trigger displaying options*. Problem severities can be changed when updating problems.

Group by	Add a grouping attribute by which to group the selected hosts: **Host group** - group hosts by their host group; **Tag value** - enter a tag name to group hosts by the values of this tag (for example, enter ”city” to group hosts by values ”Riga”, ”Tokyo”, etc.); **Severity** - group hosts by their problem severities. If *Show problems* is configured to display problems, they are displayed as follows: - for each severity group, only the corresponding problem count is displayed; - for each host, all its problem counts are displayed. Note that hosts will be grouped only by those severities marked in the *Severity* parameter; if no severities are marked, all hosts will be grouped by all severities. Grouping attributes can be reordered by dragging up or down by the handle before the group name. Note that grouping attribute order determines group nesting order. For example, specifying multiple tag names (1: color, 2: city) will result in hosts being grouped by color (red, blue, etc.) and then by city (Riga, Tokyo, etc.). A host may be displayed in multiple groups depending on the configured grouping attributes (for example, when grouping by host group and the host belongs to multiple host groups). Clicking such hosts selects and highlights them in all groups. Hosts that do not match the configured grouping attributes are displayed in the *Uncategorized* group. Up to 10 grouping attributes can be specified, and all must be unique. If no grouping attributes are specified, hosts will not be grouped.
Host limit	Enter the maximum number of hosts to be displayed. Possible values range from 1 to 9999. When more hosts are available for displaying than the set limit, a corresponding message is shown below the displayed hosts (for example, ”100 of 100+ hosts are shown”). Note that the configured host limit also affects the display of configured groups; for example, if host limit is set to 100 and hosts are grouped by tag values (more than 200), only the first 100 tag values with the corresponding hosts will be displayed in the widget. This parameter is not affected by the *Limit for search and filter results* parameter in *Administration > General > GUI*. This parameter is not available when configuring the widget on a template dashboard.

Item card

Overview

The *Item card* widget displays details of a single item, allowing you to quickly assess the status and configuration of an item (latest data, errors, description, etc.).

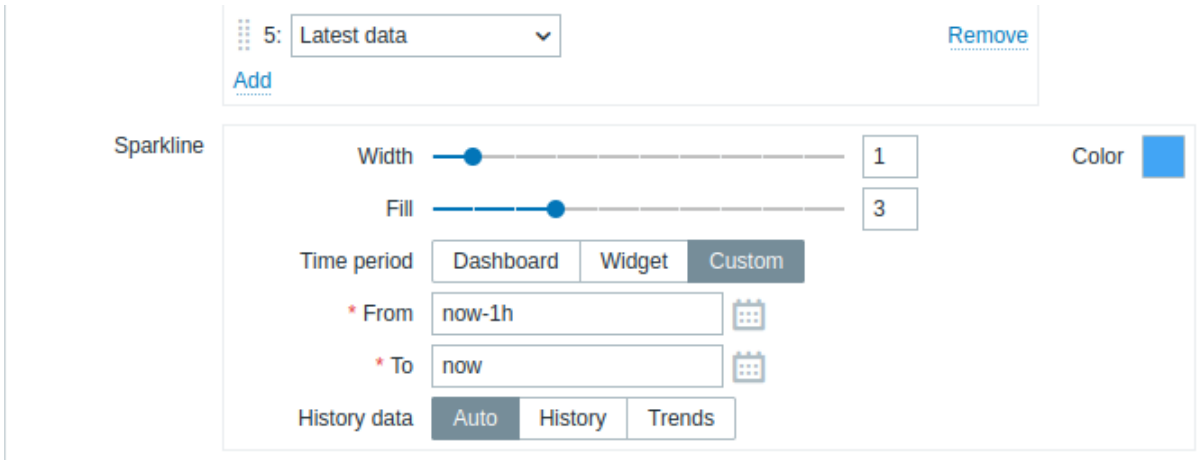


The item can be set directly in the widget configuration or selected from a compatible widget on the dashboard.

The widget can display multiple sections, each showing different information. The section layout is adjusted automatically based on the widget width; when expanded horizontally, sections are automatically rearranged into multiple columns.

Configuration

To configure, select *Item card* as type:



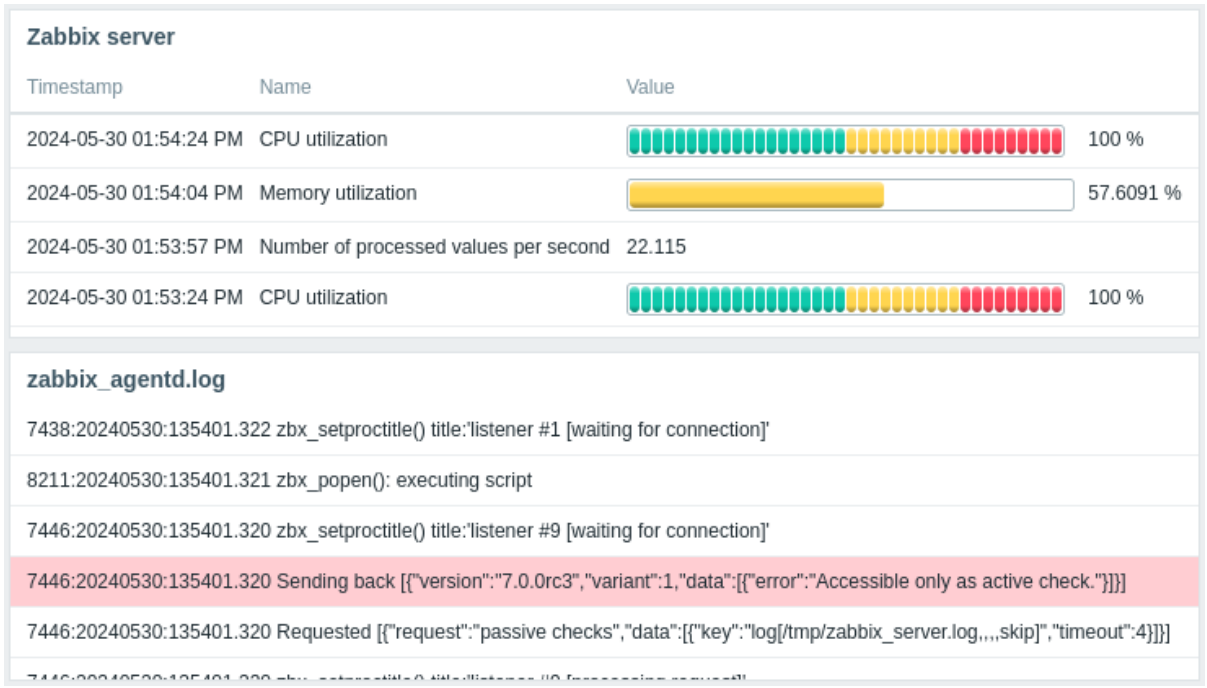
In addition to the parameters that are common for all widgets, you may set the following specific options:

Item	Select the item. Alternatively, select a compatible widget as the data source for items. Matching suggestions appear as you type. The top section of the widget always displays the **item name** (clicking it opens the item menu): - If the item is disabled, a red *Disabled* label is displayed next to the item name. - In case of errors, a square icon with the letter "i" is displayed. In case of problems, a square icon with the problem count is displayed for each problem severity. Hovering over an icon opens a pop-up with details. - On a template dashboard, the technical name (instead of visible name) of the item is displayed. The top section of the widget also displays the **item path**—its host and, if applicable, template, low-level discovery (LLD) rule, or master item (clicking an entity opens its configuration). Item path is displayed only to users with permissions to the respective entities.
Show	Add sections to display in the widget. Sections can be rearranged by dragging and dropping.
Description	Displays item description. Macros are resolved.
Error text	Displays item error (if any).
Metrics	Displays the following information: - Item update interval (except for trapper items); - Item history configuration (if any); - Item trends configuration (if any). Macros are resolved. If the item uses custom intervals, a help icon is displayed next to item update interval. Hovering over the icon opens a pop-up with custom interval details.

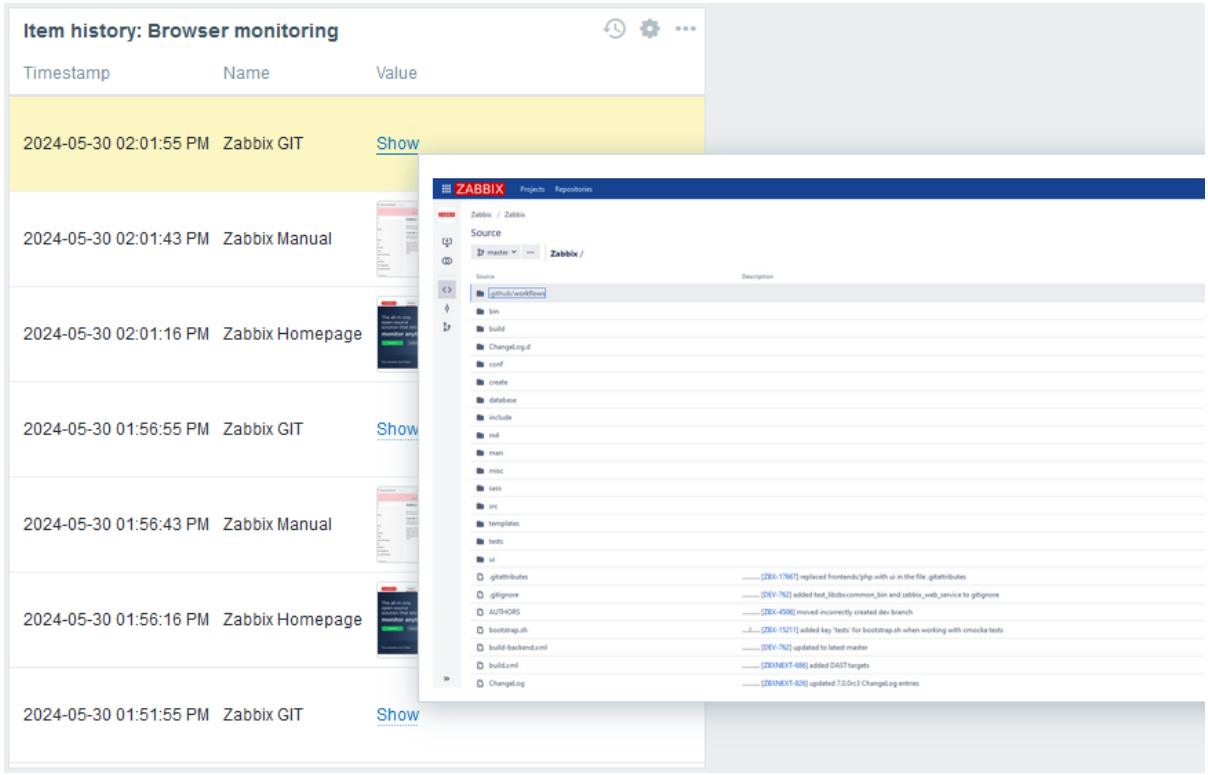
Latest data	Displays the following information: - Time since last item check; - Item last value; - Link to simple graph/history of item values (if history or trends are stored); - Configurable sparkline chart (if item is numeric). For binary type items, a thumbnail or the *Show* option is displayed instead of last value. Hovering over the thumbnail opens a pop-up with the image. Hovering over *Show* opens a pop-up with the item value (Base64 string). On a template dashboard, *No data* is displayed instead of item last value.
Type of information	Displays item type of information.
Triggers	Displays the following information: - *Triggers* label with trigger count (hovering over *Triggers* opens a pop-up with trigger details); - List of trigger names (macros are resolved).
Host interface	Displays host interface used by the item, or *No data* if the item does not have a host interface (e.g., dependent items, simple checks). On a template dashboard, *No data* is displayed.
Type	Displays item type.
Host inventory	Displays host inventory field that item value populates.
Tags	Displays item tags.
Override host	Select a compatible widget or the dashboard host selector as the data source for hosts. This parameter is not available when configuring the widget on a template dashboard.

Sparkline

Sparkline chart configuration options are available only if the *Latest data* section is added to the widget.



Width	Set the graph line thickness by using the slider or manually entering a value in the range from 0 to 10.
Color	Select line and fill color.
Fill	Set fill color transparency level by using the slider or manually entering a value in the range from 0 to 10.
Time period	Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period.
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".

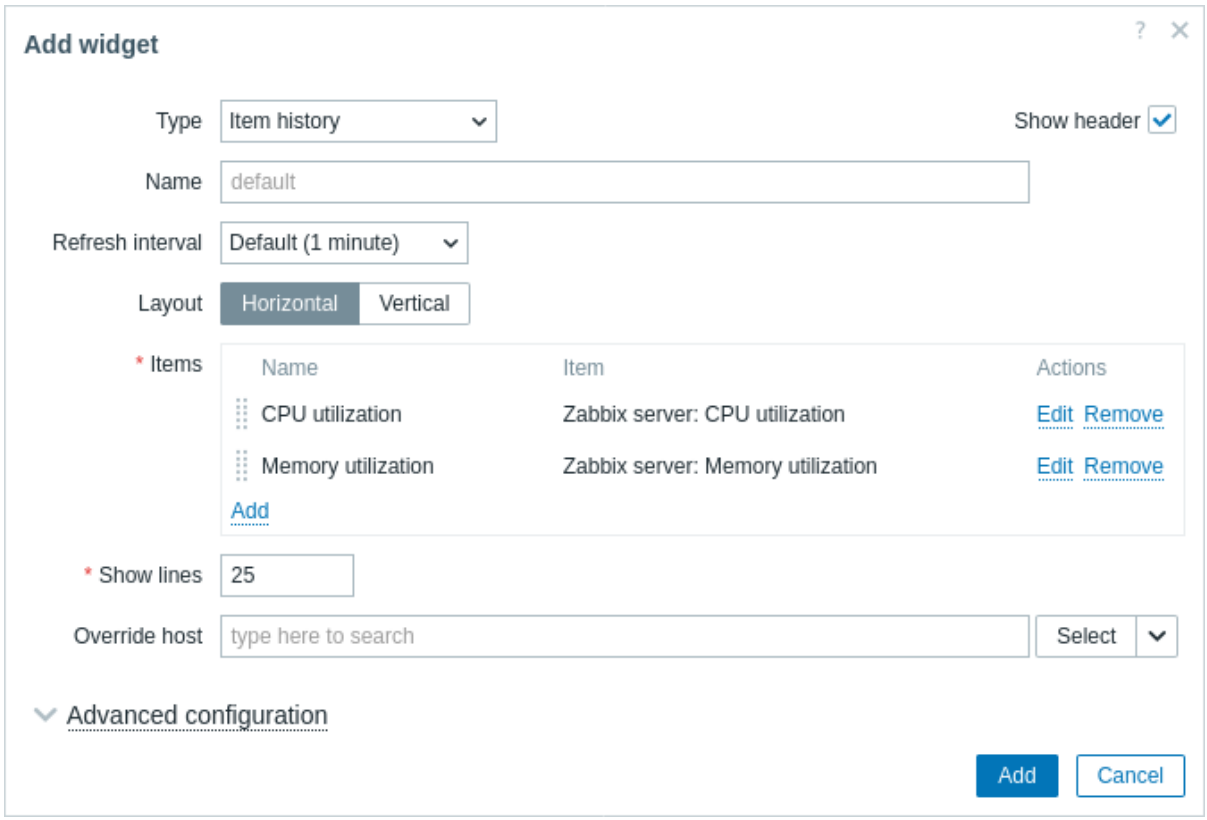


To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
History data	Take data from history or trends: **Auto** - automatic selection; **History** - take history data; **Trends** - take trend data. This parameter applies only to numeric data. Non-numeric data will always be taken from history.

Item history

Overview

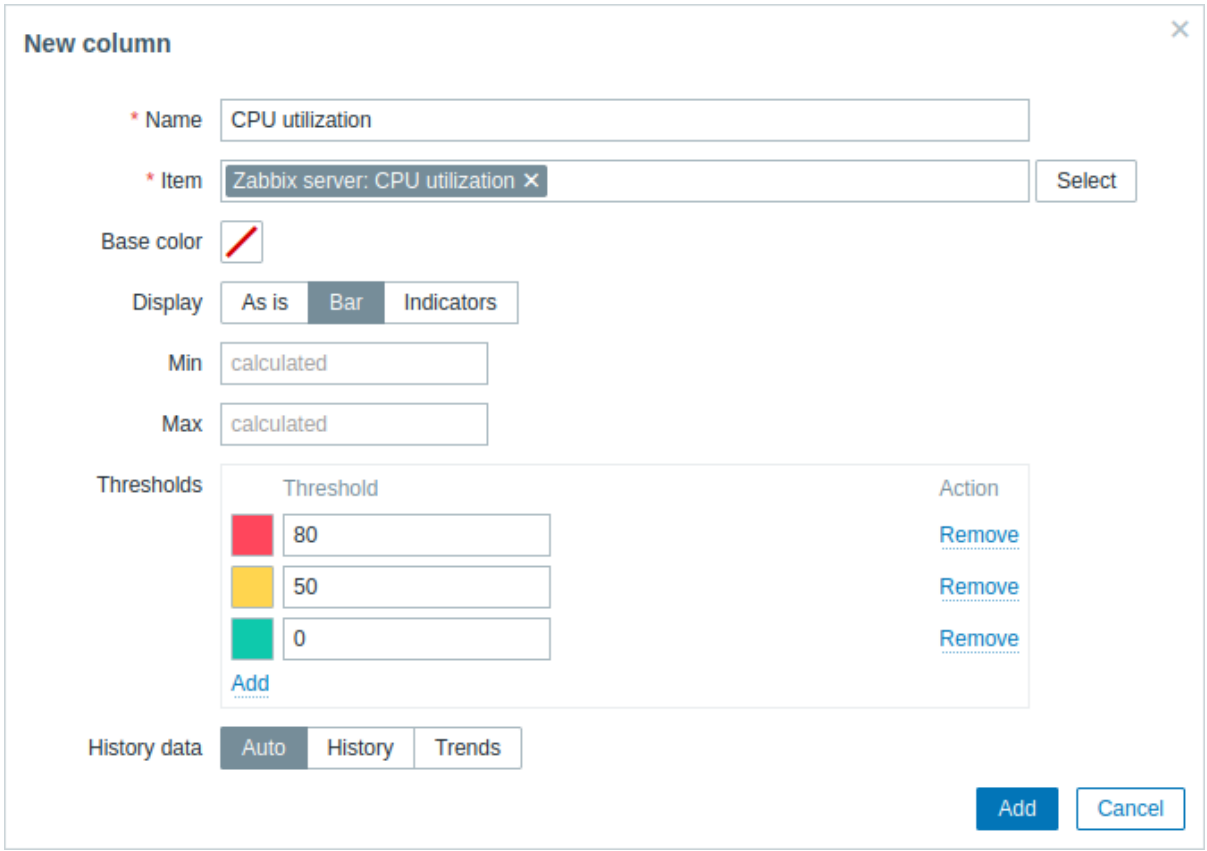
The *Item history* widget displays the latest data for all item types (numeric, text, etc.) in a table format. It can show progress bars and images (useful for browser items) and can highlight values (useful for log file monitoring).



Up to 1000 records can be displayed.

Configuration

To configure, select *Item history* as type:



In addition to the parameters that are common for all widgets, you may set the following specific options:

Layout	Select the layout option for item columns: **Horizontal** - items will be displayed horizontally, values vertically; **Vertical** - items will be displayed vertically, values horizontally.
Items	Add item columns to display. The order of items determines their display order. Items can be reordered by dragging them up or down by the handle before the item name.

Show lines	Specify the number of item value lines to display.
Override host	Select a compatible widget or the dashboard host selector as the data source for hosts. This parameter is not available when configuring the widget on a template dashboard.
Advanced configuration	Click the *Advanced configuration* label to display advanced configuration options.

Column configuration

To configure item columns, click *Add* in the *Items* parameter:

Common column parameters:

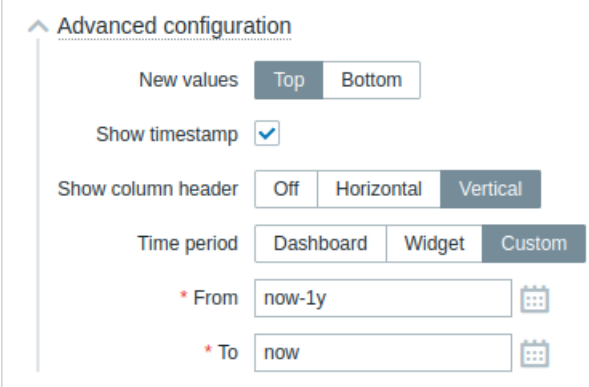
Name	Enter the name of the column. If left empty, the item name from the *Item* parameter is used.
Item	Select the item. Note that column configuration parameters vary based on the information type of the selected item; for more information, see individual parameters below. When configuring the widget on a template dashboard, only items configured on the template can be selected.
Base color	Select the column's background color or fill color if *Display* is set to "Bar" or "Indicators". Note that the base color can be overridden by threshold or highlight colors.

Column parameters specific to numeric type items:

Display	Select how the item value should be displayed: **As is** - as regular text; **Bar** - as solid, color-filled bar; **Indicators** - as segmented, color-filled bar.
Min	Enter the minimum value for bar/indicators. If left empty, the widget will use the minimum value of the item. This parameter is available only when *Display* is set to "Bar" or "Indicators".
Max	Enter the maximum value for bar/indicators. If left empty, the widget will use the maximum value of the item. This parameter is available only when *Display* is set to "Bar" or "Indicators".

Thresholds	Click *Add* to add a threshold, select a threshold color from the color picker, and specify a numeric value. The thresholds list will be sorted in ascending order when saved. Suffixes (for example, ”1d”, ”2w”, ”4K”, ”8G”) are supported. Value mappings are supported.
History data	Select whether to take data from history or trends: **Auto** - automatic selection; **History** - take history data; **Trends** - take trend data.

Column parameters specific to character, text, log, and JSON type items:



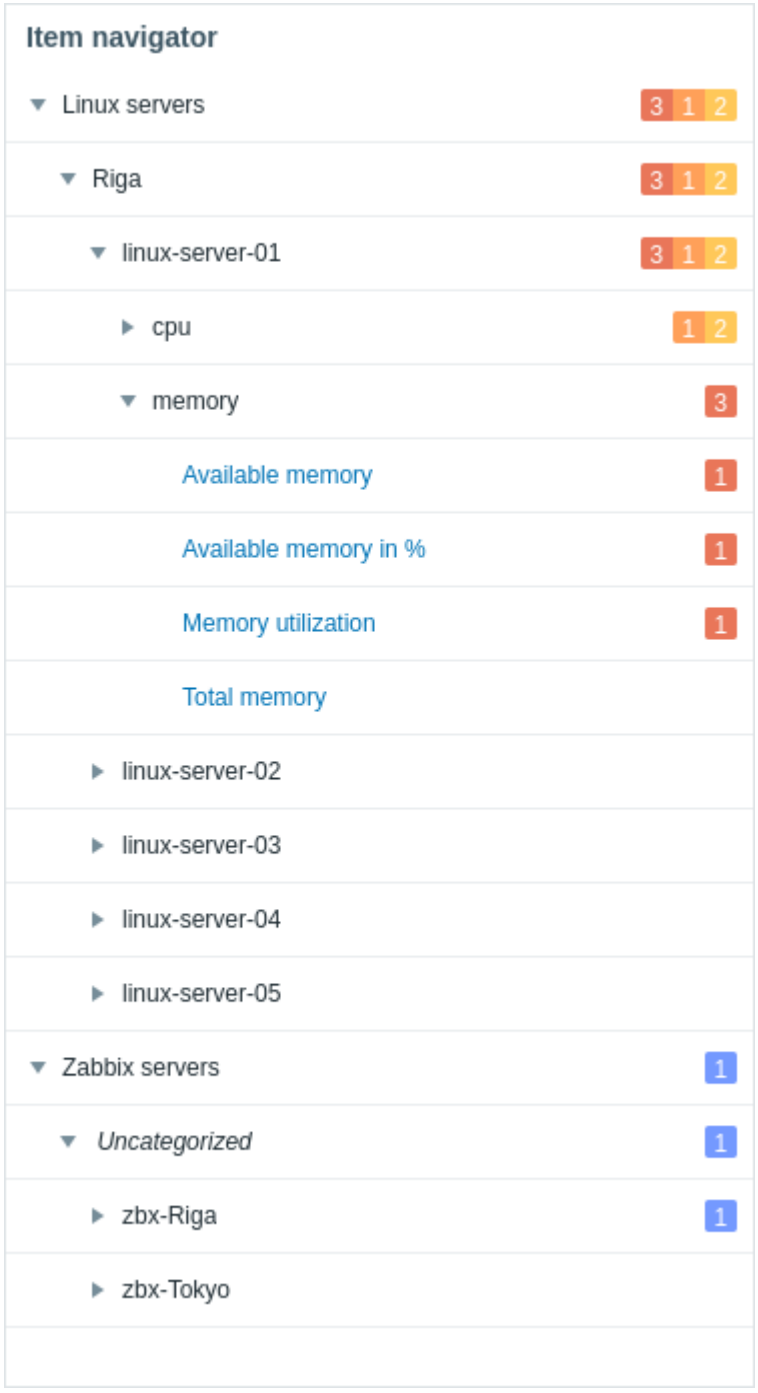
Highlights	Click *Add* to add a highlight, select a highlight color from the color picker, and specify a regular expression. The selected color will be used as the background color for item values where the specified regular expression matches the text.
Display	Select how the item value should be displayed: **As is** - exactly as received. Line breaks are preserved if the value contains line returns. Word wrapping is applied if *Layout* is set to ”Vertical” and more than one column is configured; **HTML** - as HTML-formatted text; **Single line** - as a single line, truncated to a specified length (1-500 characters). Hovering or clicking the truncated value opens a pop-up with the full value.
Use monospace font	Mark this checkbox to display the item value in monospace font (unmarked by default).
Display local time	Mark this checkbox to display local time instead of timestamp in the timestamp column. Note that the *Show timestamp* checkbox in advanced configuration must also be marked. This parameter is available only for log type items.

Column parameters specific to binary type items:

Show thumbnail	Mark this checkbox to display a thumbnail for image binaries or a ”Show” option for non-image binaries. Unmark this checkbox to display a ”Show” option for all binary item values. Hovering or clicking the ”Show” option opens a pop-up window with the item value (image or Base64 string). If the item value is an empty string, the ”Show” option is displayed; hovering or clicking it opens a pop-up containing ”Empty string”.

Advanced configuration

Advanced configuration options are available in the collapsible *Advanced configuration* section:

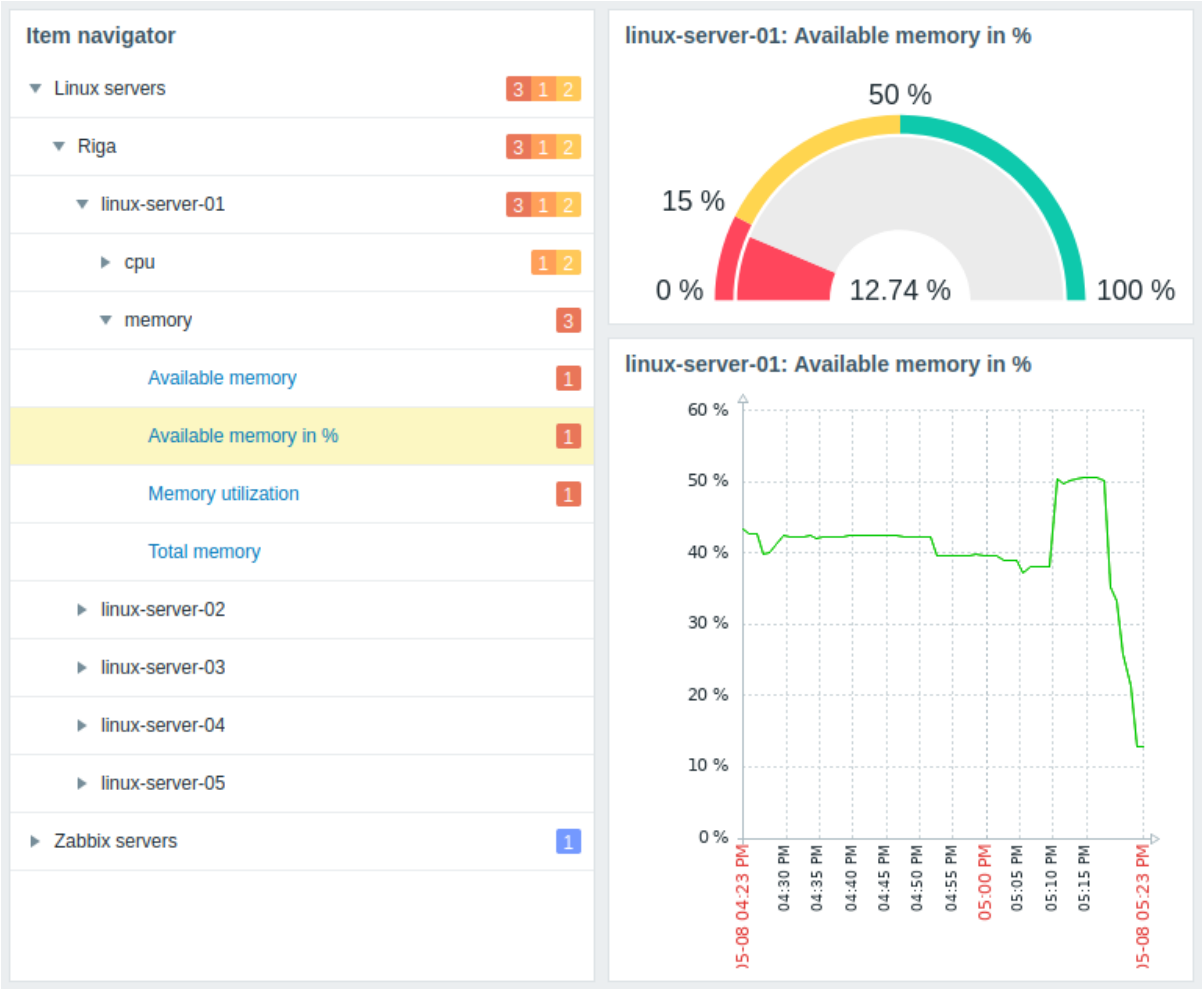


New values	Select where new item values should be added: **Top** - at the top of columns; **Bottom** - at the bottom of columns.
Show timestamp	Mark this checkbox to display the timestamp column (unmarked by default).

Show column header	Select the column header orientation: **Off** - hide the header; **Horizontal** - display the header horizontally; **Vertical** - display the header vertically.
Time period	Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period.
Widget	Enter or select a compatible widget (*Graph*, *Graph (classic)*, *Graph prototype*) as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".

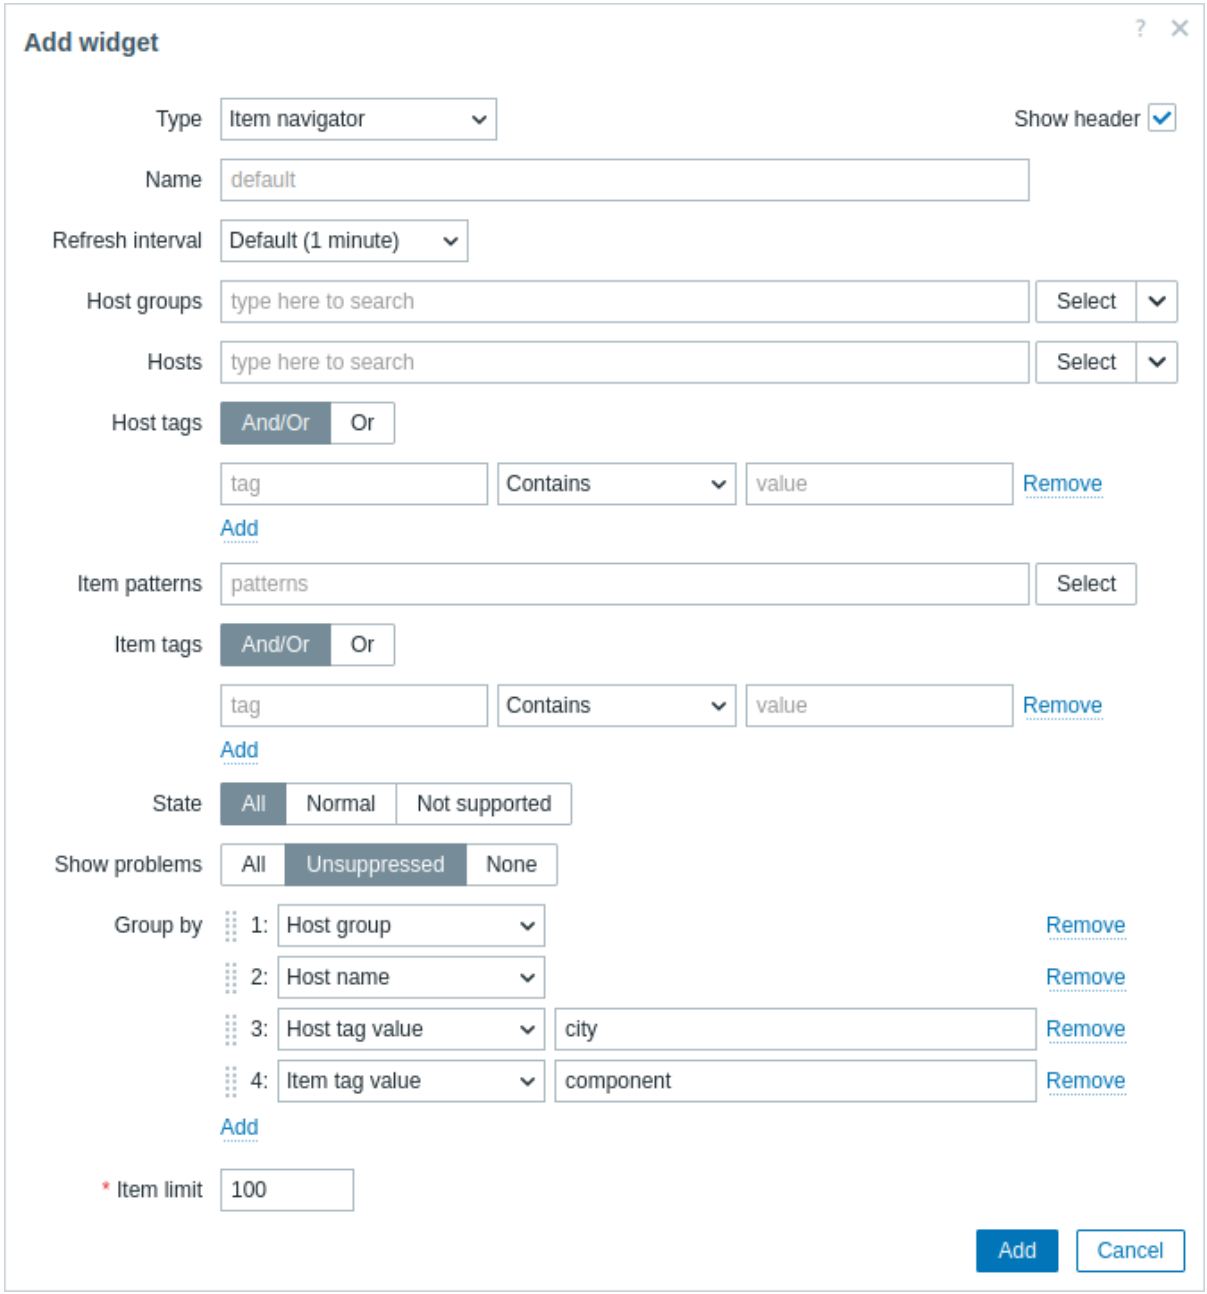
Item navigator

Overview



The *Item navigator* widget displays a list of items based on various filtering and grouping options.

Groups by which items are organized can be expanded or collapsed.



For groups and problems, additional details are accessible by mouseover hints.

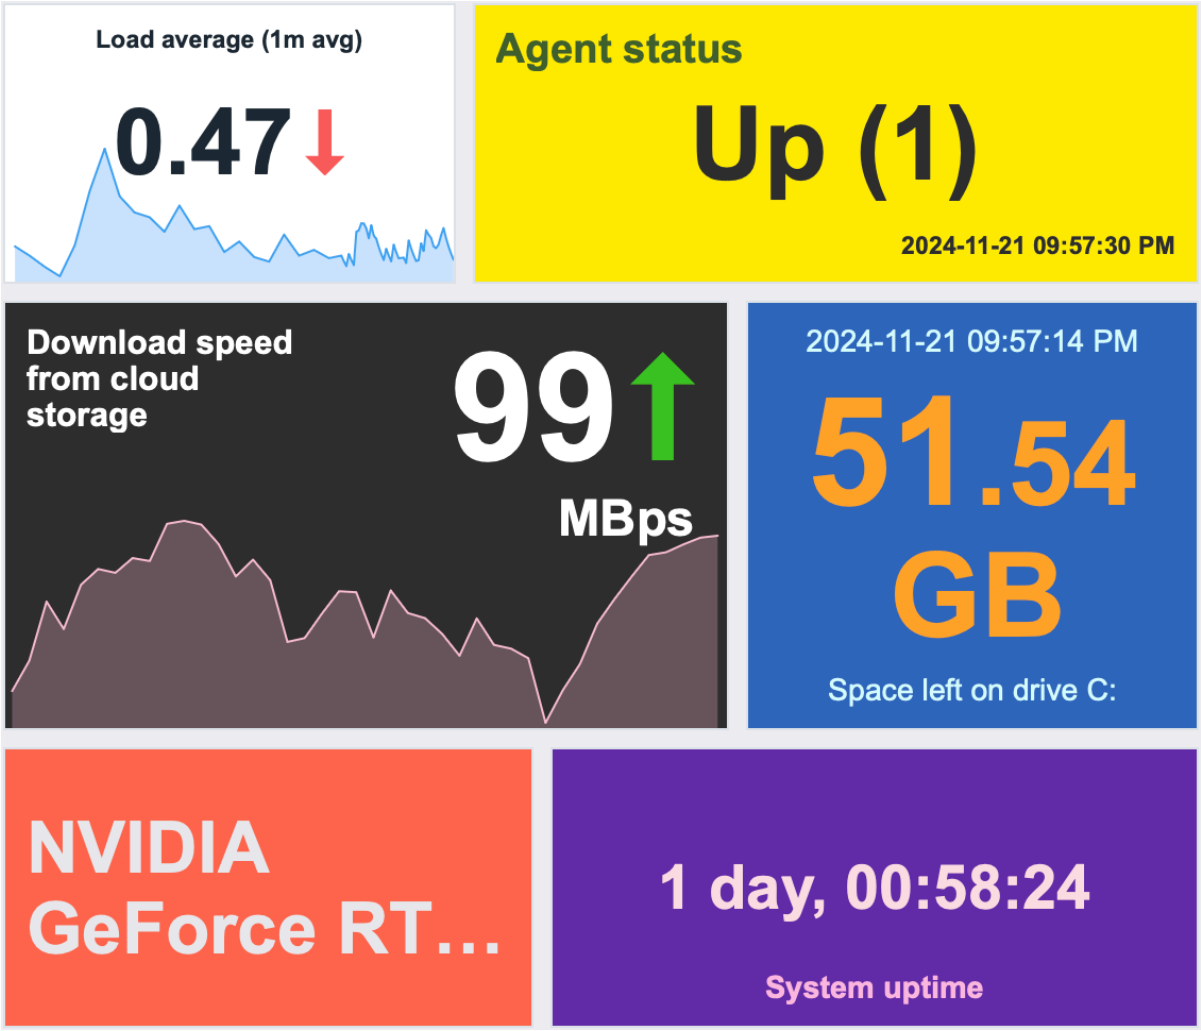
The widget is most useful for controlling what other widgets display based on the selected item.

Configuration

To configure, select *Item navigator* as type:

In addition to the parameters that are common for all widgets, you may set the following specific options:

Host groups	Select host groups. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Selecting a parent host group implicitly selects all nested host groups; if no host groups are selected, the widget will display items belonging to all hosts from all host groups. This parameter is not available when configuring the widget on a template dashboard.
Hosts	Select hosts. Alternatively, select a compatible widget or the dashboard as the data source for hosts. This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts. If no hosts are selected, the widget will display items belonging to all hosts. This parameter is not available when configuring the widget on a template dashboard.



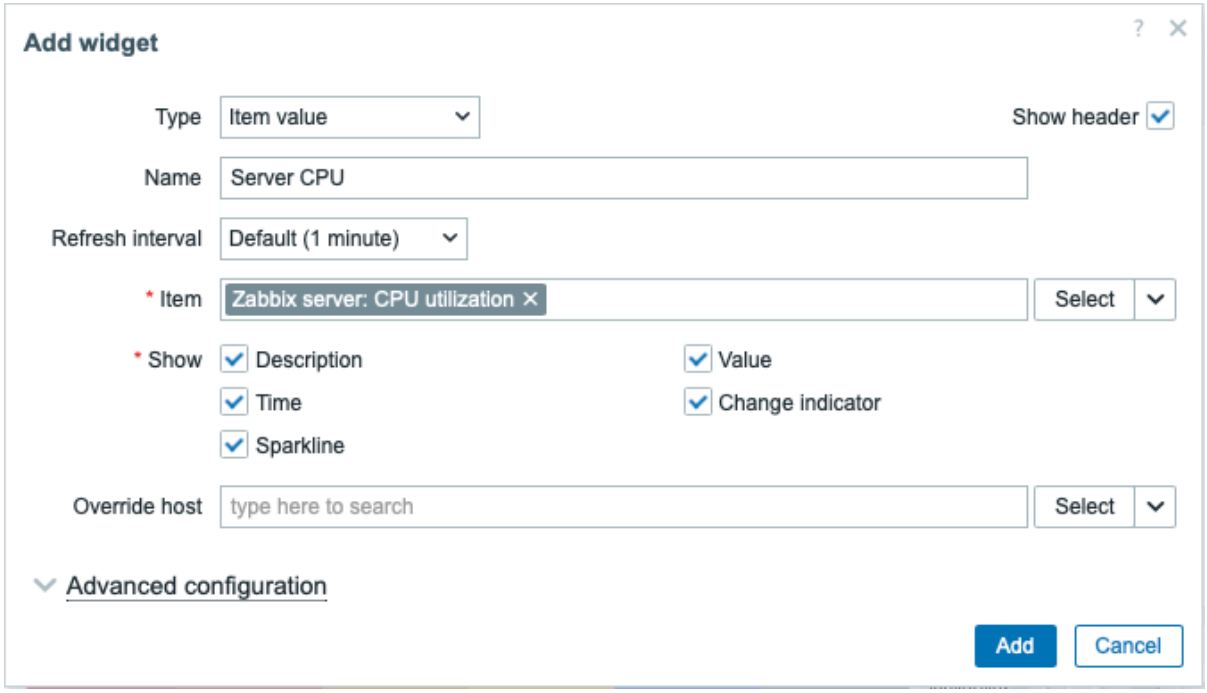
Host tags	Specify host tags to filter the items displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met. This parameter is not available when configuring the widget on a template dashboard.
Item patterns	Enter item patterns or select existing items as item patterns. Items that match the specified patterns will be displayed on the item navigator. Wildcard patterns may be used for selection (for example, `*` will return items that match zero or more characters; `Zabbix*` will return items that start with "Zabbix"). To specify a wildcard pattern, enter the string manually and press *Enter*. When you start typing, a dropdown list will show matching items limited to those belonging to selected *Hosts* or hosts within selected *Host groups*, if any. The wildcard symbol is always interpreted, therefore, it is not possible to add, for example, an item named *item** individually, if there are other matching items (e.g., item2, item3). When configuring the widget on a template dashboard, this parameter allows selecting only items configured on the template.
Item tags	Specify item tags to filter the items displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met.
State	Filter which items to display based on their state (all, normal, not supported).
Show problems	Filter which problems to display based on their status (all, unsuppressed, none). Problems are indicated with colored blocks at the end of the item row. Colors are based on problem severity, which can be customized in *Administration > General > Trigger displaying options*. Problem severities can be changed when updating problems.

Group by	Add a grouping attribute by which to group items: **Host group** - group items by host groups of their hosts; **Host name** - group items by their hosts; **Host tag value** - enter a tag name to group items by the values of this host tag (for example, enter ”city” to group items by values ”Riga”, ”Tokyo”, etc.); **Item tag value** - enter a tag name to group items by the values of this item tag (for example, enter ”component” to group items by values ”cpu”, ”memory”, etc.). Grouping attributes can be reordered by dragging up or down by the handle before the group name. Note that grouping attribute order determines group nesting order. For example, specifying multiple host tag names (1: color, 2: city) will result in items being grouped by color (red, blue, etc.) and then by city (Riga, Tokyo, etc.). An item may be displayed in multiple groups depending on the configured grouping attributes (for example, when grouping by host group and the item’s host belongs to multiple host groups). Clicking such items selects and highlights them in all groups. Items that do not match the configured grouping attributes are displayed in the *Uncategorized* group. If *Show problems* is configured to display problems, they are displayed as follows: - for each group, all subordinate item problem count is displayed; - for each item, only its problem count is displayed. Up to 10 grouping attributes can be specified, and all must be unique. If no grouping attributes are specified, items will not be grouped.
Item limit	Enter the maximum number of items to be displayed. Possible values range from 1 to 9999. When more items are available for displaying than the set limit, a corresponding message is shown below the displayed items (for example, ”100 of 100+ items are shown”). Note that the configured item limit also affects the display of configured groups; for example, if item limit is set to 100 and items are grouped by their hosts (each containing 200 items), only the first host with its 100 items will be displayed in the widget. This parameter is not affected by the *Limit for search and filter results* parameter in *Administration > General > GUI*.

Item value

Overview

The *Item value* widget displays the value of a single numeric or string item. It is useful for keeping an eye on important metrics, visualizing thresholds, and detecting sudden changes in the data.



You can configure the widget to display the following:

- Metric timestamp (2024-11-21 09:57:30)
- Item description (Load average (1m), Agent status)
- Item value, change indicator, and units (0.47 ↓, 99 ↑ Mbps)
- Background color
- Sparkline chart for values from the specified time period

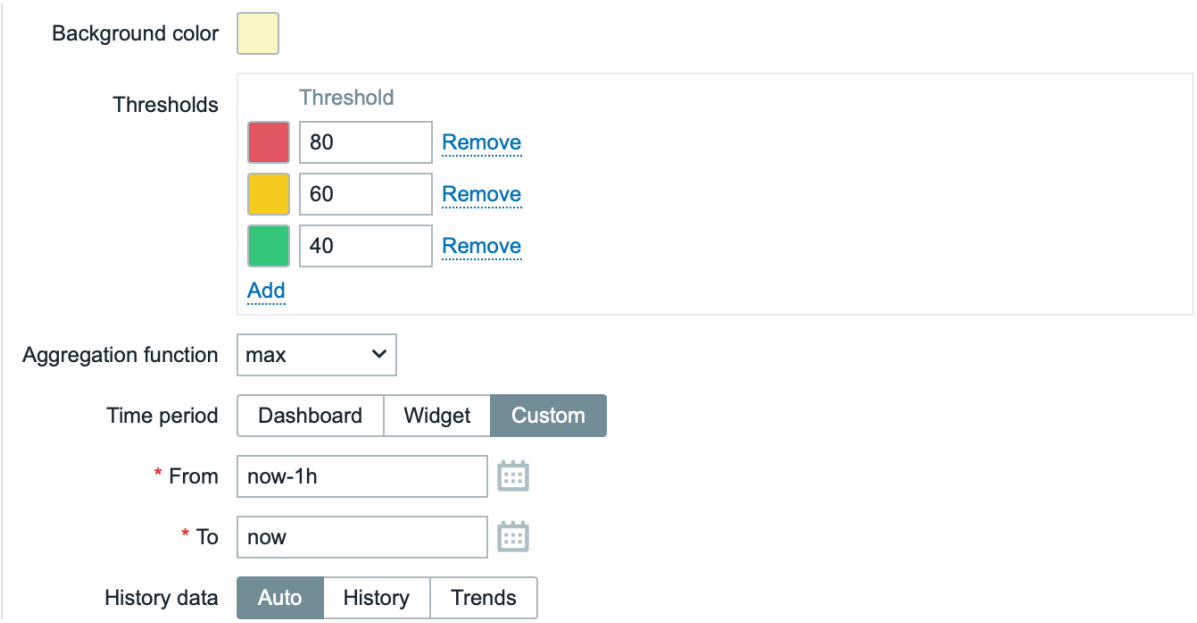
Clicking the widget opens an ad-hoc graph for numeric items or latest data for string items.

Configuration

To configure, select *Item value* as the widget type:

In addition to the parameters that are common for all widgets, you may set the following specific options:

Item	Select the item. Alternatively, select a compatible widget as the data source for the item. Items returning binary data are not supported.
Show	Mark the checkbox to display the respective element: description, value, time, change indicator, sparkline. Unmark to hide. At least one element must be selected.
Override host	Select a compatible widget or the dashboard host selector as the data source for hosts. This parameter is not available when configuring the widget on a template dashboard.
Advanced configuration	Click the *Advanced configuration* header to display advanced configuration options.



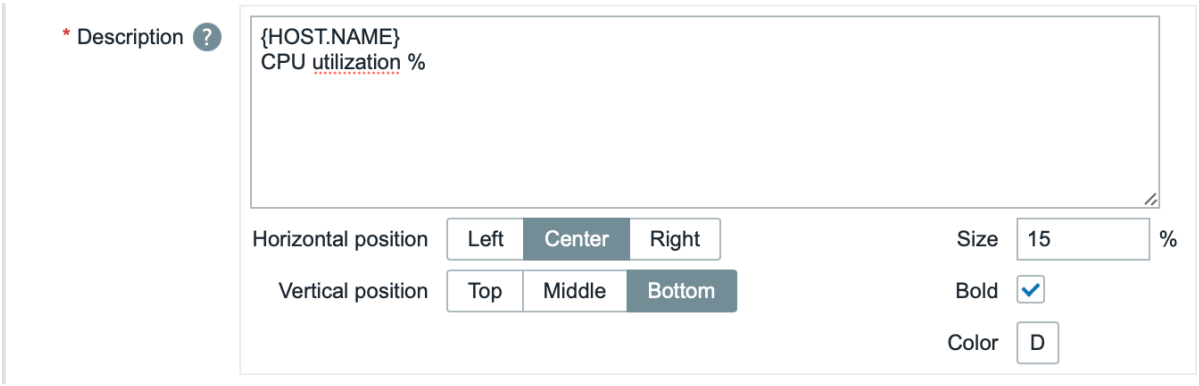
Advanced configuration

Advanced configuration options are available in the collapsible *Advanced configuration* section, and only for those elements that are selected in the *Show* field (see above).

Note that multiple elements cannot occupy the same space; if they are placed in the same space, an error message will be displayed.

Generic widget parameters

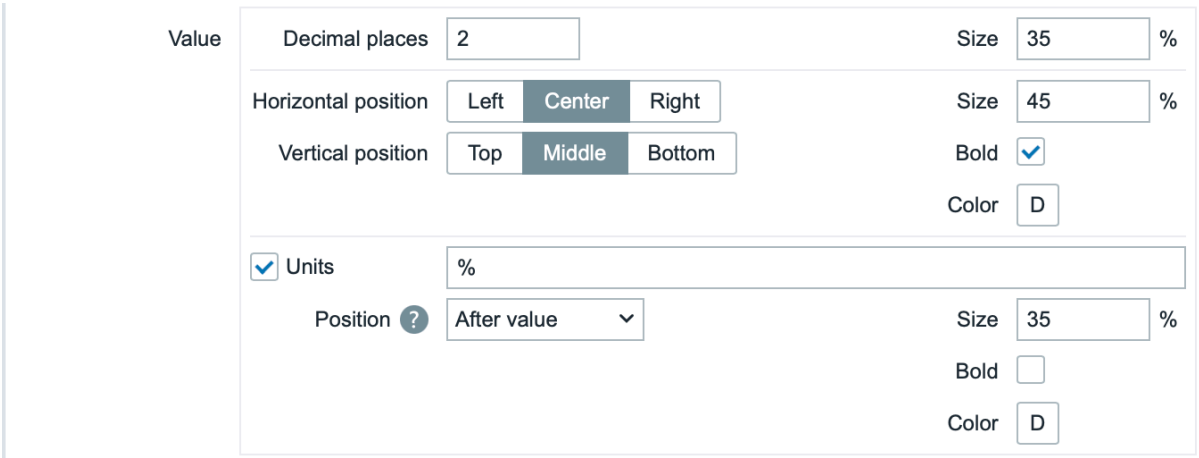
These parameters determine the background color (static or dynamic) for the whole widget and an aggregation function for displaying values.



Background color	Select the background color for the whole widget from the color picker. D stands for default color (depends on the frontend theme). To return to the default value, click the *Use default* button in the color picker.
Thresholds	Configure the dynamic background color for the whole widget. Click *Add* to add a threshold, select the background color from the color picker, and specify a numeric value. Once the item value equals or is greater than the threshold value, the background color will change. The list will be sorted in ascending order when saved. Note that the dynamic background color will be displayed correctly only for numeric items.
Aggregation function	Specify which aggregation function to use within the selected *Time period*: **min** - display the smallest value; **max** - display the largest value; **avg** - display the average value; **count** - display the count of values; **sum** - display the sum of values; **first** - display the first value; **last** - display the last value. If **not used** is selected, the most recent value is displayed (no aggregation). Aggregation allows an aggregated value to be displayed for the specified interval (5 minutes, an hour, a day), instead of the most recent value. Only numeric data can be displayed for *min*, *max*, *avg* and *sum*. For *count*, non-numeric data will be changed to numeric.
Time period	Time period to use for aggregating values. Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period. This parameter is hidden when *Aggregation function* is set to "not used".
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".

History data	Take data from history or trends: **Auto** - automatic selection; **History** - take history data; **Trends** - take trend data. This setting applies only to numeric data. Non-numeric data will always be taken from history.

Description

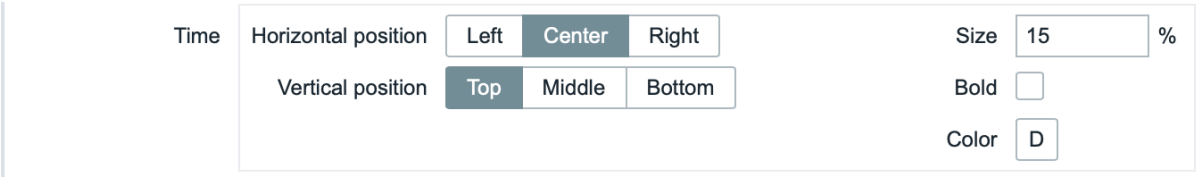


These parameters determine how the item description should be displayed.

Description	Enter the item description. This description may override the default item name. Multiline descriptions are supported. A combination of text and supported macros is possible. {HOST.*}, {ITEM.*}, {INVENTORY.*} and user macros are supported.
Horizontal position	Select horizontal position of the item description - left, right or center.
Vertical position	Select vertical position of the item description - top, bottom or middle.
Size	Enter font size height for the item description (in percent relative to total widget height).
Bold	Mark the checkbox to display item description in bold type.
Color	Select the item description color from the color picker. D stands for default color (depends on the frontend theme). To return to the default value, click the *Use default* button in the color picker.

Value

These parameters determine how the item value should be displayed.



Decimal places	Select how many decimal places will be displayed with the value. This value will affect only float items. For items with units set to ”s”, if this value is greater than 0 (the default is 2), the widget rounds the most significant time unit and displays a numeric value (e.g., ”10.43m”) instead of converting the value into a full time string. When set to 0, the seconds are converted to a human-readable time string (for example, ”4h 56m 30s”).
Size	Enter font size height for the decimal places (in percent relative to total widget height).
Horizontal position	Select horizontal position of the item value - left, right or center.
Vertical position	Select vertical position of the item value - top, bottom or middle.

Size	Enter font size height for the item value (in percent relative to total widget height). Note that the size of item value is prioritized; other elements have to concede space for the value. With the change indicator though, if the value is too large, it will be truncated to show the change indicator.
Bold	Mark the checkbox to display item value in bold type.
Color	Select the item value color from the color picker. D stands for default color (depends on the frontend theme). To return to the default value, click the *Use default* button in the color picker.
Units	
Units	Mark the checkbox to display units with the item value. If you enter a unit name, it will override the unit from item configuration.
Position	Select the item unit position - above, below, before or after the value.
Size	Enter font size height for the item unit (in percent relative to total widget height).
Bold	Mark the checkbox to display item unit in bold type.
Color	Select the item unit color from the color picker. D stands for default color (depends on the frontend theme). To return to the default value, click the *Use default* button in the color picker.

Time

These parameters determine how the time (clock value from the item history) should be displayed.

Horizontal position	Select horizontal position of the time - left, right or center.
Vertical position	Select vertical position of the time - top, bottom or middle.
Size	Enter font size height for the time (in percent relative to total widget height).
Bold	Mark the checkbox to display time in bold type.
Color	Select the time color from the color picker. D stands for default color (depends on the frontend theme). To return to the default value, click the *Use default* button in the color picker.

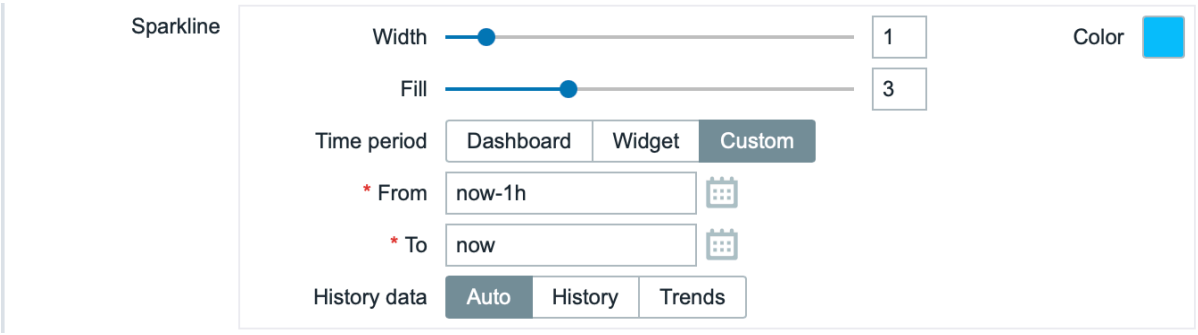
Change indicator

The section allow you to select the color of change indicators from the color picker.

The change indicators are as follows:

- ↑ - item value is up (for numeric items)
- ↓ - item value is down (for numeric items)
- ↕ - item value has changed (for string items and items with value mapping)

Note:



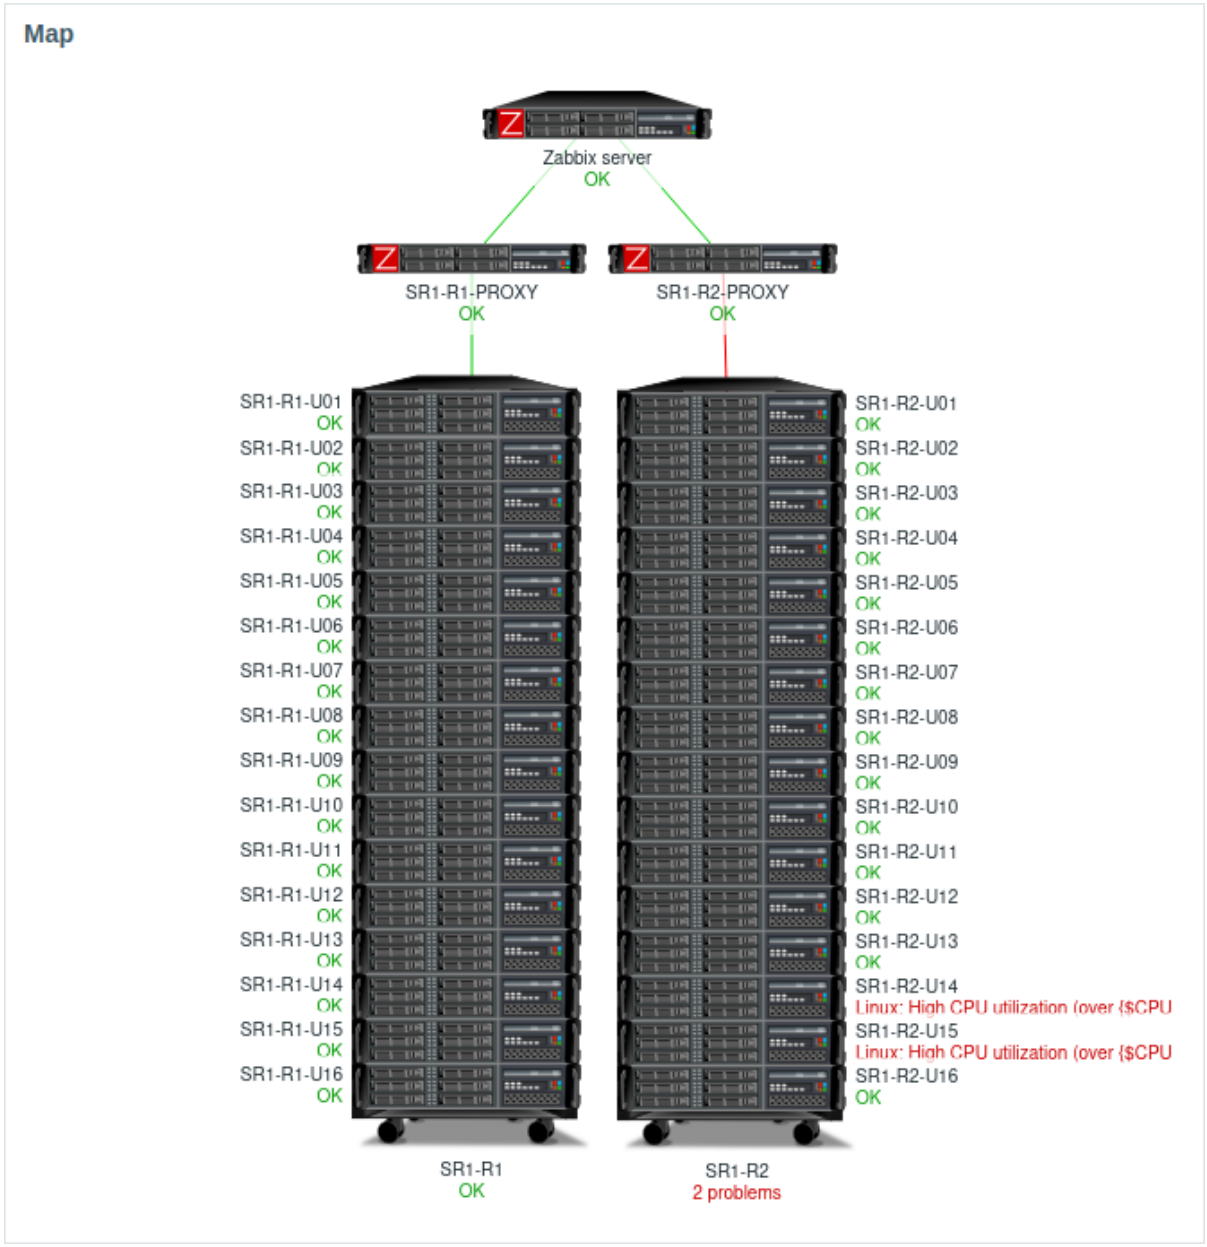
- Up (↑) and down (↓) indicators are not shown if there's only one value.
- Values are always compared within the same scope; for example:
  - The latest value is compared to the previous value.
  - A monthly value is compared to the previous month.
  - For aggregations, the previous period has the same duration as the selected period, ending immediately before the selected period begins.

D stands for default color (depends on the frontend theme). To return to the default value, click the *Use default* button in the color picker.

Vertical size of the change indicator is equal to the size of the value (integer part of the value for numeric items).

Sparkline

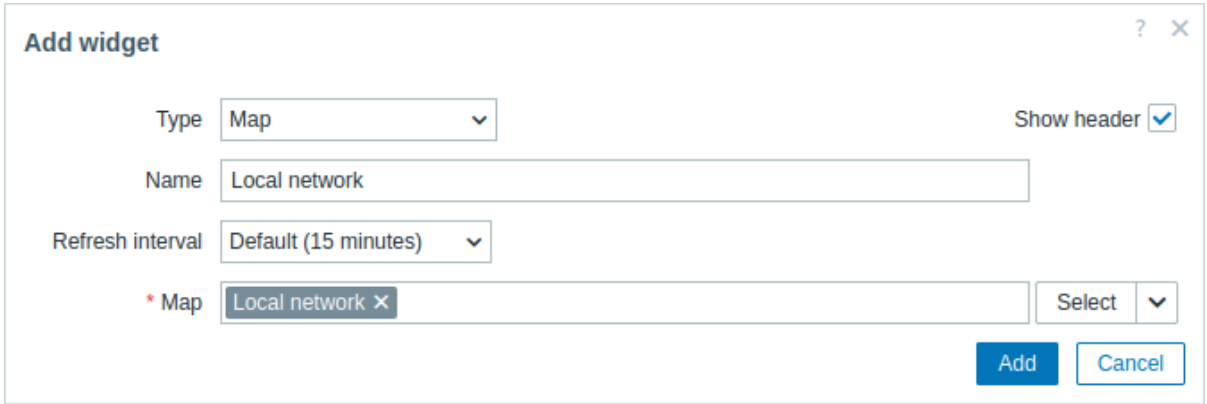
These parameters determine how the sparkline chart should be displayed.



Width	Set the graph line thickness by using the slider or manually entering a value in the range from 0 to 10.
Color	Select line and fill color.
Fill	Set fill color transparency level by using the slider or manually entering a value in the range from 0 to 10.
Time period	Specify the time period for values to be included into the sparkline chart. Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period. This parameter is not available if *Aggregation function* is set to "not used".
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
History data	Take data from history or trends: **Auto** - automatic selection; **History** - take history data; **Trends** - take trend data.

Map

Overview

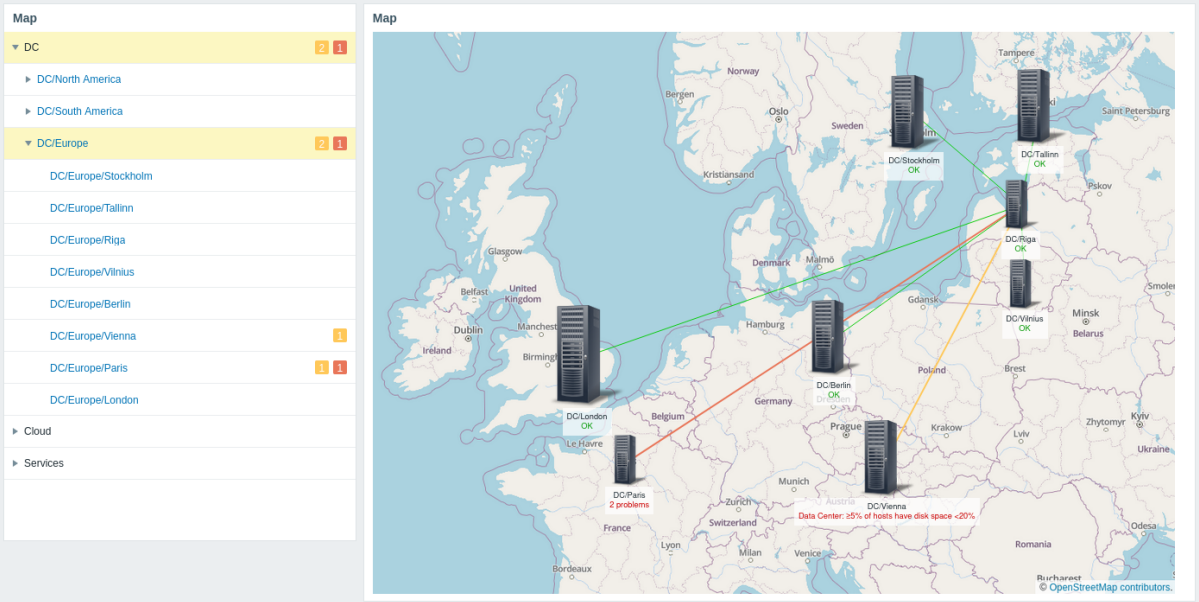


The *Map* widget can display a network map or a similar visualization, providing you a dynamic overview of your network.

You can pair it with the Map navigation tree widget to dynamically display the map selected in the tree.

Configuration

To configure, select *Map* as type:



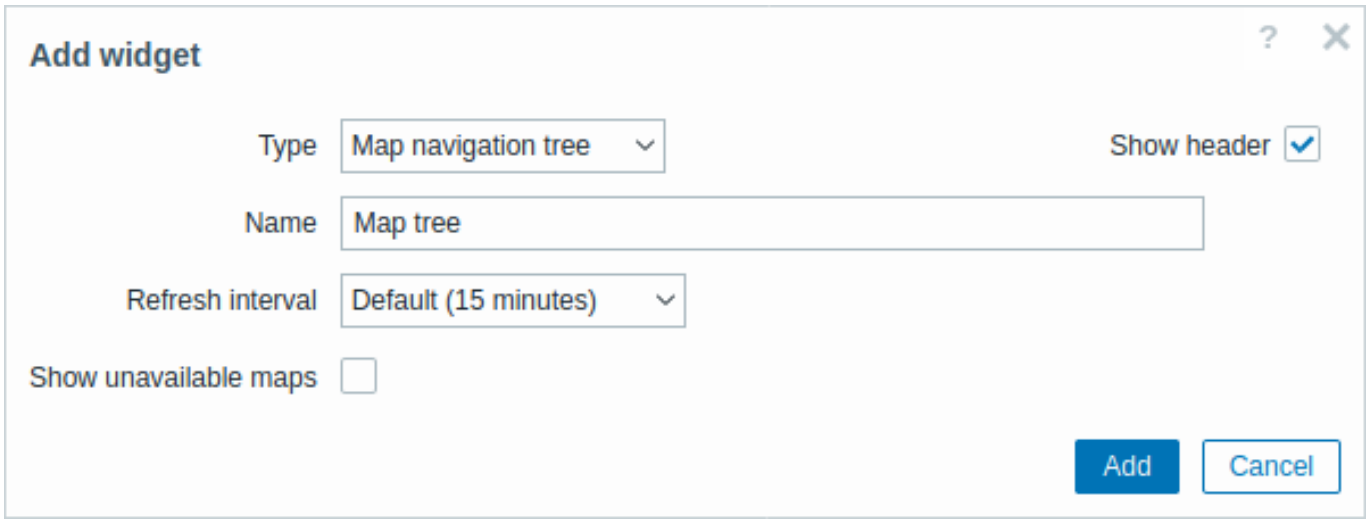
In addition to the parameters that are common for all widgets, you may set the following specific options:

Map	Set a map to display. Alternatively, select a compatible widget as the data source for the map to display. This field is auto-complete, so starting to type the name of the map or widget will offer a dropdown of matching maps or widgets.

Map navigation tree

Overview

The *Map navigation tree* widget displays a hierarchy of existing maps and the problem count for each map and map group.

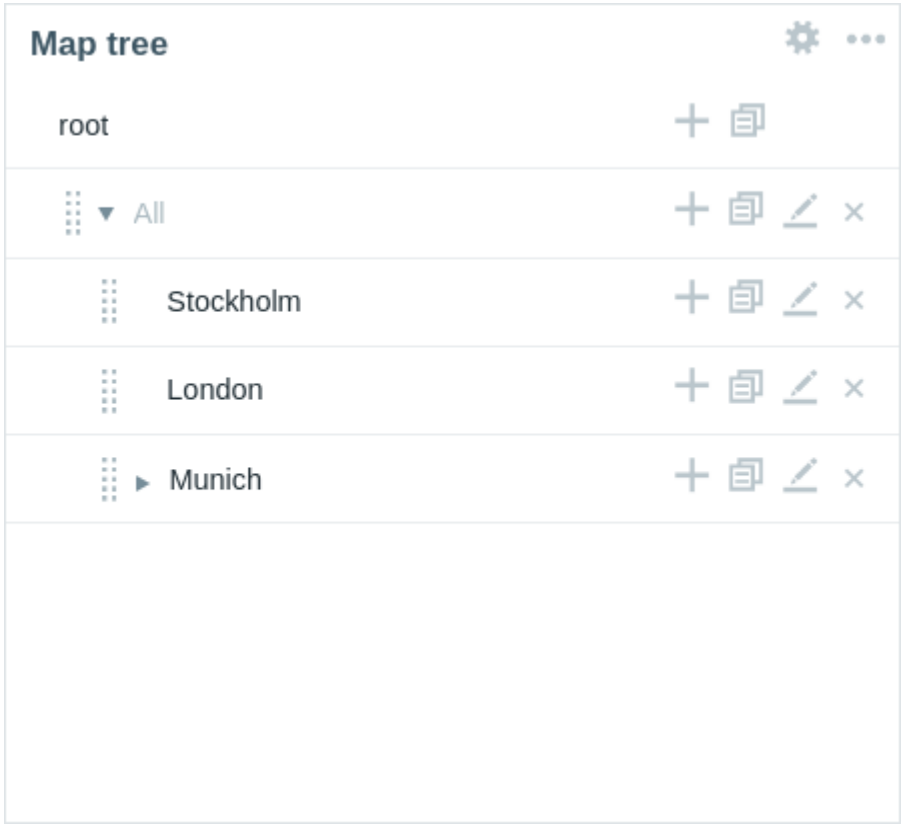


You can pair it with the Map widget to dynamically display the map selected in the tree.

The problem count for the top-level map in the hierarchy includes all submap problems and its own.

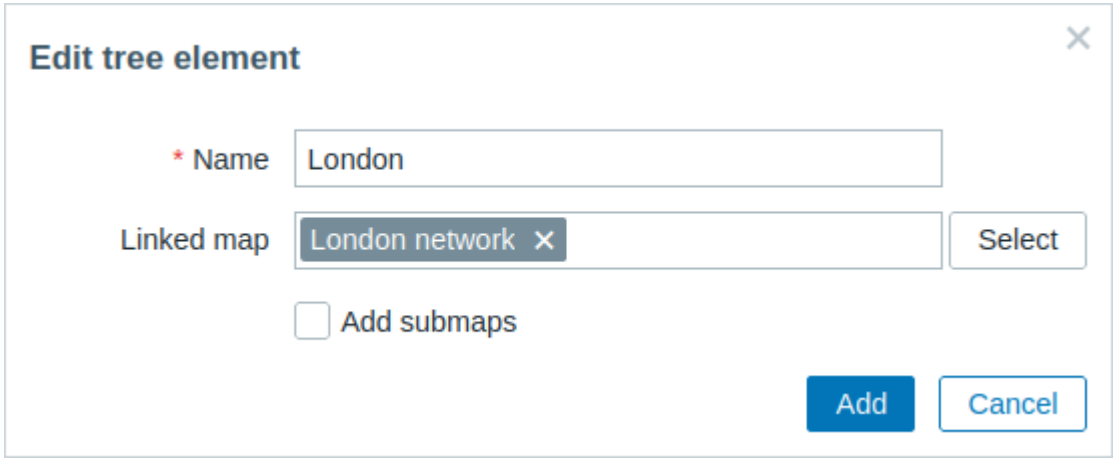
Configuration

To configure, select *Map navigation tree* as type:



In addition to the parameters that are common for all widgets, you may set the following specific options:

Show unavailable maps	Mark this checkbox to display maps that the user does not have read permission to. Unavailable maps in the navigation tree will be displayed with a grayed-out icon. Note that if this checkbox is marked, available submaps are displayed even if the parent level map is unavailable. If unmarked, available submaps to an unavailable parent map will not be displayed at all. Problem count is calculated based on available maps and available map elements.

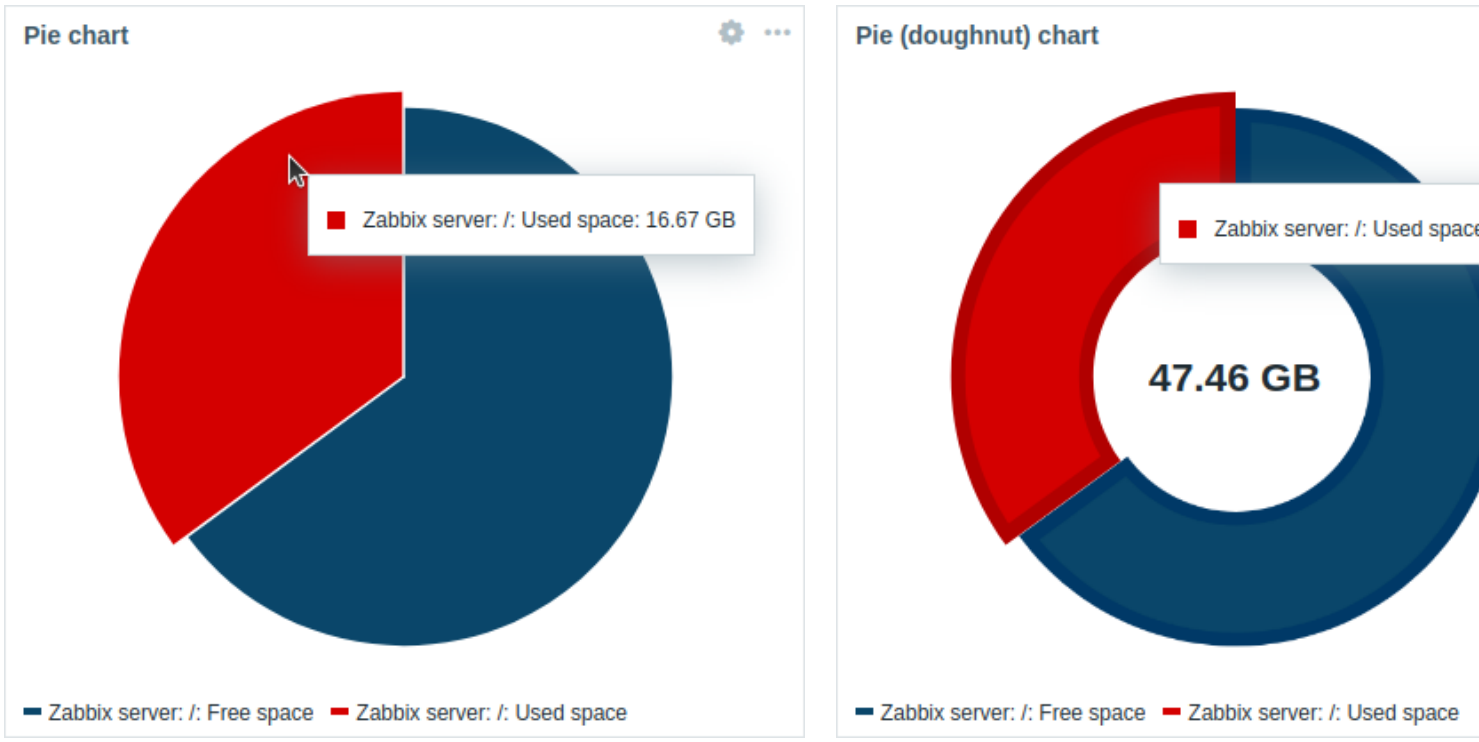


Navigation tree elements are displayed in a list. You can:

- drag an element (including its child elements) to a new place in the list;
- expand or collapse an element to display or hide its child elements;
- add a child element (with or without a linked map) to an element;
- add multiple child elements (with linked maps) to an element;
- edit an element;
- remove an element (including its child elements).

Element configuration

To configure a navigation tree element, either add a new element or edit an existing element.



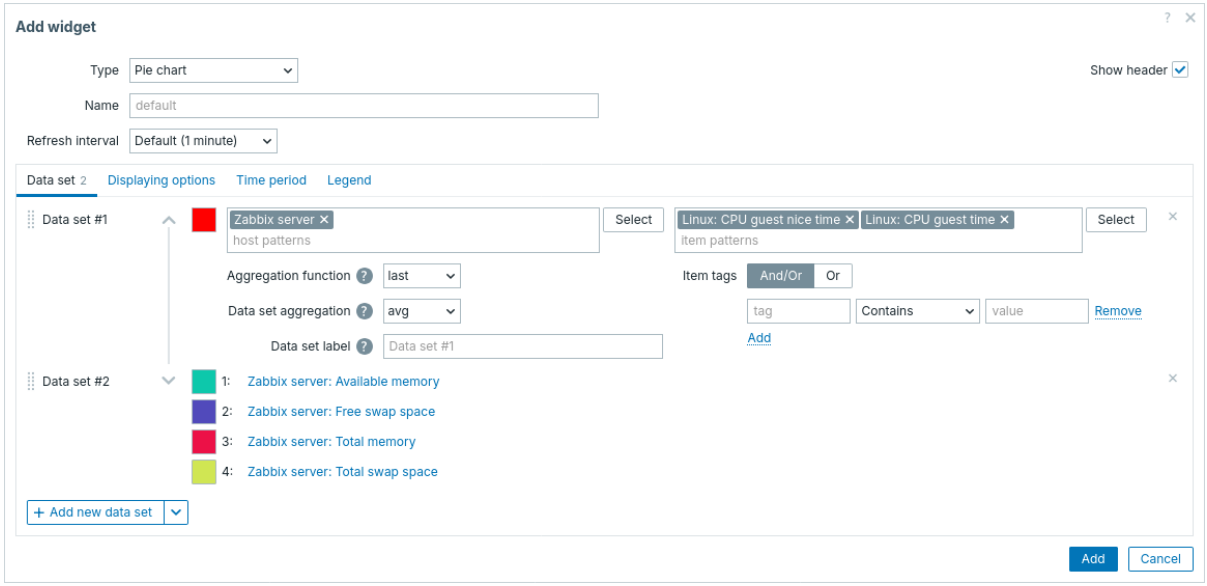
The following navigation tree element configuration parameters are available:

Name	Enter the navigation tree element name.
Linked map	Select the map to link to the navigation tree element. This field is auto-complete, so starting to type the name of a map will offer a dropdown of matching maps.
Add submaps	Mark this checkbox to add the submaps of the linked map as child elements to the navigation tree element.

Pie chart

Overview

The *Pie chart* widget displays numeric item data as a vector-based pie or doughnut chart. This widget can help you visualize how items or hosts contribute to the overall dataset.



On mouseover, the hovered sector expands and shows its legend; clicking the sector keeps it expanded and its legend visible until closed.

The information displayed in the *Pie chart* widget can be downloaded as a PNG image by selecting the *Download image* option in the widget *Actions* menu ... that appears when you hover over the widget. Depending on your browser settings, the image is either automatically saved to the `Downloads` folder, or a *Save* dialog opens, allowing you to choose the location.

Configuration

To configure, select *Pie chart* as type:

Data set

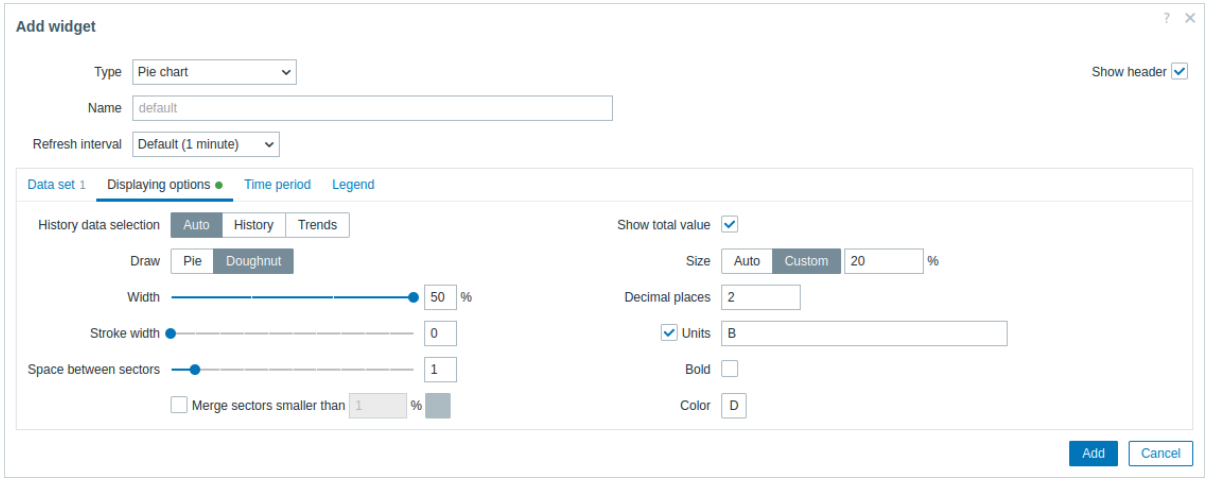
The **Data set** tab allows selecting data for the pie chart by adding data sets. Two types of data sets can be added:

- *Item patterns* - data from matching items is displayed. You can pick a single base color or select a palette row to assign distinct colors to each matched item.
- *Item list* - data from selected items is displayed. You can choose each item's color individually from the picker.

By default, an *Item patterns* data set is added.

Data set	For **Item patterns** data set: Select or enter host and item patterns; data of items that match the entered patterns will be displayed on the pie chart; up to 50 items may be displayed. Wildcard patterns may be used for selection (for example, ∗ will return results that match zero or more characters). To specify a wildcard pattern, enter the string manually and press *Enter*. The wildcard symbol is always interpreted, so it is not possible to add, for example, an item named *item** individually if there are other matching items (for example, *item2*, *item3*). Specifying host and item patterns is mandatory for "Item patterns" data sets. See also: Data set configuration details. For **Item list** data set: Select items for the pie chart by clicking the *Add item* button. The *Type* dropdown after the item name allows you to select the display type for each item: **Normal** - item value is represented proportionally on the pie chart (default); **Total** - item value takes up the whole pie chart. Note that only one "Total" item can exist per pie chart, and it will be placed first on the pie chart legend. If an item is set to "Total", the *Data set aggregation* parameter (see below) will be disabled and set to "not used". You may also select compatible widgets as the data source for items by clicking the *Add widget* button. The same options apply to widgets as to individual items. Specifying items or widgets is mandatory for "Item list" data sets. See also: Data set configuration details. Note that only numeric item types are allowed. When configuring the widget on a template dashboard, the parameter for specifying host patterns is not available, and the parameter for specifying an item list allows you to select only the items configured on the template.

Aggregation function	Specify which aggregation function to use for each item in the data set within the selected *Time period*: **min** - display the smallest value; **max** - display the largest value; **avg** - display the average value; **sum** - display the sum of values; **count** - display the count of values; **first** - display the first value; **last** - display the last value (default). Aggregation allows an aggregated value to be displayed for the specified interval (5 minutes, an hour, a day). Only numeric data can be displayed for *min*, *max*, *avg* and *sum*. For *count*, non-numeric data will be changed to numeric.
Data set aggregation	Specify which aggregation function to use for the whole data set: **not used** - no aggregation, items are displayed separately (default); **min** - display the smallest value; **max** - display the largest value; **avg** - display the average value; **sum** - display the sum of values; **count** - display the count of values. Aggregation allows an aggregated value to be displayed for the specified interval (5 minutes, an hour, a day) selected in the *Time period* tab or used for the whole dashboard.
Data set label	Specify a custom label for the data set. The label is displayed in the data set configuration and the pie chart legend (for aggregated data sets). All data sets are numbered including those with a specified *Data set label*. If no label is specified, the data set will be labeled automatically according to its number (e.g., ”Data set #2”, ”Data set #3”, etc.). Data set numbering is recalculated after reordering/dragging data sets. Data set labels that are too long will be shortened to fit where displayed (e.g., ”Number of proc...”).
Item tags	Specify tags to filter the items displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met.

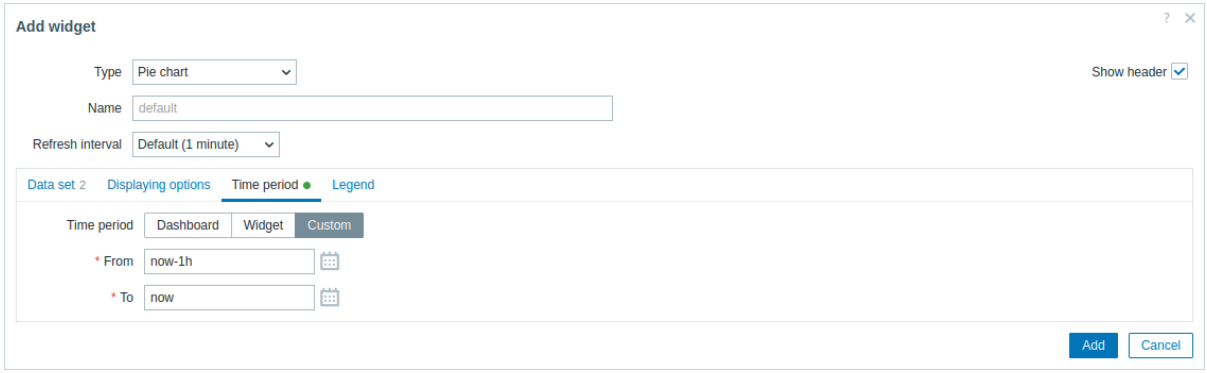


Data set configuration details

Existing data sets are displayed in a list. You can rearrange, expand/collapse, change colors, and clone these data sets.

For more information, see data set configuration details in the *Graph* widget. These details also apply to the *Pie chart* widget.

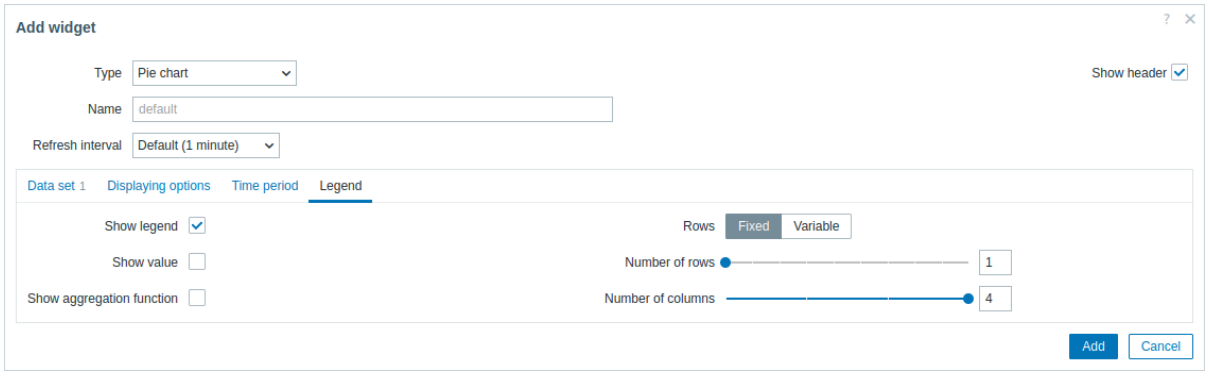
Displaying options



The **Displaying options** tab allows you to define history data selection and visualization options for the pie chart:

History data selection	Select the data source: **Auto** - data is sourced according to the classic algorithm (default); **History** - data from history; **Trends** - data from trends.
Draw	Select the visualization style of the pie chart: **Pie** - a full pie (sectors take up 100% of the radius); **Doughnut** - a pie with empty circle in the middle (sectors use up to 50% of radius).
Space between sectors	Select the space size (in units of 0-10) between sectors (default is ”1”).
Merge sectors smaller than N%	Mark the checkbox to merge sectors smaller than the N%. If enabled, select the color for the merged sectors and the percentage threshold (N) for merging small sectors.
Draw style: Doughnut	
Width	Select the doughnut width: 20, 30, 40 or 50% (default) of the radius.
Stroke width	Select the width of the doughnut sector border (0-10).
Show total value	Mark the checkbox to show the total value in the middle of the doughnut chart.
Size	Select the size option for the total value: **Auto** - the text is sized automatically to fit the doughnut middle readably; **Custom** - specify the text size as height percentage from the total widget height.
Decimal places	Specify the number of decimal places for the total value (0-6).
Units	Specify the units for the total value.
Bold	Mark the checkbox to display the total value in bold.
Color	Select the color for the total value.

Time period

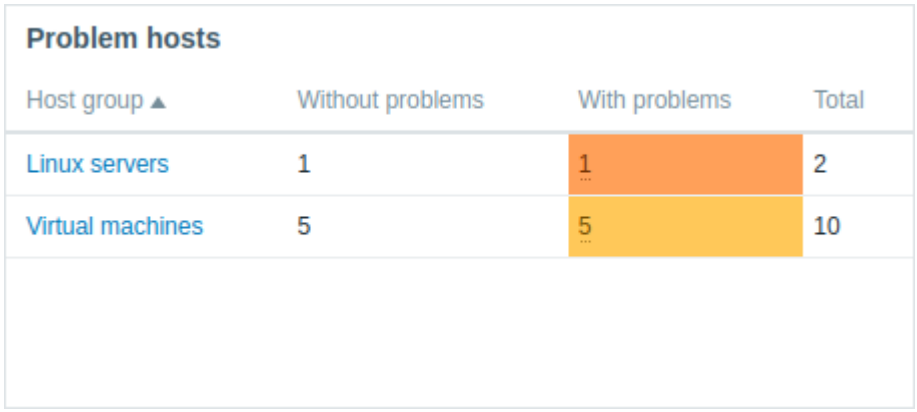


The **Time period** tab allows you to set a custom time period for the aggregation settings of the pie chart:

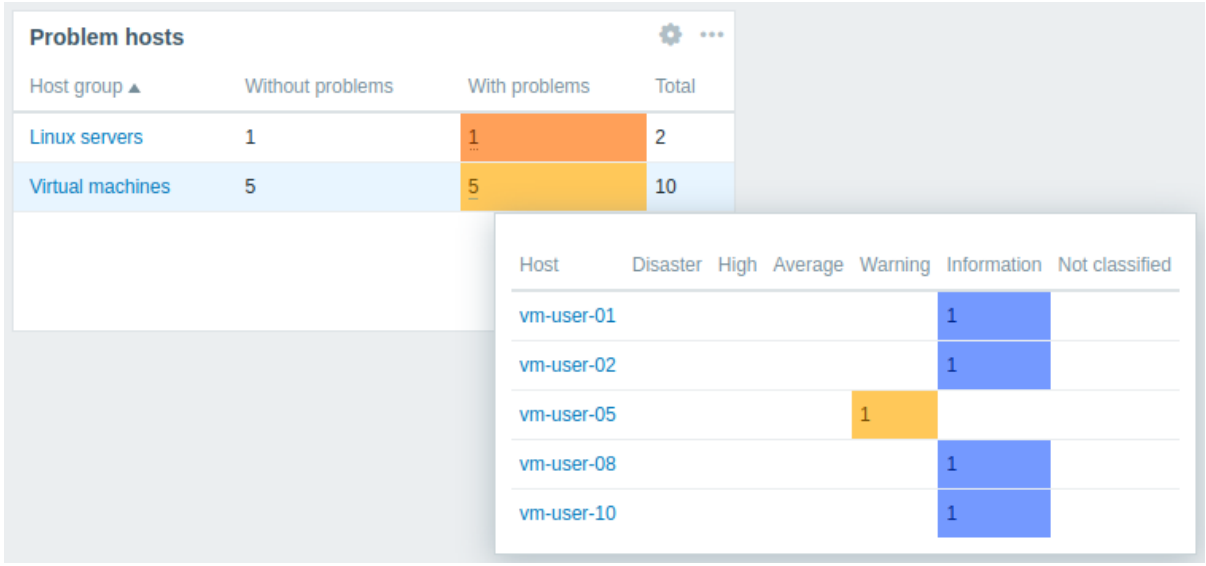
Time period	Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period specified in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period.
Widget	Enter or select a compatible widget (*Graph*, *Graph (classic)*, *Graph prototype*) as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".

Legend

The **Legend** tab allows you to customize the pie chart legend:



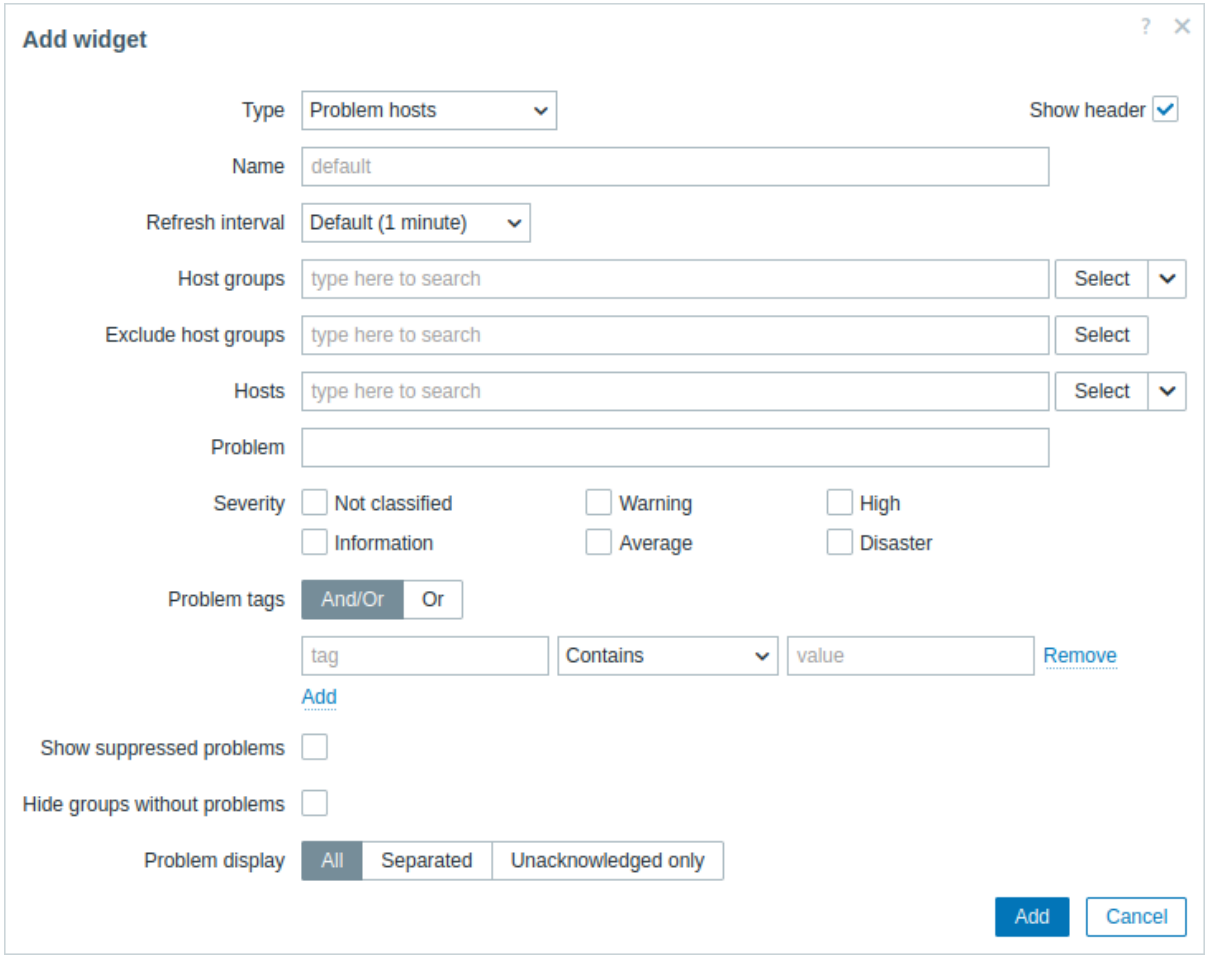
Show legend	Unmark this checkbox to hide the legend on the pie chart (marked by default).
Show value	Mark this checkbox to show the value of the item in the legend.
Show aggregation function	Mark this checkbox to show the aggregation function in the legend.
Rows	Select the display mode for legend rows: **Fixed** - the number of rows displayed is determined by the *Number of rows* parameter value; **Variable** - the number of rows displayed is determined by the amount of configured items while not exceeding the *Maximum number of rows* parameter value.
Number of rows/ Maximum number of rows	If *Rows* is set to "Fixed", set the number of legend rows to be displayed (1-10). If *Rows* is set to "Variable", set the maximum number of legend rows to be displayed (1-10).
Number of columns	Set the number of legend columns to be displayed (1-4). This parameter is available if *Show value* is unmarked.



Problem hosts

Overview

The *Problem hosts* widget displays the number of cause problems per host group and shows the highest problem severity in each group. It allows filtering problems by different parameters (host groups, hosts, problem names, etc.).

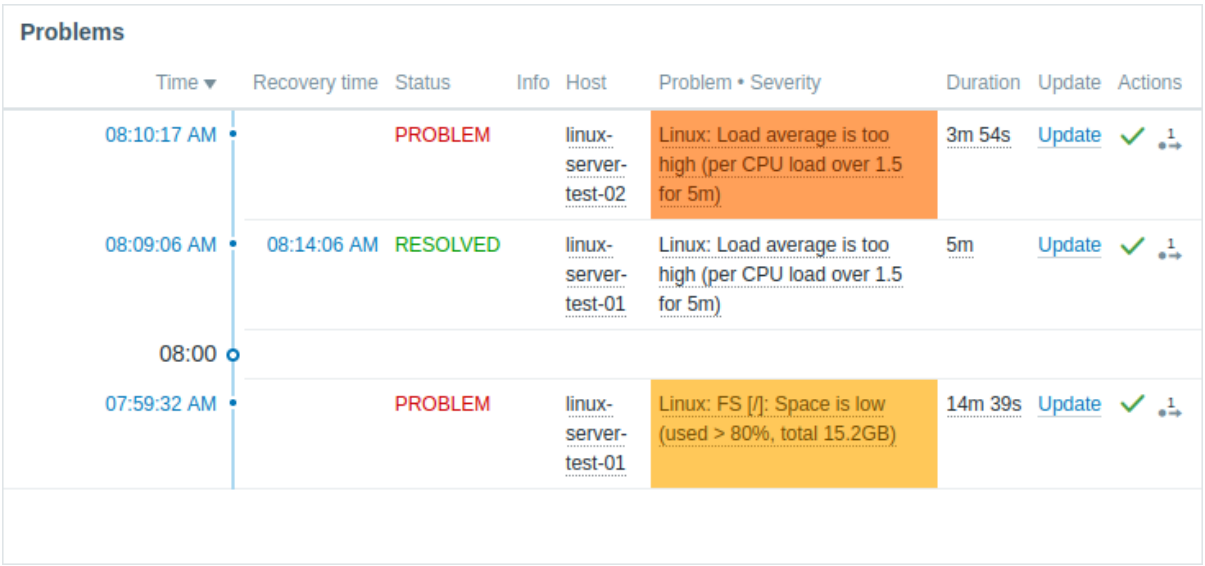


Hovering over a problem count shows the list of hosts with problems:

Configuration

To configure, select *Problem hosts* as type:

In addition to the parameters that are common for all widgets, you may set the following specific options:

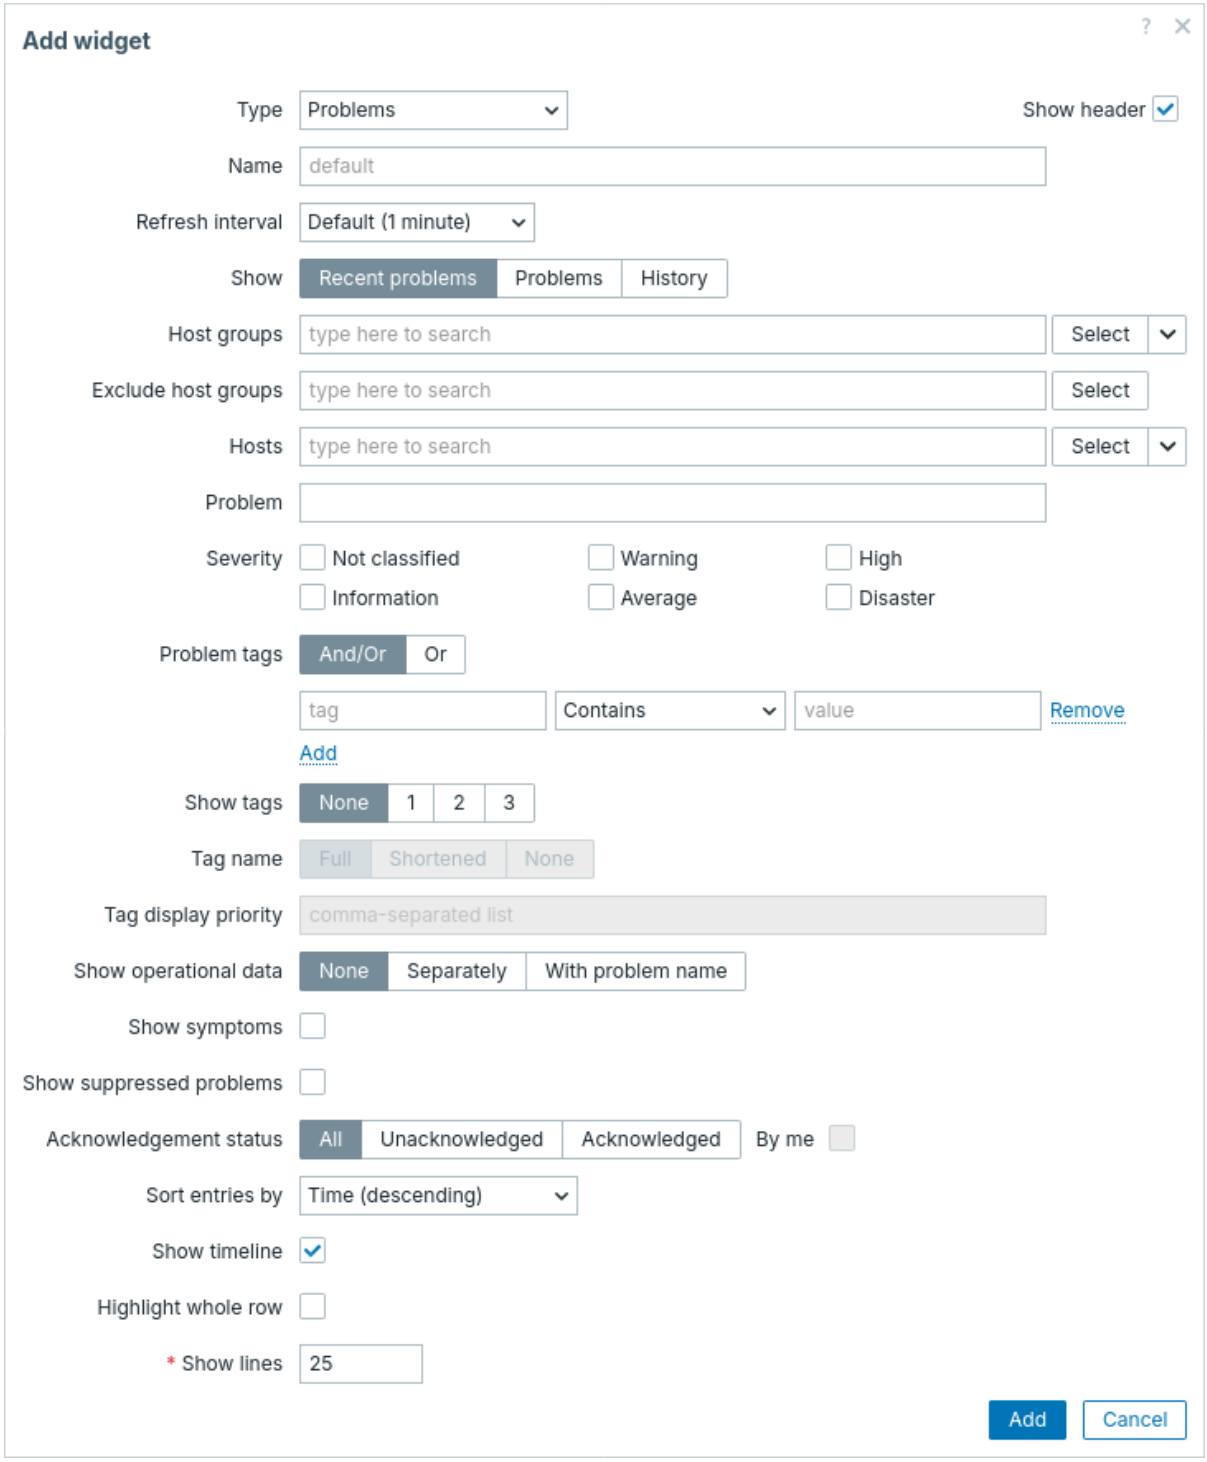


Host groups	Select host groups to display in the widget. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Specifying a parent host group implicitly selects all nested host groups. Host data from these host groups will be displayed in the widget; if no host groups are entered, all host groups will be displayed. This parameter is not available when configuring the widget on a template dashboard.
Exclude host groups	Select host groups to hide from the widget. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Specifying a parent host group implicitly selects all nested host groups. Host data from these host groups will not be displayed in the widget. For example, hosts 001, 002, 003 may be in Group A and hosts 002, 003 in Group B as well. If we select to *show* Group A and *exclude* Group B at the same time, only data from host 001 will be displayed in the dashboard. This parameter is not available when configuring the widget on a template dashboard.
Hosts	Select hosts to display in the widget. Alternatively, select a compatible widget or the dashboard as the data source for hosts. This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts. If no hosts are entered, all hosts will be displayed. This parameter is not available when configuring the widget on a template dashboard.
Problem	You can limit the number of problem hosts displayed by the problem name. If you enter a string here, only those hosts with problems whose name contains the entered string will be displayed. Macros are not expanded.
Severity	Mark problem severities to filter problems to be displayed in the widget. If no severities are marked, all problems will be displayed.

Problem tags	Specify problem tags to limit the number of problems displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the *Or* condition; **Or** - enough if one condition is met.
Show suppressed problems	Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance.
Hide groups without problems	Mark the *Hide groups without problems* option to hide data from host groups without problems in the widget. This parameter is not available when configuring the widget on a template dashboard.
Problem display	Display problem count as: **All** - full problem count will be displayed; **Separated** - unacknowledged problem count will be displayed separated as a number of the total problem count; **Unacknowledged only** - only the unacknowledged problem count will be displayed.

Problems

Overview



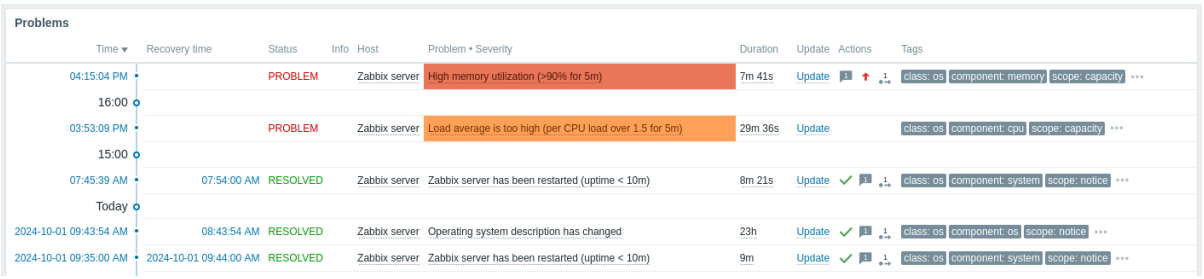
The *Problems* widget displays current problems filtered by different parameters (host groups, hosts, problem names, etc.), giving you a clear view of what needs attention.

It displays the same data as *Monitoring* > *Problems* and can display up to 1000 records.

Configuration

To configure, select *Problems* as type:

You can limit how many problems are displayed in the widget in various ways - by problem status, problem name, severity, host group, host, event tag, acknowledgment status, etc.



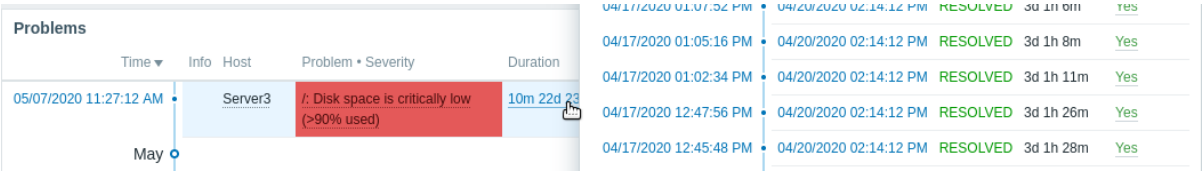
In addition to the parameters that are common for all widgets, you may set the following specific options:

Show	Filter by problem status: **Recent problems** - unresolved and recently resolved problems are displayed (default); **Problems** - unresolved problems are displayed; **History** - history of all events is displayed.
Host groups	Select host groups to display problems of in the widget. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Specifying a parent host group implicitly selects all nested host groups. Problems from these host groups will be displayed in the widget; if no host groups are entered, problems from all host groups will be displayed. This parameter is not available when configuring the widget on a template dashboard.

Exclude host groups	Select host groups to hide problems of from the widget. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Specifying a parent host group implicitly selects all nested host groups. Problems from these host groups will not be displayed in the widget. For example, hosts 001, 002, 003 may be in Group A and hosts 002, 003 in Group B as well. If we select to *show* Group A and *exclude* Group B at the same time, only problems from host 001 will be displayed in the widget. This parameter is not available when configuring the widget on a template dashboard.
Hosts	Select hosts to display problems of in the widget. Alternatively, select a compatible widget or the dashboard as the data source for hosts. This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts. If no hosts are entered, problems of all hosts will be displayed. This parameter is not available when configuring the widget on a template dashboard.
Problem	You can limit the number of problems displayed by their name. If you enter a string here, only those problems whose name contains the entered string will be displayed. Macros are not expanded.
Severity	Mark problem severities to filter problems to be displayed in the widget. If no severities are marked, all problems will be displayed.
Problem tags	Specify problem tags to limit the number of problems displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the *Or* condition; **Or** - enough if one condition is met. When filtered, the tags specified here will be displayed first with the problem, unless overridden by the *Tag display priority* (see below) list.
Show tags	Select the number of displayed tags: **None** - no *Tags* column; **1** - *Tags* column contains one tag; **2** - *Tags* column contains two tags; **3** - *Tags* column contains three tags. To see all tags for the problem roll your mouse over the three dots icon.
Tag name	Select tag name display mode: **Full** - tag names and values are displayed in full; **Shortened** - tag names are shortened to 3 symbols, but tag values are displayed in full; **None** - only tag values are displayed; no names.
Tag display priority	Enter tag display priority for a problem, as a comma-separated list of tags. Only tag names should be used, no values. Example: `Services,Applications,Application` The tags of this list will always be displayed first, overriding the natural ordering by alphabet.
Show operational data	Select the mode for displaying operational data: **None** - no operational data is displayed; **Separately** - operational data is displayed in a separate column; **With problem name** - append operational data to the problem name, using parentheses for the operational data. For details, see the description of the *Operational data* field in trigger configuration.

Show symptoms	Mark the checkbox to display in its own line problems classified as symptoms.
Show suppressed problems	Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance or single problem suppression.
Acknowledgement status	Filter to display all problems, unacknowledged problems only, or acknowledged problems only. Mark the additional checkbox to filter out those problems ever acknowledged by you.
Sort entries by	Sort entries by: **Time** (descending or ascending); **Severity** (descending or ascending); **Problem name** (descending or ascending); **Host** (descending or ascending). Sorting entries by **Host** (descending or ascending) is not available when configuring the widget on a template dashboard.
Show timeline	Mark the checkbox to display a visual timeline.
Highlight whole row	Mark the checkbox to highlight the full line for unresolved problems. The problem severity color is used for highlighting. *Highlight whole row* is not available in the high-contrast themes.
Show lines	Specify the number of problem lines to display.

Using the widget

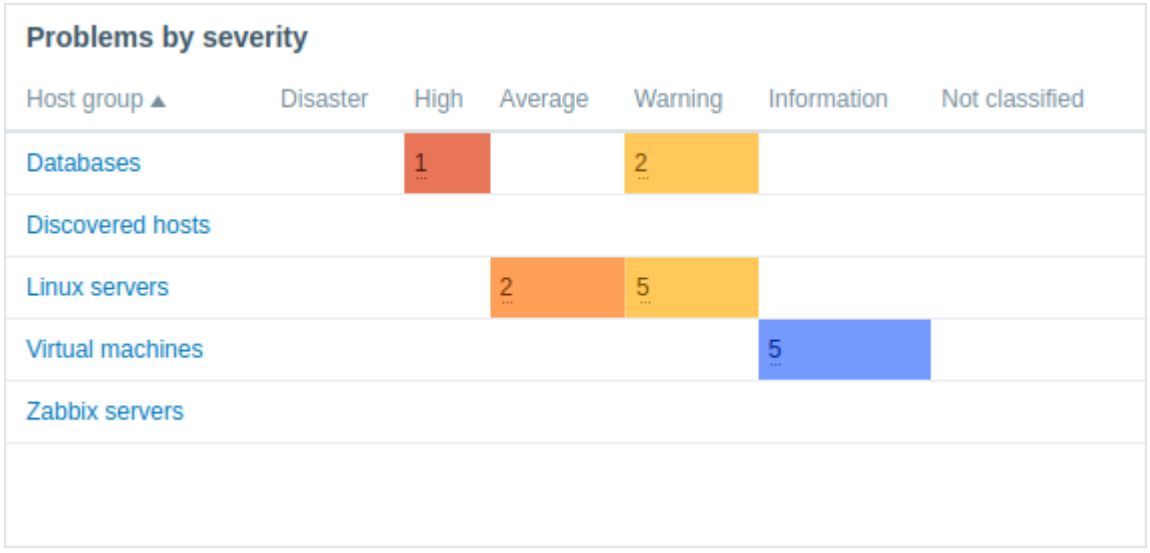


Problems widget offers quick access to additional information:

- Click the problem date (in the Time column) or the recovery date (in the Recovery Time column) to view event details.
- If the Info field is not empty, hover over the displayed icon to view additional details.
- Click the host name to open the host menu.
- Click the problem name to open the event menu.
- Hover over or click the problem duration to view problem event popup.
- Clicking *Update* opens an Update problem window.
- Hover over or click the gray arrow icon in Actions column to view list of executed actions.

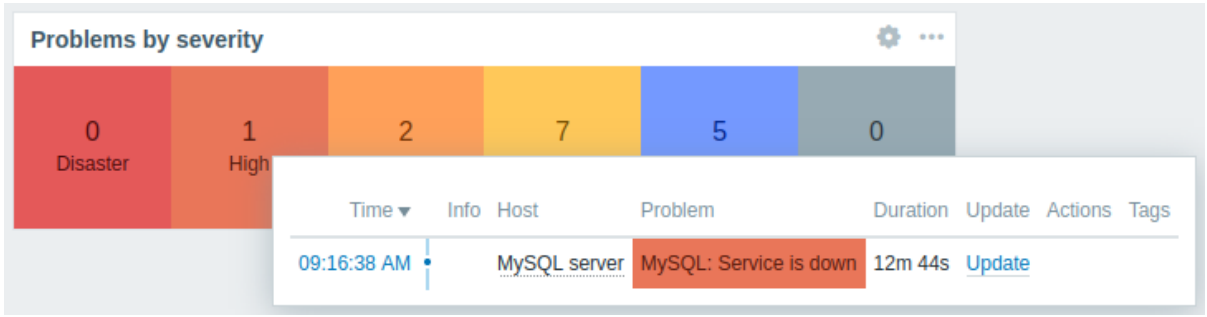
Problem event popup

The problem event popup includes the list of problem events for this trigger and, if defined, the trigger description and a clickable URL.



To bring up the problem event popup:

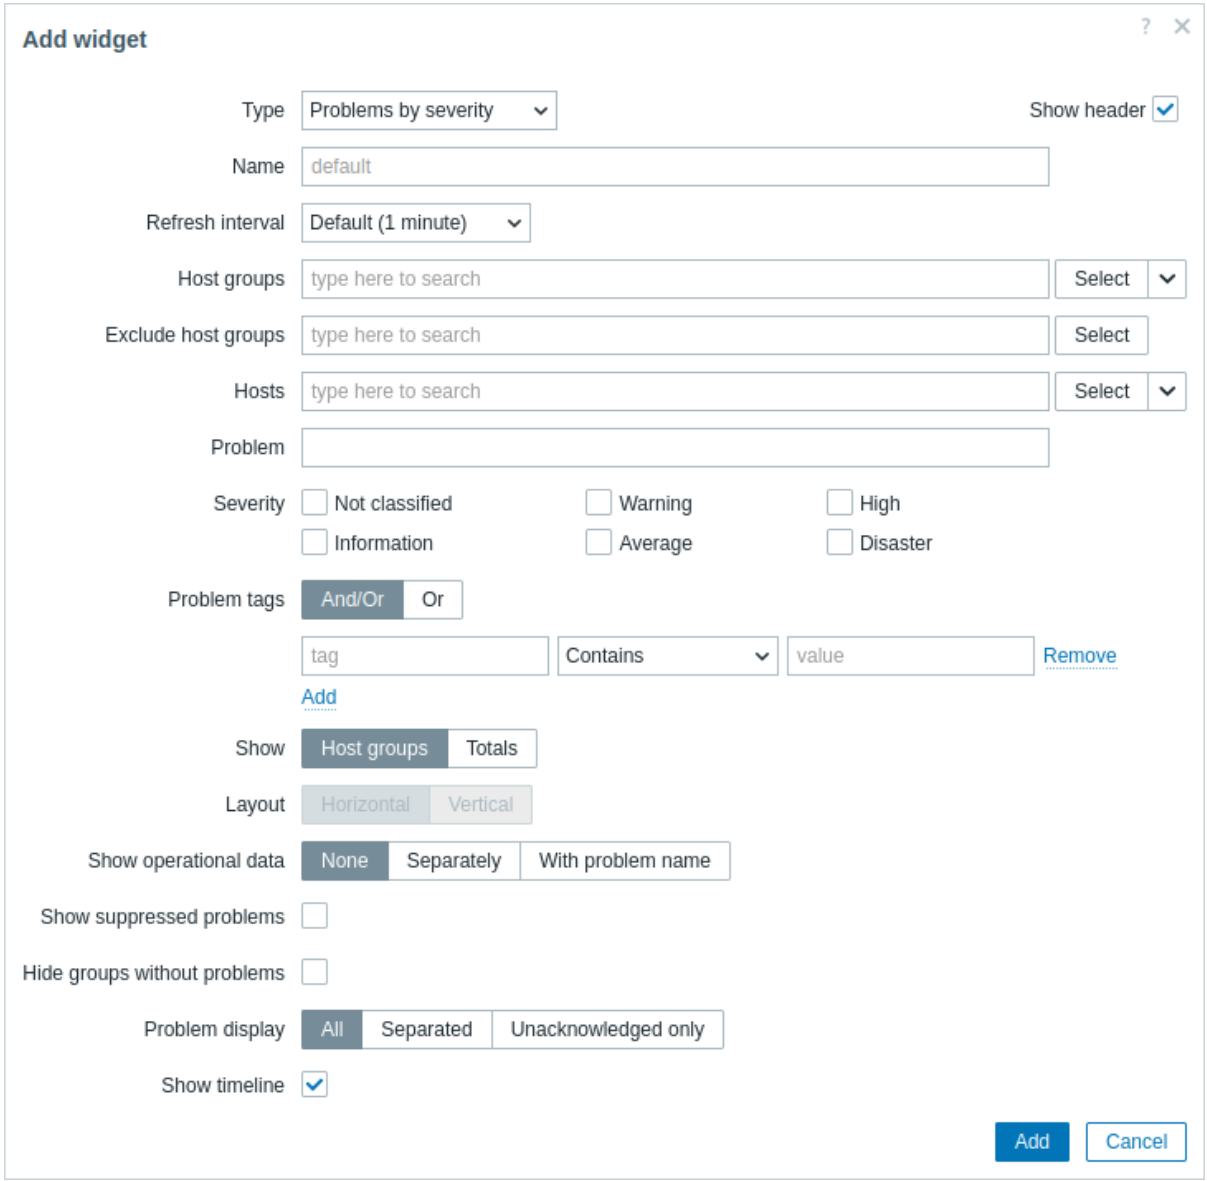
- Roll a mouse over the problem duration in the *Duration* column of the *Problems* widget. The popup disappears once you remove the mouse from the duration.
- Click the duration in the *Duration* column of the *Problems* widget. The popup disappears only if you click the duration again.



Problems by severity

Overview

The *Problems by severity* widget displays the number of cause problems grouped by severity. It allows filtering problems by different parameters (host groups, hosts, problem names, etc.).

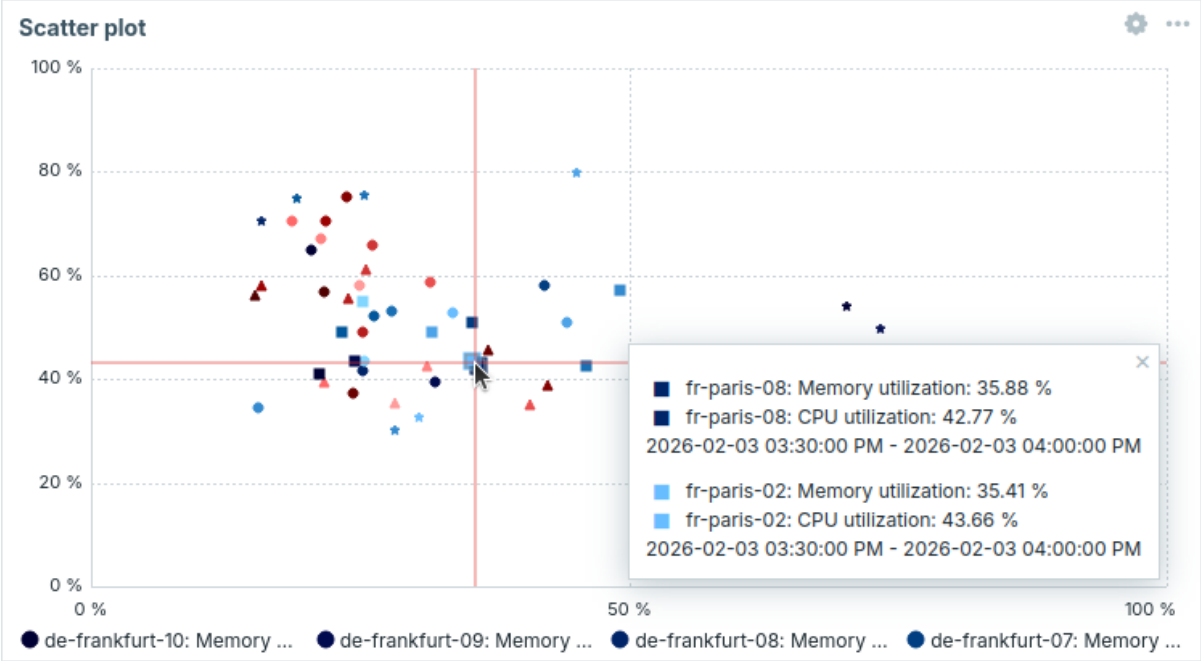


Hovering over a problem count shows the list of related problems:

Configuration

To configure, select *Problems by severity* as type:

In addition to the parameters that are common for all widgets, you may set the following specific options:



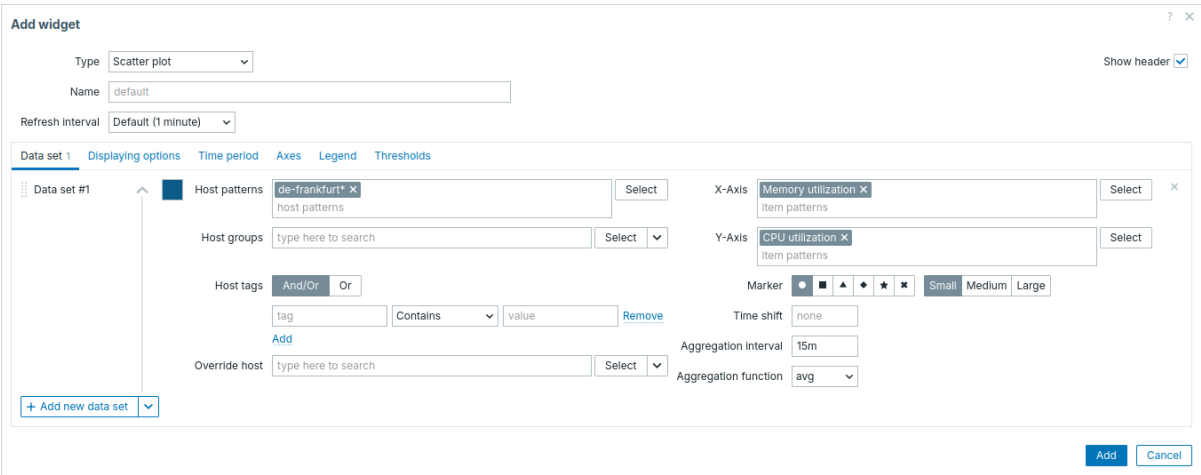
Host groups	Select host groups to display in the widget. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Specifying a parent host group implicitly selects all nested host groups. Host data from these host groups will be displayed in the widget; if no host groups are entered, all host groups will be displayed. This parameter is not available when configuring the widget on a template dashboard.
Exclude host groups	Select host groups to hide from the widget. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Specifying a parent host group implicitly selects all nested host groups. Host data from these host groups will not be displayed in the widget. For example, hosts 001, 002, 003 may be in Group A and hosts 002, 003 in Group B as well. If we select to *show* Group A and *exclude* Group B at the same time, only data from host 001 will be displayed in the dashboard. This parameter is not available when configuring the widget on a template dashboard.
Hosts	Select hosts to display in the widget. Alternatively, select a compatible widget or the dashboard as the data source for hosts. This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts. If no hosts are entered, all hosts will be displayed. This parameter is not available when configuring the widget on a template dashboard.

Problem	You can limit the number of problem hosts displayed by the problem name. If you enter a string here, only those hosts with problems whose name contains the entered string will be displayed. Macros are not expanded.
Severity	Mark problem severities to filter problems to be displayed in the widget. If no severities are marked, all problems will be displayed.
Problem tags	Specify problem tags to limit the number of problems displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the *Or* condition; **Or** - enough if one condition is met.
Show	Select the show option: **Host groups** - display problems per host group; **Totals** - display a problem total for all selected host groups in colored blocks corresponding to the problem severity. This parameter is not available when configuring the widget on a template dashboard, and only a problem total will be displayed.
Layout	Select the layout option: **Horizontal** - colored blocks of totals will be displayed horizontally; **Vertical** - colored blocks of totals will be displayed vertically. This parameter is available if *Show* is set to ”Totals”.
Show operational data	Display operational data as: **None** - operational data will not be displayed **Separately** - operational data will be displayed as a separate line **With problem name** - operational data will be displayed together with the problem name. For details, see the description of the *Operational data* field in trigger configuration.
Show suppressed problems	Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance.
Hide groups without problems	Mark the *Hide groups without problems* option to hide data from host groups without problems in the widget. This parameter is not available when configuring the widget on a template dashboard.
Problem display	Display problem count as: **All** - full problem count will be displayed; **Separated** - unacknowledged problem count will be displayed separated as a number of the total problem count; **Unacknowledged only** - only the unacknowledged problem count will be displayed.
Show timeline	Mark the checkbox to display a visual timeline.

Scatter plot

Overview

The *Scatter plot* widget displays the relationship between two metrics by plotting individual data points along an X and Y axis. This helps reveal patterns, clusters, correlations, and outliers in the data set.



Hovering over a data point displays a tooltip with a list of items from that data point and other points within a 6px radius; sorted first by the scatter plot X-axis values in ascending order and then by Y-axis values in descending order.

Selecting an item in the tooltip broadcasts its data to other widgets.

The information displayed in the *Scatter plot* widget can be downloaded as a PNG image by selecting the *Download image* option in the widget *Actions* menu ... that appears when you hover over the widget. Depending on your browser settings, the image is either automatically saved to the `Downloads` folder, or a *Save* dialog opens, allowing you to choose the location.

Configuration

To configure, select *Scatter plot* as type:

Data set

The **Data set** tab allows selecting data for the scatter plot by adding data sets. Two types of data sets can be added:

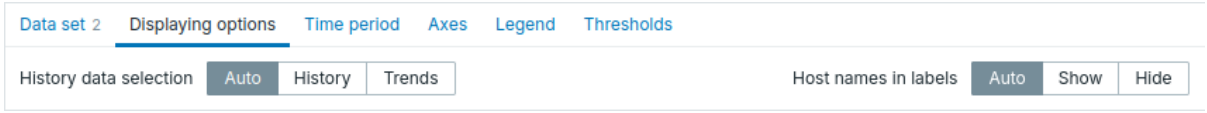
- *Item patterns* - hosts with matching items are displayed as data points. You can pick a single base color or select a palette row to assign distinct colors to each host with the matched items.
- *Item list* - selected items are displayed as data points, where each point represents a pair of items (X and Y). You can choose each data set's color individually from the picker.

Data points are created only for those hosts/item pairs that have at least one value on both axes.

By default, an *Item patterns* data set is added.

Data set	For **Item patterns** data set: Select or enter host and item patterns; data of items that match these patterns will be displayed on the scatter plot. Note that if the number of data points exceeds 8k, `memory_limit` should be increased in the `php.ini` configuration file. The recommended memory limit for 20k data points is 512 MB. Wildcard patterns may be used for selection (for example, * will return results that match zero or more characters). To specify a wildcard pattern, enter the string manually and press *Enter*. The wildcard symbol is always interpreted, so it is not possible to add, for example, an item named *item** individually if there are other matching items (for example, *item2*, *item3*). Specifying host and item patterns is mandatory for "Item patterns" data sets. See also: Data set configuration details. For **Item list** data set: Select items for the scatter plot by clicking the *Add item* button. You may also select compatible widgets as the data source for items by clicking the *Add widget* button. Specifying items or widgets is mandatory for "Item list" data sets. See also: Data set configuration details. Note that only numeric item types are allowed. When configuring the widget on a template dashboard, the parameter for specifying host patterns is not available, and the parameter for specifying an item list allows the selection of only the items configured on the template.
Host groups	Select host groups. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Specifying a parent host group implicitly selects all nested host groups. Host data from these host groups will be displayed in the widget; if no host groups are entered, all host groups will be displayed. This parameter is available only for *Item patterns* data sets and is not available when configuring the widget on a template dashboard.
Host tags	Specify tags to filter the hosts displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met. This parameter is available only for *Item patterns* data sets and is not available when configuring the widget on a template dashboard.
Override host	Select a compatible widget or the dashboard host selector as the data source for hosts. This parameter is not available when configuring the widget on a template dashboard.
Marker	Choose the marker type and size for host data points in the data set.
Time shift	Specify time shift if required. You may use time suffixes in this field. Negative values are allowed.

Aggregation function	Specify which aggregation function to use for each item in the data set within the selected *Aggregation interval*: **min** - display the smallest value; **max** - display the largest value; **avg** - display the average value; **sum** - display the sum of values; **count** - display the count of values (if at least one value exists on both axes); **first** - display the first value; **last** - display the last value. Aggregation allows an aggregated value to be displayed for the specified interval (5 minutes, an hour, a day), instead of all values. Only numeric data can be displayed for *min*, *max*, *avg* and *sum*. For *count*, non-numeric data will be changed to numeric.
Aggregation interval	Specify the interval for aggregating values. You may use time suffixes in this field. A numeric value without a suffix will be regarded as seconds. Note that if the widget is configured to display historical data based on trends (*History data selection* is set to *Trends* or *Auto*), it is recommended to use an aggregation interval that is a multiple of 1 hour (e.g., 3600, 60m, 1h, 3h, etc.). Trends store hourly aggregated values, so using an aggregation interval that is not a multiple of 1 hour (e.g., 100s, 7min, 15min, 90min, etc.) may lead to results that are hard to interpret. Specifying an aggregation interval is mandatory. The aggregation interval determines the time interval and coordinates for a data point; for example, if X-axis items have 4 values and Y-axis items have 1 value, the coordinates reflect aggregating 4 on X and 1 on Y in the specified interval.

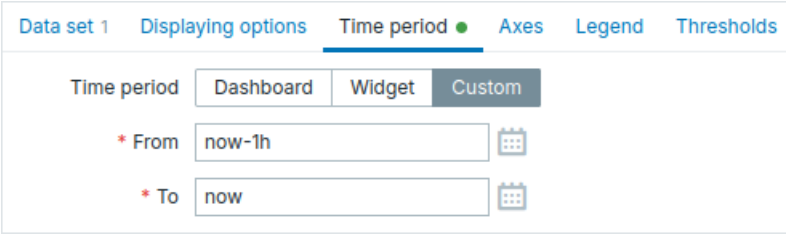


Data set configuration details

Existing data sets are displayed in a list. You can rearrange, expand/collapse, change colors, and clone these data sets.

For more information, see data set configuration details in the *Graph* widget. These details also apply to the *Scatter plot* widget.

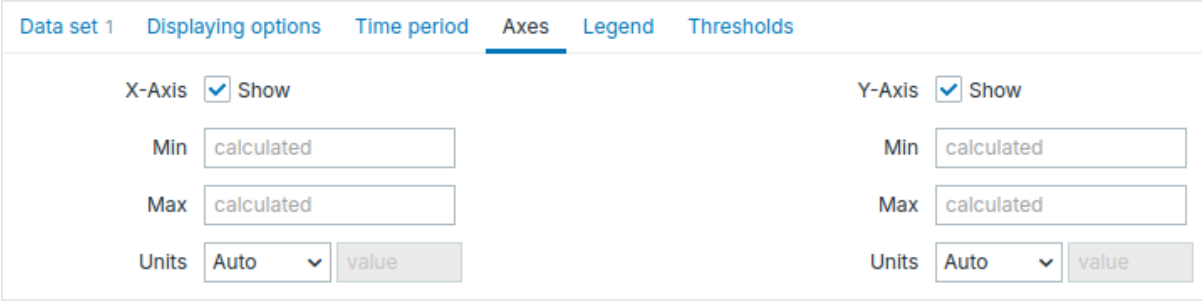
Displaying options



The **Displaying options** tab allows you to define history data selection:

History data selection	Set the source of scatter plot data: **Auto** - data is sourced according to the classic graph algorithm (default). **History** - data from history. **Trends** - data from trends.
Host names in labels	Choose whether to display host names in the graph legend and in the tooltip that appears when hovering over the graph data: **Auto** - host names are displayed only if more than one host is present across the data sets (default). **Show** - host names are displayed. **Hide** - host names are hidden. This parameter is not available when configuring the widget on a template dashboard.

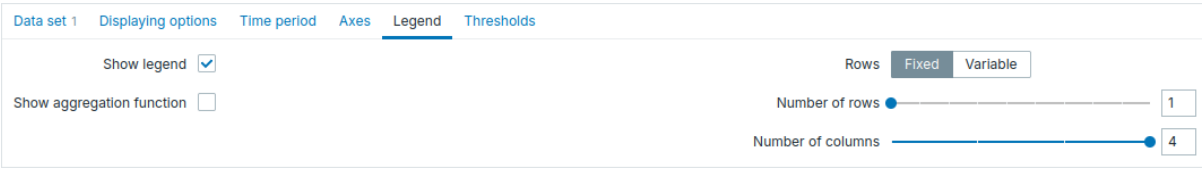
Time period



The **Time period** tab allows you to set a time period for which to display data in the scatter plot:

Time period	Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period.
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".

Axes

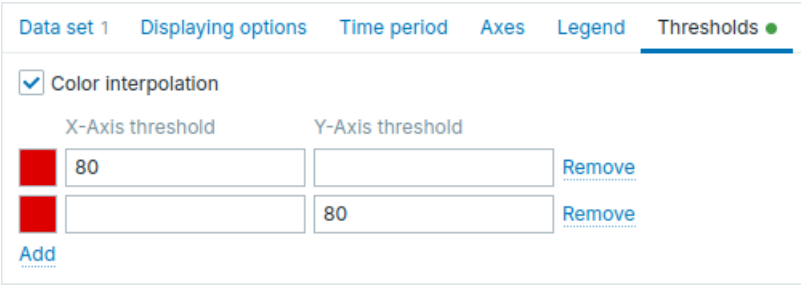


The **Axes** tab allows you to customize how axes are displayed:

X-Axis/Y-Axis	Unmark this checkbox to hide X-axis/Y-axis (marked by default).
Min	Set the minimum value of the corresponding axis.
Max	Set the maximum value of the corresponding axis.
Units	Choose the unit for the scatter plot axis values from the dropdown: **Auto** - axis values are displayed using the unit of the first item in the data set; **Static** - axis values are displayed using the unit specified in the *value* input field; if the field is left blank, only numeric values are displayed.

Legend

The **Legend** tab allows you to customize the scatter plot legend:

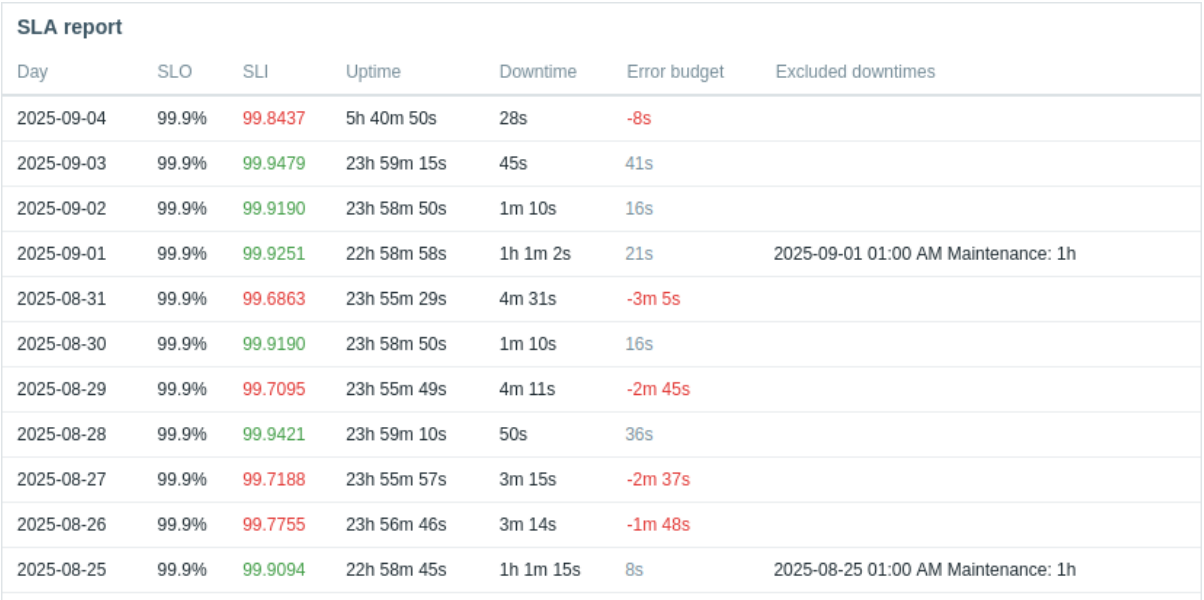


Show legend	Unmark this checkbox to hide the legend on the scatter plot (marked by default).
Show aggregation function	Mark this checkbox to show the aggregation function in the legend.

Rows	Select the display mode for legend rows: **Fixed** - the number of rows displayed is determined by the *Number of rows* parameter value; **Variable** - the number of rows displayed is determined by the amount of configured items while not exceeding the *Maximum number of rows* parameter value.
Number of rows/ Maximum number of rows	If *Rows* is set to ”Fixed”, set the number of legend rows to be displayed (1-10). If *Rows* is set to ”Variable”, set the maximum number of legend rows to be displayed (1-10).
Number of columns	Set the number of legend columns to be displayed (1-4). This parameter is available if *Display min/avg/max* is unmarked.

Thresholds

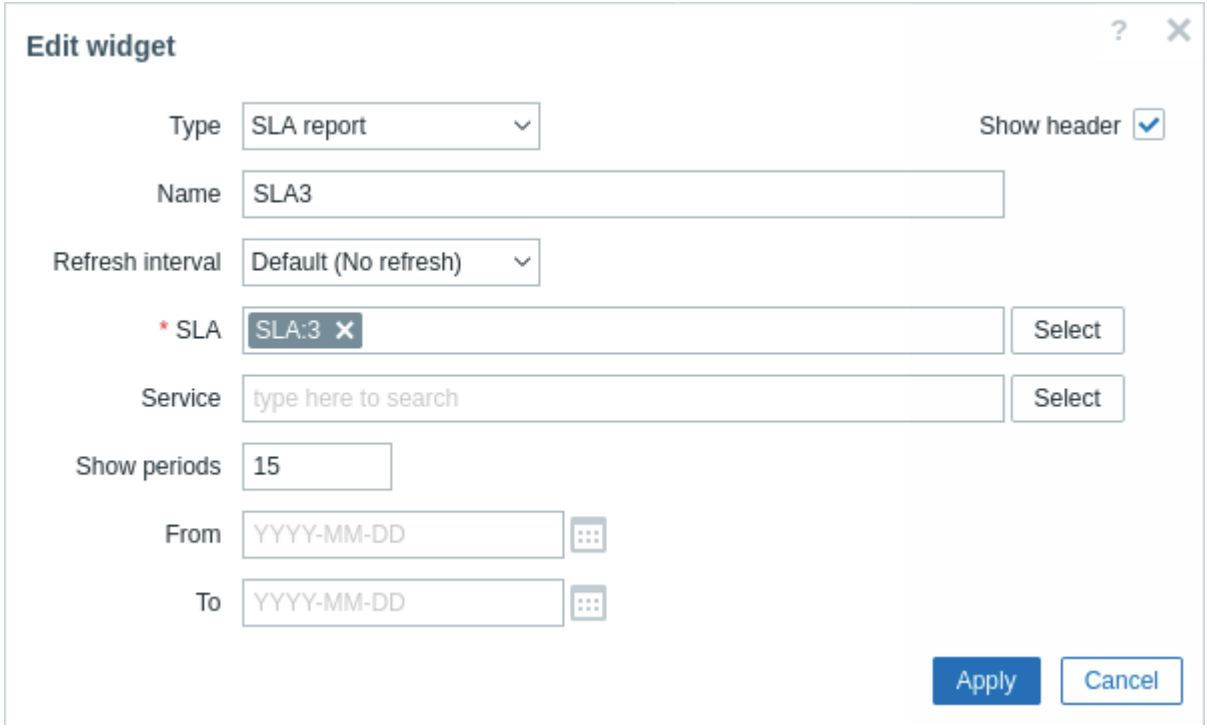
The **Thresholds** tab allows you to configure thresholds that determine host marker colors:



Color interpolation	Mark the checkbox to enable smooth transitioning between threshold colors for host markers. This parameter applies if two or more thresholds are set for either the X-axis, the Y-axis, or both axes simultaneously.
X-Axis/Y-Axis threshold	Click *Add* to add a threshold, select a threshold color from the color picker, and specify a numeric value. Thresholds can be applied to a single axis, both axes separately, or both axes simultaneously. For example, a single threshold with X=80 and Y=80 will color the markers when both conditions are met. The thresholds list will be sorted in ascending order when saved. Suffixes (for example, ”1d”, ”2w”, ”4K”, ”8G”) are supported. Value mappings are supported.

SLA report

Overview

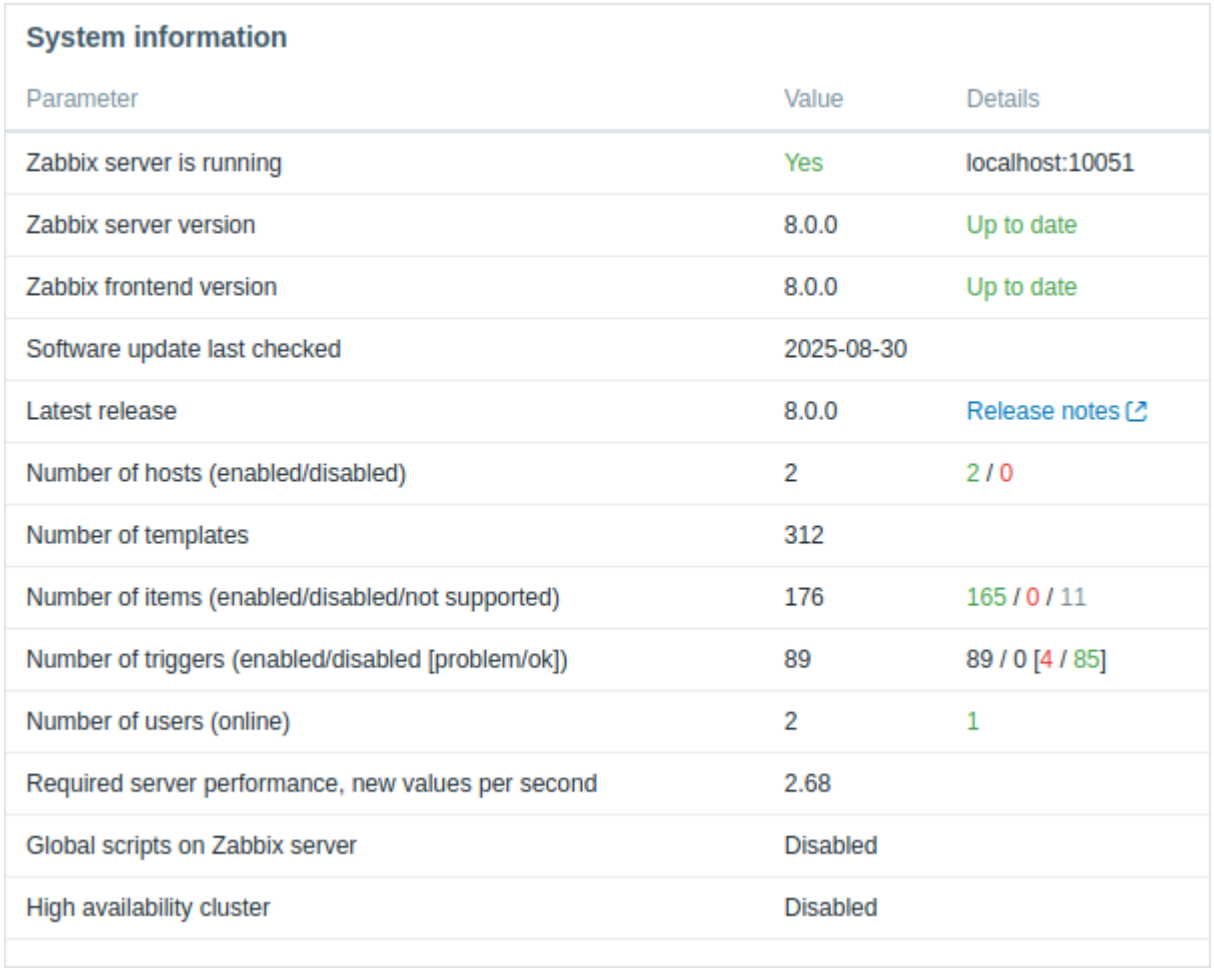


The *SLA report* widget displays SLA reports, helping you monitor service performance against defined targets.

It displays the same data as *Services* > *SLA report*.

Configuration

To configure, select *SLA report* as type:

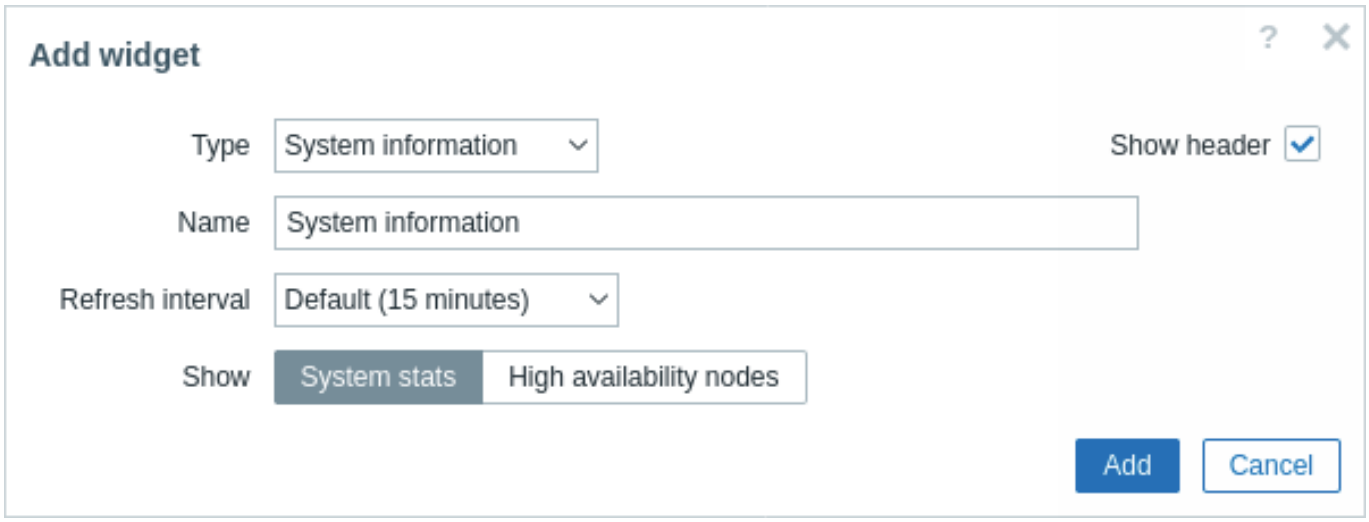


In addition to the parameters that are common for all widgets, you may set the following specific options:

SLA	Select the SLA for the report.
Service	Select the service for the report.
Show periods	Set how many periods will be displayed in the widget (20 by default, 100 maximum).
From	Select the beginning date for the report. Relative dates are supported: `now`, `now/d`, `now/w-1w` etc; supported date modifiers: d, w, M, y.
To	Select the end date for the report. Relative dates are supported: `now`, `now/d`, `now/w-1w` etc; supported date modifiers: d, w, M, y.

System information

Overview

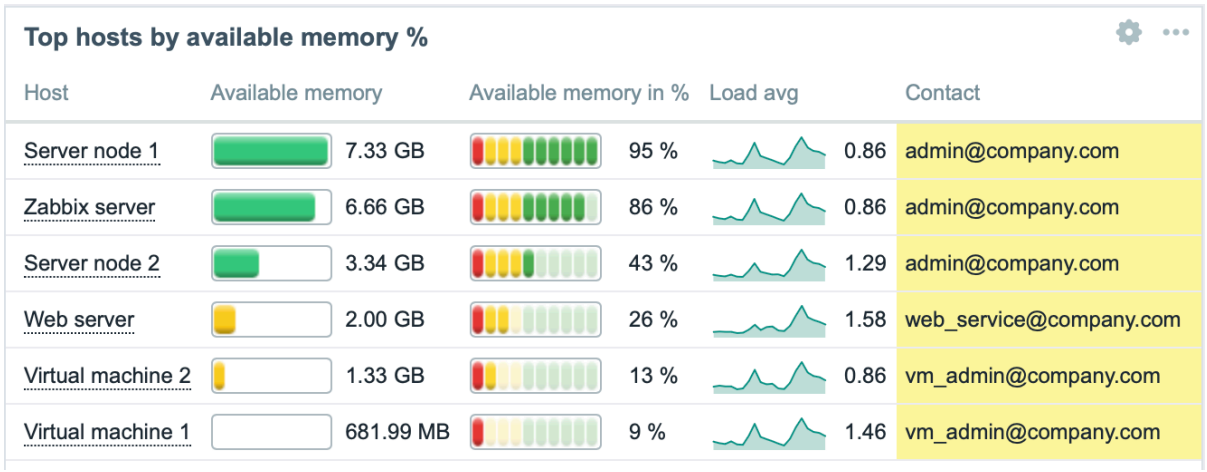


The *System information* widget displays a summary of key Zabbix server and system data, and, when high availability is enabled, details of the high availability nodes.

It displays the same data as *Reports* > *System information*, except for *Zabbix server ID*.

Configuration

To configure, select *System information* as type:

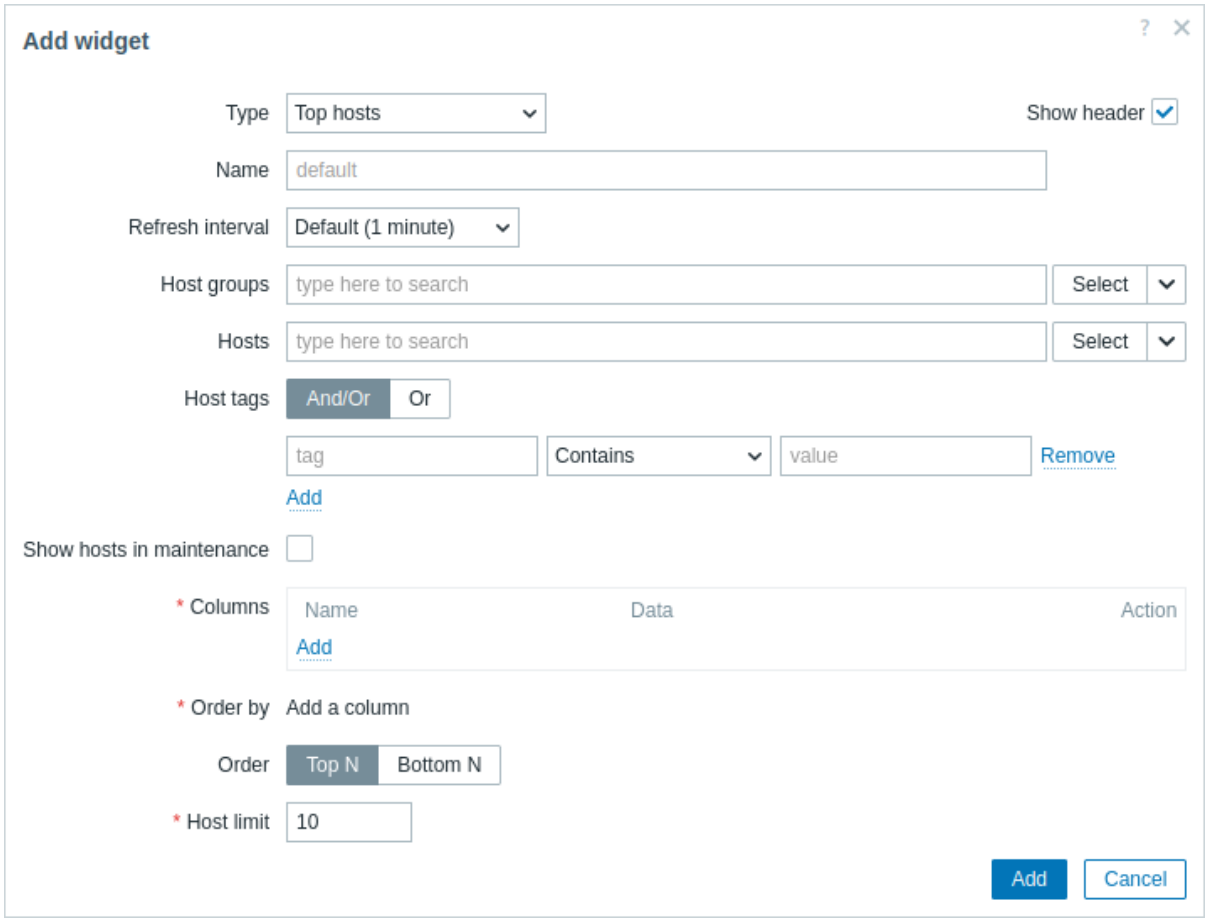


In addition to the parameters that are common for all widgets, you may set the following specific options:

Show	Select what to display: **System stats** - display a summary of key Zabbix server and system data; **High availability nodes** - display the status of high availability nodes (if high availability cluster is enabled).
Show software update check details	Mark the checkbox to display Zabbix software update check details. This option is only available if software update check is enabled in the Zabbix server configuration and "System stats" is selected in the *Show* field.

Top hosts

Overview



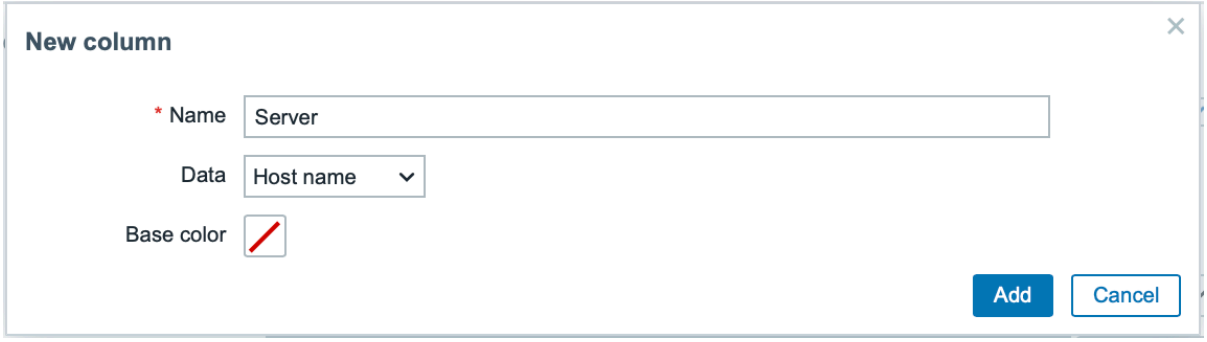
The *Top hosts* widget displays the top/bottom values for selected items from multiple hosts.

The widget supports displaying up to 1000 hosts simultaneously.

Configuration

To configure, select *Top hosts* as type:

In addition to the parameters that are common for all widgets, you may set the following specific options:



Host groups	Select host groups to display in the widget. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. This parameter is not available when configuring the widget on a template dashboard.
Hosts	Select hosts to display in the widget. Alternatively, select a compatible widget or the dashboard as the data source for hosts. This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts. This parameter is not available when configuring the widget on a template dashboard.
Host tags	Specify tags to limit the number of hosts displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met. This parameter is not available when configuring the widget on a template dashboard.
Show hosts in maintenance	Mark this checkbox for hosts in maintenance to be displayed as well (in this case, maintenance icon will be shown next to the host name). Unmarked by default.
Columns	Add data columns to display. The column order determines their display from left to right. Columns can be reordered by dragging up and down by the handle before the column name.
Order by	Specify the column from the defined *Columns* list to use for *Top N* or *Bottom N* ordering.
Order	Specify the ordering of rows: **Top N** - in descending order according to the *Order by* aggregated value; **Bottom N** - in ascending order according to the *Order by* aggregated value.
Host limit	Number of host rows to be shown (1-1000). This parameter is not available when configuring the widget on a template dashboard.

Column configuration

It is possible to add columns of three data types: host name, item value, or text. The list of available column parameters depends on the column data type and, for the item value type, on the value format.

Host name column

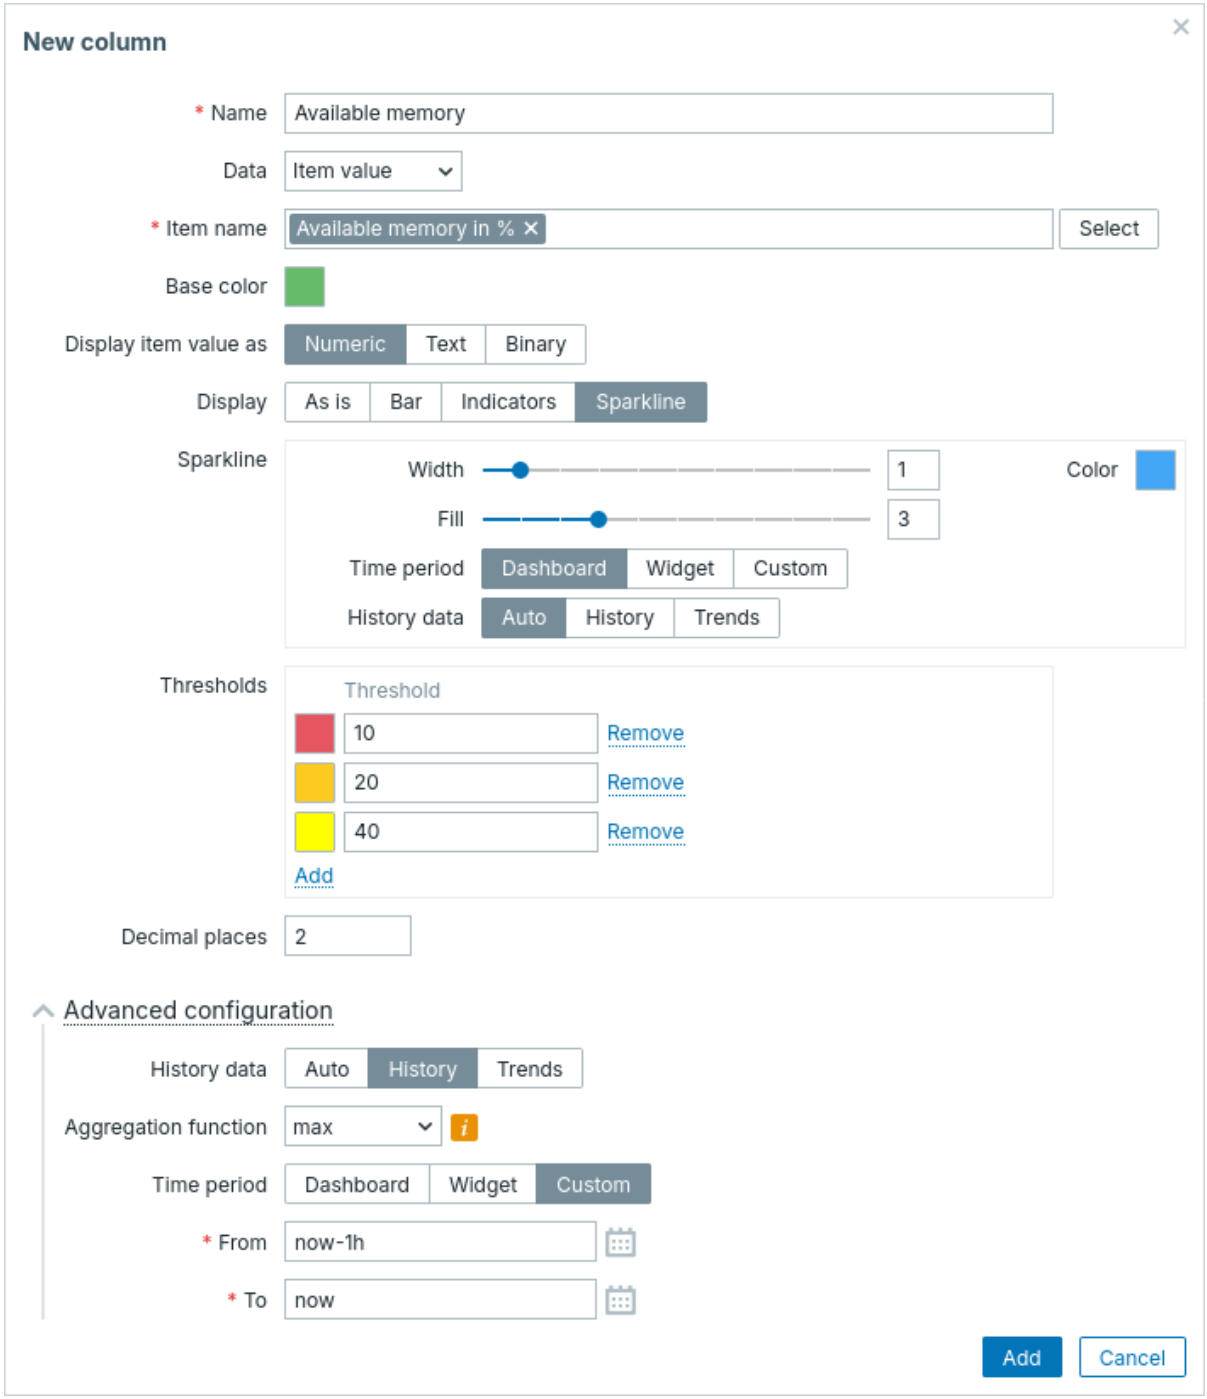
Host name column is used to display the name of the host.

Supported parameters:

Name	Name of the column.
Data	Data type to display in the column, select **Host name**.
Base color	Background color of the column.

Text column

Text column is used to display any specified text string.



Supported parameters:

Name	Name of the column.
Data	Data type to display in the column, select **Text**.
Base color	Background color of the column.
Text	Enter the string to display. May contain host and inventory macros.

Item value column

Item value column is used to display value of the specified item; it supports multiple value display formats and options.

Supported parameters:

Name	Name of the column.
Data	Data type to display in the column, select **Item value**.
Item name	Select an item; its name is used to match and display items with the same name on all selected hosts. If a host has multiple such items, the widget displays the item whose key is first alphabetically (e.g., *CPU utilization* with key `proc.cpu.util` instead of `system.cpu.util`). When configuring the widget on a template dashboard, only items configured on the template can be selected.
Base color	Background color of the column; fill color if *Item value* data is displayed as bar/indicators. The default color can be overridden by custom color, if the item value is over one of the specified thresholds.
Display item value as	Format for displaying the item value: **Numeric**, **Text**, or **Binary**. The selected option determines which additional parameters will be available. Refer to the parameter list for each format below.
Advanced configuration	

History data	Take data from history or trends: **Auto** - automatic selection; **History** - take history data; **Trends** - take trend data. This parameter is available only for numeric item values. For text and binary values data will always be taken from history.
Aggregation function	Specify which aggregation function to use within the selected *Time period*: **min** - display the smallest value; **max** - display the largest value; **avg** - display the average value; **count** - display the count of values; **sum** - display the sum of values; **first** - display the first value; **last** - display the last value. If **not used** is selected, the most recent value is displayed (no aggregation). Aggregation allows an aggregated value to be displayed for the specified interval (5 minutes, an hour, a day), instead of the most recent value. Only numeric data can be displayed for *min*, *max*, *avg* and *sum*. For *count*, non-numeric data will be changed to numeric.
Time period	Specify the time period to use for aggregating values. Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period. This parameter is not available if *Aggregation function* is set to "not used".
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".

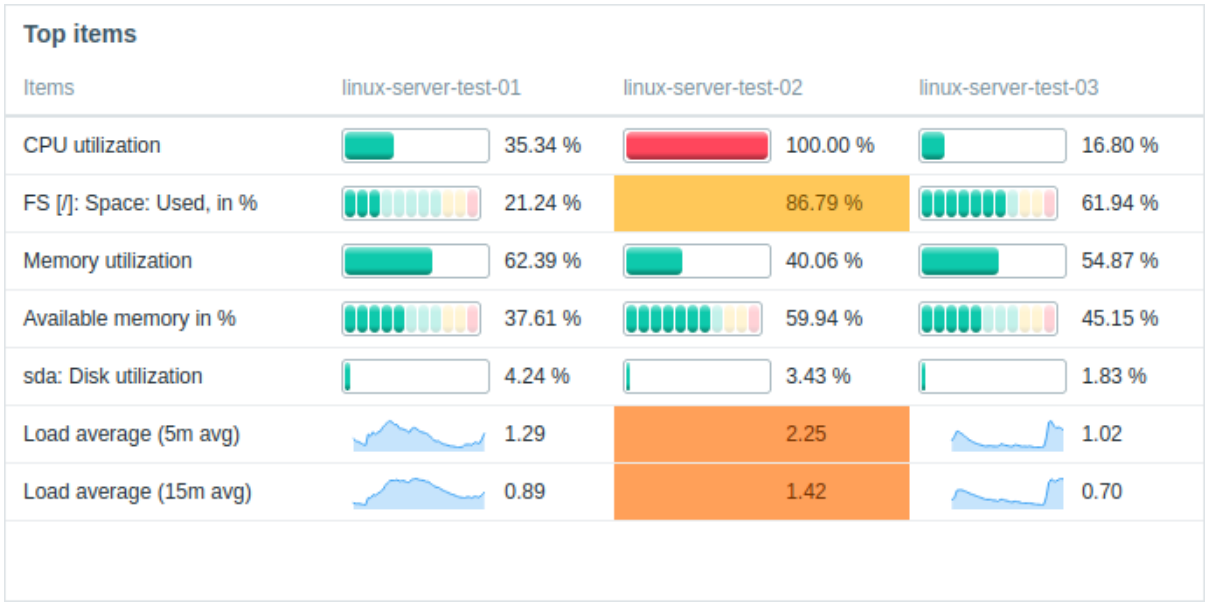
Numeric item value parameters:

Display	Define how the value should be displayed: **As is** - as regular text; **Bar** - as solid, color-filled bar; **Indicators** - as segmented, color-filled bar; **Sparkline** - mini line graph.
Thresholds	Specify threshold values when the background/fill color should change. The list will be sorted in ascending order when saved. For sparklines, thresholds are applied only to the item last value.
Decimal places	Specify how many decimal places will be displayed with the value.
Bar/Indicators	
Min	Minimum value.
Max	Maximum value.
Sparkline	
Width	Set the graph line thickness by using the slider or manually entering a value in the range from 0 to 10.
Color	Select line and fill color.
Fill	Set fill color transparency level by using the slider or manually entering a value in the range from 0 to 10.

Time period	Specify the time period for values to be included into the sparkline chart. Select the data source for the time period: **Dashboard** - use the dashboard time period selector **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period.
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
History data	Take data from history or trends: **Auto** - automatic selection; **History** - take history data; **Trends** - take trend data.

Text item value parameters:

Highlights	Specify the regular expressions upon matching which the background/fill color should change.



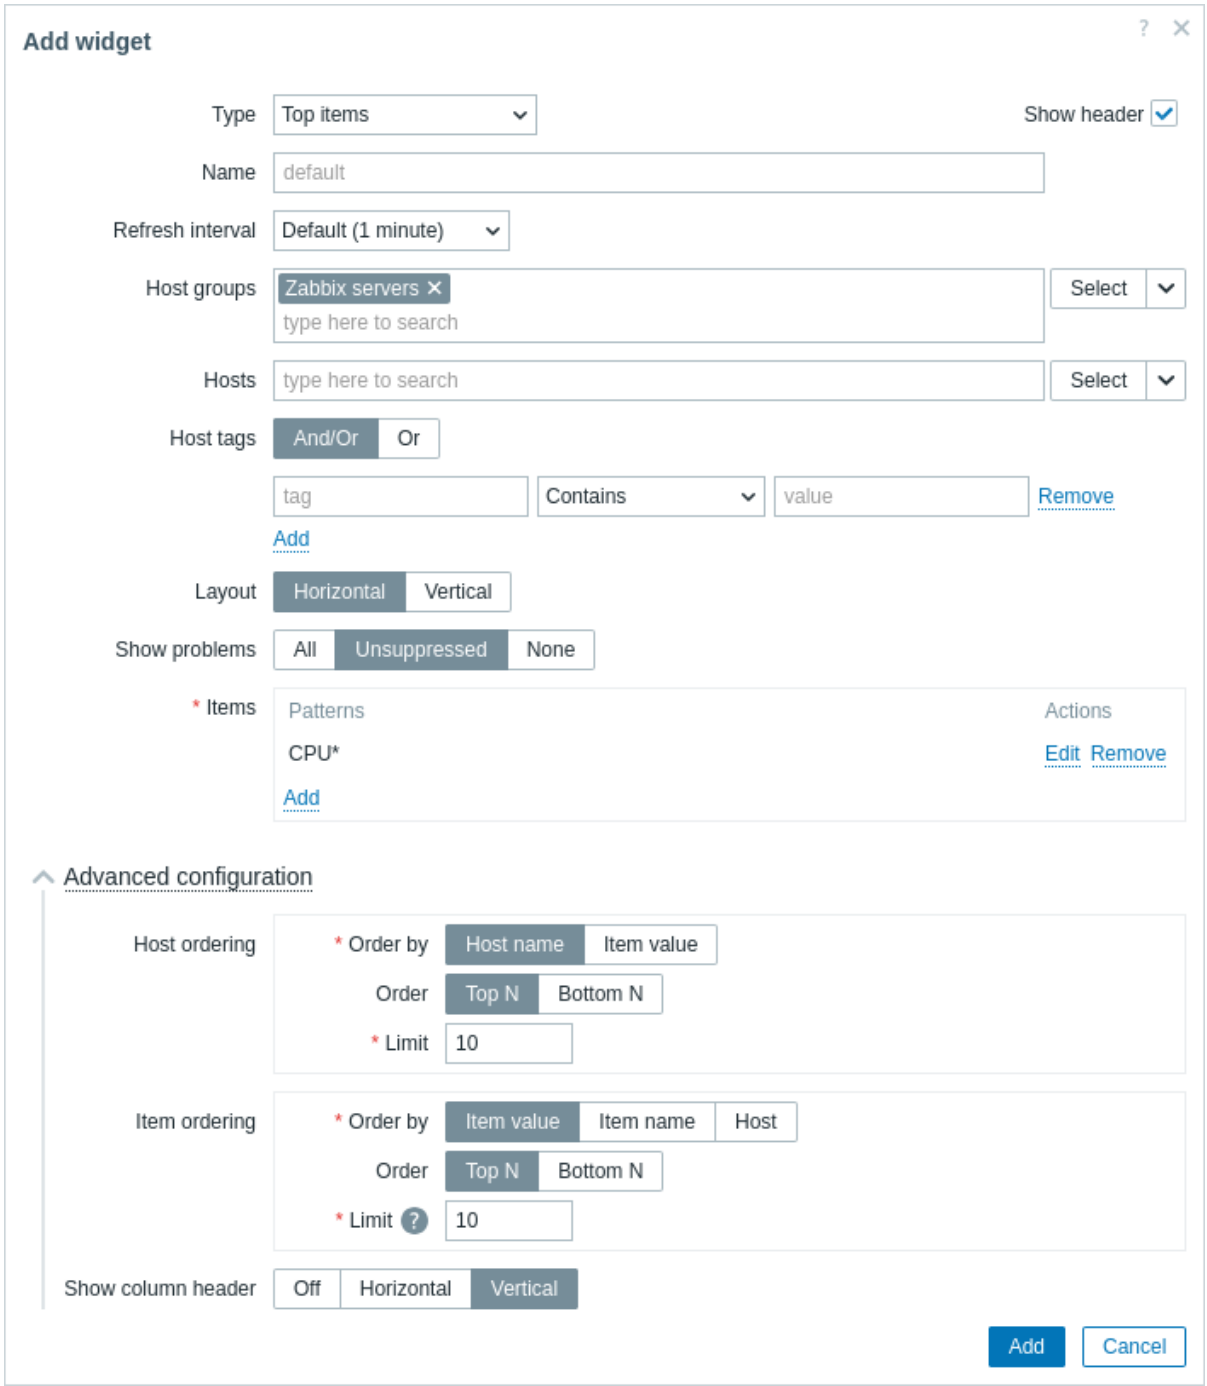
Binary item value parameters:

Show thumbnail	Specify whether to create and display a thumbnail for the image containing binary data or to display a hyperlink *Show* leading to the full-size image in the value column.

Top items

Overview

The *Top items* widget displays the top/bottom values for selected items, providing a quick overview of their performance.



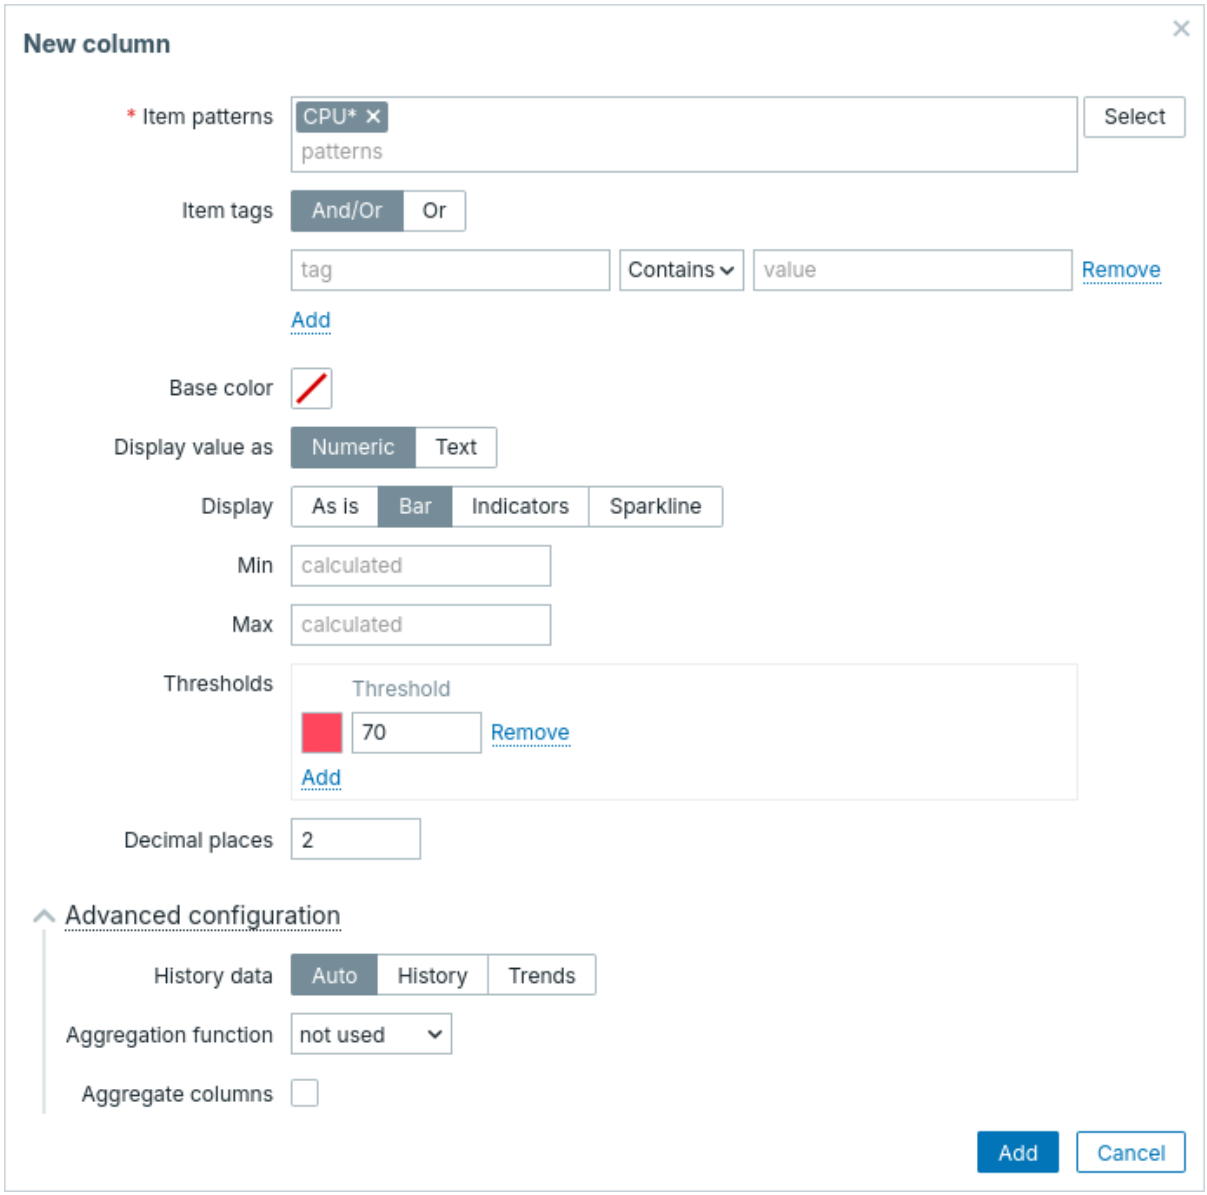
By default, the widget displays values from the last 24 hours. This period can be changed in *Administration* > *General* > *GUI* (*Max history display period*).

Clicking the item value opens the item menu.

Configuration

To configure, select *Top items* as type:

In addition to the parameters that are common for all widgets, you may set the following specific options:



Host groups	Select host groups. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete so starting to type the name of a group will offer a dropdown of matching groups. This parameter is not available when configuring the widget on a template dashboard.
Hosts	Select hosts. Alternatively, select a compatible widget or the dashboard as the data source for hosts. This field is auto-complete so starting to type the name of a host will offer a dropdown of matching hosts. This parameter is not available when configuring the widget on a template dashboard.

Host tags		Specify tags to limit the number of host data displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the *Or* condition; **Or** - enough if one condition is met.
Layout		Select the layout option: **Horizontal** - host names will be displayed on the left; **Vertical** - host names will be displayed at the top.
Show problems		Filter which problems to display based on their status (all, unsuppressed, none). Problems are indicated with colored item values, overriding the item column display settings. Colors are based on problem severity, which can be customized in *Administration > General > Trigger displaying options*. Problem severities can be changed when updating problems.
Items		Add item patterns or specific items for display (see Column configuration).
Advanced configuration		
Host ordering		Select ordering options for the host column/row.
	Order by	Order hosts by: **Host name** - hosts will be ordered by host name; **Item value** - hosts will be ordered by the value of selected items.
	Order	Select whether to display the highest or lowest values: **TopN** - top N values; **BottomN** - bottom N values. The value of N is selected in the *Limit* field.
	Limit	Enter limit for displayable hosts (range 1-1000; default 10). This value will become the value of N in the *Order* field.
Item ordering		Select ordering options for the item column/row.
	Order by	Order items by: **Item value** - items will be ordered by item value; **Item name** - items will be ordered by item name; **Host** - items will be ordered by the selected host pattern.
	Order	Select whether to display the highest or lowest values: **TopN** - top N values; **BottomN** - bottom N values. The value of N is selected in the *Limit* field.
	Limit	Enter limit for displayable items (range 1-1000; default 10). This value will become the value of N in the *Order* field.

Show column header	Select column header display options: **Off** - do not display column header; **Horizontal** - display text horizontally in the header; **Vertical** - display text vertically in the header.

Column configuration

To configure item columns, click *Add* in the *Items* parameter:

Common column parameters:

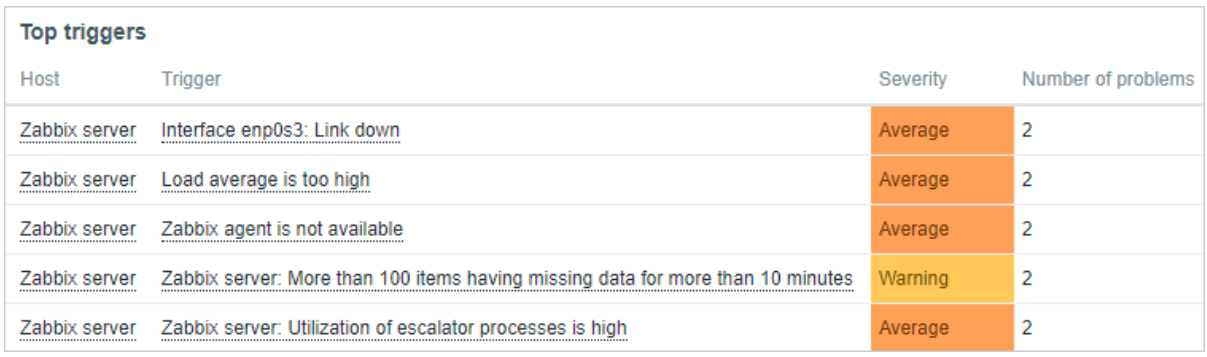
Item patterns	Specify one or several item patterns, using the wildcard character. Alternatively, select the items. When configuring the widget on a template dashboard, only items configured on the template can be selected.

Item tags	Specify tags to limit the number of item data displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the *Or* condition; **Or** - enough if one condition is met.
Base color	Select the column's background color or fill color if *Display* is set to "Bar" or "Indicators". Note that the base color can be overridden by threshold or highlight colors.
Display value as	Format for displaying the item value: **Numeric** or **Text**. The selected option determines which additional parameters will be available. Refer to the parameter list for each format below.

Column parameters for numeric values:

Display	Define how the value should be displayed: **As is** - as regular text; **Bar** - as solid, color-filled bar; **Indicators** - as segmented, color-filled bar; **Sparkline** - mini line graph.
Min	Minimum value for bar/indicators display.
Max	Maximum value for bar/indicators display.
Width	Set the graph line thickness by using the slider or manually entering a value in the range from 0 to 10. This parameter is for sparkline display only.
Fill	Set fill color transparency level by using the slider or manually entering a value in the range from 0 to 10. This parameter is for sparkline display only.
Color	Select line and fill color. This parameter is for sparkline display only.
See *Advanced configuration* for description of fields related to time period and history data selection.	
Thresholds	Specify threshold values when the background/fill color should change. The list will be sorted in ascending order when saved. For sparklines, thresholds are applied only to the item last value.
Decimal places	Specify how many decimal places will be displayed with the value.
Advanced configuration	
History data	Take data from history or trends: **Auto** - automatic selection; **History** - take history data; **Trends** - take trend data. This parameter is available only for numeric item values. For text values data will always be taken from history.

Aggregation function	Specify which aggregation function to use within the selected *Time period*: **min** - display the smallest value; **max** - display the largest value; **avg** - display the average value; **count** - display the count of values; **sum** - display the sum of values; **first** - display the first value; **last** - display the last value. If **not used** is selected, the most recent value is displayed (no aggregation). Aggregation allows an aggregated value to be displayed for the specified interval (5 minutes, an hour, a day), instead of the most recent value. Only numeric data can be displayed for *min*, *max*, *avg* and *sum*. For *count*, non-numeric data will be changed to numeric.
Time period	Specify the time period to use for aggregating values. Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period. This parameter is not available if *Aggregation function* is set to "not used".
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
Aggregate columns	When checked, group all items that match the column's item patterns into a single combined column/row. Values from matching items will be aggregated using the selected *Column aggregation function* and displayed under the *Combined column name*. Default: off (unchecked).This parameter is shown only when *Display value as* is **Numeric**.
Column aggregation function	Choose how values from the grouped item patterns are combined. Available options: **min**, **max**, **avg**, **count**, **sum** (default). This parameter is shown only when *Aggregate columns* is checked.
Combined column name	Enter the display name for the aggregated column. This field is mandatory when *Aggregate columns* is checked and becomes the column header for the combined values.

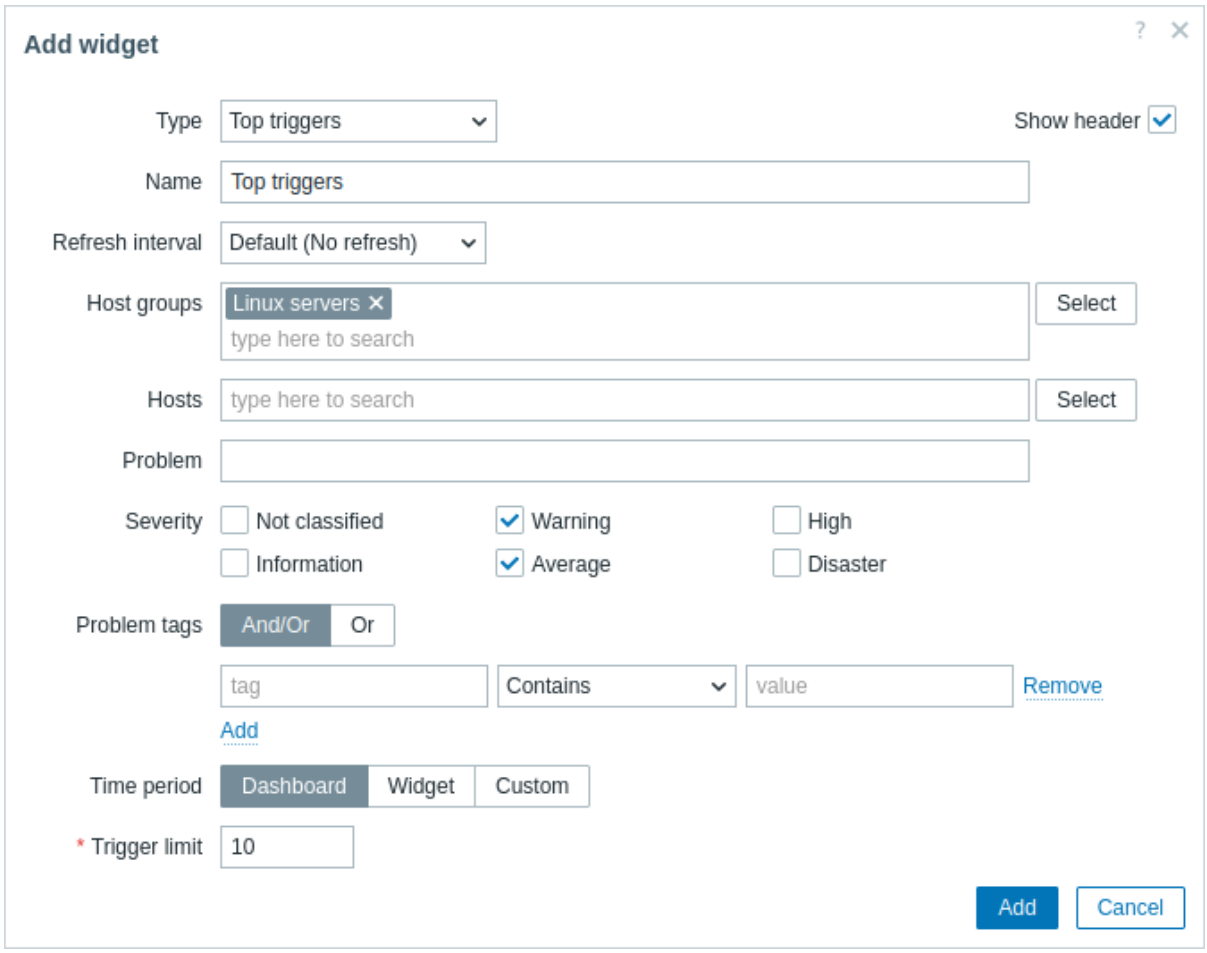


Column parameters for text values:

Highlights	Specify the regular expressions upon matching which the background/fill color should change.

Top triggers

Overview



The *Top triggers* widget displays triggers with the highest number of problems.

It displays the same data as *Reports > Top 100 triggers* and can display up to 1000 records.

Configuration

To configure, select *Top triggers* as widget type:

In addition to the parameters that are common for all widgets, you may set the following specific options:

Host groups	Select host groups to display problems of in the widget. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Specifying a parent host group implicitly selects all nested host groups. Problems from these host groups will be displayed in the widget; if no host groups are entered, problems from all host groups will be displayed. This parameter is not available when configuring the widget on a template dashboard.
Hosts	Select hosts to display problems of in the widget. This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts. If no hosts are entered, problems of all hosts will be displayed. This parameter is not available when configuring the widget on a template dashboard.
Problem	You can view the triggers for particular problems only. For this, enter the string to be matched in the problem name. Macros are not expanded.
Severity	Mark trigger severities to filter triggers to be displayed in the widget. If no severities are marked, all triggers will be displayed.

Problem tags	Specify the tags of the problems to be displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the *Or* condition; **Or** - enough if one condition is met.
Time period	Select the data source for the time period: **Dashboard** - use the dashboard time period selector; **Widget** - use a compatible widget (set in the *Widget* parameter); **Custom** - use a custom time period set in the *From* and *To* parameters; if set, a clock icon will be displayed in the upper-right corner of the widget, indicating the set time on mouseover. Note that regardless of the widget's *Time period* configuration, compatible widgets can still use it as a data source for the time period.
Widget	Enter or select a compatible widget as the data source for the time period. This parameter is available if *Time period* is set to "Widget".
From	Enter or select the start of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
To	Enter or select the end of the time period. Relative time syntax (`now`, `now/d`, `now/w-1w`, etc.) is supported. This parameter is available if *Time period* is set to "Custom".
Trigger limit	Set the number of triggers to be displayed. Possible value range: 1-1000.

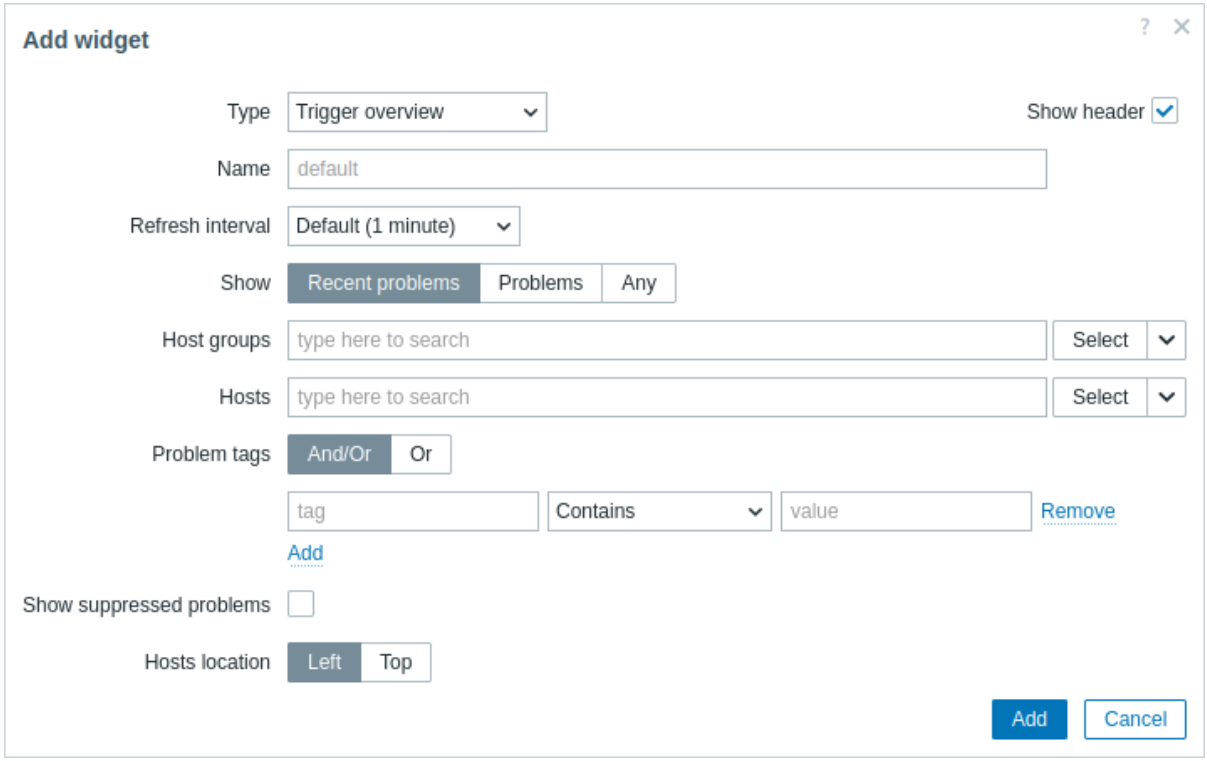
Trigger overview

Overview

The *Trigger overview* widget displays the current states of host triggers as a table of colored blocks. It provides a quick visual snapshot of trigger health and activity on different hosts.

The widget uses multiple visual elements to convey trigger details:

- Block colors for PROBLEM triggers match problem severities.
- Blinking blocks indicate recent trigger state changes (within the last 2 minutes).
- Gray arrows indicate triggers with dependencies (hover over them to see details).
- Checkbox icons indicate acknowledged problems; all active or resolved problems for the trigger must be acknowledged for this icon to appear.



Note:
Trigger severity colors can be adjusted in *Administration* > *General*. Trigger severities can be modified when updating problems.

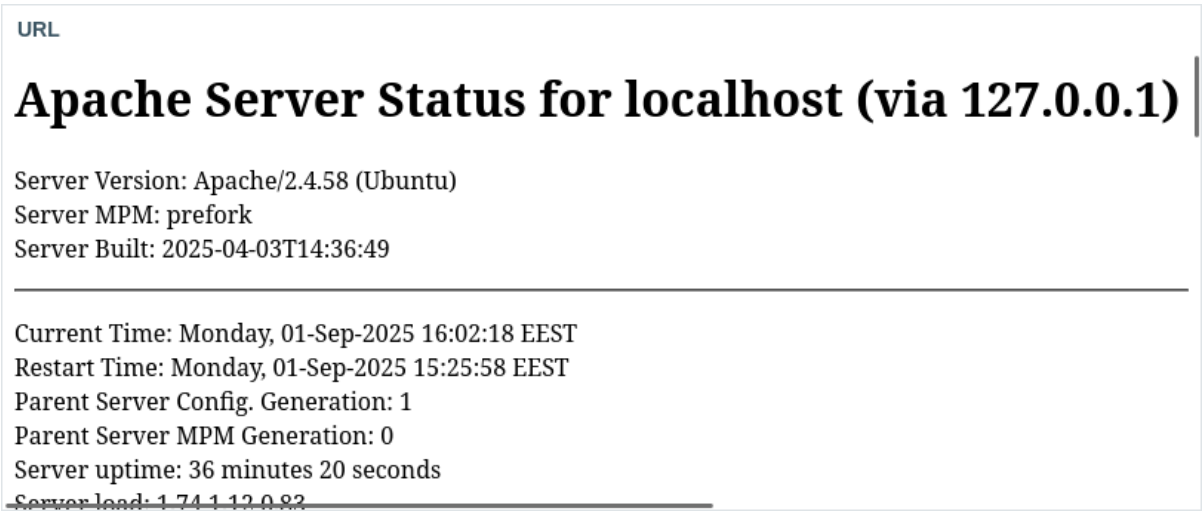
Clicking a block provides links to trigger-related information (problems, trigger configuration, etc.).

By default, up to 50 records are displayed (configurable in *Administration* > *General* > *GUI* under *Max number of columns and rows in overview tables*). If more triggers exist, a message prompts you to refine the filtering criteria. This limit is applied before any additional filtering (for example, by tags).

Configuration

To configure, select *Trigger overview* as type:

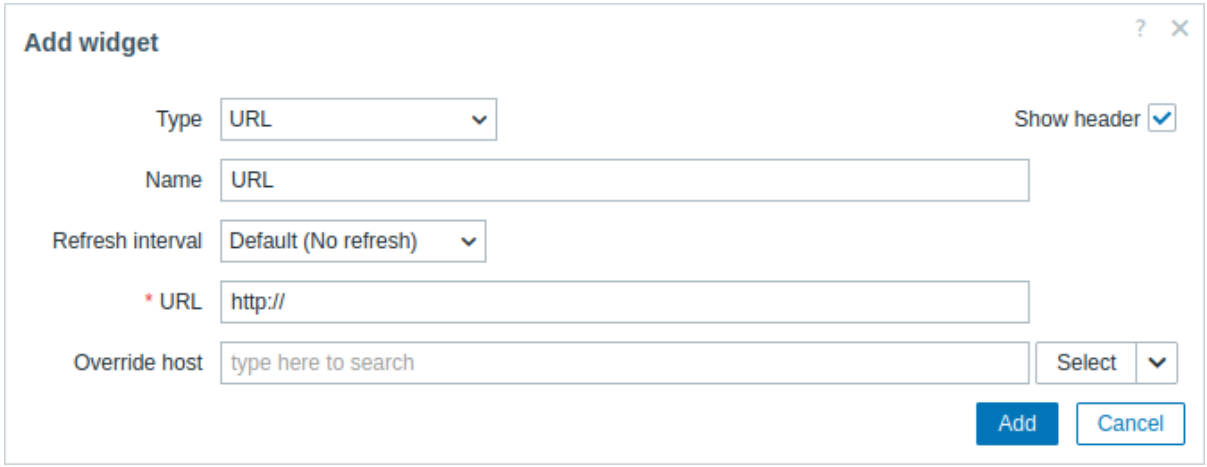
In addition to the parameters that are common for all widgets, you may set the following specific options:



Show	Filter triggers by trigger state: **Recent problems** - *(default)* show triggers that recently have been or still are in a PROBLEM state (resolved and unresolved); **Problems** - show triggers that are in a PROBLEM state (unresolved); **Any** - show all triggers.
Host groups	Select host groups. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. This parameter is not available when configuring the widget on a template dashboard.
Hosts	Select hosts. Alternatively, select a compatible widget or the dashboard as the data source for hosts. This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts. This parameter is not available when configuring the widget on a template dashboard.

Problem tags	Specify tags to filter the triggers displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. **Note:** If the parameter *Show* is set to 'Any', all triggers will be displayed even if tags are specified. However, while recent trigger state changes (displayed as blinking blocks) will update for all triggers, the trigger state details (problem severity color and whether the problem is acknowledged) will only update for triggers that match the specified tags. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the *Or* condition; **Or** - enough if one condition is met.
Show suppressed problems	Mark the checkbox to display problems that would otherwise be suppressed (not shown) because of host maintenance.
Layout	Select the layout option: **Horizontal** - host names will be displayed on the left; **Vertical** - host names will be displayed at the top.

URL



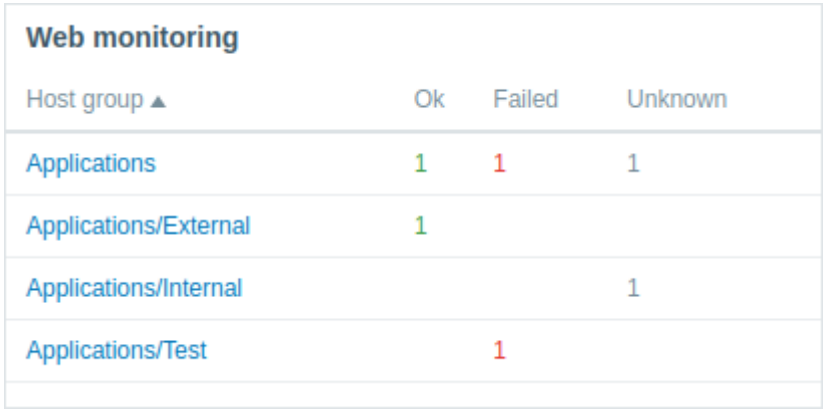
Overview

The *URL* widget displays the content retrieved from a URL.

Configuration

To configure, select *URL* as type:

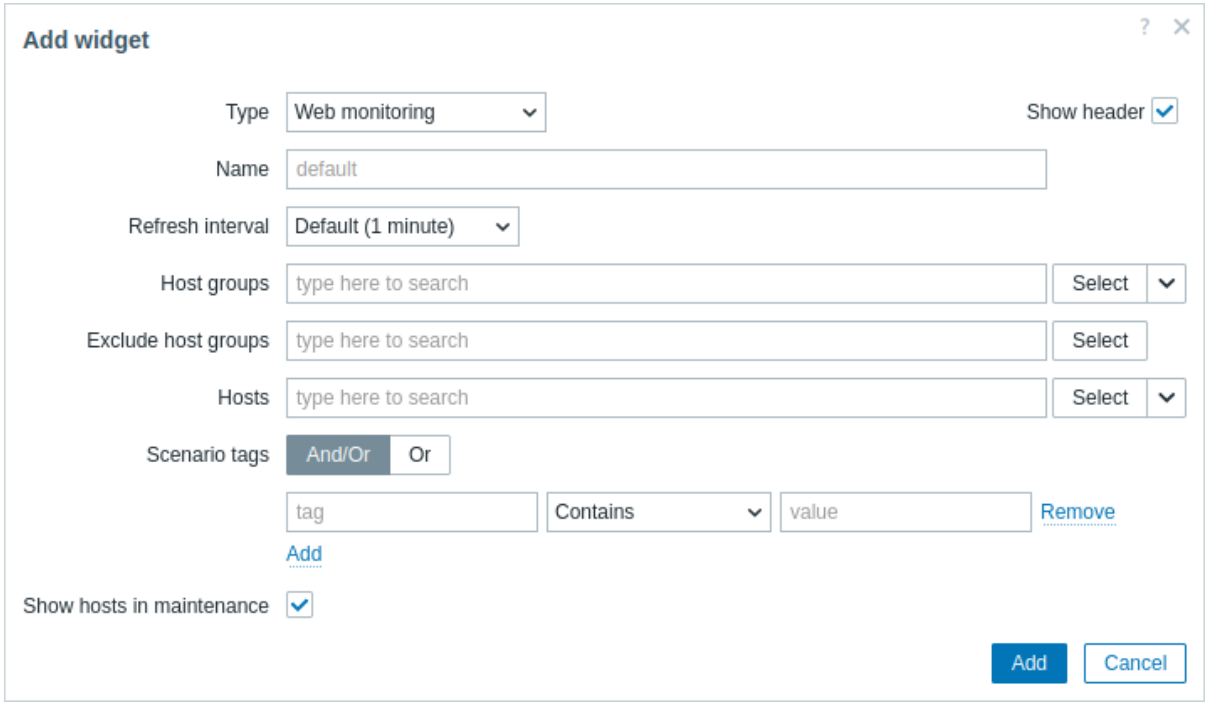
In addition to the parameters that are common for all widgets, you may set the following specific options:



URL	Enter the URL to display (up to 2048 characters). External URLs must start with `http://` or `https://`. Internal URLs support relative paths (for example, `zabbix.php?action=report.status`). `{HOST.*}` macros are supported.
Override host	Select a compatible widget or the dashboard host selector as the data source for hosts. This parameter is not available when configuring the widget on a template dashboard.

Attention:
Browsers might not load an HTTP page configured in the widget if Zabbix frontend is accessed over HTTPS. Also, you may need to modify the X-Frame-Options HTTP response header to display content external to Zabbix frontend.

Web monitoring



Overview

The *Web monitoring* widget displays the status of active web scenarios.

Clicking a host group name opens *Monitoring* > *Hosts* > *Web scenarios*, where you can view scenario details.

Configuration

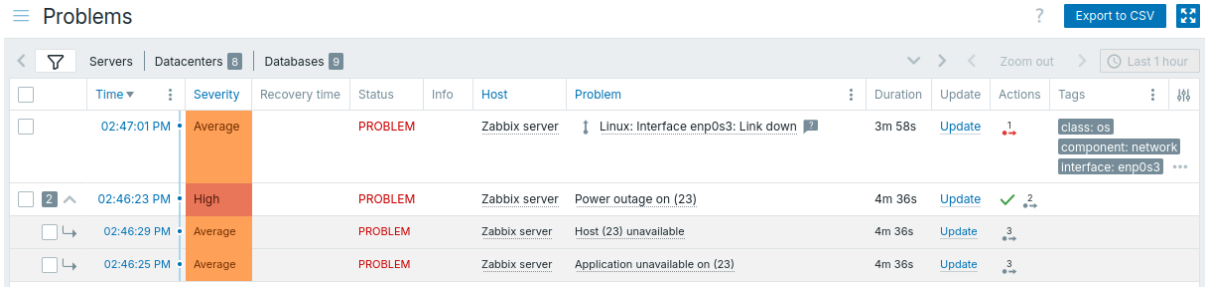
In addition to the parameters that are common for all widgets, you may set the following specific options:

Host groups	Select host groups to display in the widget. Alternatively, select a compatible widget as the data source for host groups. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Specifying a parent host group implicitly selects all nested host groups. Host data from these host groups will be displayed in the widget; if no host groups are entered, all host groups will be displayed. This parameter is not available when configuring the widget on a template dashboard.
Exclude host groups	Select host groups to hide from the widget. This field is auto-complete, so starting to type the name of a group will offer a dropdown of matching groups. Specifying a parent host group implicitly selects all nested host groups. Host data from these host groups will not be displayed in the widget. For example, hosts 001, 002, 003 may be in Group A and hosts 002, 003 in Group B as well. If we select to *show* Group A and *exclude* Group B at the same time, only data from host 001 will be displayed in the dashboard. This parameter is not available when configuring the widget on a template dashboard.
Hosts	Select hosts to display in the widget. Alternatively, select a compatible widget or the dashboard as the data source for hosts. This field is auto-complete, so starting to type the name of a host will offer a dropdown of matching hosts. If no hosts are entered, all hosts will be displayed. This parameter is not available when configuring the widget on a template dashboard.

Scenario tags	Specify tags to limit the number of web scenarios displayed in the widget. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the *Or* condition; **Or** - enough if one condition is met.
Show hosts in maintenance	Include hosts that are in maintenance in the statistics. This parameter is labeled *Show data in maintenance* when configuring the widget on a template dashboard.

Monitoring

Overview



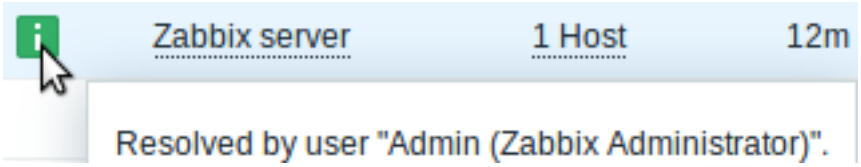
The Monitoring menu is all about displaying data. Whatever information Zabbix is configured to gather, visualize and act upon, it will be displayed in the various sections of the *Monitoring* menu.

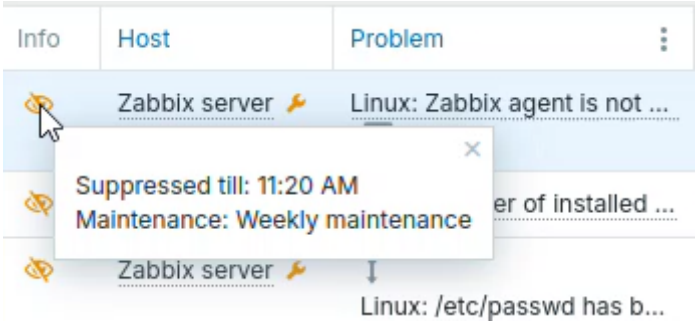
Problems

Overview

In *Monitoring* > *Problems* you can see what problems you currently have. Problems are those triggers that are in the "Problem" state.

By default, all new problems are classified as cause problems. It is possible to manually reclassify certain problems as symptom problems of the cause problem. For more details, see cause and symptom events.





Problem details are displayed in a customizable table. The *Customize table* button in the table header lets you show, hide, or reorder columns, and reset the layout to default. These options are also available:

- *Compact view* - reduces row height to fit more problems on screen.
- *Highlight full row* - uses the problem severity color to highlight unresolved problems (not available in high-contrast themes).

You can also resize each column by dragging its right border; double-click the border to reset. All customizations are applied immediately and always remembered for the current user within the active filter tab (default or saved).

The following columns are available:

Column	Description
Checkbox	Checkboxes for problem selection are displayed. Icons next to the checkboxes have the following meaning:  - the number of symptom events for the cause problem;  - expand to show symptom events;  - collapse to hide symptom events;  - this is a symptom event.
Time	Problem start time is displayed. Clicking the *Options* button in the column header gives you access to the *Show timeline* option, which toggles the visual timeline and problem grouping (not available when *Compact view* is enabled).
Severity	Problem severity is displayed. Problem severity is originally based on the severity of the underlying problem trigger, however, after the event has happened it can be updated using the *Update problem* screen. Color of the problem severity is used as cell background during problem time.
Recovery time	Problem resolution time is displayed This column is not available when *Show* in the filter is set to *Problems*.
Status	Problem status is displayed: **Problem** - unresolved problem **Resolved** - recently resolved problem. You can hide recently resolved problems using the filter. New and recently resolved problems blink for 2 minutes. Resolved problems are displayed for 5 minutes in total. Both of these values are configurable in *Administration* > *General* > *Trigger displaying options*. This column is not available when *Show* in the filter is set to *Problems*.
Info	A green information icon is displayed if a problem is closed by global correlation or manually when updating the problem. Hovering over the icon displays more details:  If a suppressed problem is shown, the following icon is displayed: . When the event is suppressed by host maintenance, the icon is shown in orange: . If both maintenance and manual suppression apply, manual suppression takes priority in the icon color. Hovering over the icon displays more details: 
Host	Problem host is displayed. Clicking the host name brings up the host menu.

Column	Description
Problem	Problem name is displayed. Problem name is based on the name of the underlying problem trigger. Macros in the trigger name are resolved at the time of the problem happening and the resolved values do not update any more. Clicking the problem name brings up the event menu. Hovering on the  icon after the problem name will bring up the trigger description (for those problems that have it). Clicking the *Options* button in the column header gives you access to two options: - *Show operational data* that displays operational data after the problem name in parentheses (only if the *Operational data* field is not empty in the trigger configuration). - *Show trigger expression* that displays the problem's trigger expression below the problem name (not available when *Compact view* is enabled).
Operational data	Dynamic, real-time data for the problem is displayed. The content depends on the *Operational data* field in trigger configuration: if a string with macros is defined, it is shown here; if the field is left empty, the latest values of all items in the trigger expression are shown instead.
Duration	Problem duration is displayed. See also: Negative problem duration
Update	Click the *Update* link to go to the problem update screen where various actions can be taken on the problem, including commenting and acknowledging the problem.
Actions	History of activities about the problem is displayed using symbolic icons:  - problem has been acknowledged. This icon is always displayed first.  - comments have been made. The number of comments is also displayed.  - problem severity has been increased (e.g., Information > Warning).  - problem severity has been decreased (e.g., Warning > Information).  - problem severity has been changed, but returned to the original level (e.g., Warning > Information > Warning).  - problem has been suppressed.  - problem has been unsuppressed.  - problem has been suppressed due to host maintenance.  - problem has been unsuppressed after host maintenance.  - actions have been taken. The number of actions is also displayed.  - actions have been taken, at least one is in progress. The number of actions is also displayed.  - actions have been taken, at least one has failed. The number of actions is also displayed. When rolling the mouse over the icons, popups with details about the activity are displayed. See viewing details to learn more about icons used in the popup for actions taken.
Tags	Problem tags are displayed. In addition, tags from an external ticketing system may also be displayed (see the *Process tags* option when configuring webhooks). Hovering or clicking the ••• three dots icon after the displayed tags opens a pop-up with all tags. Clicking the *Options* button in the column header lets you set the number of tags displayed (1-3), choose how tag names are displayed (full, shortened, or none), set tag display priority, or duplicate the column (duplicated columns can be renamed or deleted).
Tag value	Problem tag values are displayed. Clicking the *Options* button in the column header lets you rename the column, choose which tag values to display, or duplicate the column (duplicated columns can be renamed or deleted).

Column	Description
Custom text	Custom text, macro values, or a combination of both is displayed. Clicking the *Options* button in the column header lets you rename the column, enter the custom text or macros, or duplicate the column (duplicated columns can be renamed or deleted). Supported macros: `{HOST.*}` (except `{HOST.METADATA}`), `{INVENTORY.*}`, `{ITEM.*}` (except `{ITEM.STATE.ERROR}`), `{TRIGGER.ID}`, `{EVENT.ID}`, and user macros.

Negative problem duration

It is actually possible in some common situations to have negative problem duration i.e. when the problem resolution time is earlier than problem creation time, e. g.:

- If some host is monitored by proxy and a network error happens, leading to no data received from the proxy for a while, the nodata(/host/key) trigger will be fired by the server. When the connection is restored, the server will receive item data from the proxy having a time from the past. Then, the nodata(/host/key) problem will be resolved and it will have a negative problem duration;
- When item data that resolve the problem event are sent by Zabbix sender and contain a timestamp earlier than the problem creation time, a negative problem duration will also be displayed.

Note:
Negative problem duration is not affecting SLA calculation or Availability report of a particular trigger in any way; it neither reduces nor expands problem time.

Mass editing options

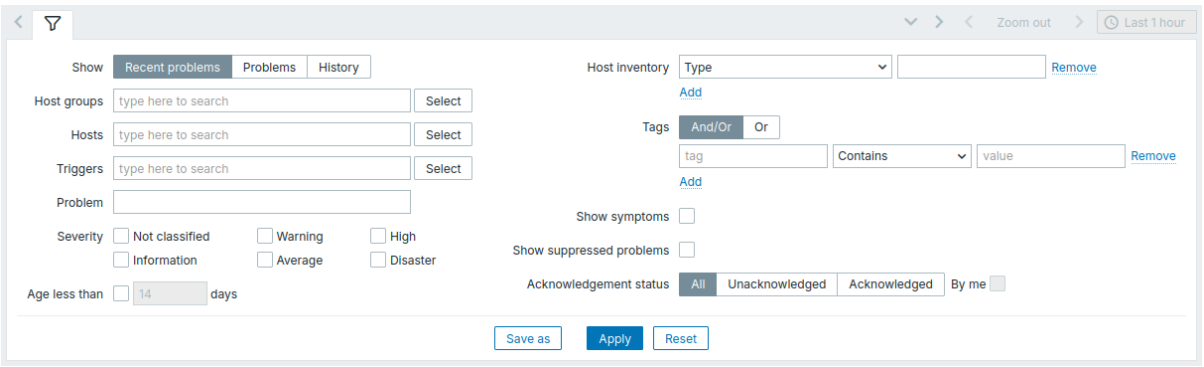
Buttons below the list offer some mass-editing options:

- *Mass update* - update the selected problems by navigating to the problem update screen

To use this option, mark the checkboxes before the respective problems, then click the *Mass update* button.

Buttons

The button to the right offers the following option:



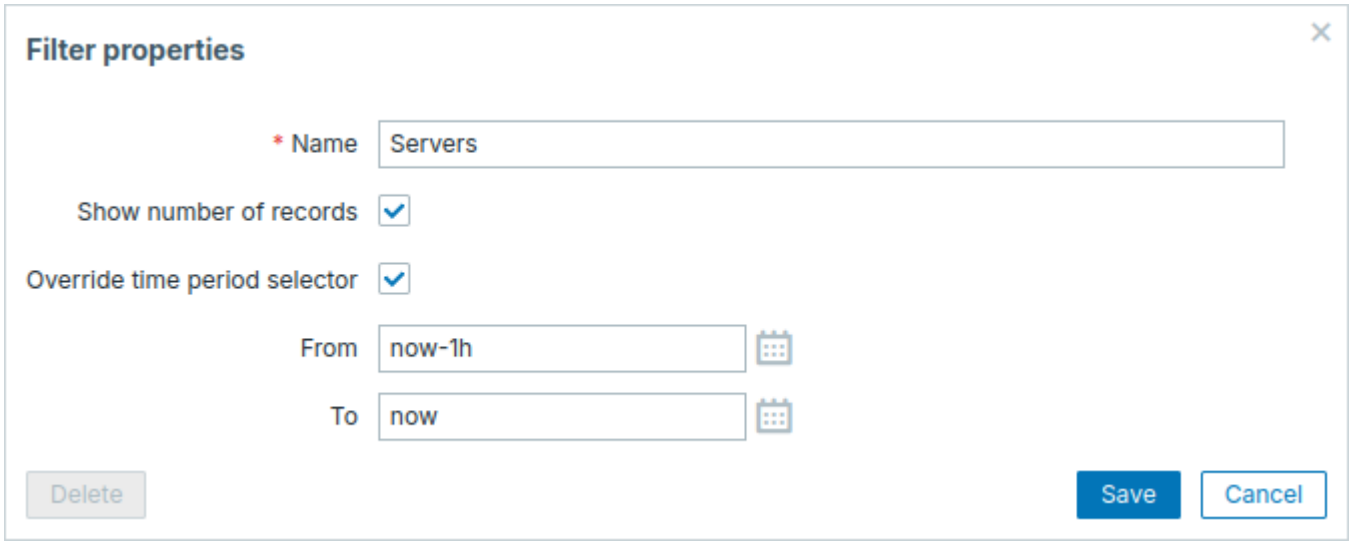
Export to CSV	Export content from all pages to a CSV file.

View mode buttons, being common for all sections, are described on the Monitoring page.

Using filter

You can use the filter to display only the problems you are interested in. For better search performance, data is searched with macros unresolved.

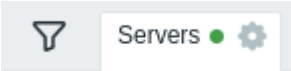
The filter is located above the table. Favorite filter settings can be saved as tabs and then quickly accessed by clicking the tabs above the filter.



Parameter	Description
Show	Filter by problem status: **Recent problems** - unresolved and recently resolved problems are displayed (default) **Problems** - unresolved problems are displayed **History** - history of all events is displayed
Host groups	Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups.
Hosts	Filter by one or more hosts.
Triggers	Filter by one or more triggers.
Problem	Filter by problem name.
Severity	Filter by trigger (problem) severity.
Age less than	Filter by how old the problem is.
Host inventory	Filter by inventory type and value.
Tags	Filter by event tag name and value. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names **Equals** - include the specified tag names and values (case-sensitive) **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) **Does not exist** - exclude the specified tag names **Does not equal** - exclude the specified tag names and values (case-sensitive) **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition **Or** - enough if one condition is met When filtered, the tags specified here will be displayed first with the problem, unless overridden by the *Tag display priority* (see below) list.
Show symptoms	Mark the checkbox to display in its own line problems classified as symptoms.
Show suppressed problems	Mark the checkbox to display problems that would otherwise be suppressed and hidden because of host maintenance or suppressed manually by a user.
Acknowledgement status	Filter to display all problems, unacknowledged problems only, or acknowledged problems only. Mark the additional checkbox to filter out those problems ever acknowledged by you.

Tabs for favorite filters

Frequently used sets of filter parameters can be saved in tabs.



To save a new set of filter parameters, open the main tab, and configure the filter settings, then click the *Save as* button. In a new popup window, define *Filter properties*.

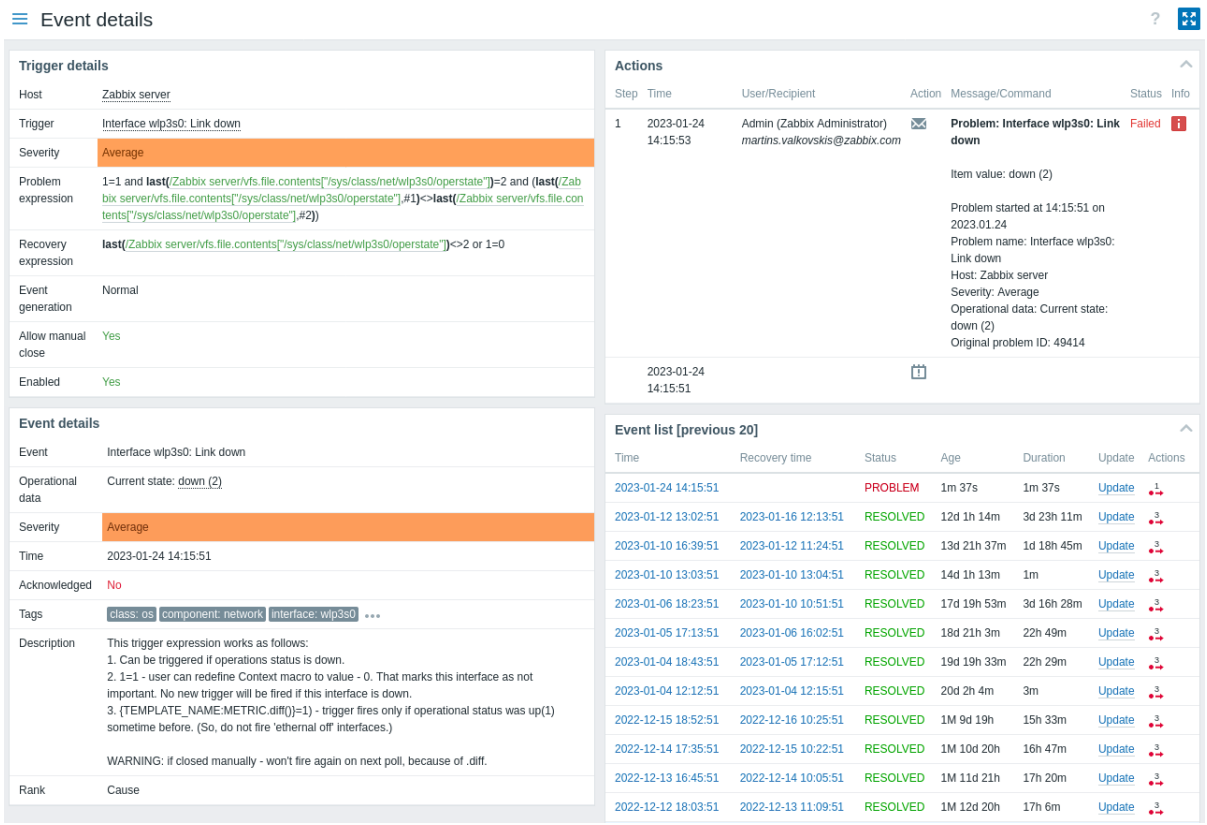
Parameter	Description
Name	The name of the filter to display in the tab list.
Show number of records	Check, if you want the number of problems to be displayed next to the tab name.
Override time period selector	Check to set specific default time period for this filter set. If set, you will only be able to change the time period for this tab by updating filter settings. For tabs without a custom time period, the time range can be changed by clicking the time selector button in the upper-right corner (button name depends on selected time interval: This week, Last 30 minutes, Yesterday, etc.). This option is available only for filters in *Monitoring* > *Problems*.
From/To	Time period start and end in absolute (`Y-m-d H:i:s`) or relative time syntax (`now-1d`). Available if *Set custom time period* is checked.

When saved, the filter is created as a named filter tab and immediately activated.

To edit the filter properties of an existing filter, click the gear symbol next to the active tab name.

Notes:

- To hide the filter area, click the name of the current tab. Click the active tab name again to open the filter area again.
- Keyboard navigation is supported: use arrows to switch between tabs, press *Enter* to open.
- The left/right buttons above the filter may be used to switch between saved filters. Alternatively, the downward pointing button opens a drop-down menu with all saved filters and you can click the one you need.
- If the settings of a saved filter have been changed (but not saved), a green dot is displayed after the filter name. To update the filter according to the new settings, click the *Update* button, which is displayed instead of the *Save as* button.
- Table column layout is saved per filter tab. To customize the layout of a saved filter, open that filter tab first, then customize the columns.
- Filter tabs, filter settings, and table column layout for each tab are remembered in the user profile and restored when the user opens the page again.



Note:
To share filters, copy and send to others a URL of an active filter. After opening this URL, other users will be able to save this set of parameters as a permanent filter in their Zabbix account.
 See also: Page parameters.

Filter buttons

Apply	Apply specified filtering criteria (without saving).
Reset	Reset current filter and return to saved parameters of the current tab. On the main tab, this will clear the filter.
Save as	Save current filter parameters in a new tab. Only available on the main tab.
Update	Replace tab parameters with currently specified parameters. Not available on the main tab.

Viewing details

The times for problem start and recovery in *Monitoring* > *Problems* are links. Clicking them opens more details of the event.

In event details, you can see whether the event was suppressed because of maintenance or suppressed manually by a user.

Note that the problem severity may differ for the trigger and the problem event - if it has been updated for the problem event using the *Update problem* screen.

In the action list, the following icons are used to denote the activity type:

- - problem event generated.
- - message has been sent.
- - problem event acknowledged.
- - problem event unacknowledged.
- - a comment has been added.
- - problem severity has been increased (e.g., Information > Warning).
- - problem severity has been decreased (e.g., Warning > Information).
- - problem severity has been changed, but returned to the original level (e.g., Warning > Information > Warning).
- - a remote command has been executed.
- - problem event has recovered.
- - the problem has been closed manually.
- - the problem has been suppressed.
- - the problem has been unsuppressed.
- - problem has been suppressed due to host maintenance.
- - problem has been unsuppressed after host maintenance.
- - the problem has been converted to a symptom problem.
- - the problem has been converted to a cause problem.

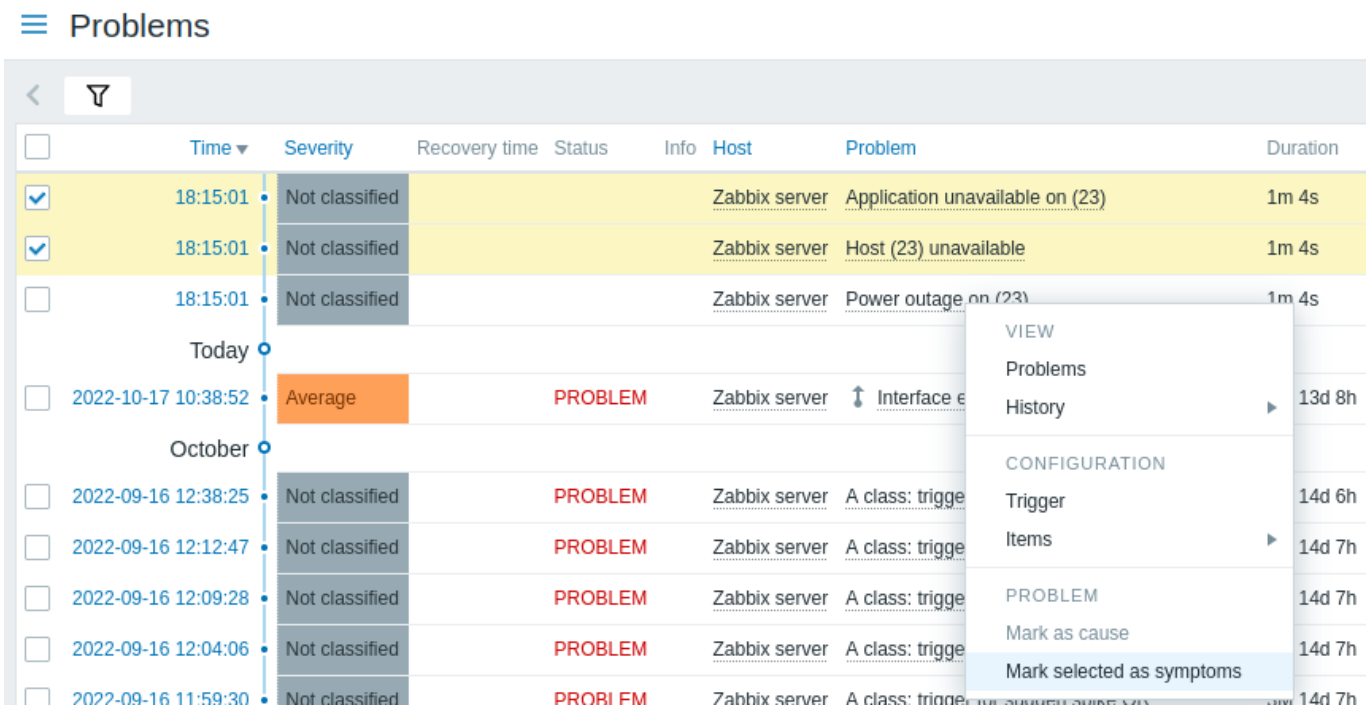
Cause and symptom problems

Overview

By default, all new problems are classified as cause problems. It is possible to manually reclassify certain problems as symptom problems of the cause problem.

For example, power outage may be the actual root cause why some host is unreachable or some service is down. In this case, "host is unreachable" and "service is down" problems must be classified as symptom problems of "power outage" - the cause problem.

The cause-symptom hierarchy supports only two levels. A problem that is already a symptom cannot be assigned "subordinate" symptom problems; any problems assigned as symptoms to a symptom problem will become symptoms of the same cause problem.



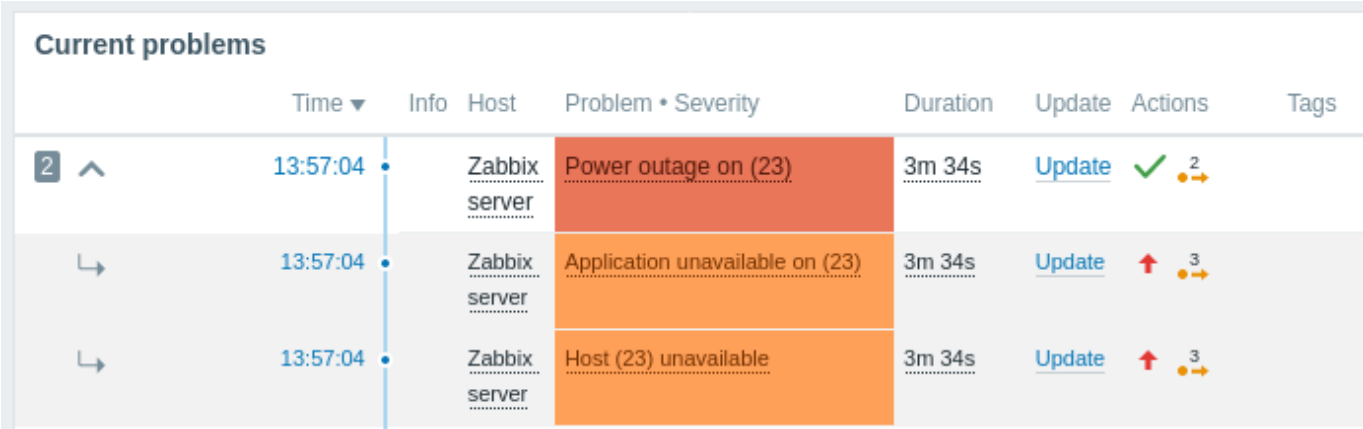
Only cause problems are counted in problem totals in maps, dashboard widgets such as *Problems by severity* or *Problem hosts*, etc. However, problem ranking does not affect services.

A symptom problem can be linked to only one cause problem. Symptom problems are not automatically resolved, if the cause problem is resolved or closed.

Configuration

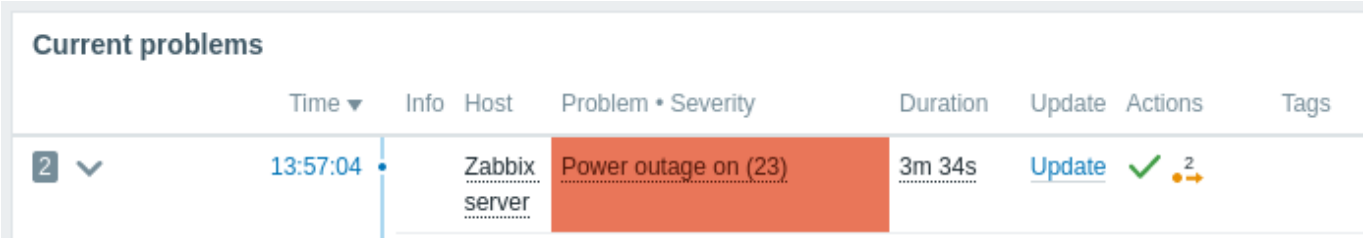
To reclassify a problem as symptom problem, first select it in the list of problems. One or several problems can be selected.

Then go to the cause problem, and in its context menu click the *Mark selected as symptoms* option.



After that, the selected problems will be updated by the server to symptom problems of the cause problem.

While the status of the problem is being updated, it is displayed in one of two ways:



- A blinking "UPDATING" status is displayed in the Status column;
- A blinking or icon in the Info column (this is in effect if *Problems* only are selected in the filter and thus the Status column is not shown).

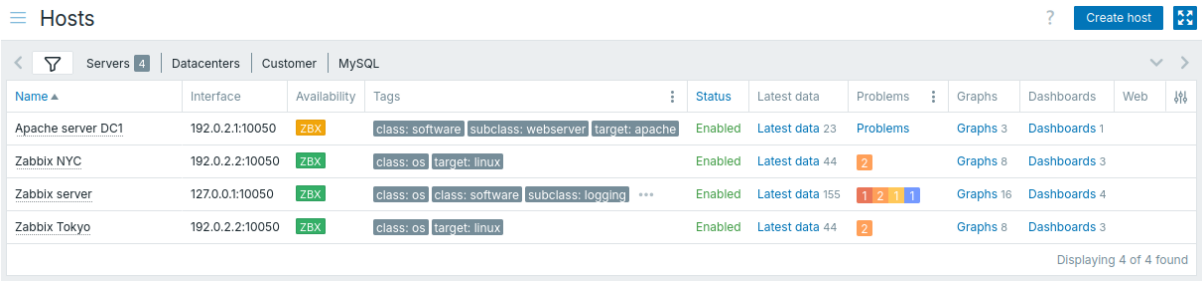
Display

Symptom problems are displayed below the cause problem and marked accordingly in *Monitoring* > *Problems* (and the *Problems* dashboard widget) - with an icon, smaller font and different background.

In collapsed view, only the cause problem is seen; the existence of symptom problems is indicated by the number in the beginning of the line and the icon for expanding the view.

It is also possible to additionally display symptom problems in normal font and in their own line. For that select *Show symptoms* in the filter settings or the widget configuration.

Reverting to cause problem



A symptom problem can be reverted back to a cause problem. To do that, either:

- click the *Mark as cause* option in the context menu of the symptom problem;
- mark the *Convert to cause* option in to the problem update screen and click *Update* (this option will also work if several problems are selected).

Hosts

Overview

The *Monitoring* > *Hosts* section displays a full list of monitored hosts with detailed information about host interface, availability, tags, current problems, status (enabled/disabled), and links to easily navigate to the host's latest data, problem history, graphs, dashboards and web scenarios.

Host details are displayed in a customizable table. The *Customize table* button in the table header lets you show, hide, or reorder columns, and reset the layout to default. You can also resize each column by dragging its right border; double-click the border to reset. All customizations are applied immediately and always remembered for the current user within the active filter tab (default or saved).

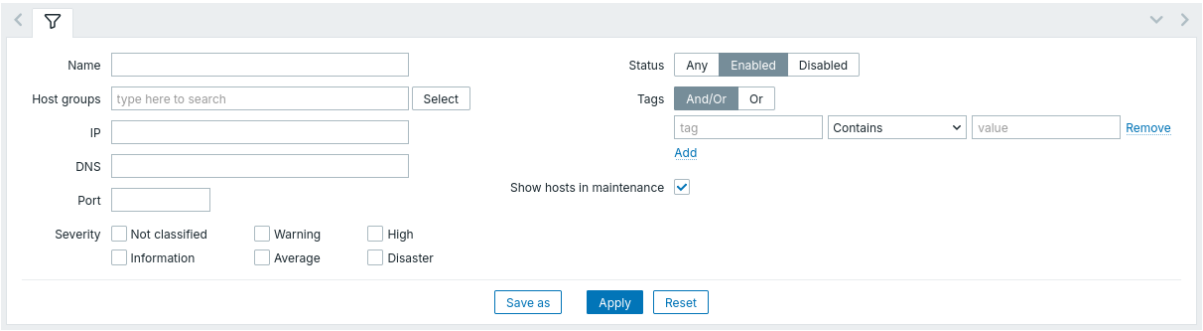
The following columns are available:

Column	Description
Name	The visible host name. Clicking the name brings up the host menu. An orange wrench icon after the name indicates that this host is in maintenance. Click the column header to sort hosts by name in ascending or descending order.

Column	Description
Interface	The main interface of the host is displayed.
Availability	Host availability per configured interface is displayed. Availability icons represent host interface current status on Zabbix server. Therefore, if you disable a host in the frontend, its availability will update after Zabbix server has synchronized the configuration changes. Similarly, if you enable a host, its availability will update after Zabbix server has synchronized the configuration changes and polled the host. Availability icons represent only those interface types (Agent, SNMP, IPMI, JMX) that are configured. Hovering over the icon displays a pop-up with a list of all interfaces of the same type with details, status, and errors. For Agent interface, the pop-up displays interfaces (passive) and active checks. If a host has active checks only, the Agent interface icon is displayed even if the host does not have an Agent interface configured. The column is empty for hosts with no interfaces. The status of a single host interface is determined by the connection between an enabled item using the interface and the host. The status can be: **Available** - the connection to the host was successful; **Not available** - the connection to the host was unsuccessful (timeout, firewall issues, etc.); **Unknown** - the connection to the host has not been attempted or the result is unknown. For additional details on how Zabbix server determines interface status, see Unknown interface status and Unreachable/unavailable host interface settings. The status of all host interfaces of a single type (Agent, SNMP, IPMI, JMX) is determined by those interfaces that are used by at least one enabled item. The status is indicated by the icon color: **Green** - all interfaces are available; **Yellow** - at least one interface is not available, and at least one is available or unknown; **Red** - all interfaces are not available; **Gray** - at least one interface is unknown, but none are not available. **Active check availability.** If at least one active check is enabled on the host, active checks also affect the total Agent interface availability as described above. To determine active check availability, heartbeat messages are sent in the agent active check thread. The frequency of heartbeat messages is controlled by the `HeartbeatFrequency` parameter in Zabbix agent or agent 2 configuration (default 60 seconds, range 0-3600). Active checks are considered not available when the active check heartbeat is older than 2 x HeartbeatFrequency seconds. **Note:** Zabbix agents older than version 6.2.x do not send active check heartbeats, so the availability of their hosts remains unknown.
Tags	Host tags are displayed. Hovering or clicking the three dots icon after the displayed tags opens a pop-up with all tags. Clicking the *Options* button in the column header lets you set the number of tags displayed (1–3), choose how tag names are displayed (full, shortened, or none), set tag display priority, or duplicate the column (duplicated columns can be renamed or deleted).
Tag value	Host tag values are displayed. Clicking the *Options* button in the column header lets you rename the column, choose which tag values to display, or duplicate the column (duplicated columns can be renamed or deleted).
Status	Host status - *Enabled* or *Disabled*. Click the column header to sort hosts by status in ascending or descending order.
Latest data	Clicking the link will open the *Monitoring* > *Latest data* section with all the latest data collected from the host. The number of items with latest data is displayed in gray.
Problems	The number of open problems for a host is displayed, sorted by severity. The color of each problem icon shows the severity, while the number shows the problem count for that severity. Clicking an icon opens *Monitoring* > *Problems* for that host; if a host has no problems, a *Problems* link is shown instead. Clicking the *Options* button in the column header gives you access to the *Show suppressed problems* option, which includes problems that would otherwise be suppressed (hidden) because of host maintenance or single problem suppression.

Column	Description
Graphs	Clicking the link will display graphs configured for the host. The number of graphs is displayed in gray. If a host has no graphs, no link is displayed.
Dashboards	Clicking the link will display dashboards configured for the host. The number of dashboards is displayed in gray. If a host has no dashboards, no link is displayed.
Web	Clicking the link will display web scenarios configured for the host. The number of web scenarios is displayed in gray. If a host has no web scenarios, no link is displayed.
Custom text	Custom text, macro values, or a combination of both is displayed. Clicking the *Options* button in the column header lets you rename the column, enter the custom text or macros, or duplicate the column (duplicated columns can be renamed or deleted). Supported macros: {HOST.*} (except {HOST.METADATA}), {INVENTORY.*}, and user macros.

Buttons



Create host allows you to create a new host. This button is available for Admin and Super Admin users only.

View mode buttons being common for all sections are described on the Monitoring page.

Using filter

You can use the filter to display only the hosts you are interested in. For better search performance, data is searched with macros unresolved.

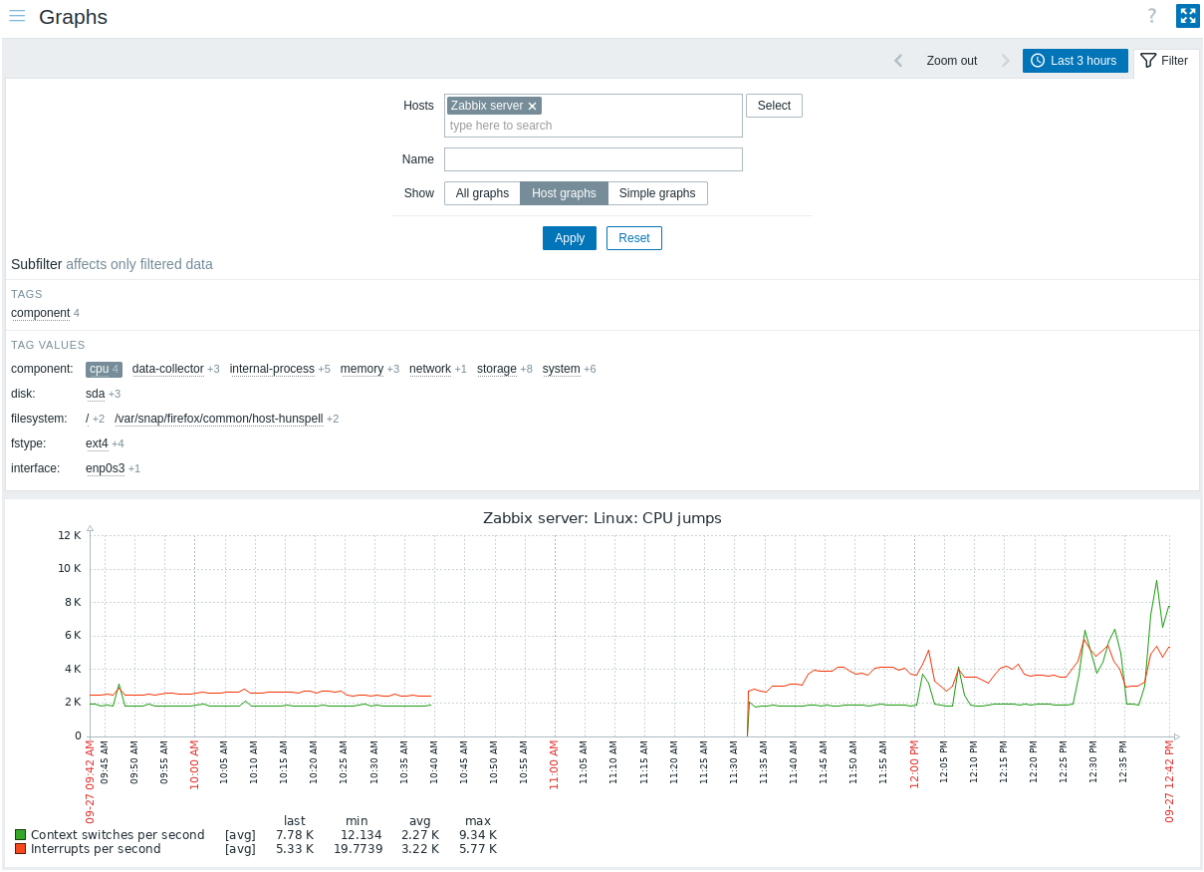
The filter is located above the table. It is possible to filter hosts by name, host group, IP or DNS, interface port, tags, problem severity, status (enabled/disabled/any); you can also select whether to display hosts that are currently in maintenance.

Parameter	Description
Name	Filter by visible host name.
Host groups	Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups.
IP	Filter by IP address.
DNS	Filter by DNS name.
Port	Filter by port number.
Severity	Filter by problem severity. By default, problems of all severities are displayed. Problems are displayed if not suppressed.
Status	Filter by host status.

Parameter	Description
Tags	Filter by host tag name and value. Hosts can be filtered by host-level tags as well as tags from all linked templates, including nested templates. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names **Equals** - include the specified tag names and values (case-sensitive) **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) **Does not exist** - exclude the specified tag names **Does not equal** - exclude the specified tag names and values (case-sensitive) **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition **Or** - enough if one condition is met
Show hosts in maintenance	Mark the checkbox to display hosts that are in maintenance (displayed by default).

Saving filter

Favorite filter settings can be saved as tabs and then quickly accessed by clicking the respective tab above the filter.



See more details about saving filters.

Graphs

Overview

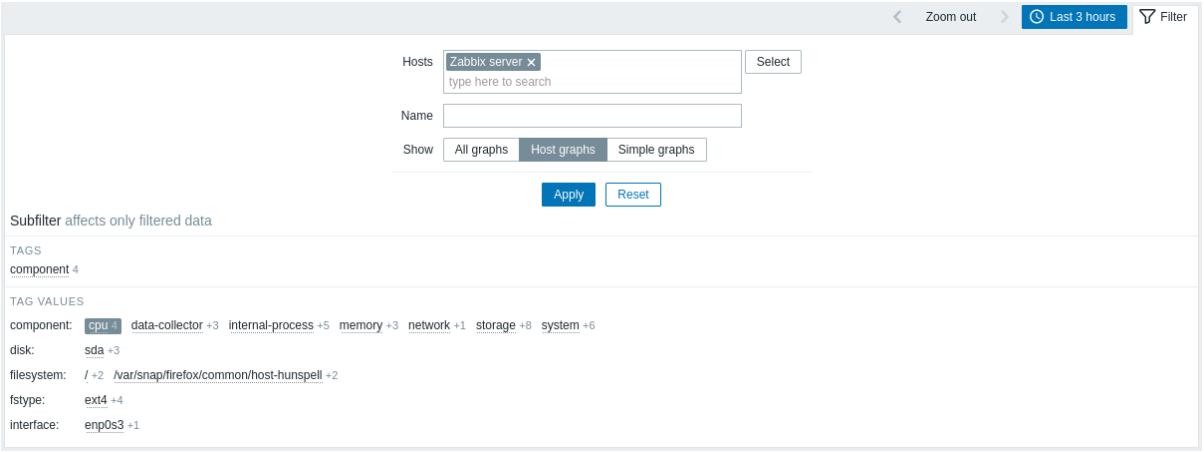
Host graphs can be accessed from *Monitoring* > *Hosts* by clicking Graphs for the respective host.

Any custom graph that has been configured for the host can be displayed, as well as any simple graph.

Graphs are sorted by:

- graph name (custom graphs)
- item name (simple graphs)

Graphs for disabled hosts are also accessible.



Time period selector

Take note of the time period selector above the graph. It allows selecting often required periods with one mouse click.

See also: *Time period selector*

Using filter

To view a specific graph, select it in the filter. The filter allows you to specify the host, the graph name and the *Show* option (all/host graphs/simple graphs).

If no host is selected in the filter, no graphs are displayed.

Using subfilter

The subfilter allows further modification of the filtering applied by the main filter.

It contains clickable links for a quick access to related graphs. Graphs are related by common entity - tag name or value. When a tag name/value is clicked, it is highlighted with a gray background, and graphs are immediately filtered (no need to click *Apply* in the main filter). Clicking another tag name/value adds it to the filtered results. Clicking the tag name/value again removes the filtering.

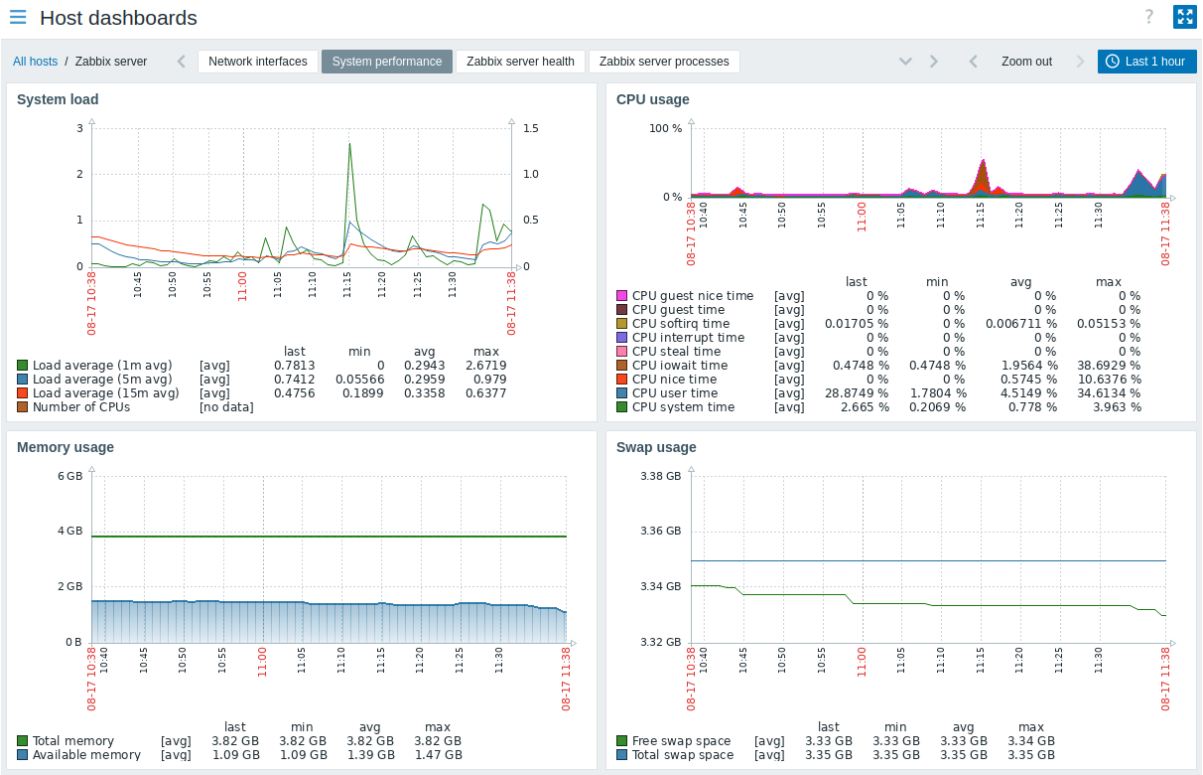
Subfilters are generated based on the filtered data, which is limited to 1000 records. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration* > *General* > *GUI*).

Unlike the main filter, the subfilter is updated together with each table refresh request to always get up-to-date information of available filtering options and their counter numbers.

The number of entities displayed is limited to 100 horizontally. If there are more, a three-dot icon is displayed at the end; it is not clickable. Vertical lists (such as tags with their values) are limited to 20 entries. If there are more, a three-dot icon is displayed; it is not clickable.

A number next to each clickable entity indicates the number of graphs it has in the results of the main filter.

Once one entity is selected, the numbers with other available entities are displayed with a plus sign indicating how many graphs may be added to the current selection.



Buttons

View mode buttons, being common for all sections, are described on the Monitoring page.

Host dashboards

Overview

Host dashboards look similar to global dashboards; however, host dashboards lack an owner and display data only for the selected host.

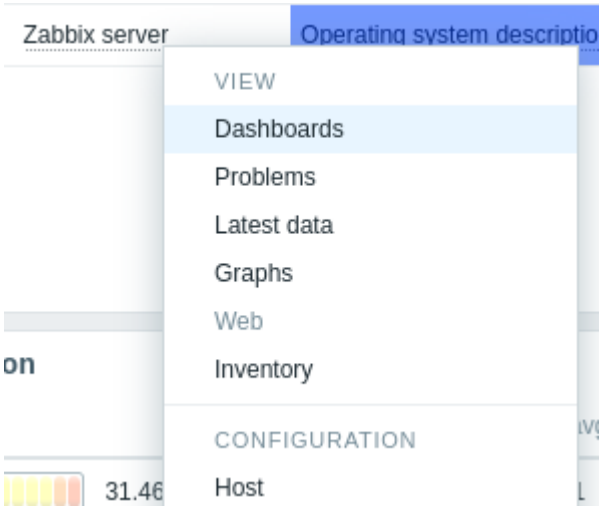
When viewing host dashboards, you can switch between the configured dashboards by clicking:

- the dashboard tabs;
- the  arrow buttons under the header;
- the  arrow button under the header, which will display the full list of host dashboards available.

To switch to the *Monitoring* > *Hosts* section, click the *All hosts* navigation link under the header in the upper-left corner.

Configuration

Host dashboards are configured at the template level. Once a template is linked to a host, host dashboards are generated for that host. Note that host dashboards *cannot* be configured in the *Dashboards* section, which is reserved for global dashboards.



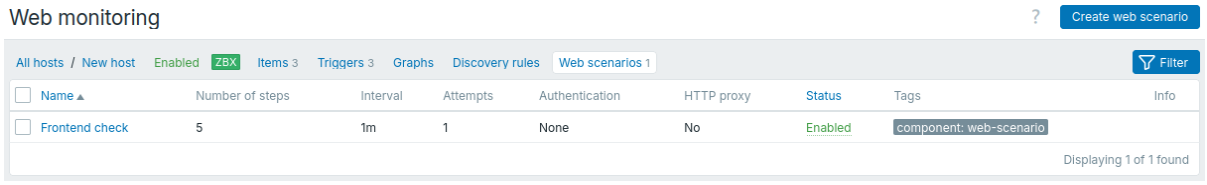
Widgets of host dashboards can also be configured only at the template level, except for changing the refresh interval. Moreover, widgets of host dashboards can only be copied to other host dashboards within the same template. Note that widgets from global dashboards *cannot* be copied to host dashboards.

Note:
Host dashboards used to be host screens before Zabbix 5.2. When importing an older template that contains screens, the screen import will be ignored.

Access

Host dashboards can be accessed:

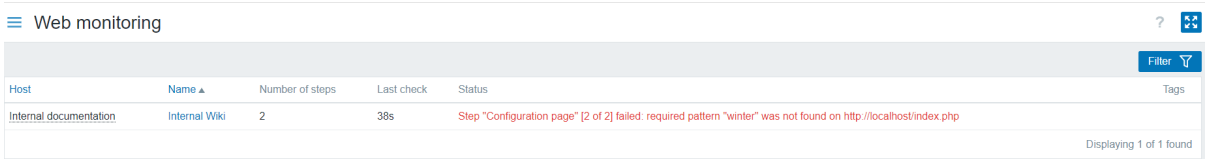
- after searching for a host name in global search (click the *Dashboards* link provided in the search results);
- after clicking a host name in *Inventory* > *Hosts* (click the *Dashboards* link provided in the host overview);
- from the host menu by clicking *Dashboards*.



Note that host dashboards *cannot* be directly accessed in the *Dashboards* section, which is reserved for global dashboards.

Web scenarios

Overview



Host web scenario information can be accessed from *Monitoring* > *Hosts* by clicking Web for the respective host.

Clicking the host name brings up the host menu. Data of disabled hosts is also accessible. The name of a disabled host is listed in red.

The status of a web scenario can be:

- OK (green) - all steps have succeeded and Zabbix has collected data for the scenario.
- Error (red) - one or more steps have failed (see the error message for hints on which parameters may need correction).
- Unknown (gray) - no step status is available yet or no data has been collected.

The maximum number of scenarios displayed per page depends on the *Rows per page* user profile setting.

By default, only values that fall within the last 24 hours are displayed. This limit has been introduced with the aim of improving initial loading times for large pages of latest data. You can extend this time period by changing the value of *Max history display period* parameter in the *Administration > General > GUI* menu section.

The scenario name is link to more detailed statistics about it:

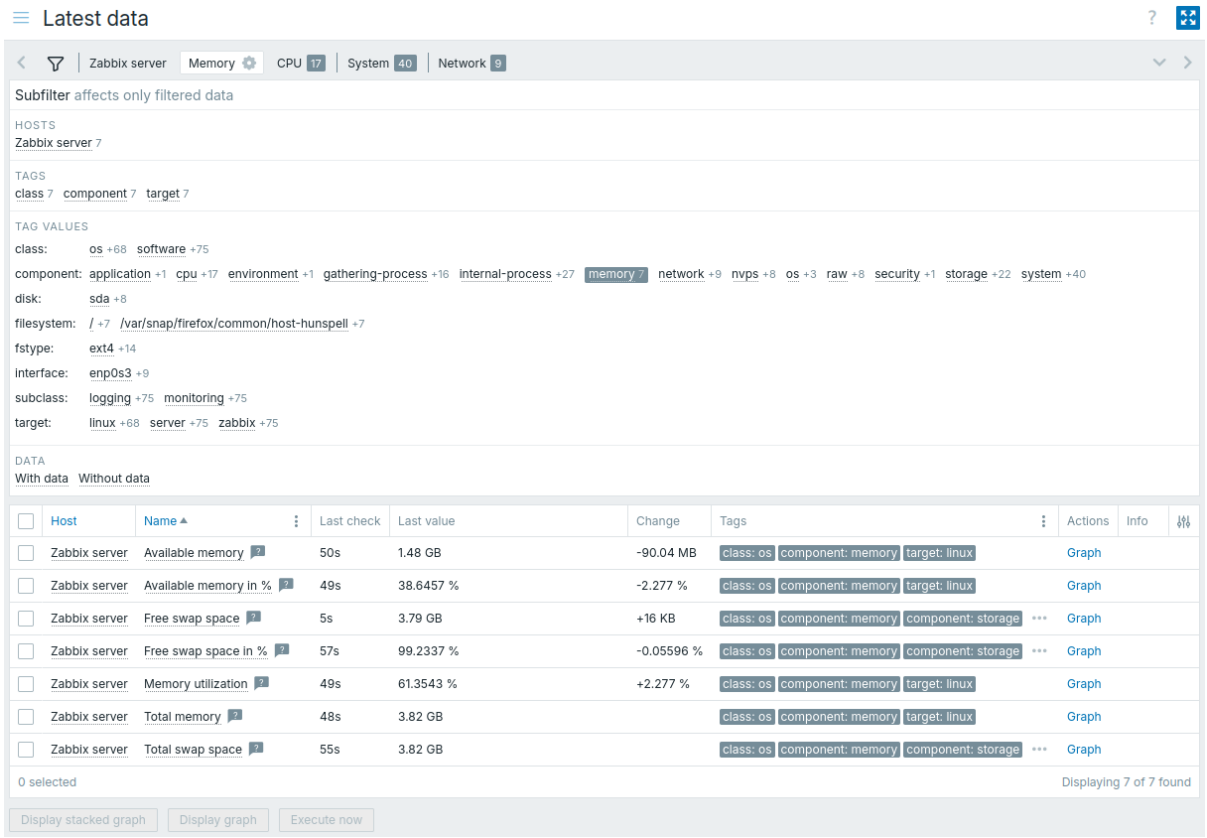
Using filter

The page shows a list of all web scenarios of the selected host. To view web scenarios for another host or host group without returning to the *Monitoring* > *Hosts* page, select that host or group in the filter. You may also filter scenarios based on tags.

Buttons

View mode buttons being common for all sections are described on the Monitoring page.

Latest data



Overview

The *Monitoring* > *Latest data* section displays the latest values gathered by items.

This section contains the following elements:

- Filter
- Subfilter
- Item list

Note:
The subfilter and item list is displayed only if the filter is set and there are results to display.

Latest value details are displayed in a customizable table. The *Customize table* button in the table header lets you show, hide, or reorder columns, and reset the layout to default. You can also resize each column by dragging its right border; double-click the border to reset. All customizations are applied immediately and always remembered for the current user within the active filter tab (default or saved).

The following columns are available:

Column	Description
Host	Name of the host to which the item belongs. Clicking the name brings up the host context menu. If a host is in maintenance, an orange wrench icon is displayed after the host's name. If a host is disabled, the name of the host is displayed in red. Note that data of disabled hosts (including graphs and item value lists) is accessible in the *Latest data* section.
Name	Name of the item. Clicking the name brings up the item menu. A question mark icon is displayed next to the item name for all items that have a description. Hover over the icon to display a tooltip with the item description. Clicking the *Options* button in the column header gives you access to the *Show item key* option that displays the item key below each item's name.
Interval	Update interval of the item.
History	History storage period of the item.
Trends	Trends storage period of the item.
Type	Type of the item.
Last check	Time since the last item check.
Last value	Most recent value for the item. Values are displayed with unit conversion and value mapping applied. Hover over the value to display raw data (truncated to 8192 characters). Binary values are displayed as a placeholder (*binary value*) instead of the actual value. By default, only values received in the last 24 hours are displayed. This limit improves initial loading times for large pages of latest data; to extend it, update the value of the *Max history display period* parameter in *Administration* > *General* > *GUI*.
Change	Difference between the previous value and the most recent value. For items with an update frequency of 1 day or more, the change amount will never be displayed (with the default setting). In this case, the last value will not be displayed at all if it was received more than 24 hours ago.

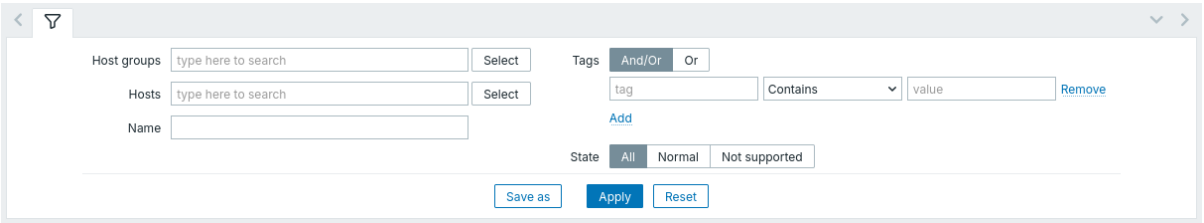
Column	Description
Tags	Tags associated with the item. Clicking a tag enables it in the subfilter, thus filtering the item list by that tag (and any other tags selected in the subfilter). Once clicked, such tags are no longer clickable; to adjust filtering by tags, the subfilter must be used. Clicking the *Options* button in the column header lets you set the number of tags displayed (1-3), choose how tag names are displayed (full, shortened, or none), set tag display priority, or duplicate the column (duplicated columns can be renamed or deleted).
Tag value	Item tag values are displayed. Clicking the *Options* button in the column header lets you rename the column, choose which tag values to display, or duplicate the column (duplicated columns can be renamed or deleted).
Actions	Link to simple graph/history of item values.
Info	Additional information about the item. If an item has errors (for example, has become unsupported), an information icon is displayed. Hover over the icon for details.
Custom text	Custom text, macro values, or a combination of both is displayed. Clicking the *Options* button in the column header lets you rename the column, enter the custom text or macros, or duplicate the column (duplicated columns can be renamed or deleted). Supported macros: {HOST.*} (except {HOST.METADATA}), {INVENTORY.*}, {ITEM.*} (except {ITEM.STATE.ERROR}), and user macros.

Buttons

View mode buttons being common for all sections are described on the Monitoring page.

Mass actions

Buttons below the list offer mass actions with one or several selected items:



- *Display stacked graph* - display a stacked ad-hoc graph.
- *Display graph* - display a simple ad-hoc graph.
- *Execute now* - execute a check for new item values immediately. Supported for **passive** checks only (see more details). This option is available only for hosts with read-write access. Accessing this option for hosts with read-only permissions depends on the user role option called *Invoke "Execute now" on read-only hosts*.

To use these options, mark the checkboxes before the respective items, then click the required button.

Using filter

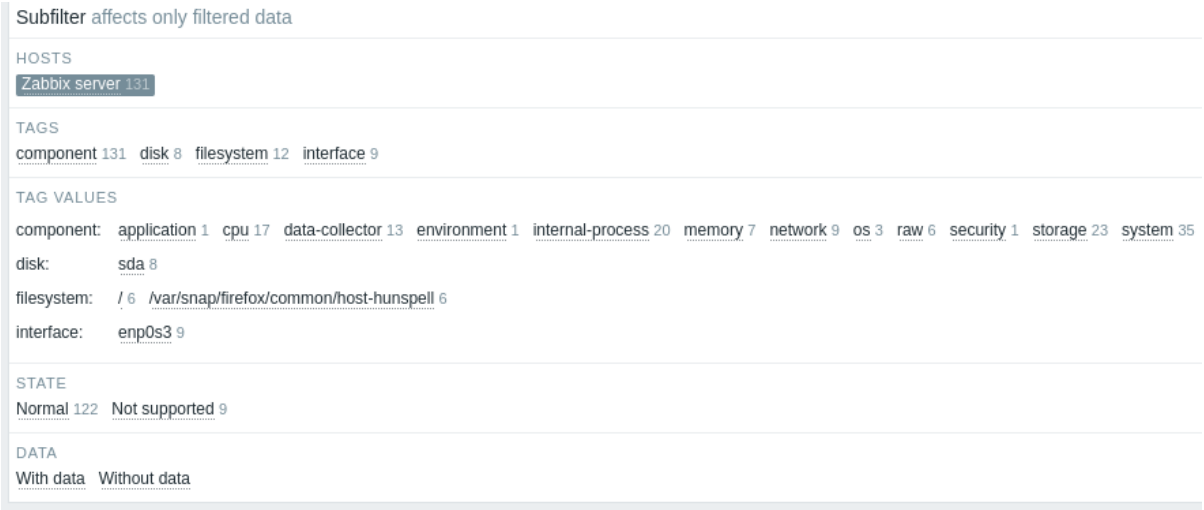
You can use the filter to display only the items you are interested in. For better search performance, data is searched with macros unresolved.

The filter icon is located above the item list and the subfilter. Click it to expand the filter.

The filter allows you to narrow the item list by host group, host, item name, tags, and state. Specifying a parent host group in the filter implicitly selects all nested host groups. See *Monitoring* > *Problems* for details on filtering by tags.

The *Show details* filter option allows the information displayed for the items to be expanded. Mark it to display such details as the item refresh interval, history and trends settings, item type, and item errors (fine/unsupported).

Saving filter



Favorite filter settings can be saved as tabs and then quickly accessed by clicking the respective tab above the filter.

See more details about saving filters.

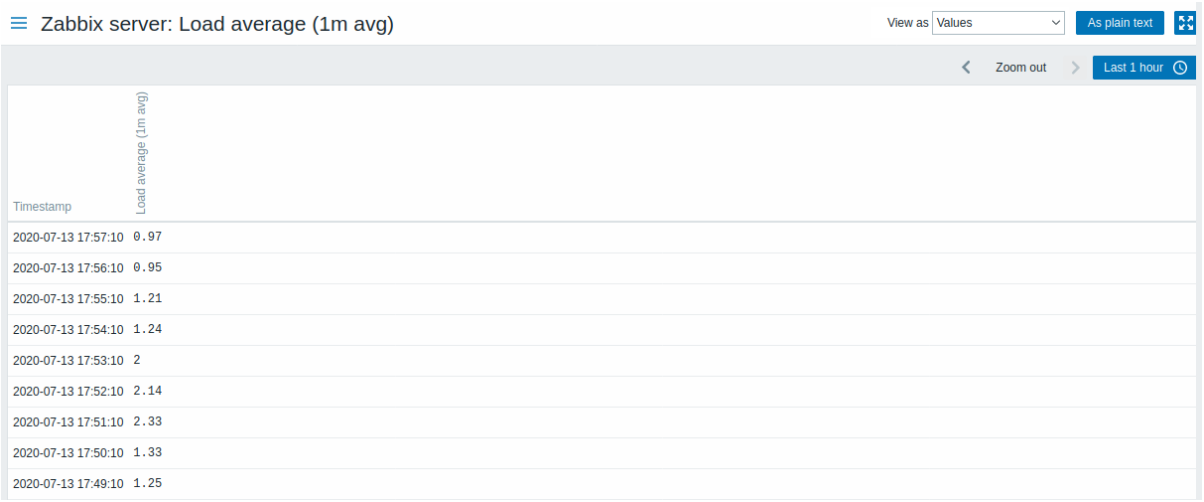
Using subfilter

The subfilter allows you to further modify the filtering from the main filter.

It contains clickable links for a quick access to related items. Items are related by common entity - host, tag name or value, item state, or data status. When an entity is clicked, the entity is highlighted with a gray background, and items are immediately filtered (no need to click *Apply* in the main filter). Clicking another entity adds it to the filtered results. Clicking the entity again removes the filtering.

Subfilters are generated based on the filtered data, which is limited to 1000 records. If there are 20 hosts each having 100 items (so 2000 records in total), only half of the hosts will be visible in the subfilter. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration* > *General* > *GUI*).

Unlike the main filter, the subfilter is updated with each table refresh request to always have up-to-date information of available filtering options and their counter numbers.



For each entity group (hosts, tags, tag values, etc.), up to 10 rows of entities are displayed. If there are more entities, this list can be expanded to display a maximum of 1000 entries (the value of SUBFILTER_VALUES_PER_GROUP in frontend definitions) by clicking the three-dot icon at the end of the list. For *Tag values*, the list can be expanded to display a maximum of 200 tag names with their corresponding values. Note that once fully expanded, the list cannot be collapsed.

A number next to each clickable entity indicates the number of items grouped in it (based on the results of the main filter). When an entity is clicked, the numbers with other available entities are displayed with a plus sign indicating how many items may be added to the current selection. Entities without items are not displayed unless selected in the subfilter before.

Graphs and history

The *Graph/History* column in the item list offers the following links:

- **History** - for all textual items, leading to listings (*Values/500 latest values*) displaying the history of previous item values.
- **Graph** - for all numeric items, leading to a simple graph. Note that when the graph is displayed, a dropdown on the upper right offers a possibility to switch to *Values/500 latest values* as well.

The values displayed in this list are raw, that is, no postprocessing is applied.

Note:
The total amount of values displayed is defined by the value of *Limit for search and filter results* parameter, set in *Administration > General > GUI*.

Maps

Overview

In the *Monitoring > Maps* section you can configure, manage and view network maps.

When you open this section, you will either see the last map you accessed or a listing of all maps you have access to.

All maps can be either public or private. Public maps are available to all users, while private maps are accessible only to their owner and the users the map is shared with.

Map listing

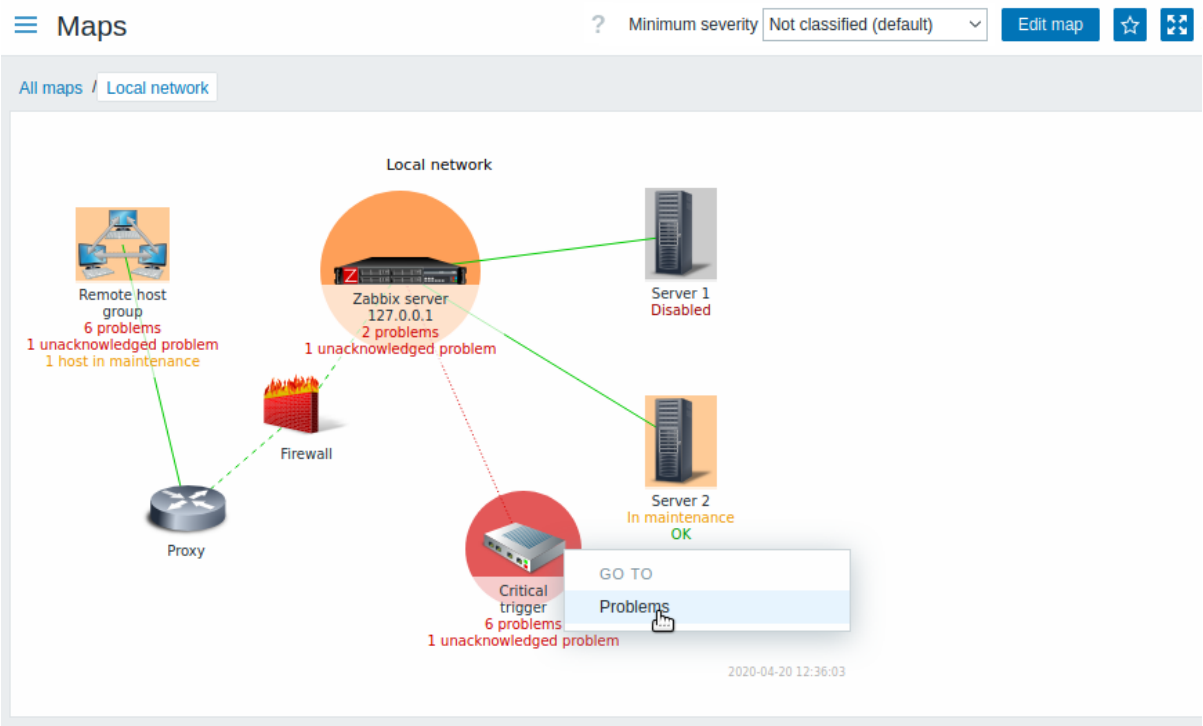
Displayed data:

Column	Description
Name	Name of the map. Click the name to view the map.
Width	Map width is displayed.
Height	Map height is displayed.
Actions	Two actions are available: **Properties** - set general map properties **Edit** - access the grid for adding map elements

To configure a new map, click the *Create map* button in the upper-right corner. To import a map from a YAML, XML, or JSON file, click the *Import* button in the upper-right corner. The user who imports the map will be set as its owner.

Two buttons below the list offer some mass-editing options:

- *Export* - export the maps to a YAML, XML, or JSON file
- *Delete* - delete the maps



To use these options, mark the checkboxes before the respective maps, then click the required button.

Using filter

You can use the filter to display only the maps you are interested in. For better search performance, data is searched with macros unresolved.

Viewing maps

To view a map, click its name in the list of all maps.

You can use the drop-down in the map title bar to select the lowest severity level of the problem triggers to display. The severity marked as *default* is the level set in the map configuration. If the map contains a sub-map, navigating to the sub-map will retain the higher-level map severity (except if it is *Not classified*, in this case, it will not be passed to the sub-map).

Icon highlighting

If a map element is in problem state, it is highlighted with a round circle. The fill color of the circle corresponds to the severity color of the problem. Only problems on or above the selected severity level will be displayed with the element. If all problems are acknowledged, a thick green border around the circle is displayed.

Additionally:

- a host in maintenance is highlighted with an orange, filled square. Note that maintenance highlighting has priority over the problem severity highlighting, if the map element is host.
- a disabled (not-monitored) host is highlighted with a gray, filled square.

Highlighting is displayed if the *Icon highlighting* check-box is marked in the map configuration.

Recent change markers

Inward pointing red triangles around an element indicate a recent change of trigger state - one that's happened within the last 30 minutes. These triangles are shown if the *Mark elements on trigger status change* check-box is marked in the map configuration.

Links

Clicking a map element opens a menu with some available links. Clicking the host name brings up the host menu.

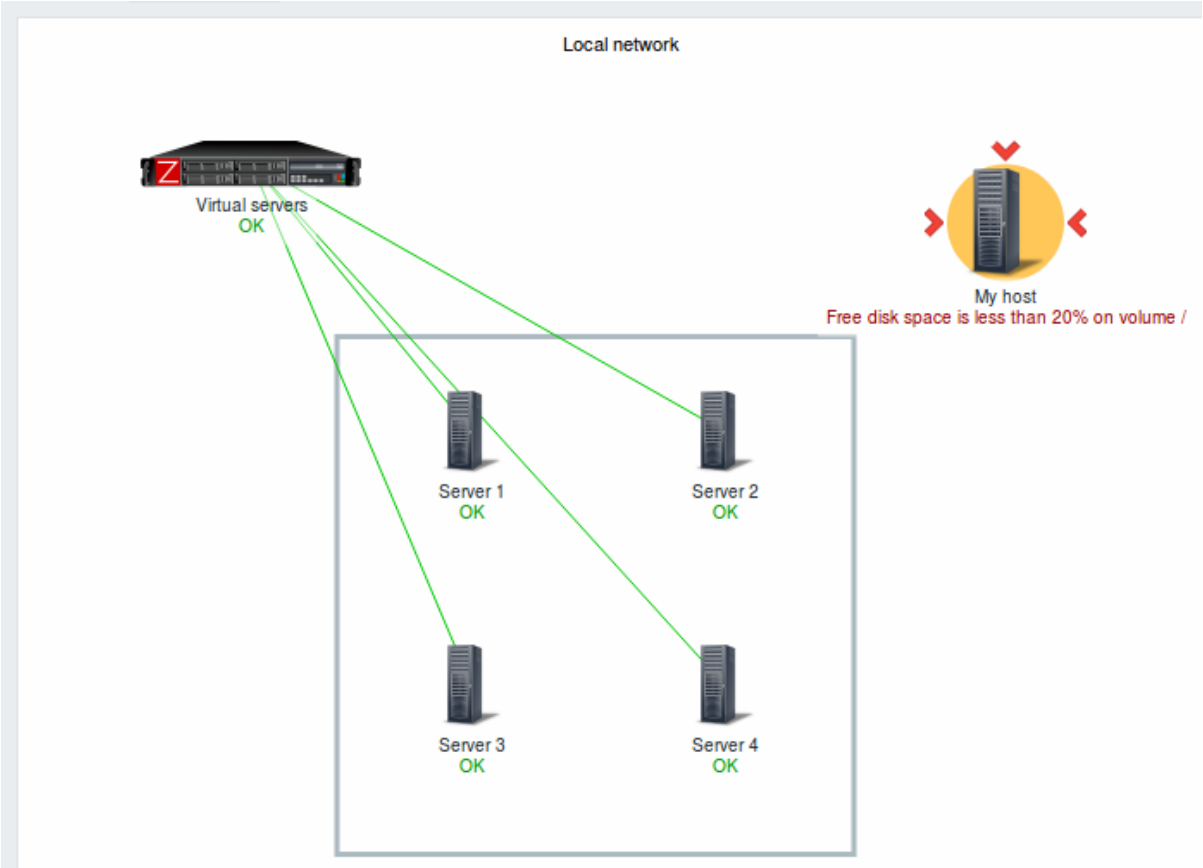
Buttons

Buttons to the right offer the following options:

Edit map	Go to editing of the map content.
☆	Add map to the favorites widget in Dashboards.
★	The map is in the favorites widget in Dashboards. Click to remove map from the favorites widget.

View mode buttons being common for all sections are described on the Monitoring page.

Readable summary in maps



A hidden "aria-label" property is available, allowing map information to be read with a screen reader. Both general map description and individual element description is available, in the following format:

- for map description: `<Map name>, <* of * items in problem state>, <* problems in total>.`
- for describing one element with one problem: `<Element type>, Status <Element status>, <Element name>, <Problem description>.`
- for describing one element with multiple problems: `<Element type>, Status <Element status>, <Element name>, <* problems>.`
- for describing one element without problems: `<Element type>, Status <Element status>, <Element name>.`

For example, this description is available:

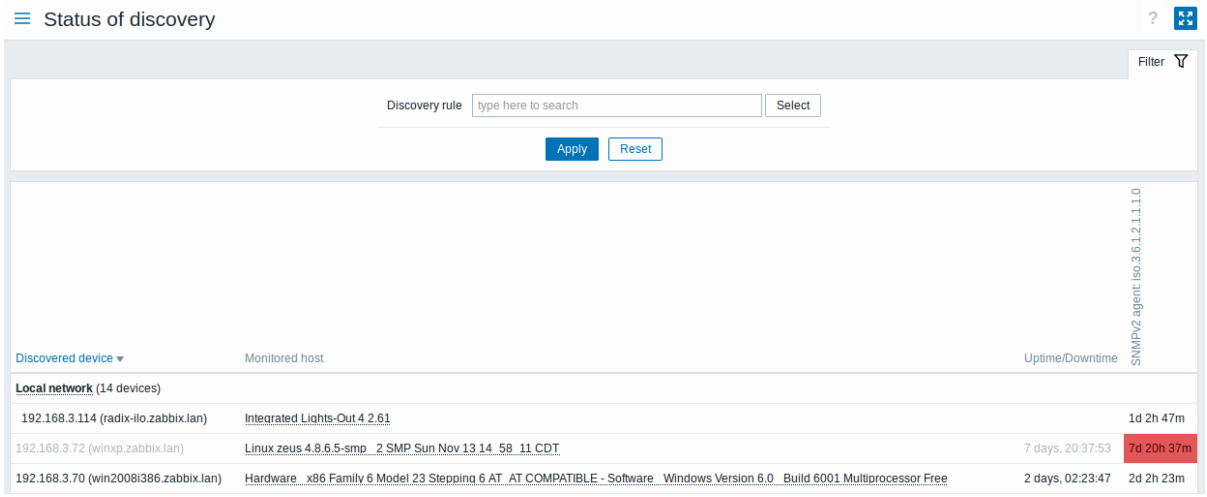
```
'Local network, 1 of 6 elements in problem state, 1 problem in total. Host, Status problem, My host, Free
```

for the following map:

Referencing a network map

Network maps can be referenced by both `sysmapid` and `mapname` GET parameters. For example,

```
http://zabbix/zabbix/zabbix.php?action=map.view&mapname=Local%20network
```



will open the map with that name (Local network).

If both `sysmapid` (map ID) and `mapname` (map name) are specified, `mapname` has higher priority.

Discovery

Overview

In the *Monitoring* > *Discovery* section results of network discovery are shown. Discovered devices are sorted by the discovery rule.

Displayed data:

Column	Description
Discovered device	Discovered devices are listed, grouped by the discovery rule. Clicking the discovery rule brings up the rule menu containing the link to the discovery rule configuration form. If a device has several IP addresses (as determined by the *Device uniqueness criteria* of the discovery rule), they are listed together: the primary IP address of the device first, followed by its other IP addresses (indented). The primary IP address is the lowest IP address that has a host listed in the *Monitored host* column or, if there is no such address, the lowest IP address of the device. Devices can be sorted by their primary IP address in ascending or descending order; the other IP addresses of a device are always listed below its primary IP address, in ascending order.
Monitored host	If a device is already monitored, the host name will be listed in this column. Clicking the host name brings up the host menu.
Uptime/Downtime	The duration of the device being discovered or lost after previous discovery is displayed in this column. For a device with several IP addresses, the duration is displayed only for its primary IP address.
Discovery check	The state of the individual service (discovery check) for each discovered device is displayed. A red cell shows that the service is down. Service uptime or downtime is included within the cell. This column is displayed only if the service has been found on at least one discovered device.

Note:
The number of discovery rules and the total number of discovered devices displayed in this section are limited by the *Limit for search and filter results* parameter in *Administration > General > GUI*. Rules or devices exceeding the limit are not displayed, and no indication of this is shown.

Buttons

View mode buttons being common for all sections are described on the Monitoring page.

Using filter

You can use the filter to display only the discovery rules you are interested in. For better search performance, data is searched with macros unresolved.

With nothing selected in the filter, all enabled discovery rules are displayed. To select a specific discovery rule for display, start typing its name in the filter. All matching enabled discovery rules will be listed for selection. More than one discovery rule can be selected.

APM

Overview

The *APM* menu is for application performance monitoring (APM) features of Zabbix. It displays telemetry data that your applications and services send using OpenTelemetry, an open standard for collecting telemetry data. This data helps you see how requests flow through your applications and services, measure their performance, and find the cause of slow or failed operations.

The menu contains the following sections that correspond to OpenTelemetry signal types:

- Traces
- Metrics
- Logs

Unlike *Monitoring* > *Latest data*, which displays values collected by Zabbix items, the *APM* sections display telemetry data directly from the data source, so you don't need to create any items. To display data in the *APM* sections:

1. Specify a telemetry data source in *Administration* > *Data source*.
2. Make sure that telemetry data is written to the data source by Zabbix proxy with APM enabled, or by an OpenTelemetry collector. Note that Zabbix server cannot receive telemetry data; only Zabbix proxy can.

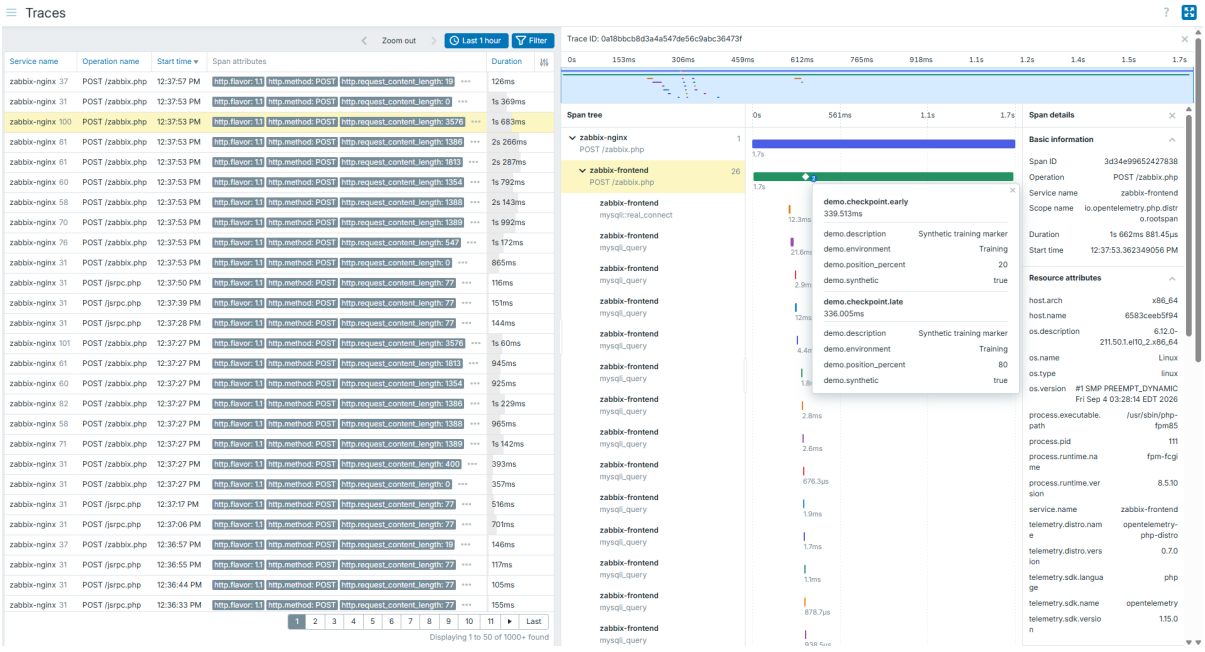
To use telemetry data in triggers or graphs, use the telemetry query item.

Traces

Overview

The *APM* > *Traces* section displays traces collected from your applications and services.

A **trace** represents the path that a request takes through your applications and services. For example, when a user clicks the *Place order* button in an online shop, the request can pass from the frontend service, through the checkout and payment services, to the database.



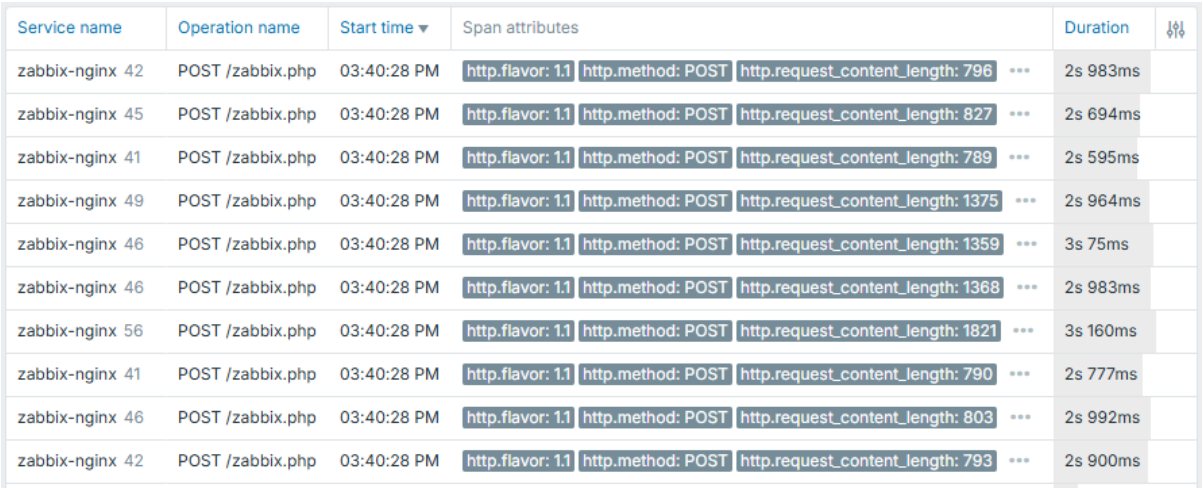
A trace consists of **spans**. Each span represents a single operation, such as an HTTP request that the frontend service sends to the checkout service, a database query that saves the order, or a function call that calculates the shipping cost.

Spans form a hierarchy. The **root span** represents the first operation of the request. Every other span is a **child span** of the span during which its operation was started. For example, the frontend service receiving the *Place order* request is the root span, and the checkout service processing the order is its child span.

Each span is produced by a **service** (e.g., `zabbix-frontend`; named by the OpenTelemetry `service.name` resource attribute), and by an instrumentation scope, the part of the code that created it (e.g., a library that traces HTTP requests).

To provide context about each operation, spans also have key-value **attributes**: span attributes describe the operation itself (e.g., `http.method: POST`), and resource attributes describe the service and the environment it runs in (e.g., `host.name: eabf8c2a5ddc`).

For more details on traces, see the OpenTelemetry documentation.



The *APM* > *Traces* section contains the following elements:

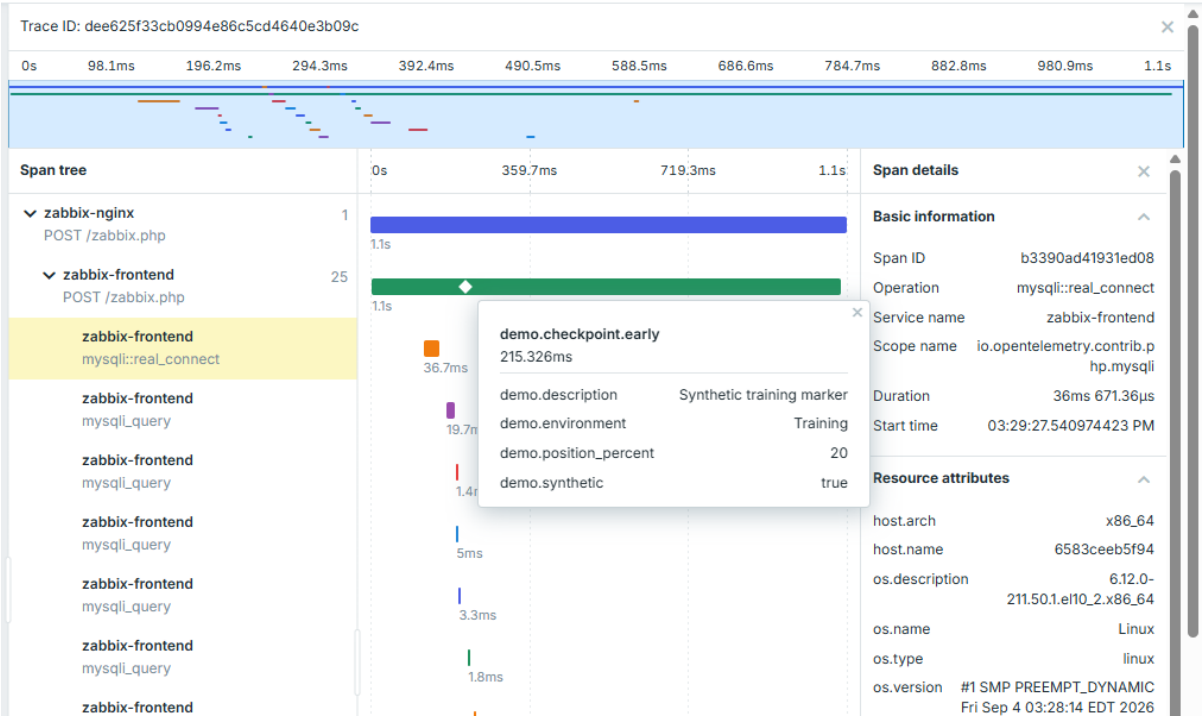
- Kiosk mode button - display only the page content, without the menu and header.
- Time period selector - select the time period for which to display traces.
- Filter - display only the traces you are interested in.
- Trace list - view the traces, described by their root spans.
- Trace panel - view all spans of the selected trace on a timeline.

Trace list

Each row in the trace list represents a trace; the columns show the data of its root span.

Service name	Operation name	Start time ▾	Span attributes	Duration
zabbix-nginx 42	POST /zabbix.php	03:40:28 PM	http.flavor: 1.1 http.method: POST http.request_content_length: 796 •••	2s 983ms
zabbix-nginx 45	POST /zabbix.php	03:40:28 PM	http.flavor: 1.1 http.method: POST http.request_content_length: 827 •••	2s 694ms
zabbix-nginx 41	POST /zabbix.php	03:40:28 PM	http.flavor: 1.1 http.method: POST http.request_content_length: 789 •••	2s 595ms
zabbix-nginx 49	POST /zabbix.php	03:40:28 PM	http.flavor: 1.1 http.method: POST http.request_content_length: 1375 •••	2s 964ms
zabbix-nginx 46	POST /zabbix.php	03:40:28 PM	http.flavor: 1.1 http.method: POST http.request_content_length: 1359 •••	3s 75ms
zabbix-nginx 46	POST /zabbix.php	03:40:28 PM	http.flavor: 1.1 http.method: POST http.request_content_length: 1368 •••	2s 983ms
zabbix-nginx 56	POST /zabbix.php	03:40:28 PM	http.flavor: 1.1 http.method: POST http.request_content_length: 1821 •••	3s 160ms
zabbix-nginx 41	POST /zabbix.php	03:40:28 PM	http.flavor: 1.1 http.method: POST http.request_content_length: 790 •••	2s 777ms
zabbix-nginx 46	POST /zabbix.php	03:40:28 PM	http.flavor: 1.1 http.method: POST http.request_content_length: 803 •••	2s 992ms
zabbix-nginx 42	POST /zabbix.php	03:40:28 PM	http.flavor: 1.1 http.method: POST http.request_content_length: 793 •••	2s 900ms

Traces are displayed in a customizable table. The *Customize table* button in the table header lets you show, hide, or reorder columns, and reset the layout to default. You can also resize each column by dragging its right border; double-click the border to reset. All customizations are applied immediately and remembered for the current user.



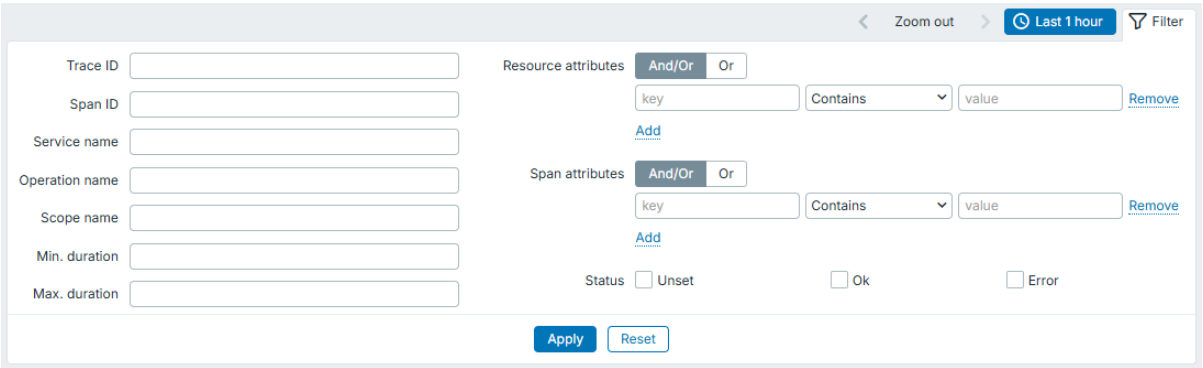
The trace list can have the following columns:

Note:
Each column corresponds to a column in the `otel_traces` table of the telemetry data source; for the list of columns, see Supported telemetry data columns. Most columns have the same name as in the data source (e.g., *Trace ID* corresponds to the `TraceId` column). Where the names differ, the data source column is specified in the table below.

Column	Description
Trace ID	ID of the trace, shared by all spans that belong to the trace.
Span ID	ID of the root span.
Trace state	Additional data, if any, that tracing tools attach to the trace (see W3C Trace Context).
Service name	Service that produced the root span, followed by the number of spans in the trace. If any spans have the *Error* status code (see below), a red icon shows the number of them.
Operation name	Operation that the root span represents (e.g., `POST /zabbix.php`). Data source column: `SpanName`.
Span kind	Role of the root span: **Unspecified** - not specified. **Internal** - operation performed within an application. **Server** - handling of an incoming request. **Client** - outgoing request. **Producer** - creation of an asynchronous operation (e.g., sending a message). **Consumer** - processing of an asynchronous operation.
Scope name	Instrumentation scope that produced the root span.
Scope version	Version of the instrumentation scope.
Status code	Status of the operation that the root span represents: **Unset** - no explicit status has been assigned to the root span. **Ok** - the operation was completed successfully. **Error** - the operation was completed with an error.
Status message	Additional information, if any, about the status.
Start time	Date and time when the root span started. Data source column: `Timestamp`.
Span attributes	Span attributes of the root span. Click the ••• three-dot button to display all attributes.
Resource attributes	Resource attributes of the root span. Click the ••• three-dot button to display all attributes.
Duration	Duration of the trace; the gray bar shows it relative to the other traces.

Trace panel

Click a trace in the trace list to open the trace panel, which shows all spans of the trace on a timeline: which operations were performed, in what order, and how long each took.



The trace panel can have the following elements:

Element	Description
Trace ID	ID of the selected trace.
Trace timeline overview	The whole trace, with spans in up to 8 rows (several spans can share a row). Drag the borders of the selected range, or the range itself, to zoom the span timeline to that part of the trace.
Span tree	Spans in their hierarchy; each shows its service (in bold), operation name, and number of direct child spans.
Span timeline	Spans as bars: the position and length show when each span started and how long it took. Markers show events (e.g., exceptions); hover over or click a marker for details.
Span details	Click a span in the span tree to see its details and attributes.

Using filter

You can use the filter to display only the traces you are interested in.

To filter by attributes, enter the attribute key, select the operator, and enter the attribute value.

The following operators are supported:

- **Contains** - *(default)* the attribute value contains the entered string.
- **Equals** - the attribute value equals the entered string.
- **Does not contain** - the attribute value does not contain the entered string.
- **Does not equal** - the attribute value does not equal the entered string.
- **Exists** - the attribute with the entered key exists.

- **Does not exist** - the attribute with the entered key does not exist.

If you add several conditions, select how to evaluate them:

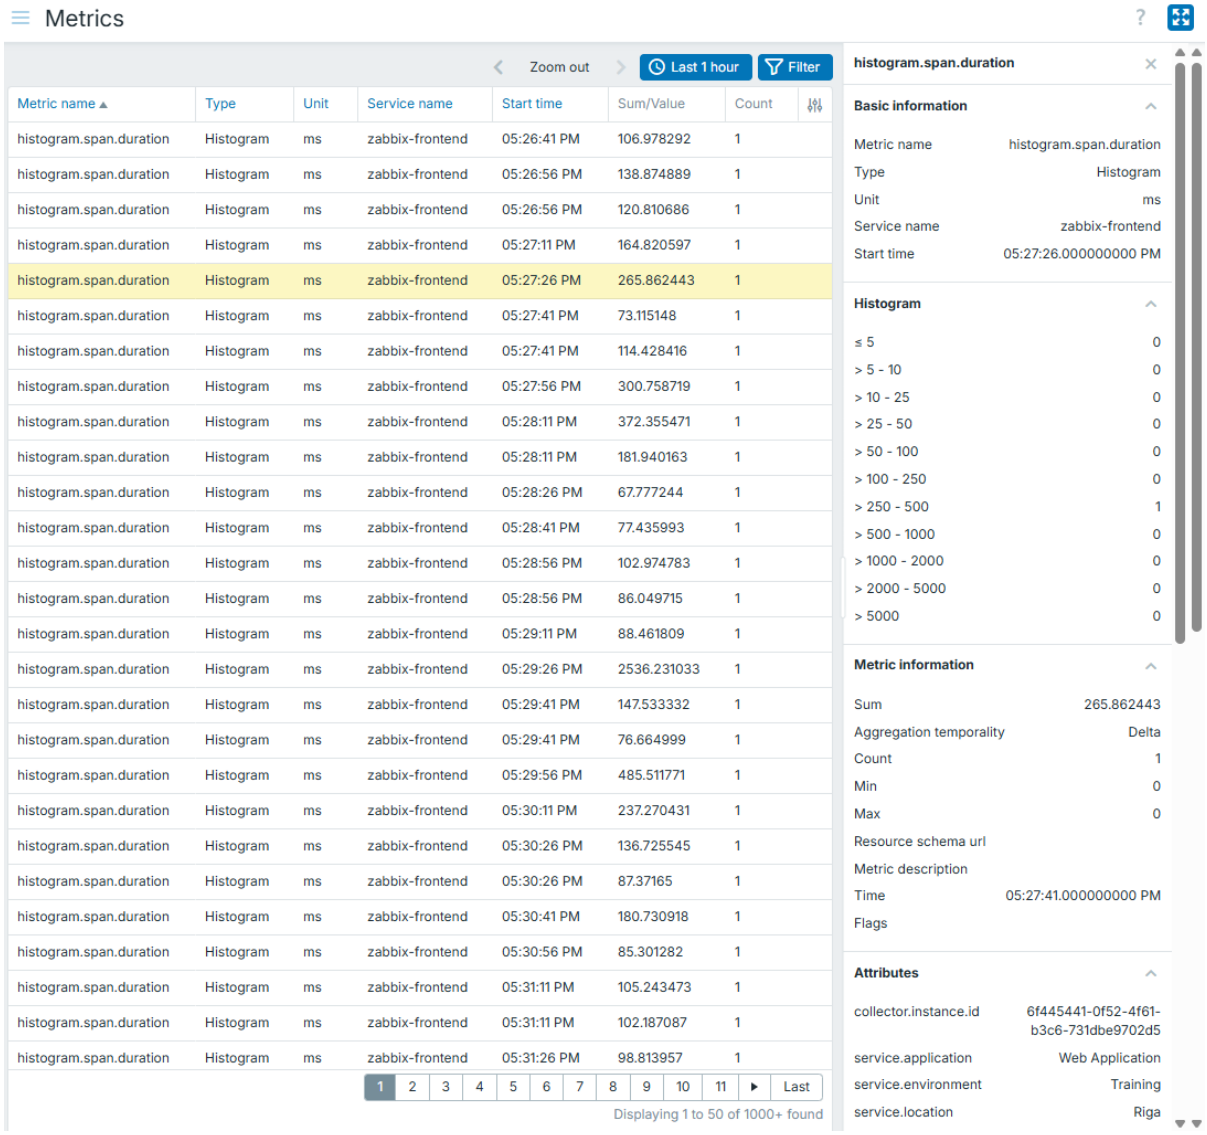
- **And/Or** - *(default)* all conditions must be met; conditions with the same attribute key are combined with *Or*.
- **Or** - at least one condition must be met.

Metrics

Overview

The *APM* > *Metrics* section displays metric data points collected from your applications and services.

A **metric** is a measurement (e.g., request duration, number of processed orders, or memory usage). Applications send their values as **data points** that contain the value (or aggregated values) measured at a specific time. A metric is similar to a Zabbix item, and a data point is similar to a value of that item.



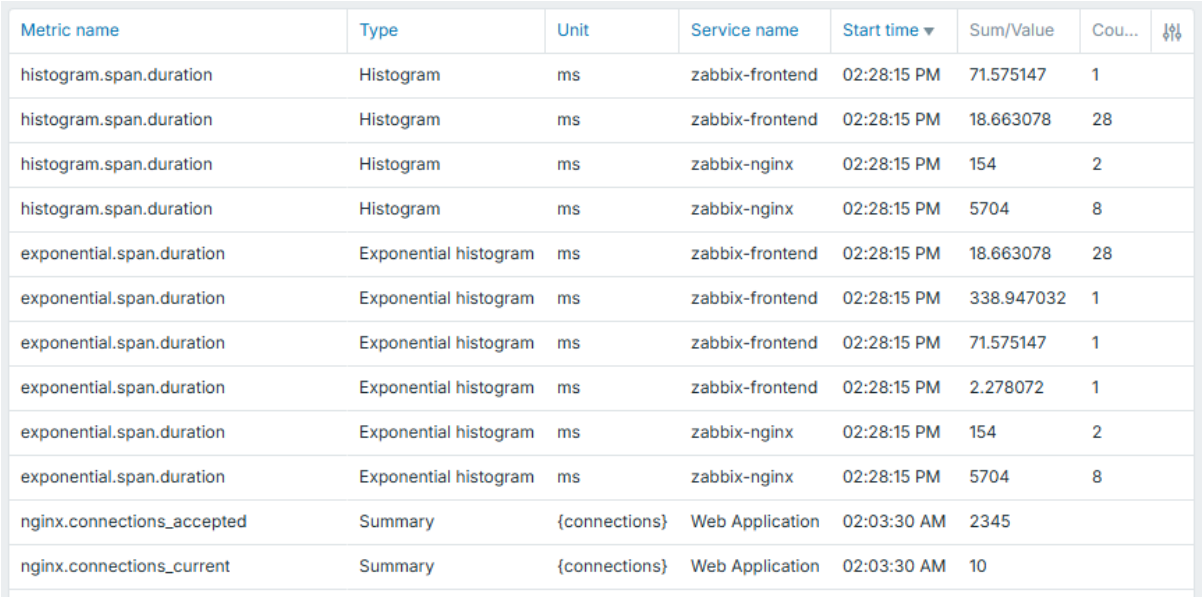
A data point can be one of the following types:

- **Gauge** - a value measured at a specific time (e.g., current memory usage).
- **Sum** - a sum of measurements over a time period (e.g., total number of requests).
- **Histogram** - the number of measurements over a time period that fall into each of several fixed value ranges, called buckets (e.g., how many requests took 0-100 ms, 100-250 ms, or 250-500 ms).
- **Exponential histogram** - like a histogram, but each bucket is wider than the previous one by the same factor (e.g., 1-2 ms, 2-4 ms, 4-8 ms).

Each data point is produced by a **service** (e.g., `zabbix-frontend`; named by the OpenTelemetry `service.name` resource attribute), and by an instrumentation scope, the part of the code that created it (e.g., a library that measures HTTP request durations).

To provide context about each measurement, data points also have key-value **attributes**: data point attributes describe what was measured and distinguish data points of the same metric (e.g., `http.request.method: POST`), and resource attributes describe the service and the environment it runs in (e.g., `host.name: eabf8c2a5ddc`).

For more details on metrics, see the OpenTelemetry documentation.



Metric name	Type	Unit	Service name	Start time	Sum/Value	Count
histogram.span.duration	Histogram	ms	zabbix-frontend	05:26:41 PM	106.978292	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:26:56 PM	138.874889	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:26:56 PM	120.810686	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:27:11 PM	164.820597	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:27:26 PM	265.862443	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:27:41 PM	73.115148	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:27:41 PM	114.428416	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:27:56 PM	300.758719	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:28:11 PM	372.355471	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:28:11 PM	181.940163	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:28:26 PM	67.777244	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:28:41 PM	77.435993	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:28:56 PM	102.974783	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:28:56 PM	86.049715	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:29:11 PM	88.461809	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:29:26 PM	2536.231033	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:29:41 PM	147.533332	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:29:41 PM	76.664999	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:29:56 PM	485.511771	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:30:11 PM	237.270431	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:30:26 PM	136.725545	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:30:26 PM	87.37165	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:30:41 PM	180.730918	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:30:56 PM	85.301282	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:31:11 PM	105.243473	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:31:11 PM	102.187087	1
histogram.span.duration	Histogram	ms	zabbix-frontend	05:31:26 PM	98.813957	1

The *APM* > *Metrics* section contains the following elements:

- Kiosk mode button - display only the page content, without the menu and header.
- Time period selector - select the time period for which to display data points.
- Filter - display only the data points you are interested in.
- Metric list - view the data points.
- Metric details - view the details of the selected data point.

Metric list

Each row in the metric list represents a data point.

Metric name	Type	Unit	Service name	Start time ▾	Sum/Value	Cou...
histogram.span.duration	Histogram	ms	zabbix-frontend	02:28:15 PM	71.575147	1
histogram.span.duration	Histogram	ms	zabbix-frontend	02:28:15 PM	18.663078	28

nginx.connections_accepted	Summary	{connections}	Web Application	02:03:30 AM	2345	
nginx.connections_current	Summary	{connections}	Web Application	02:03:30 AM	10	

Data points are displayed in a customizable table. The *Customize table* button in the table header lets you show, hide, or reorder columns, and reset the layout to default. You can also resize each column by dragging its right border; double-click the border to reset. All customizations are applied immediately and remembered for the current user.

The metric list can have the following columns:

Note:
Each column, except *Type*, corresponds to a column in the metric tables (`otel_metrics_gauge`, `otel_metrics_sum`, `otel_metrics_histogram`, and `otel_metrics_exponential_histogram`) of the telemetry data source; for the list of columns, see Supported telemetry data columns. Most columns have the same name as in the data source (e.g., *Metric name* corresponds to the `MetricName` column). Where the names differ, the data source column is specified in the table below.

Column	Description
Metric name	Metric that the data point belongs to (e.g., `http.server.duration`).
Type	Type of the data point: *Gauge*, *Sum*, *Histogram*, or *Exponential histogram*. Determined by the metric table that holds the data point.
Unit	Unit, if any, of the metric values (e.g., `s` or `By`; see UCUM). Data source column: `MetricUnit`.
Service name	Service that produced the data point.
Scope name	Instrumentation scope that produced the data point.
Start time	Date and time when the measurement period of the data point started. Data source column: `StartTimeUnix`.
Sum/Value	Sum of all measurements (*Histogram*, *Exponential histogram*), or the value (*Gauge*, *Sum*) of the data point.
Count	Number of measurements in a *Histogram* or *Exponential histogram* data point.
Time	Date and time of the data point; for *Sum*, *Histogram*, and *Exponential histogram* data points, the end of the measurement period. Data source column: `TimeUnix`.
Flags	Flags of the data point: **0** - no flags are set. **1** - no value was recorded for the data point.
Aggregation temporality	How the values of a *Sum*, *Histogram*, or *Exponential histogram* data point are aggregated over time: **Unspecified** - not specified. **Delta** - aggregated over the period since the previous data point. **Cumulative** - aggregated over the period since the start time.
Metric description	Description, if any, of the metric.
Attributes	Data point attributes. Click the ••• three-dot button to display all attributes.
Resource attributes	Resource attributes of the data point. Click the ••• three-dot button to display all attributes.

Column	Description
Scope attributes	Attributes of the instrumentation scope. Click the ••• three-dot button to display all attributes.

Metric details

Click a data point in the metric list to open the metric details panel, which shows all information about the data point.

exponential.span.calls

Basic information

Metric name	exponential.span.calls
Type	Summary
Unit	
Service name	zabbix-frontend
Start time	02:22:15.000000000 PM

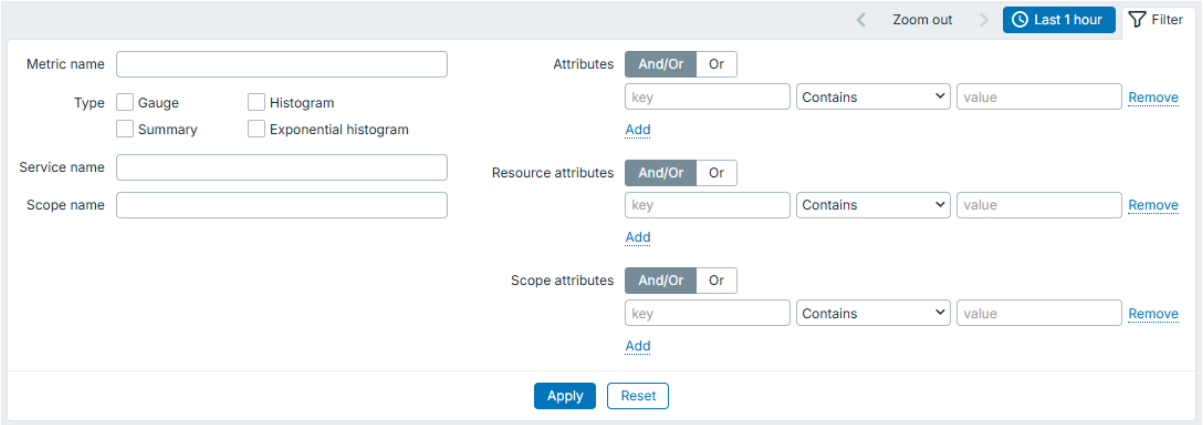
Metric information

Value	1
Aggregation temporality	Delta
Is monotonic	true
Resource schema url	
Metric description	
Time	02:22:30.000000000 PM
Flags	

Attributes

Resource attributes

Scope attributes



Scope

The metric details panel can have the following sections:

Section	Description
Basic information	Metric name, type, unit, service name, and start time.
Histogram	Buckets (e.g., `> 5 – 10`), each with the number of measurements in it. Displayed only for *Histogram* data points.
Exponential histogram	Buckets (e.g., `>= 249.7885 – 249.7887`), each with the number of measurements in it. Displayed only for *Exponential histogram* data points.
Metric information	Values of the data point, which depend on its type, and the metric description, time, flags, and resource schema URL.
Attributes	Data point attributes.
Resource attributes	Resource attributes.
Scope attributes	Attributes, if any, of the instrumentation scope.
Scope	Name, version, and schema URL of the instrumentation scope.

Using filter

You can use the filter to display only the data points you are interested in.

To filter by attributes, enter the attribute key, select the operator, and enter the attribute value.

The following operators are supported:

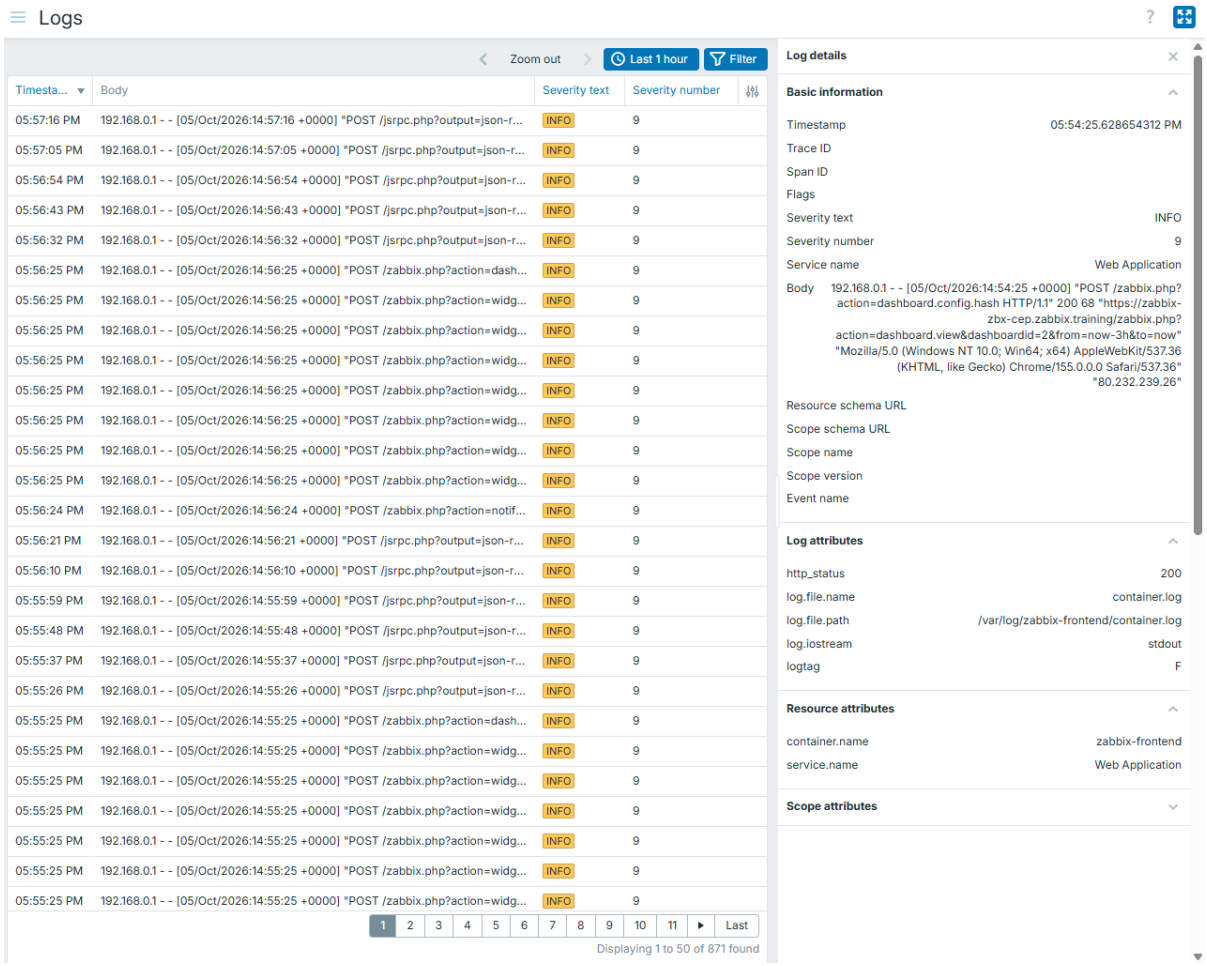
- **Contains** - *(default)* the attribute value contains the entered string.
- **Equals** - the attribute value equals the entered string.
- **Does not contain** - the attribute value does not contain the entered string.
- **Does not equal** - the attribute value does not equal the entered string.
- **Exists** - the attribute with the entered key exists.
- **Does not exist** - the attribute with the entered key does not exist.

If you add several conditions, select how to evaluate them:

- **And/Or** - *(default)* all conditions must be met; conditions with the same attribute key are combined with *Or*.
- **Or** - at least one condition must be met.

Logs

Overview



The *APM* > *Logs* section displays log records collected from your applications and services.

A **log record** is a text record of an event (e.g., a failed payment or a database timeout). Each log record has a severity and a message (body). If a log record was produced during an operation that is part of a trace, it also contains the IDs of that trace and span.

Each log record is produced by a **service** (e.g., `zabbix-frontend`; named by the OpenTelemetry `service.name` resource attribute), and by an instrumentation scope, the part of the code that created it (e.g., a logging library).

To provide context about each event, log records also have key-value **attributes**: log attributes describe the event itself (e.g., `log.file.path: /var/log/zabbix/zabbix_frontend.log`), and resource attributes describe the service and the environment it runs in (e.g., `host.name: eabf8c2a5ddc`).

For more details on logs, see the OpenTelemetry documentation.

The *APM* > *Logs* section contains the following elements:

- Kiosk mode button - display only the page content, without the menu and header.
- Time period selector - select the time period for which to display log records.
- Filter - display only the log records you are interested in.
- Log list - view the log records.
- Log details - view the details of the selected log record.

Log list

Each row in the log list represents a log record.

Timestamp	Body	Severity text	Severity number
06:04:03 PM	192.168.0.1 - - [05/Oct/2026:15:04:03 +0000] "POST /jsrpc.php?output=json-rpc HTTP/1.1" 200 76 "htt...	INFO	9
06:03:52 PM	192.168.0.1 - - [05/Oct/2026:15:03:52 +0000] "POST /jsrpc.php?output=json-rpc HTTP/1.1" 200 76 "htt...	INFO	9
06:03:41 PM	192.168.0.1 - - [05/Oct/2026:15:03:41 +0000] "POST /jsrpc.php?output=json-rpc HTTP/1.1" 200 76 "htt...	INFO	9
06:03:30 PM	192.168.0.1 - - [05/Oct/2026:15:03:30 +0000] "POST /jsrpc.php?output=json-rpc HTTP/1.1" 200 76 "htt...	INFO	9

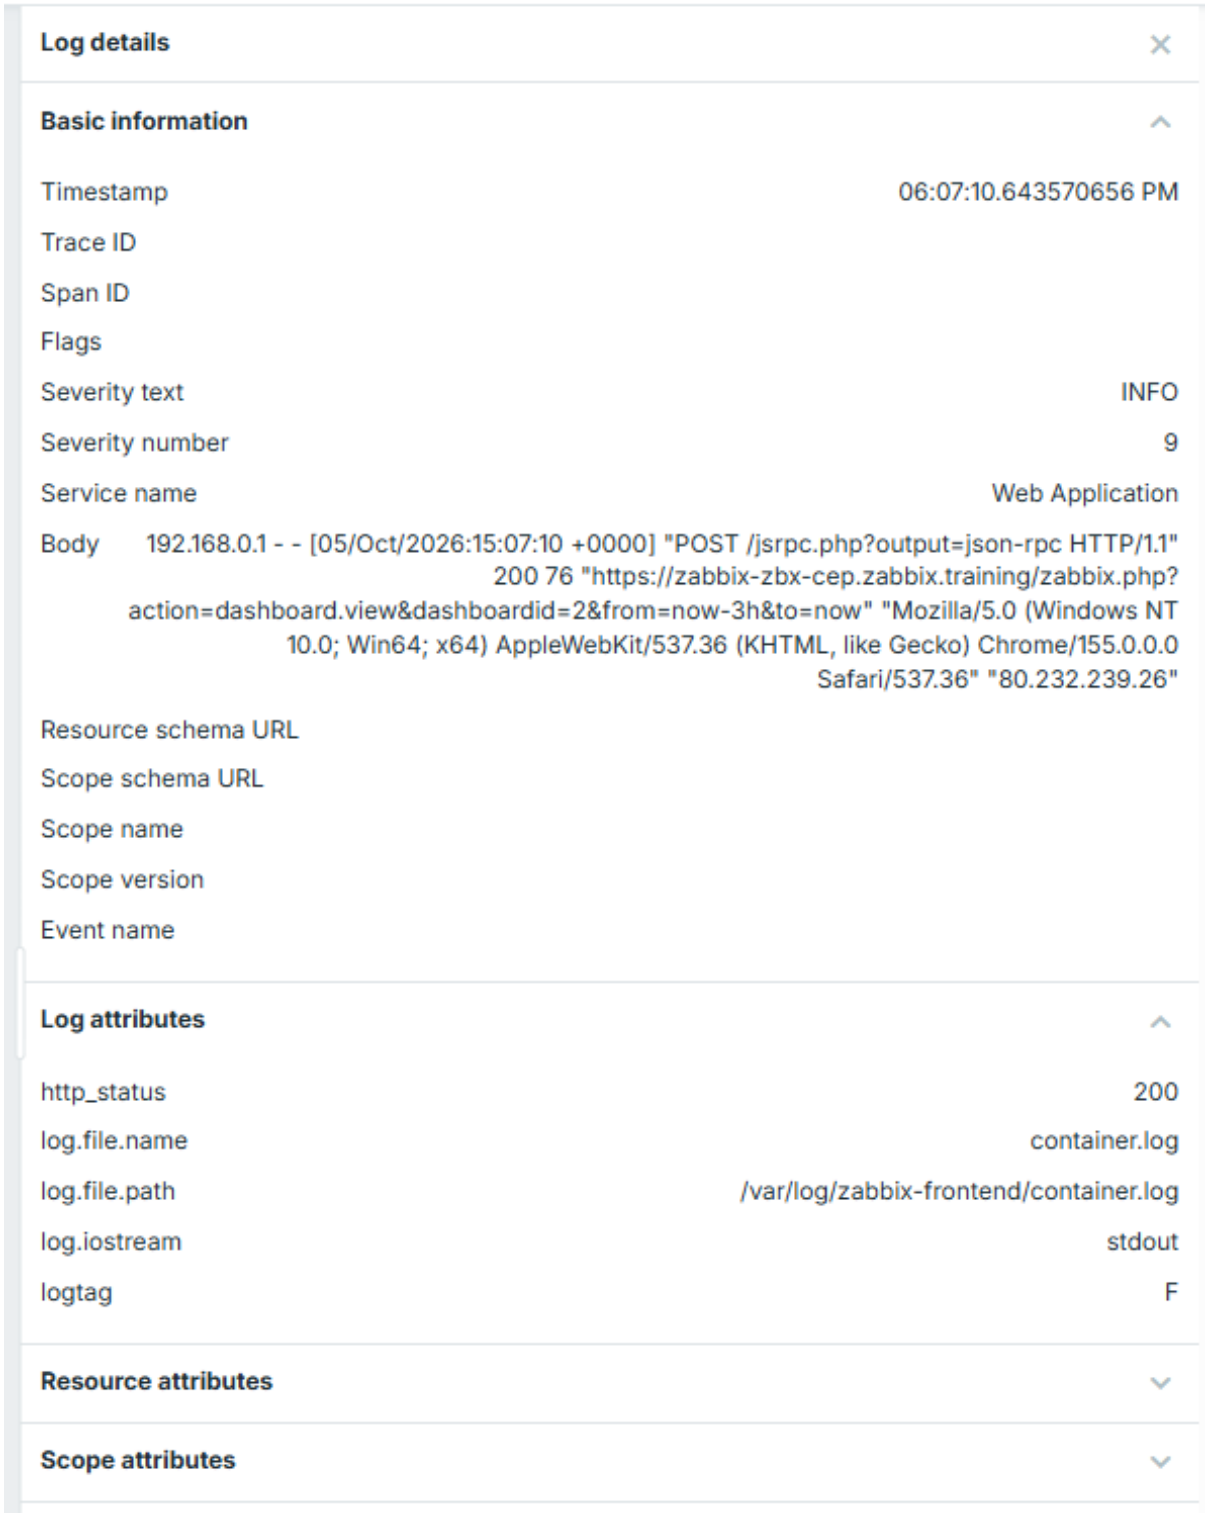
06:03:26 PM	192.168.0.1 - - [05/Oct/2026:15:03:26 +0000] "POST /zabbix.php?action=widget.svggraph.view HTTP/...	INFO	9
06:03:26 PM	192.168.0.1 - - [05/Oct/2026:15:03:26 +0000] "POST /zabbix.php?action=widget.svggraph.view HTTP/...	INFO	9
06:03:26 PM	192.168.0.1 - - [05/Oct/2026:15:03:26 +0000] "POST /zabbix.php?action=dashboard.config.hash HTTP...	INFO	9
06:03:26 PM	192.168.0.1 - - [05/Oct/2026:15:03:26 +0000] "POST /zabbix.php?action=widget.svggraph.view HTTP/...	INFO	9
06:03:26 PM	192.168.0.1 - - [05/Oct/2026:15:03:26 +0000] "POST /zabbix.php?action=widget.problems.view HTTP/...	INFO	9
06:03:25 PM	192.168.0.1 - - [05/Oct/2026:15:03:25 +0000] "POST /zabbix.php?action=notifications.get&output=ajax...	INFO	9
06:03:25 PM	192.168.0.1 - - [05/Oct/2026:15:03:25 +0000] "POST /zabbix.php?action=widget.svggraph.view HTTP/...	INFO	9
06:03:19 PM	192.168.0.1 - - [05/Oct/2026:15:03:19 +0000] "POST /jsrpc.php?output=json-rpc HTTP/1.1" 200 76 "htt...	INFO	9

Log records are displayed in a customizable table. The *Customize table* button in the table header lets you show, hide, or reorder columns, and reset the layout to default. You can also resize each column by dragging its right border; double-click the

border to reset. All customizations are applied immediately and remembered for the current user.



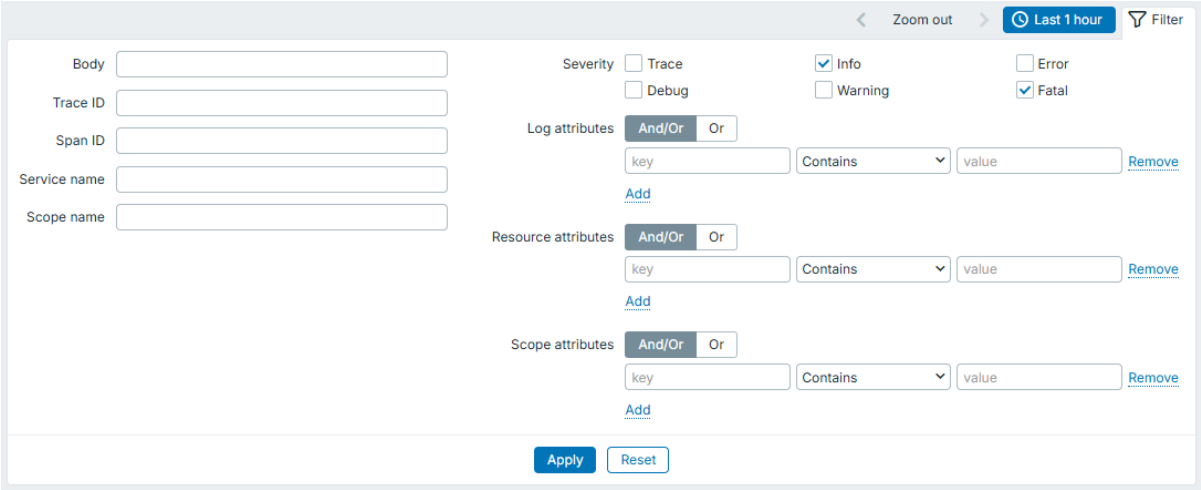
The log list can have the following columns:

> **Note:**
> Each column corresponds to a column in the `otel_logs` table of the telemetry data source; for the list of columns, see Supported telemetry data columns. Most columns have the same name as in the data source (e.g., *Severity text* corresponds to the `SeverityText` column). Where the names differ, the data source column is specified in the table below.

Column	Description
Timestamp	Date and time when the event occurred.
Body	Message of the log record.
Severity text	Severity level as provided by the application (e.g., `INFO`, `WARN`, or `ERROR`). The label color depends on the severity.
Severity number	Severity level as a number: **0** - UNSPECIFIED. **1-4** - TRACE. **5-8** - DEBUG. **9-12** - INFO. **13-16** - WARN. **17-20** - ERROR. **21-24** - FATAL.
Trace ID	ID, if any, of the trace during which the log record was produced.
Span ID	ID, if any, of the span during which the log record was produced.
Flags	Trace flags of the log record: **0** - the trace is not sampled. **1** - the trace is sampled (recorded). Data source column: `TraceFlags`.
Service name	Service that produced the log record.
Scope name	Instrumentation scope that produced the log record.
Scope version	Version of the instrumentation scope.
Event name	Name, if any, of the event type that the log record represents.
Log attributes	Log attributes of the log record. Click the ••• three-dot button to display all attributes.
Resource attributes	Resource attributes of the log record. Click the ••• three-dot button to display all attributes.
Scope attributes	Attributes of the instrumentation scope. Click the ••• three-dot button to display all attributes.

Log details

Click a log record in the log list to open the *Log details* panel, which shows all information about the log record.



The *Log details* panel can have the following sections:

Section	Description
Basic information	Trace ID, span ID, and trace flags of the log record.
Log attributes	Log attributes of the log record.
Resource attributes	Schema URL and resource attributes.
Scope attributes	Schema URL, name, version, and attributes of the instrumentation scope.

Using filter

You can use the filter to display only the log records you are interested in.

To filter by attributes, enter the attribute key, select the operator, and enter the attribute value.

The following operators are supported:

- **Contains** - *(default)* the attribute value contains the entered string.
- **Equals** - the attribute value equals the entered string.
- **Does not contain** - the attribute value does not contain the entered string.
- **Does not equal** - the attribute value does not equal the entered string.
- **Exists** - the attribute with the entered key exists.
- **Does not exist** - the attribute with the entered key does not exist.

If you add several conditions, select how to evaluate them:

- **And/Or** - *(default)* all conditions must be met; conditions with the same attribute key are combined with *Or*.
- **Or** - at least one condition must be met.

Services

Overview

The Services menu is for the service monitoring functions of Zabbix.

Services

Overview

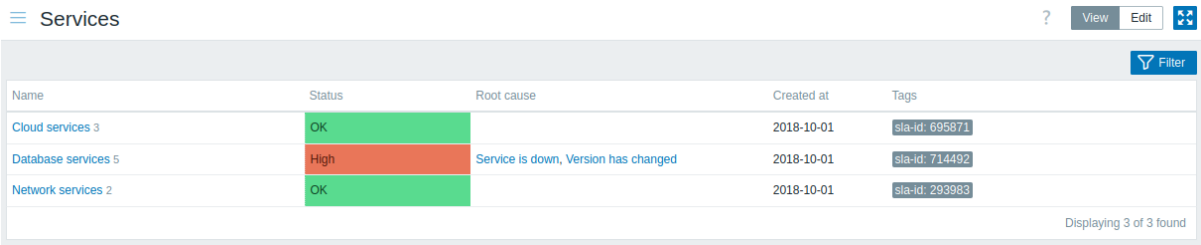
In this section you can see a high-level status of whole services that have been configured in Zabbix, based on your infrastructure.

A service may be a hierarchy consisting of several levels of other services, called ”child” services, which are attributes to the overall status of the service (see also an overview of the service monitoring functionality.)

The main categories of service state are *OK* or *Problem*, where the *Problem* state is expressed by the corresponding problem severity name and color.

While view mode allows services to be monitored along with their status and other details, you can also configure the service hierarchy in this section (add/edit services, child services) by switching to edit mode.

To switch from view to edit mode (and back), click the respective button in the upper-right corner:



- 

- view services
- 

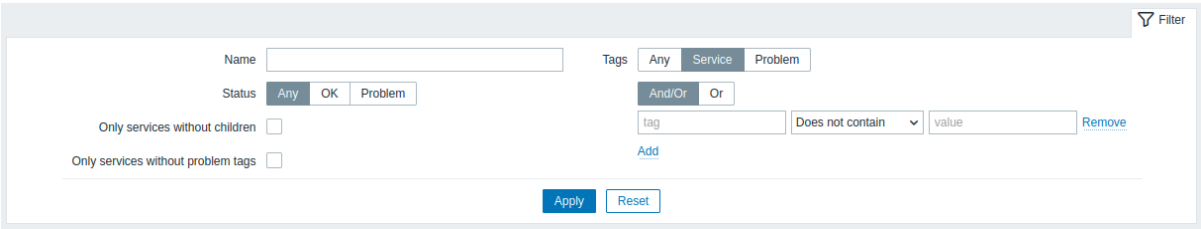
- add/edit services, and child services

Note that access to editing depends on user role settings.

Viewing services

A list of the existing services is displayed.

Displayed data:



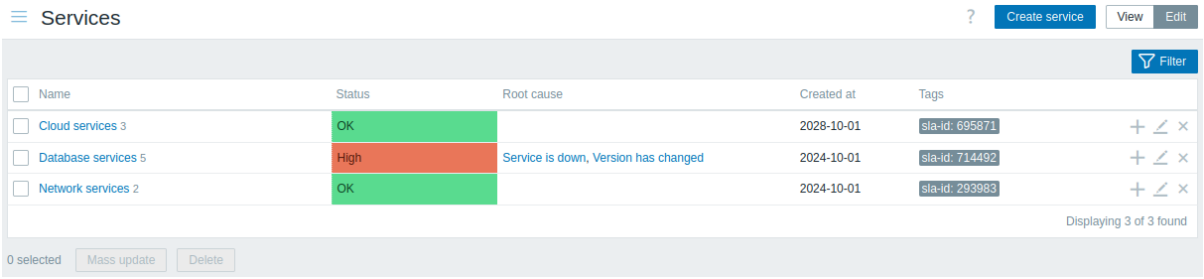
Parameter	Description
Name	Service name. The service name is a link to service details. The number after the name indicates how many child services the service has.
Status	Service state: **OK** - no problems **<problem color and severity>** - indicates a problem and its severity. In case of multiple problems, the color and severity of the most critical problem are displayed.
Root cause	Underlying problems that directly or indirectly affect the service state are listed. The same problems are listed as returned by the {SERVICE.ROOTCAUSE} macro. Click the problem name to see more details about it in *Monitoring* > *Problems*. Problems that do not affect the service state are not in the list.
Created at	The time when the service was created is displayed.
Tags	Tags of the service are displayed. Tags are used to identify a service in service actions and SLAs.

Buttons

View mode buttons being common for all sections are described on the Monitoring page.

Using filter

You can use the filter to display only the services you are interested in.



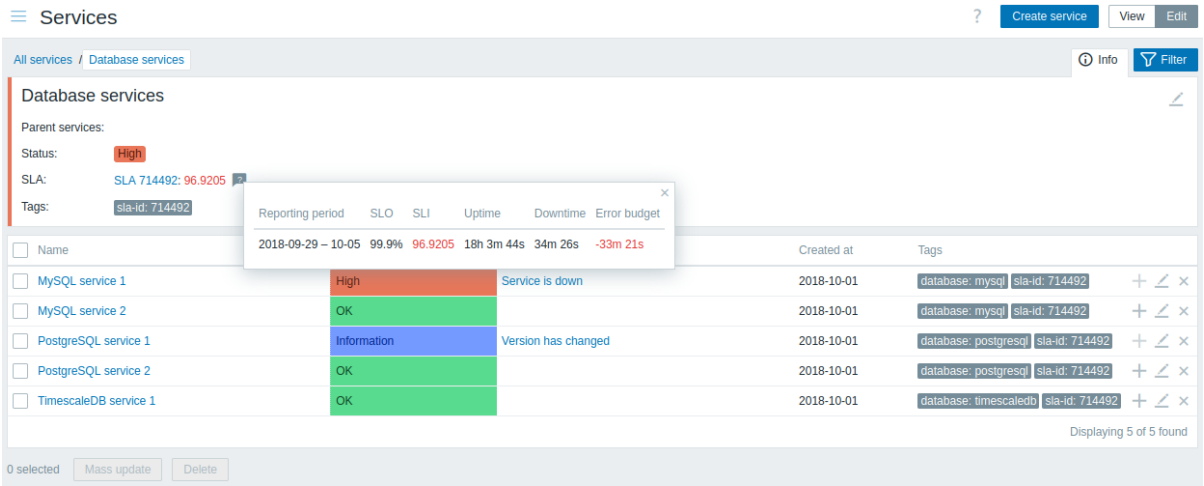
Parameter	Description
Name	Filter by service name.
Status	Filter by service state.
Only services without children	Mark the checkbox to display only services without child services. This parameter is available only in service edit mode.
Only services without problem tags	Mark the checkbox to display only services without problem tags. This parameter is available only in service edit mode.

Parameter	Description
Tags	Filter by service tag name and value, or service problem tag name and value (in service edit mode). It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met.

Editing services

Click the *Edit* button to access edit mode. When in edit mode, the listing is complemented with checkboxes before the entries and also these additional options:

-  - add a child service to this service
-  - edit this service
-  - delete this service



To configure a new service, click the *Create service* button in the upper-right corner.

Service details

To access service details, click the service name. To return to the list of all services, click *All services*.

Service details include the info box and the list of child services.

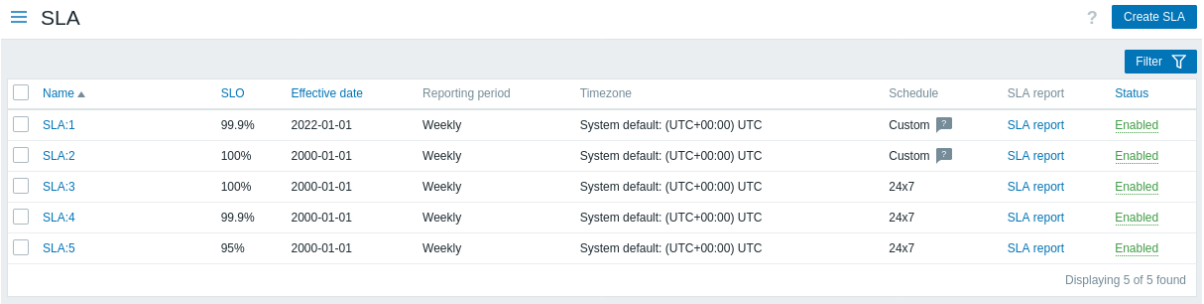
To access the info box, click the *Info* tab. The info box contains the following entries:

- Names of parent services (if any)
- Current status of this service
- Current SLA(s) of this service, in the format `SLA name:service level indicator`. 'SLA name' is also a link to the SLA report for this service. If you position the mouse on the info box next to the service-level indicator (SLI), a pop-up info list is displayed with SLI details. The service-level indicator displays the current service level, in percentage.
- Service tags

The info box also contains a link to the service configuration.

To use the filter for child services, click the *Filter* tab.

When in edit mode, the child service listing is complemented with additional editing options:



-  - add a child service to this service
-  - edit this service
-  - delete this service

SLA

Overview

This section allows SLAs to be viewed and configured.

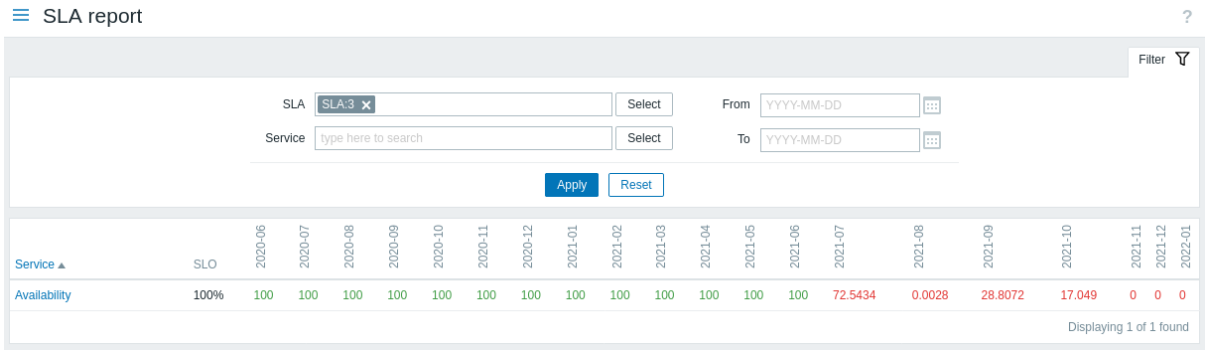
SLAs

A list of the configured SLAs is displayed. *Note* that only the SLAs related to services accessible to the user will be displayed (as read-only, unless *Manage SLA* is enabled for the user role).

Displayed data:

Parameter	Description
Name	The SLA name is displayed. The name is a link to SLA configuration.
SLO	The service level objective (SLO) is displayed.
Effective date	The date of starting SLA calculation is displayed.
Reporting period	The period used in the SLA report is displayed - *daily*, *weekly*, *monthly*, *quarterly*, or *annually*.
Time zone	The SLA time zone is displayed.
Schedule	The SLA schedule is displayed - 24x7 or custom.
SLA report	Click the link to see the SLA report for this SLA.
Status	The SLA status is displayed - enabled or disabled.

SLA report



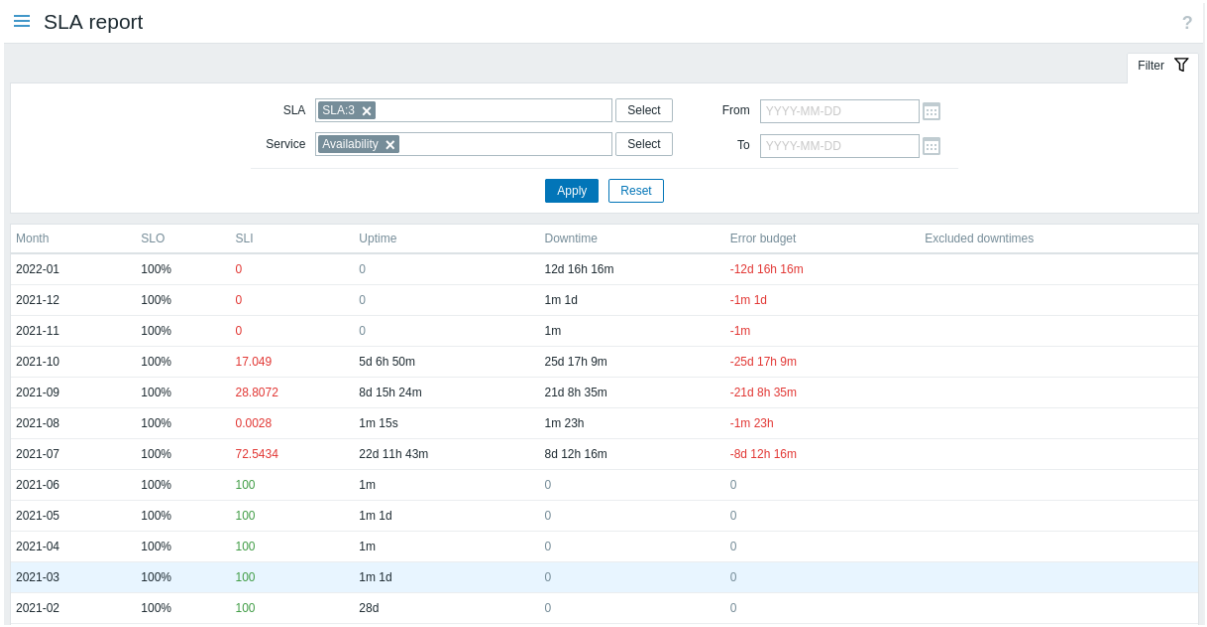
Overview

This section allows SLA reports to be viewed based on the criteria selected in the filter.

SLA reports can also be displayed as a dashboard widget.

Report

The filter allows you to select the report based on the SLA name as well as the service name. It is also possible to limit the displayed period.



Each column (period) displays the SLI for that period. SLIs that are in breach of the set SLO are highlighted in red.

20 periods are displayed in the report. A maximum of 100 periods can be displayed, if both the *From* date and *To* date are specified.

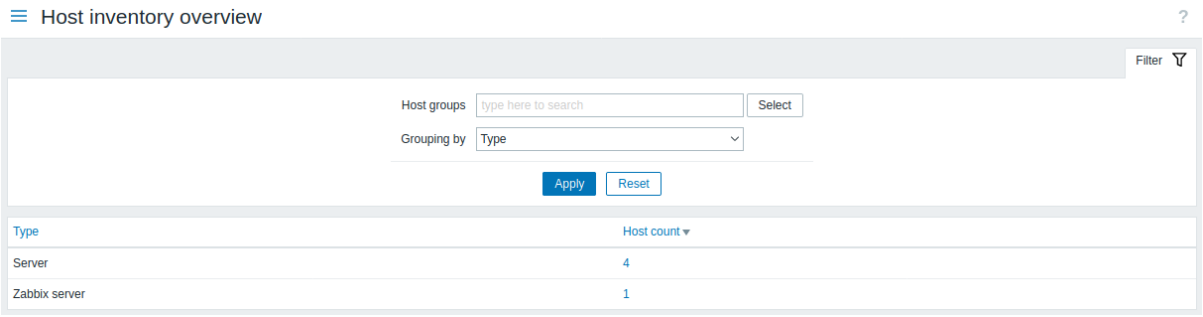
Report details

If you click the service name in the report, you can access another report that displays a more detailed view.

Note that negative problem duration does not affect SLA calculation or reporting.

Inventory

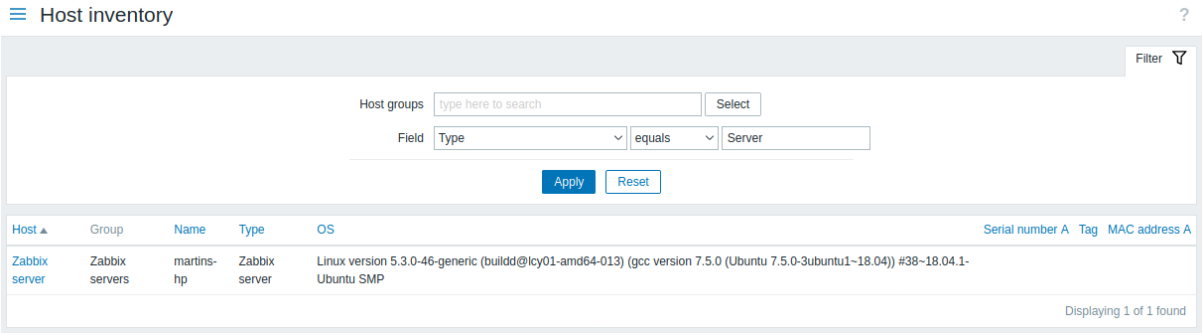
Overview



The Inventory menu features sections providing an overview of host inventory data by a chosen parameter as well as the ability to view host inventory details.

Overview

Overview

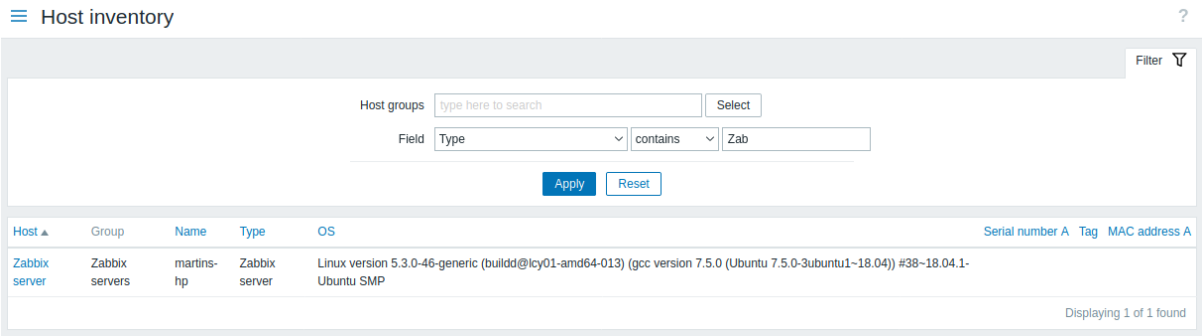


The *Inventory* > *Overview* section provides ways of having an overview of host inventory data.

For an overview to be displayed, choose host groups (or none) and the inventory field by which to display data. The number of hosts corresponding to each entry of the chosen field will be displayed.

The completeness of an overview depends on how much inventory information is maintained with the hosts.

Numbers in the *Host count* column are links; they lead to these hosts being filtered out in the *Host Inventories* table.

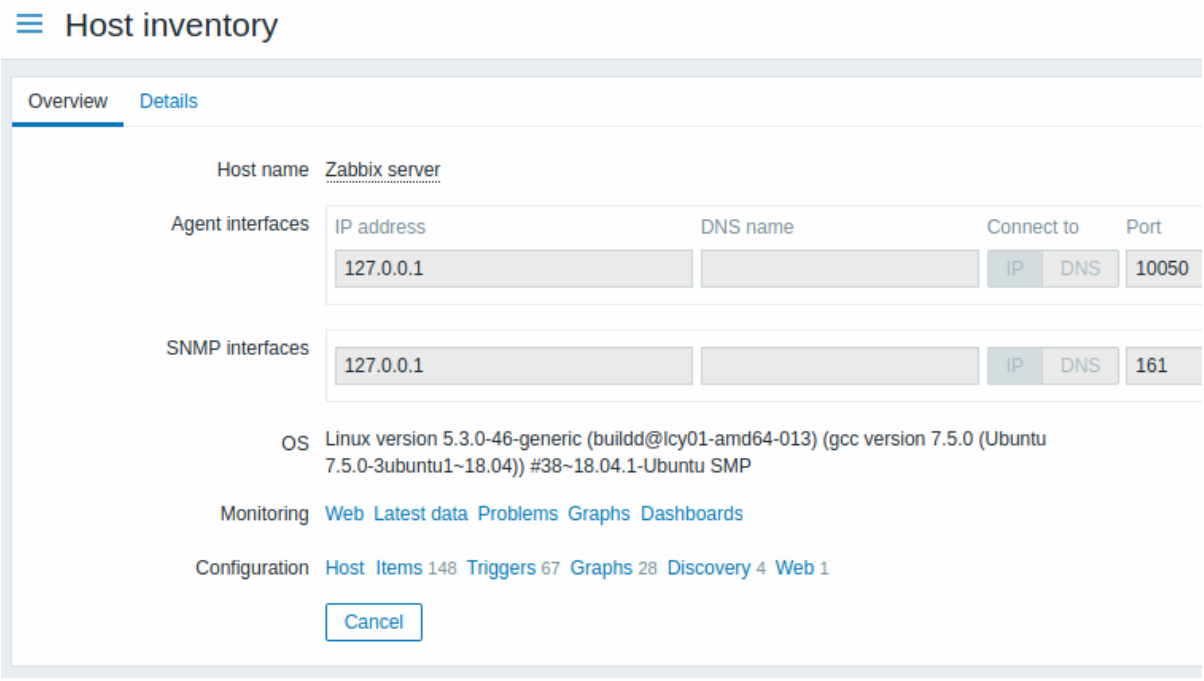


Hosts

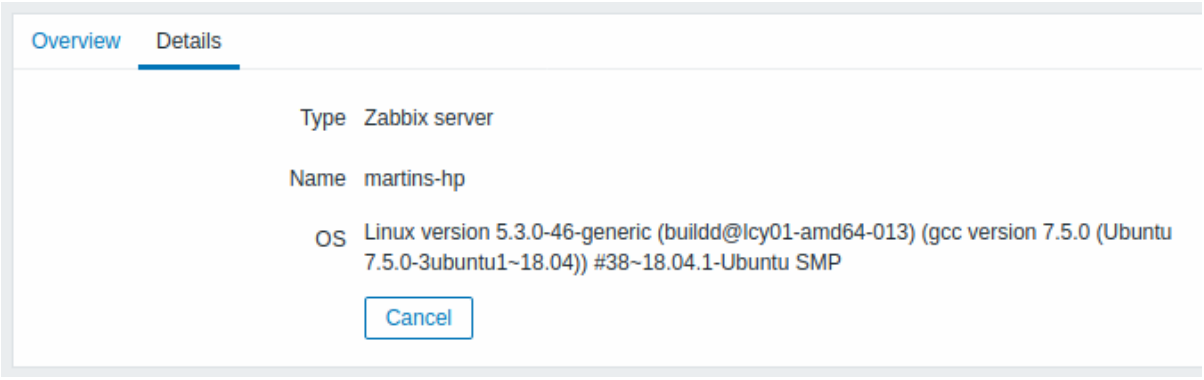
Overview

In the *Inventory* > *Hosts* section inventory data of hosts are displayed.

You can filter the hosts by host group(s) and by any inventory field to display only the hosts you are interested in.



To display all host inventories, click the *Reset* button.



While only some key inventory fields are displayed in the table, you can also view all available inventory information for that host. To do that, click the host name in the first column.

Inventory details

The **Overview** tab contains some general information about the host, latest monitoring data, and host configuration options:

The **Details** tab contains all available inventory details for the host:

The completeness of inventory data depends on how much inventory information is maintained with the host. If no information is maintained, the *Details* tab is disabled.

Reports

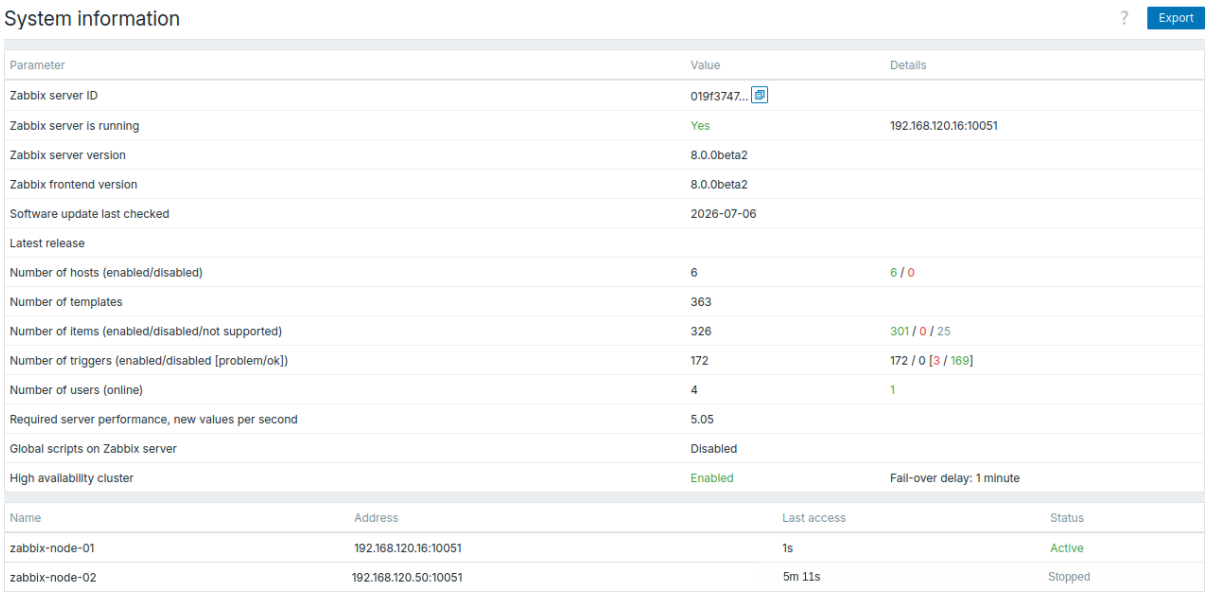
Overview

The Reports menu features several sections that contain a variety of predefined and user-customizable reports focused on displaying an overview of such parameters as system information, triggers and gathered data.

System information

Overview

In *Reports* > *System information*, a summary of key Zabbix server and system data is displayed. System data is collected using internal items.



The system information report is visible only to Zabbix *Super Admin* and Zabbix *Admin* users.

Note that in a high availability setup, it is possible to redirect the system information source (server instance). To do this, edit the frontend configuration file file - uncomment and set `$ZBX_SERVER` or both `$ZBX_SERVER` and `$ZBX_SERVER_PORT` to a server other than the one shown active. Note that when setting `$ZBX_SERVER` only, a default value (10051) for `$ZBX_SERVER_PORT` will be used.

With the high availability setup enabled, a separate block is displayed below the system stats with details of high availability nodes.

System information is also available as a dashboard widget.

System stats

Displayed data:

Parameter	Value	Details
Zabbix server ID	Zabbix server unique identifier (UUIDv7).	Server ID is generated on the first server start. The first 8 characters are shown, followed by an ellipsis. When hovering over or clicking a server ID value, a tooltip appears showing the full value. Clicking the icon next to the value copies the ID to the clipboard. If high-availability is enabled, each node has its own node ID for command-line addressing, but all nodes are grouped under a single server ID generated by the node that was launched first (or was previously a standalone server), regardless of which node is currently active.
Zabbix server is running	Status of Zabbix server: **Yes** - server is running **No** - server is not running *Note:* To display the rest of the information the web, frontend needs the server to be running and there must be at least one trapper process started on the server (StartTrappers parameter in `zabbix_server.conf` file > 0).	Location and port of Zabbix server.
Zabbix server version	Current server version number is displayed. *Note:* It is only displayed when Zabbix server is running.	Server version status is displayed: **Up to date** - using the latest version; **New update available** - a more up-to-date version is available; **Outdated** - the full support period for this version has expired. This information is only available if software update check is enabled in the Zabbix server configuration. Nothing is displayed if the last software update check was performed more than a week ago or no data exist about the current version.

Parameter	Value	Details
Zabbix frontend version	Zabbix frontend version number is displayed.	Zabbix frontend version status is displayed: **Up to date** - using the latest version; **New update available** - a more up-to-date version is available; **Outdated** - the full support period for this version has expired. This information is only available if software update check is enabled in the Zabbix server configuration. Nothing is displayed if the last software update check was performed more than a week ago or no data exist about the current version.
Software update last checked	The date of the last Zabbix software update check is displayed. This information is only available if software update check is enabled in the Zabbix server configuration.	
Latest release	The number of a newer release (if available) for the current Zabbix version is displayed. This information is only available if software update check is enabled in the Zabbix server configuration. Nothing is displayed if the last software update check was performed more than a week ago or no data exist about the current version.	A link to the release notes of the latest available Zabbix release is displayed.
Number of hosts	Total number of hosts configured is displayed.	Number of monitored hosts/not monitored hosts.
Number of templates	Total number of templates is displayed.	
Number of items	Total number of items is displayed.	Number of monitored/disabled/unsupported host-level items. Items on disabled hosts are counted as disabled.
Number of triggers	Total number of triggers is displayed.	Number of enabled/disabled host-level triggers; split of the enabled triggers according to ”Problem”/”OK” states. Triggers listed under the ”OK” state include triggers with the status ”Unknown”. Triggers dependent on disabled items or assigned to disabled hosts are counted as disabled.
Number of users	Total number of users configured is displayed.	Number of users online.
Required server performance, new values per second	The expected number of new values processed by Zabbix server per second is displayed.	*Required server performance* is an estimate and can be useful as a guideline. For precise numbers of values processed, use the `zabbix[wcache,values,all]` internal item. Enabled items from monitored hosts are included in the calculation. Log items are counted as one value per item update interval. Regular interval values are counted; flexible and scheduling interval values are not. The calculation is not adjusted during a ”nodata” maintenance period. Trapper items are not counted.
Global scripts on Zabbix server	**Disabled** will be displayed in this field if global scripts are disabled on Zabbix server by setting EnableGlobalScripts=0 in server configuration.	
High availability cluster	Status of high availability cluster for Zabbix server: **Disabled** - standalone server **Enabled** - at least one high availability node exists	If enabled, the failover delay is displayed.

System information will also display an error message in the following conditions:

- The database used does not have the required character set or collation (UTF-8).
- The version of the database is below or above the supported range (available only to users with the *Super admin role* type).
- Housekeeping for TimescaleDB is incorrectly configured (history or trend tables contain compressed chunks, but *Override item history period* or *Override item trend period* options are disabled).

Buttons

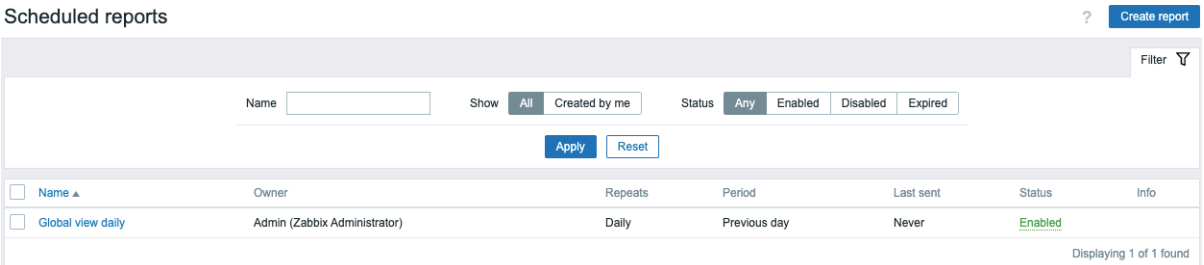
The button at the upper-right corner of the page offers the following option:

Export	Export system information to a JSON file. The file is saved as `Zabbix-system-information-{time}.json`, where `{time}` is the Unix timestamp indicating when the data was prepared on the server. If high availability is enabled, details of the high-availability nodes are also exported.

High availability nodes

If high availability cluster is enabled, an additional block of data is displayed showing the status of each high availability node.

Name	Address	Last access	Status
node-active	192.168.1.13:10051	12s	Active
node6	192.168.1.10:10053	1h 2m 40s	Unavailable
node7	192.168.1.11:10053	3m 40s	Unavailable
node4	192.168.1.8:10052	1h 34m 29s	Stopped
node5	192.168.1.9:10053	1h 9m 51s	Stopped
node8	192.168.1.12:10051	21m 16s	Stopped
node1	192.168.1.5:10051	17s	Standby
node2	192.168.1.6:10051	16s	Standby
node3	192.168.1.7:10052	16 2021-10-20 17:58:47	Standby



Displayed data:

Column	Description
Name	Node name, as defined in server configuration.
Address	Node IP address and port.
Last access	Time of node last access. Hovering over the cell shows the timestamp of last access in long format.
Status	Node status. Table rows are sorted by these statuses in this priority order: **Active** - node is up and working **Unavailable** - node hasn't been seen for more than failover delay (you may want to find out why) **Stopped** - node has been stopped or couldn't start (you may want to start it or delete it) **Standby** - node is up and waiting

Scheduled reports

Overview

In *Reports* > *Scheduled reports*, users with sufficient permissions can configure scheduled generation of PDF versions of the dashboards, which will be sent by email to specified recipients.

The opening screen displays information about scheduled reports, which can be filtered out for easy navigation - see Using filter section below.

Displayed data:

Column	Description
Name	Name of the report. Clicking it opens the report configuration form.
Owner	User who created the report.
Repeats	Report generation frequency (daily/weekly/monthly/yearly).
Period	Time period for which the report is prepared (previous day, week, month, or year).
Last sent	The date and time when the latest report has been sent.
Status	Current status of the report (enabled/disabled/expired). Users with sufficient permissions can change the status by clicking it - from ”Enabled” to ”Disabled” (and back); from ”Expired” to ”Disabled” (and back). For users with insufficient rights, the status is not clickable.
Info	Displays informative icons: A red icon indicates that report generation has failed; hovering over it will display a tooltip with the error information. A yellow icon indicates that a report was generated, but sending to some (or all) recipients has failed or that a report is expired; hovering over it will display a tooltip with additional information.

Using filter

You may use the filter to narrow down the list of reports. For better search performance, data is searched with macros unresolved.

The following filtering options are available:

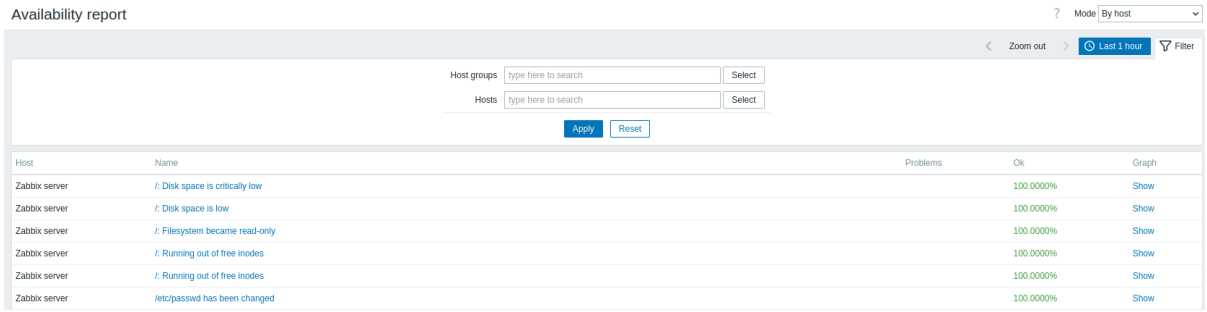
- *Name* - partial name match is allowed
- *Show* - created by current user or all reports
- *Status* - select between ”Any” (show all reports), ”Enabled”, ”Disabled”, or ”Expired”

The filter is located below the *Scheduled reports* section name. It can be opened and collapsed by clicking the *Filter* tab in the upper-right corner.

Mass update

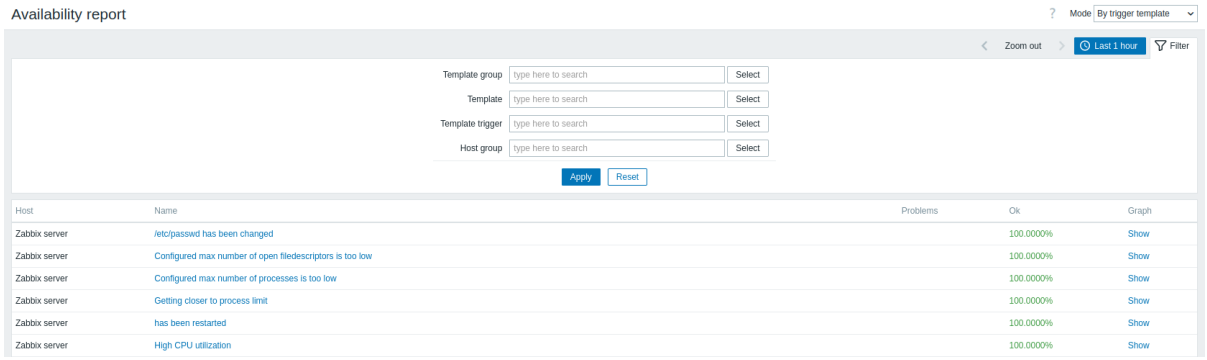
Sometimes you may want to delete or change the status of a number of reports at once. Instead of opening each individual report for editing, you may use the mass update function for that.

To mass-update some reports, do the following:



- Mark the checkboxes of the reports to update in the list
- Click the required button below the list to make the changes (*Enable*, *Disable*, or *Delete*)

Availability report



Overview

In *Reports* > *Availability report*, you can see what proportion of time each trigger has been in the problem/OK state.

For each state, a percentage of time is displayed, making it easy to determine the availability of various elements on your system.

In the dropdown in the upper-right corner, you can choose the selection mode - whether to display triggers by hosts or by triggers belonging to a template.

The name of the trigger is a link to the latest events of that trigger.

Using filter

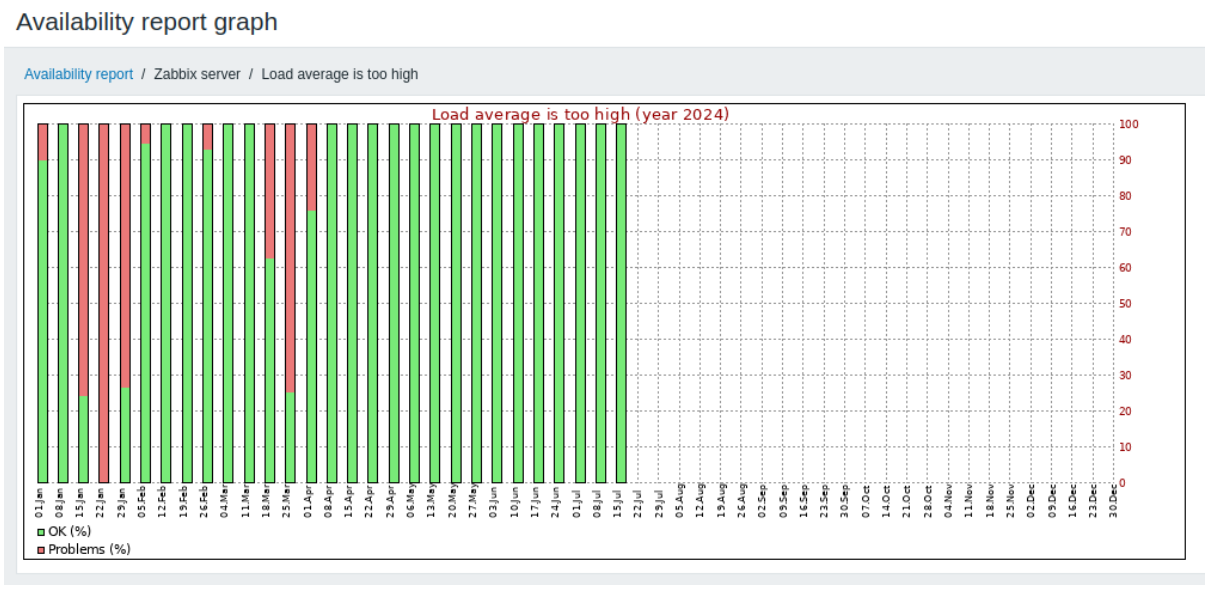
The filter can help narrow down the number of hosts and/or triggers displayed. For better search performance, data is searched with macros unresolved.

The filter is located below the *Availability report* section name. It can be opened and collapsed by clicking the *Filter* tab on the right.

Filtering by trigger template

In *By trigger template* mode, results can be filtered by one or several of the parameters listed below.

Parameter	Description
Template group	Filter hosts by triggers that are inherited from templates belonging to the selected template group. Specifying a parent template group implicitly selects all nested template groups.
Template	Filter hosts by triggers that are inherited from the selected template, including nested templates. If a nested template has its own triggers, those triggers will not be displayed.
Template trigger	Filter hosts by the selected trigger. Other triggers of the filtered hosts will not be displayed.
Host group	Filter hosts belonging to the selected host group.



Filtering by host

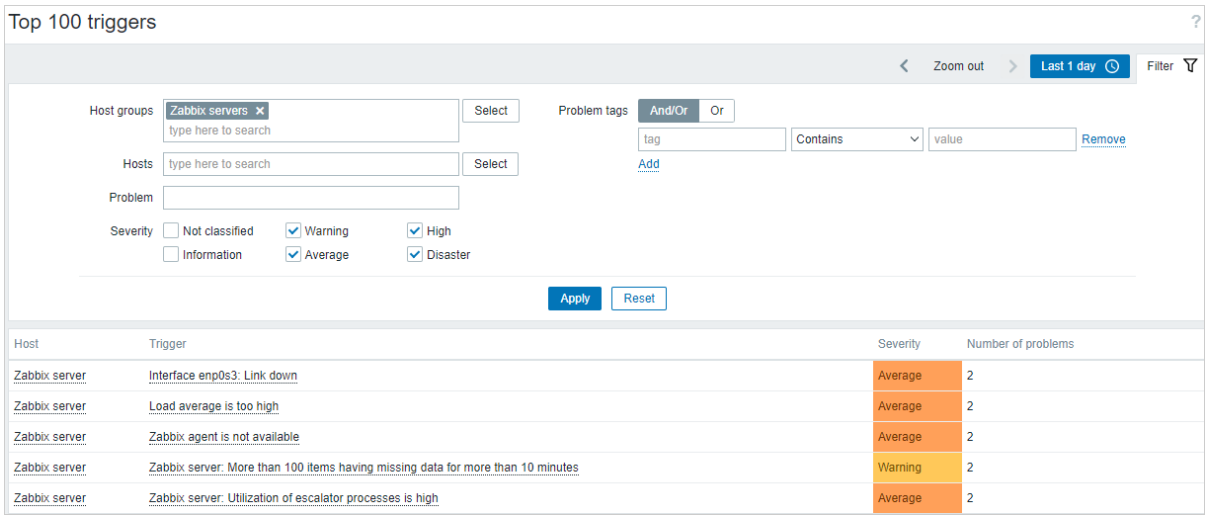
In *By host* mode, results can be filtered by host or host group. Specifying a parent host group implicitly selects all nested host groups.

Time period selector

The time period selector allows you to select commonly used time periods with one click. The selector can be expanded and collapsed by clicking the *Time period* tab next to the filter.

Clicking *Show* in the *Graph* column displays availability information in a bar graph where each bar represents a passed week of the current year.

The green of a bar stands for OK time and red - for problem time.



Effect of maintenance periods

Maintenance does not automatically exclude time from the availability report. Only maintenance configured as *No data collection* stops polling (so no problems are generated) and therefore leaves the availability percentage unchanged for affected triggers.

Top 100 triggers

Overview

In *Reports* > *Top 100 triggers*, you can see the triggers with the highest number of problems detected during the selected period.

Both host and trigger column entries are links that offer some useful options:

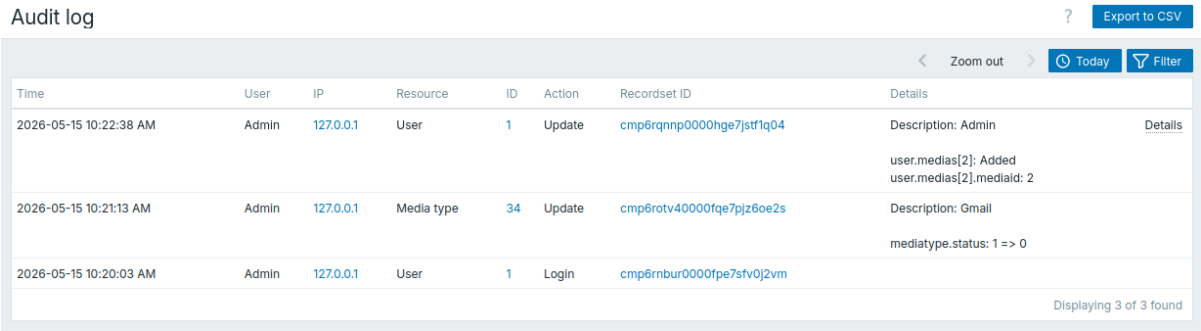
- for host - clicking the host name brings up the host menu
- for trigger - clicking the trigger name brings up links to the latest events, simple graph for each trigger item, and the configuration forms of the trigger itself and each trigger item

Using filter

You may use the filter to display triggers by host group, host, problem name, tags, or trigger severity. Specifying a parent host group implicitly selects all nested host groups. For better search performance, data is searched with macros unresolved.

The filter is located below the *Top 100 triggers* section name. It can be opened and collapsed by clicking the *Filter* tab on the right.

Time period selector



The time period selector next to the filter allows you to select often required periods with one mouse click. For more information, see Time period and host selectors.

Audit log

Overview

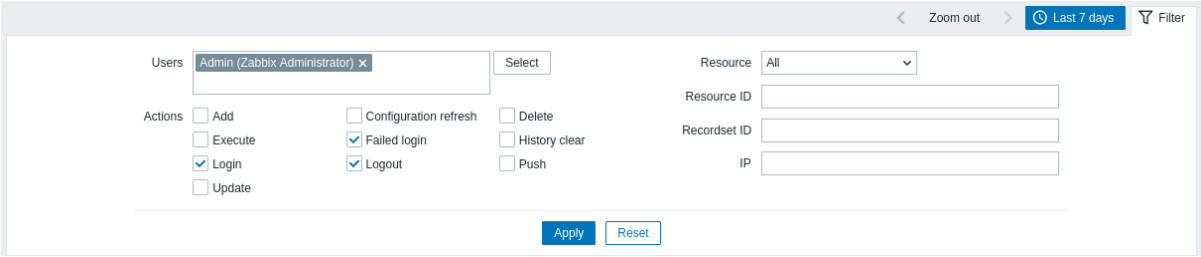
In the *Reports* > *Audit log* section, the records of user and system activity can be viewed.

> **Note:**
> For audit records to be collected and displayed, the *Enable audit logging* checkbox has to be marked in the *Administration* > *Audit log* section. Without this setting enabled, the history of activities will not be recorded in the database and will not be shown in the audit log.

Audit log displays the following data:

Column	Description
Time	Timestamp of the audit record.
User	User who performed the activity.
IP	IP from which the activity was initiated. Clicking the hyperlink will result in filtering audit log records by this IP.
Resource	Type of the affected resource (*API token*, *Action*, *Authentication*, *Autoregistration*, etc.).
ID	ID of the affected resource. Clicking the hyperlink will result in filtering audit log records by this resource ID.
Action	Type of the activity (*Add*, *Configuration refresh*, *Delete*, *Execute*, *Failed login*, *History clear*, *Login*, *Logout*, *Push*, *Update*).
Recordset ID	Shared ID for all audit log records created as a result of the same operation. For example, when linking a template to a host, a separate audit log record is created for each inherited template entity (item, trigger, etc.) - all these records will have the same *Recordset ID*. Clicking the hyperlink will result in filtering audit log records by this *Recordset ID*.
Details	Description of the resource and detailed information about the performed activity. If a record contains more than two rows, an additional *Details* link will be displayed. Click this link to view the full list of changes.

Note:
When a trapper item or an HTTP agent item (with trapping enabled) has received some data, an entry in the audit log will be added only if the data was sent using the `history.push` API method, and not the Zabbix sender utility.



Buttons

The button at the upper-right corner of the page offers the following option:

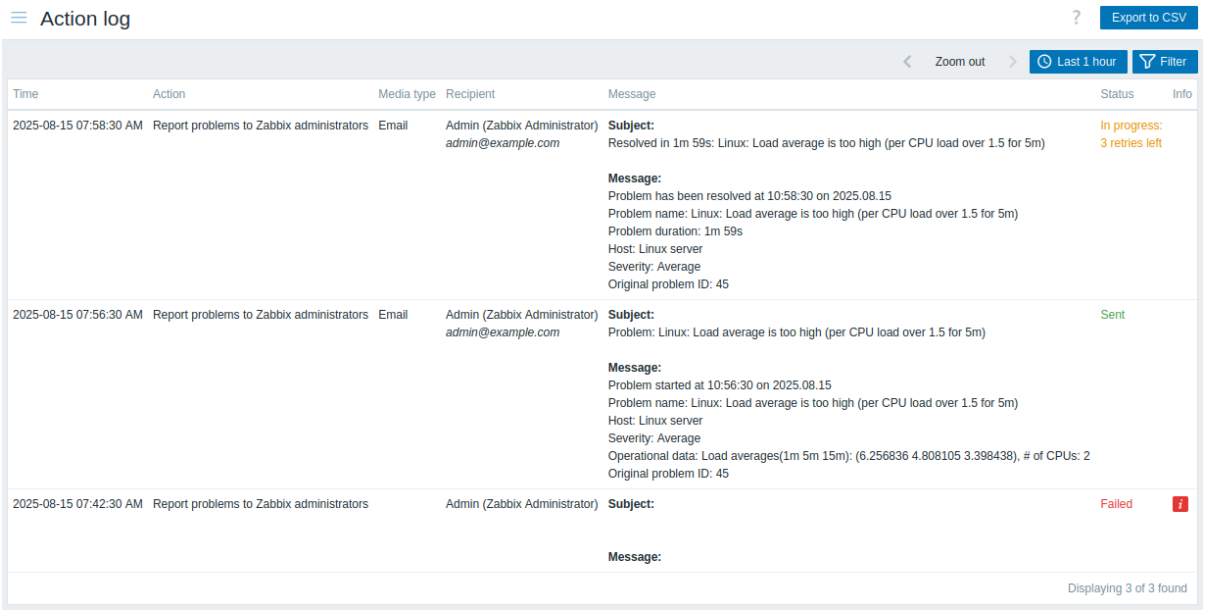
Export to CSV	Export audit log records from all pages to a CSV file. If a filter is applied, only the filtered records will be exported.

Using filter

The filter is located below the *Audit log* bar. It can be opened and collapsed by clicking the *Filter* tab in the upper-right corner.

You may use the filter to narrow the records by user, affected resource, resource ID, performed operation (*Recordset ID*), and IP. Depending on the resource, one or more specific actions can be selected in the filter.

For better search performance, all data is searched with macros unresolved.



Time period selector

The time period selector next to the filter allows you to select often required periods with one mouse click. For more information, see Time period and host selectors.

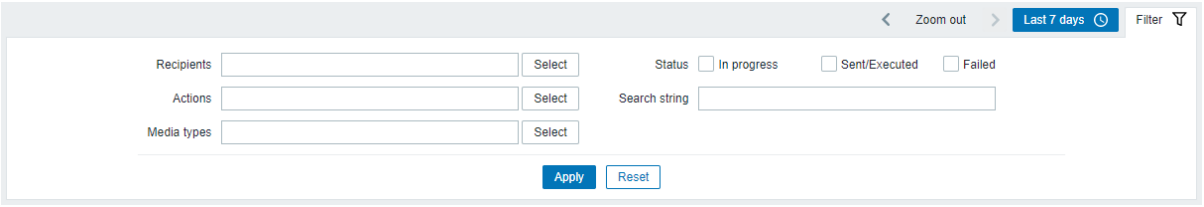
Action log

Overview

In *Reports* > *Action log*, you can view details of operations (notifications, remote commands) executed within an action.

Displayed data:

Column	Description
Time	Timestamp of the operation.
Action	Name of the action causing operations.
Media type	Media type (e.g., Email, Jira, etc.) used for sending a notification. For operations that executed remote commands, this column will be empty.
Recipient	Information about the notification recipient - username, name and surname (in parentheses), and additional information depending on the media type (email, username, etc.). For operations that executed remote commands, this column will be empty.
Message	The content of the message, remote command or global script name. A remote command is separated from the target host with a colon symbol: `<host>:<command>`. For example, if the remote command was executed on Zabbix server, then the information will have the following format: `Zabbix server:<command>`.
Status	Operation status: *In progress* - operation for sending a notification is in progress (the remaining number of times the server will try to send the notification is also displayed) *Sent* - notification has been sent *Executed* - remote command has been executed *Failed* - operation has not been completed
Info	Error information (if any) regarding the operation execution.



Buttons

The button at the upper-right corner of the page offers the following option:

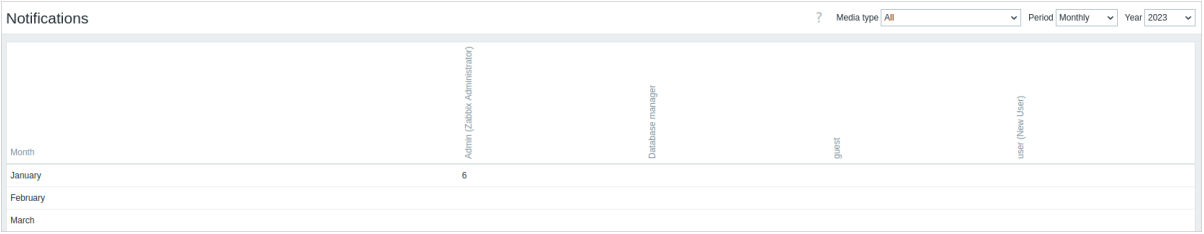
Export to CSV	Export action log records from the current page to a CSV file. If a filter is applied, only the filtered records will be exported. In the exported CSV file the columns "Recipient" and "Message" are divided into several columns - "Recipient's Zabbix username", "Recipient's name", "Recipient's surname", "Recipient", and "Subject", "Message", "Command".

Using filter

The filter is located below the *Action log* bar. It can be opened and collapsed by clicking the *Filter* tab at the upper-right corner of the page.

You may use the filter to narrow down the records by notification recipients, actions, media types, status, or by the message/remote command content (*Search string*). For better search performance, data is searched with macros unresolved.

Time period selector



The time period selector next to the filter allows you to select often required periods with one mouse click. For more information, see Time period and host selectors.

Notifications

Overview

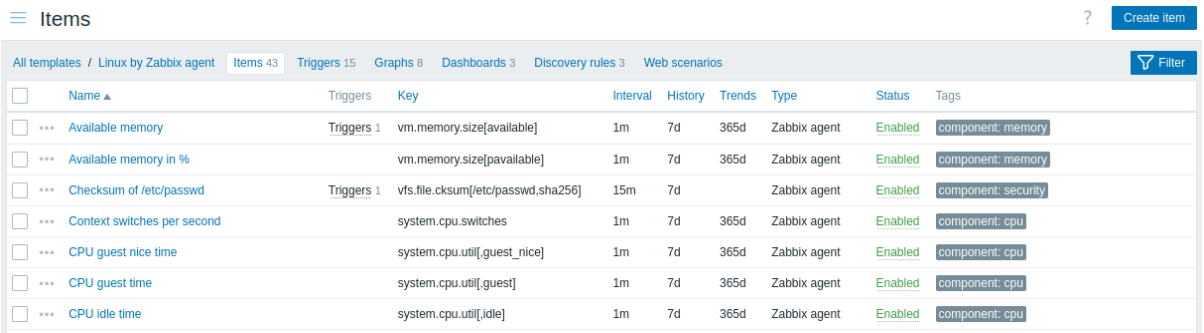
In the *Reports* > *Notifications* section a report on the number of notifications sent to each user is displayed.

From the dropdowns in the upper-right corner you can choose the media type (or all), period (data for each day/week/month/year) and year for the notifications sent.

Each column displays totals per one system user.

Data collection

Overview



This menu features sections that are related to configuring data collection.

Items

Overview

The item list for a template can be accessed from *Data collection* > *Templates* by clicking *Items* for the respective template.

A list of existing items is displayed.

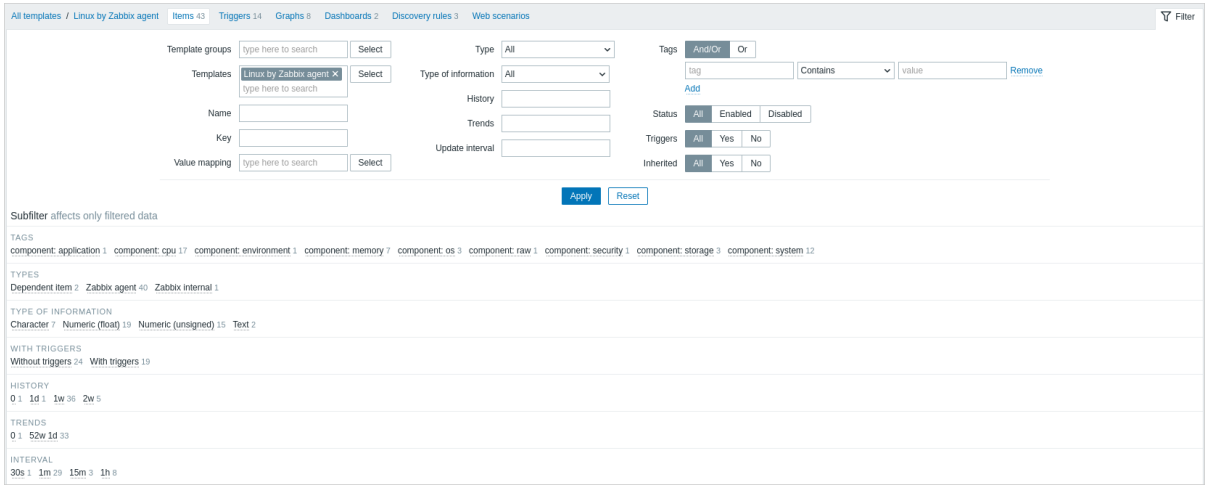
Displayed data:

Column	Description
Item menu	Click the three-dot icon to open the item menu.
Template	Template the item belongs to. Clicking the template name opens the template configuration form. This column is displayed only if multiple templates or no templates are selected in the filter.
Name	Name of the item displayed as a blue link to item details. Clicking the item name link opens the item configuration form. If the item is inherited from another template, the template name is displayed before the item name as a gray link. Clicking the template link opens the item list on that template level.
Triggers	Moving the mouse over Triggers will display an infobox displaying the triggers associated with the item. The number of the triggers is displayed in gray.
Key	Item key is displayed.
Interval	Frequency of the check is displayed.
History	How many days item data history will be kept is displayed.
Trends	How many days item trends history will be kept is displayed.
Type	Item type is displayed (Zabbix agent, SNMP agent, simple check, etc).
Status	Item status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it - from Enabled to Disabled (and back).
Tags	Item tags are displayed. Up to three tags (name:value pairs) can be displayed. If there are more tags, a "..." link is displayed that allows all tags to be viewed on mouseover.

To configure a new item, click the *Create item* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



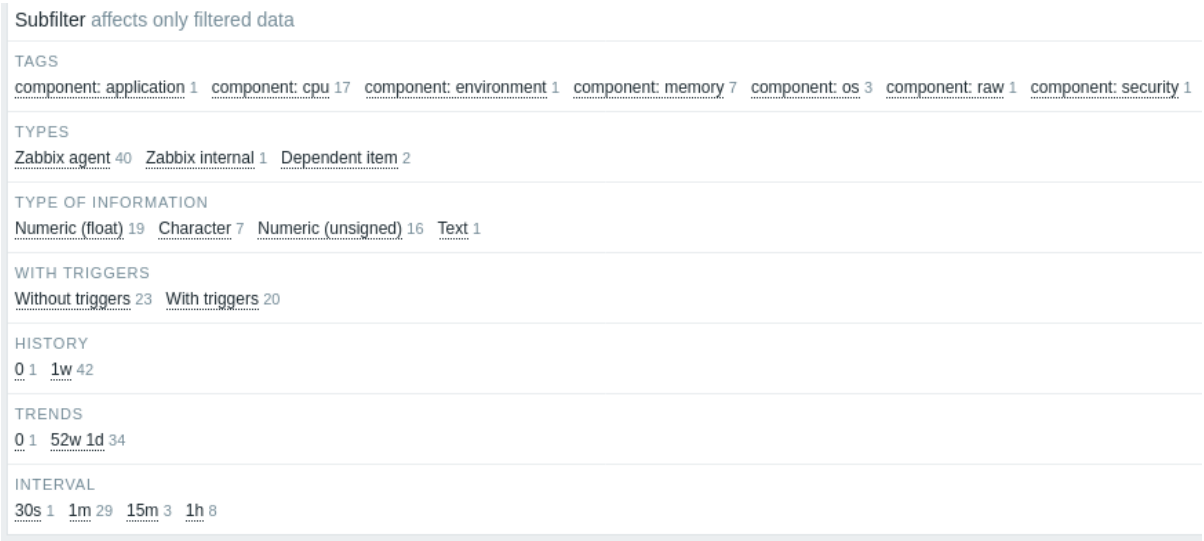
- *Enable* - change item status to *Enabled*.
- *Disable* - change item status to *Disabled*.
- *Copy* - copy the items to other hosts or templates.
- *Mass update* - update several properties for a number of items at once.
- *Delete* - delete the items.

To use these options, mark the checkboxes before the respective items, then click the required button.

Using filter

The item list may contain a lot of items. By using the filter, you can filter out some of them to quickly locate the items you're looking for. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the upper-right corner. Clicking it will open a filter where you can specify the desired filtering criteria.



Parameter	Description
Template groups	Filter by one or more template groups. Specifying a parent template group implicitly selects all nested groups.
Templates	Filter by one or more templates.
Name	Filter by item name.

Parameter	Description
Key	Filter by item key.
Value mapping	Filter by the value map used. This parameter is not displayed if the *Templates* option is empty.
Type	Filter by item type (Zabbix agent, SNMP agent, etc.).
Type of information	Filter by type of information (Numeric unsigned, float, etc.).
History	Filter by how long item history is kept.
Trends	Filter by how long item trends are kept.
Update interval	Filter by item update interval.
Tags	Specify tags to limit the number of items displayed. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names **Equals** - include the specified tag names and values (case-sensitive) **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) **Does not exist** - exclude the specified tag names **Does not equal** - exclude the specified tag names and values (case-sensitive) **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition **Or** - enough if one condition is met
Status	Filter by item status - *Enabled* or *Disabled*.
Triggers	Filter items with (or without) triggers.
Inherited	Filter items inherited (or not inherited) from linked templates.

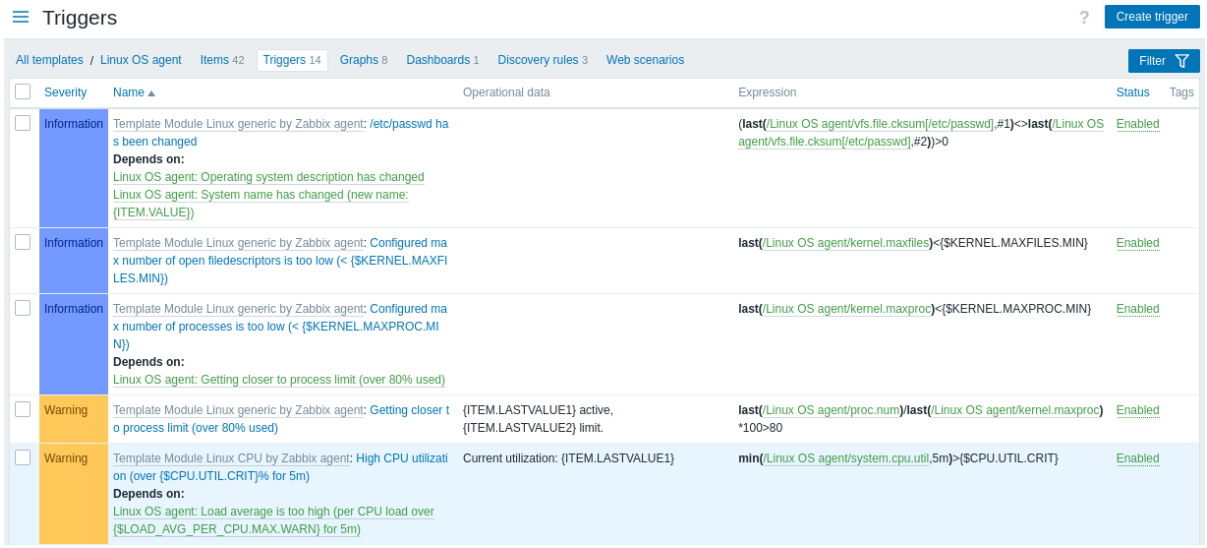
Using subfilter

The subfilter allows further modification of the filtering applied by the main filter.

It contains clickable links for a quick access to related items. Items are related by common entity - tag, item type, item update interval, etc. When an entity is clicked, the entity is highlighted with a gray background, and items are immediately filtered (no need to click *Apply* in the main filter). Clicking another entity adds it to the filtered results. Clicking the entity again removes the filtering.

Subfilters are generated based on the filtered data, which is limited to 1000 records. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration* > *General* > *GUI*).

Unlike the main filter, the subfilter is updated with each table refresh request to always have up-to-date information of available filtering options and their counter numbers.



The number of entities displayed is limited to 100 horizontally. If there are more, a three-dot icon is displayed at the end; it is not clickable.

A number next to each clickable entity indicates the number of items grouped in it (based on the results of the main filter). When an entity is clicked, the numbers with other available entities are displayed with a plus sign indicating how many items may be added to the current selection. Entities without items are not displayed unless selected in the subfilter before.

Triggers

Overview

The trigger list for a template can be accessed from *Data collection* > *Templates* by clicking *Triggers* for the respective template.

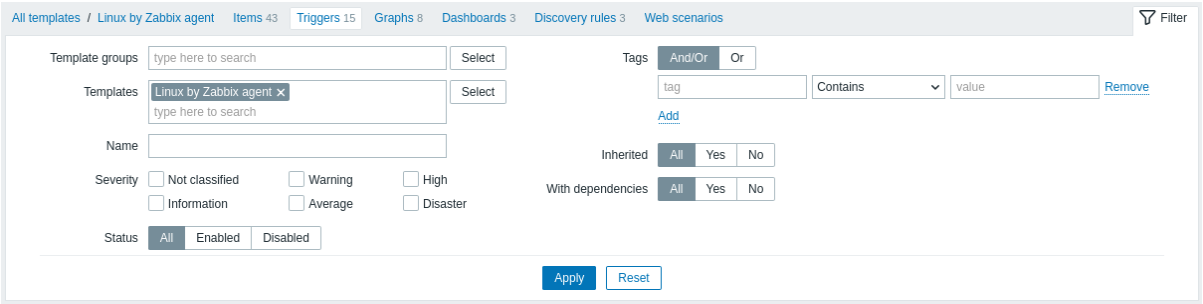
Displayed data:

Column	Description
Severity	Severity of the trigger is displayed by both name and cell background color.
Template	Template the trigger belongs to. Clicking the template name opens the template configuration form. This column is displayed only if multiple templates or no templates are selected in the filter.
Name	Name of the trigger displayed as a blue link to trigger details. Clicking the trigger name link opens the trigger configuration form. If the trigger is inherited from another template, the template name is displayed before the trigger name as a gray link. Clicking the template link opens the trigger list on that template level.
Operational data	Operational data definition of the trigger, containing arbitrary strings and macros that will resolve dynamically in *Monitoring* > *Problems*.
Expression	Trigger expression is displayed. The template-item part of the expression is displayed as a link, leading to the item configuration form.
Status	Trigger status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it - from Enabled to Disabled (and back).
Tags	If a trigger contains tags, tag name and value are displayed in this column.

To configure a new trigger, click the *Create trigger* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



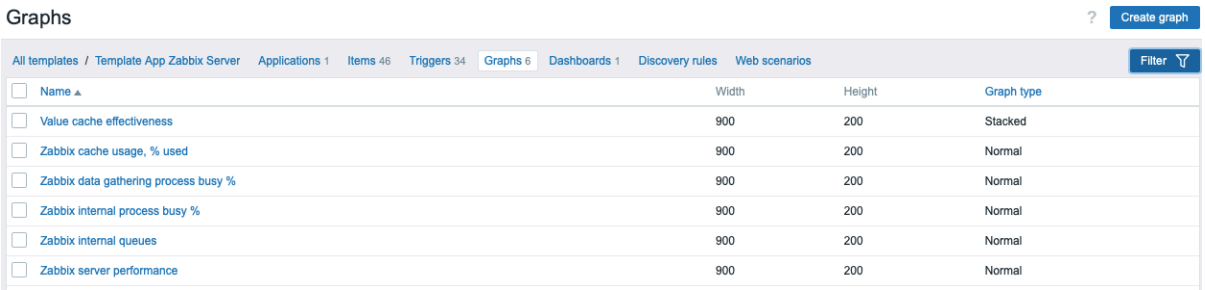
- *Enable* - change trigger status to *Enabled*
- *Disable* - change trigger status to *Disabled*
- *Copy* - copy the triggers to other hosts or templates
- *Mass update* - update several properties for a number of triggers at once
- *Delete* - delete the triggers

To use these options, mark the checkboxes before the respective triggers, then click the required button.

Using filter

You can use the filter to display only the triggers you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the upper-right corner. Clicking it will open a filter where you can specify the desired filtering criteria.



Parameter	Description
Template groups	Filter by one or more template groups. Specifying a parent template group implicitly selects all nested groups.
Templates	Filter by one or more templates. If template groups are already selected above, template selection is limited to those groups.
Name	Filter by trigger name.
Severity	Select to filter by one or several trigger severities.
Status	Filter by trigger activation status (Enabled/Disabled).
Tags	Filter by trigger tag name and value. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names **Equals** - include the specified tag names and values (case-sensitive) **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) **Does not exist** - exclude the specified tag names **Does not equal** - exclude the specified tag names and values (case-sensitive) **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition **Or** - enough if one condition is met Macros and macro functions are supported in tag name and tag value fields.
Inherited	Filter triggers inherited (or not inherited) from linked templates.
With dependencies	Filter triggers with (or without) dependencies.

Graphs

Overview

The custom graph list for a template can be accessed from *Data collection* > *Templates* by clicking *Graphs* for the respective template.

A list of existing graphs is displayed.

Displayed data:

Column	Description
Template	Template the graph belongs to. Clicking the template name opens the template configuration form. This column is displayed only if multiple templates or no templates are selected in the filter.
Name	Name of the custom graph, displayed as a blue link to graph details. Clicking the graph name link opens the graph configuration form. If the graph is inherited from another template, the template name is displayed before the graph name as a gray link. Clicking the template link opens the graph list on that template level.
Width	Graph width is displayed.
Height	Graph height is displayed.
Graph type	Graph type is displayed - *Normal*, *Stacked*, *Pie* or *Exploded*.

To configure a new graph, click the *Create graph* button at the upper-right corner.

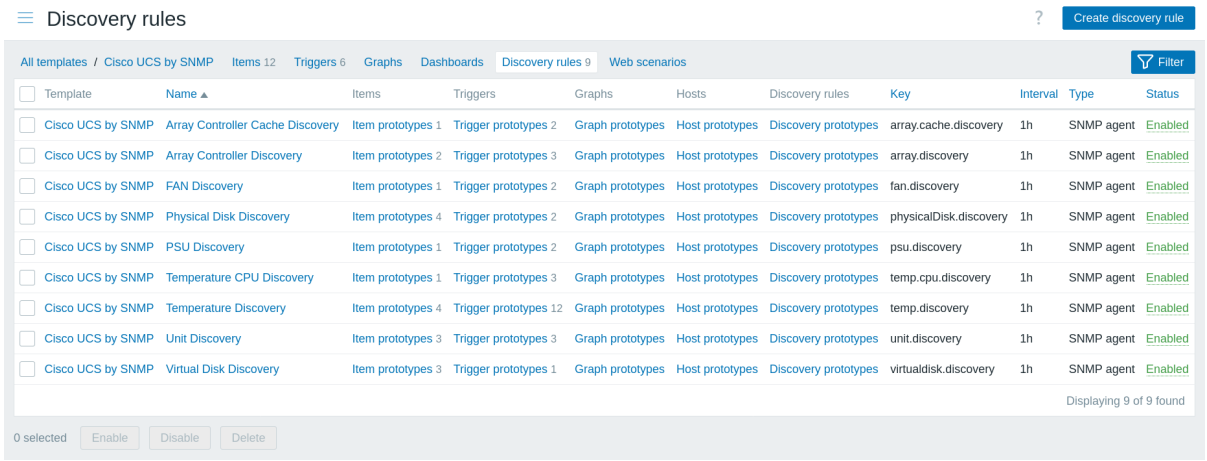
Mass editing options

Buttons below the list offer some mass-editing options:

- *Copy* - copy the graphs to other hosts or templates
- *Delete* - delete the graphs

To use these options, mark the checkboxes before the respective graphs, then click the required button.

Using filter



You can filter graphs by template group and template. For better search performance, data is searched with macros unresolved.

Discovery rules

Overview

The list of low-level discovery rules for a template can be accessed from *Data collection* > *Templates* by clicking *Discovery* for the respective template.

A list of existing low-level discovery rules is displayed. It is also possible to see all discovery rules independently of the template, or all discovery rules of a specific template group by changing the filter settings.

Displayed data:

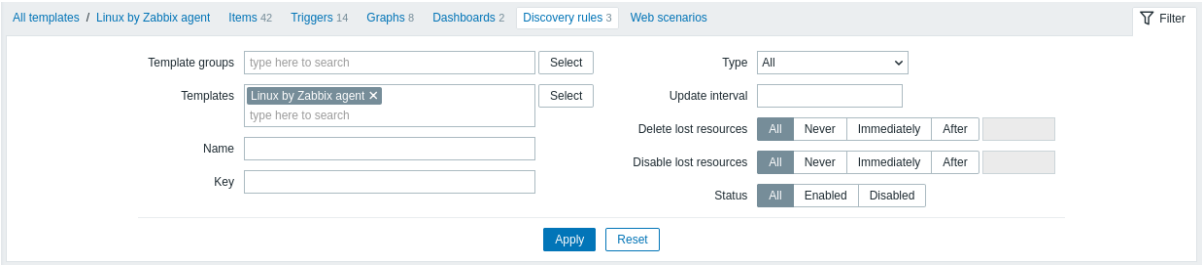
Column	Description
Template	The template discovery rule belongs to. Clicking the template name opens the template configuration form.
Name	Name of the rule, displayed as a blue link. Clicking the rule name opens the low-level discovery rule configuration form. If the discovery rule is inherited from another template, the template name is displayed before the rule name as a gray link. Clicking the template link opens the discovery rule list on that template level.
Items	A link to the list of item prototypes is displayed. The number of existing item prototypes is displayed in gray.

Column	Description
Triggers	A link to the list of trigger prototypes is displayed. The number of existing trigger prototypes is displayed in gray.
Graphs	A link to the list of graph prototypes displayed. The number of existing graph prototypes is displayed in gray.
Hosts	A link to the list of host prototypes displayed. The number of existing host prototypes is displayed in gray.
Key	The item key used for discovery is displayed.
Interval	The frequency of performing discovery is displayed.
Type	The item type used for discovery is displayed (Zabbix agent, SNMP agent, etc).
Status	Discovery rule status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it - from Enabled to Disabled (and back).

To configure a new low-level discovery rule, click the *Create discovery rule* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



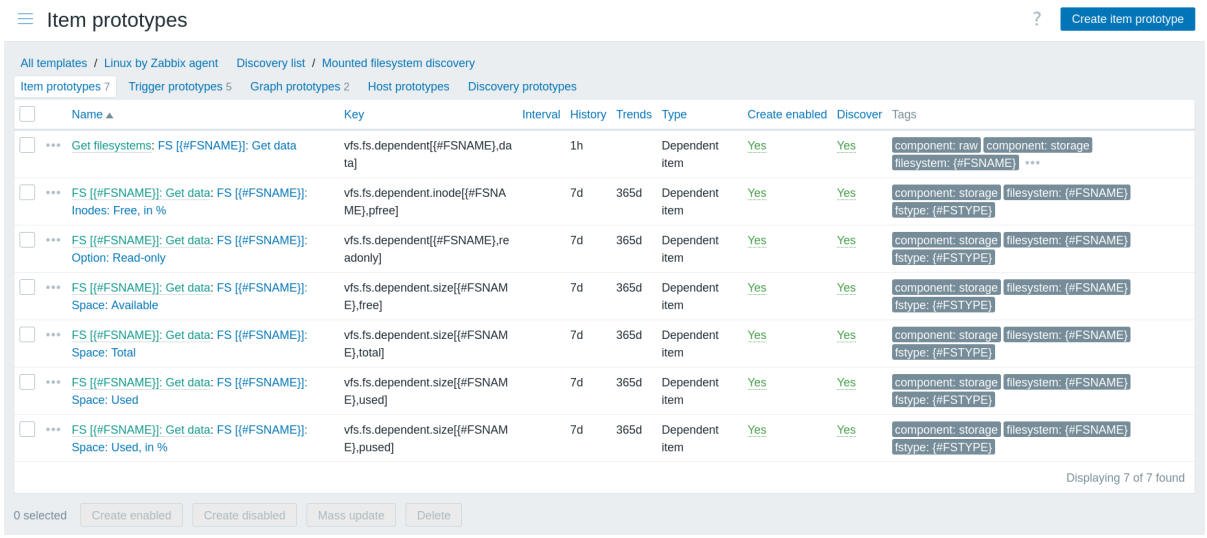
- *Enable* - change the low-level discovery rule status to *Enabled*
- *Disable* - change the low-level discovery rule status to *Disabled*
- *Delete* - delete the low-level discovery rules

To use these options, mark the checkboxes before the respective discovery rules, then click the required button.

Using filter

You can use the filter to display only the discovery rules you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the upper-right corner. Clicking it will open a filter where you can specify the desired filtering criteria such as template, discovery rule name, item key, item type, etc.



Parameter	Description
Template groups	Filter by one or more template groups. Specifying a parent template group implicitly selects all nested groups.
Templates	Filter by one or more templates.
Name	Filter by discovery rule name.
Key	Filter by discovery item key.
Type	Filter by discovery item type.
Update interval	Filter by update interval. Not available for Zabbix trapper and dependent items.
Delete lost resources	Filter by *Delete lost resources* period.
Disable lost resources	Filter by *Disable lost resources* period.
Status	Filter by discovery rule status (All/Enabled/Disabled).

Item prototypes

Overview

In this section the configured item prototypes of a low-level discovery rule on the template are displayed.

If the template is linked to the host, item prototypes will become the basis of creating real host items during low-level discovery.

Displayed data:

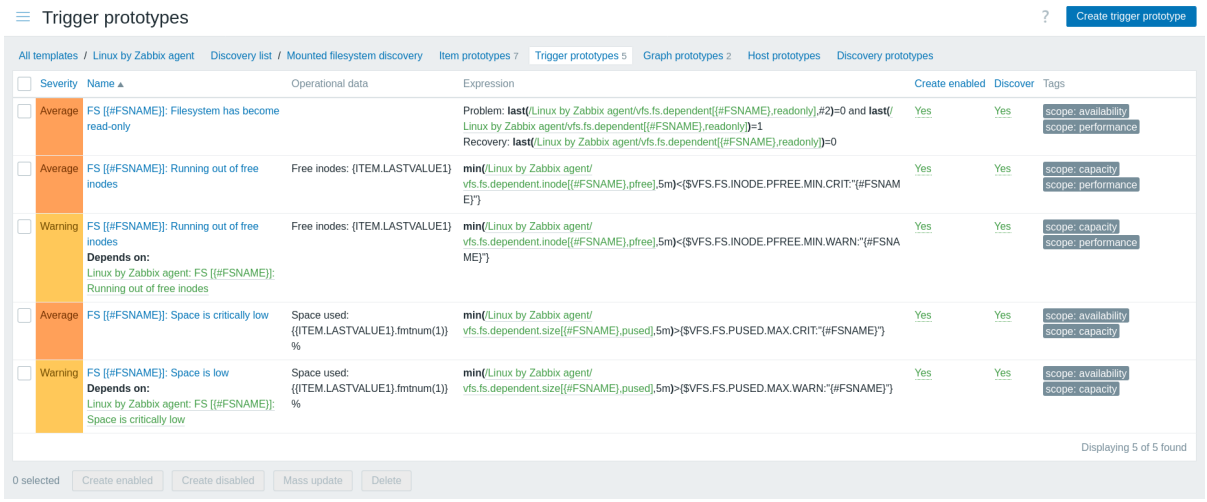
Column	Description
Name	Name of the item prototype, displayed as a blue link. Clicking the name opens the item prototype configuration form. If the item prototype belongs to a linked template, the template name is displayed before the item prototype name as a gray link. Clicking the template link opens the item prototype list on the linked template level. If the item prototype is of the ”Dependent item” type, the master item name is displayed before the item prototype name in green (as in the case of item prototypes on the host level).
Key	Key of the item prototype is displayed.
Interval	Frequency of the check is displayed.
History	How many days to keep item data history is displayed.
Trends	How many days to keep item trends history is displayed.
Type	Type of the item prototype is displayed (Zabbix agent, SNMP agent, simple check, etc).
Create enabled	Create the item based on this prototype as: **Yes** - enabled **No** - disabled. You can switch between ’Yes’ and ’No’ by clicking them.
Discover	Discover the item based on this prototype: **Yes** - discover **No** - do not discover. You can switch between ’Yes’ and ’No’ by clicking them.
Tags	Tags of the item prototype is displayed.

To configure a new item prototype, click the *Create item prototype* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Create enabled* - create these items as *Enabled*
- *Create disabled* - create these items as *Disabled*
- *Mass update* - mass update these item prototypes
- *Delete* - delete these item prototypes



To use these options, mark the checkboxes before the respective item prototypes, then click the required button.

Trigger prototypes

Overview

In this section the configured trigger prototypes of a low-level discovery rule on the template are displayed.

If the template is linked to the host, trigger prototypes will become the basis of creating real host triggers during low-level discovery.

Displayed data:

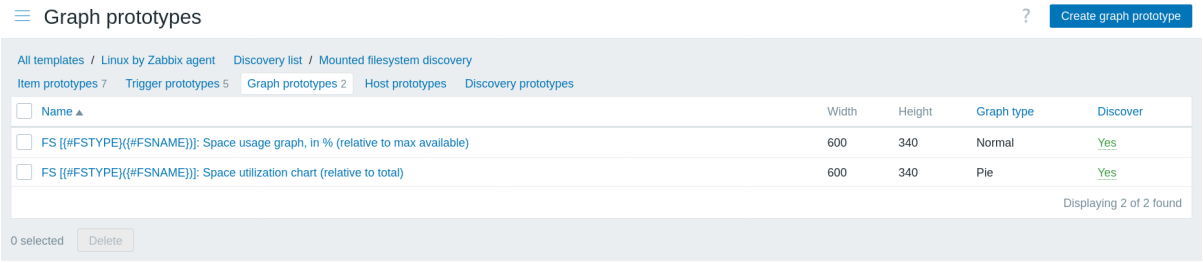
Column	Description
Severity	Severity of the trigger is displayed by both name and cell background color.
Name	Name of the trigger prototype, displayed as a blue link. Clicking the name opens the trigger prototype configuration form. If the trigger prototype belongs to a linked template, the template name is displayed before the trigger name as a gray link. Clicking the template link opens the trigger prototype list on the linked template level.
Expression	Trigger expression is displayed. The template-item part of the expression is displayed as a link, leading to the item configuration form.
Operational data	Format of the operational data of the trigger is displayed, containing arbitrary strings and macros that will resolve dynamically in *Monitoring > Problems*.
Create enabled	Create the trigger based on this prototype as: **Yes** - enabled **No** - disabled. You can switch between 'Yes' and 'No' by clicking them.
Discover	Discover the trigger based on this prototype: **Yes** - discover **No** - do not discover. You can switch between 'Yes' and 'No' by clicking them.
Tags	Tags of the trigger prototype are displayed.

To configure a new trigger prototype, click the *Create trigger prototype* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Create enabled* - create these triggers as *Enabled*
- *Create disabled* - create these triggers as *Disabled*
- *Mass update* - mass update these trigger prototypes
- *Delete* - delete these trigger prototypes



To use these options, mark the checkboxes before the respective trigger prototypes, then click the required button.

Graph prototypes

Overview

In this section the configured graph prototypes of a low-level discovery rule on the template are displayed.

If the template is linked to the host, graph prototypes will become the basis of creating real host graphs during low-level discovery.

Displayed data:

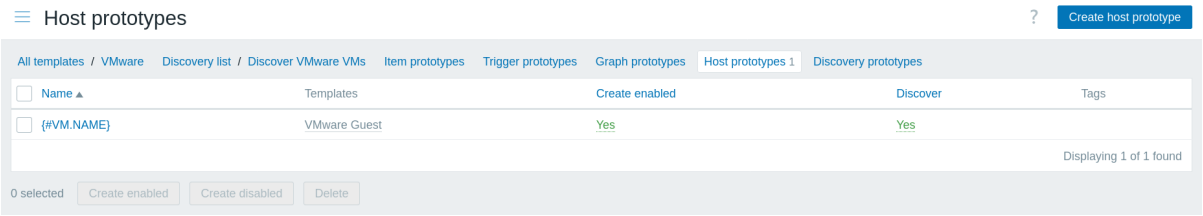
Column	Description
Name	Name of the graph prototype, displayed as a blue link. Clicking the name opens the graph prototype configuration form. If the graph prototype belongs to a linked template, the template name is displayed before the graph name as a gray link. Clicking the template link opens the graph prototype list on the linked template level.
Width	Width of the graph prototype is displayed.
Height	Height of the graph prototype is displayed.
Type	Type of the graph prototype is displayed - *Normal*, *Stacked*, *Pie* or *Exploded*.
Discover	Discover the graph based on this prototype: **Yes** - discover **No** - do not discover. You can switch between 'Yes' and 'No' by clicking them.

To configure a new graph prototype, click the *Create graph prototype* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Delete* - delete these graph prototypes



To use these options, mark the checkboxes before the respective graph prototypes, then click the required button.

Host prototypes

Overview

In this section the configured host prototypes of a low-level discovery rule on the template are displayed.

If the template is linked to the host, host prototypes will become the basis of creating real hosts during low-level discovery.

Displayed data:

Column	Description
Name	Name of the host prototype, displayed as a blue link. Clicking the name opens the host prototype configuration form. If the host prototype belongs to a linked template, the template name is displayed before the host name as a gray link. Clicking the template link opens the host prototype list on the linked template level.
Templates	Templates of the host prototype are displayed.
Create enabled	Create the host based on this prototype as: **Yes** - enabled **No** - disabled. You can switch between 'Yes' and 'No' by clicking them.

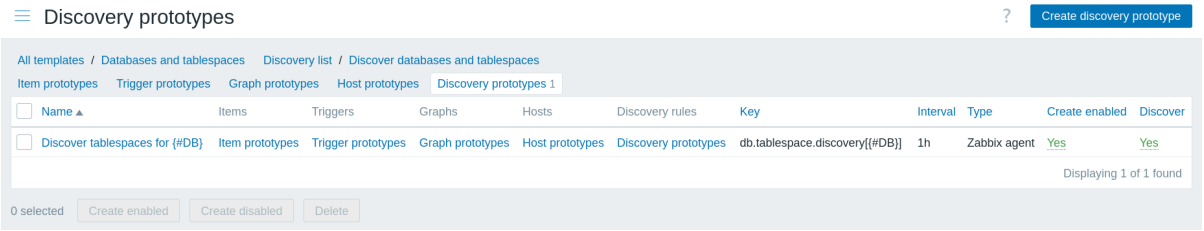
Column	Description
Discover	Discover the host based on this prototype: **Yes** - discover **No** - do not discover. You can switch between 'Yes' and 'No' by clicking them.
Tags	Tags of the host prototype are displayed.

To configure a new host prototype, click the *Create host prototype* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Create enabled* - create these hosts as *Enabled*
- *Create disabled* - create these hosts as *Disabled*
- *Delete* - delete these host prototypes



To use these options, mark the checkboxes before the respective host prototypes, then click the required button.

Discovery prototypes

Overview

In this section the configured discovery prototypes of a low-level discovery rule on the template are displayed.

If the template is linked to the host, discovery prototypes will become the basis of creating real discovery prototypes of the parent discovery rule.

Displayed data:

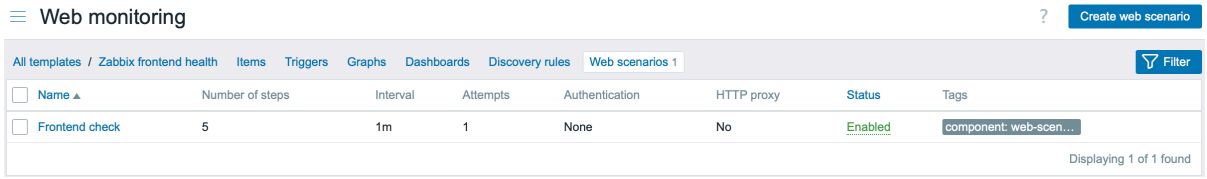
Column	Description
Name	Name of the discovery prototype, displayed as a blue link. Clicking the name opens the discovery prototype configuration form. If the discovery prototype belongs to a linked template, the template name is displayed before the discovery prototype name as a gray link. Clicking the template link opens the discovery prototype list on the linked template level.
Items	A link to the list of item prototypes is displayed. The number of existing item prototypes is displayed in gray.
Triggers	A link to the list of trigger prototypes is displayed. The number of existing trigger prototypes is displayed in gray.
Graphs	A link to the list of graph prototypes displayed. The number of existing graph prototypes is displayed in gray.
Hosts	A link to the list of host prototypes displayed. The number of existing host prototypes is displayed in gray.
Discovery rules	A link to the list of discovery prototypes displayed. The number of existing discovery prototypes is displayed in gray.
Key	The item key used for discovery is displayed.
Interval	The frequency of performing discovery is displayed.
Type	The item type used for discovery is displayed (Zabbix agent, SNMP agent, etc).
Create enabled	Discovery prototype creation status is displayed - create enabled (*Yes*) or create disabled (*No*). By clicking the status you can change it - from Yes to No (and back).
Discover	Discovery prototype discovery status is displayed - discover (*Yes*) or do not discover (*No*). By clicking the status you can change it - from Yes to No (and back).

To configure a new discovery prototype, click the *Create discovery prototype* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Create enabled* - create these discovery prototypes as *Enabled*
- *Create disabled* - create these discovery prototypes as *Disabled*
- *Delete* - delete these discovery prototypes



To use these options, mark the checkboxes before the respective discovery prototypes, then click the required button.

Web scenarios

Overview

The web scenario list for a template can be accessed from *Data collection* > *Templates* by clicking *Web* for the respective template.

A list of existing web scenarios is displayed.

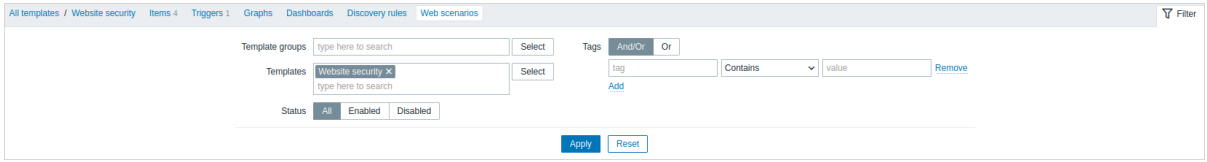
Displayed data:

Column	Description
Name	Name of the web scenario. Clicking the web scenario name opens the web scenario configuration form. If the web scenario is inherited from another template, the template name is displayed before the web scenario name as a gray link. Clicking the template link opens the web scenario list on that template level.
Number of steps	The number of steps the scenario contains.
Update interval	How often the scenario is performed.
Attempts	How many attempts for executing web scenario steps are performed.
Authentication	Authentication method is displayed - Basic, NTLM, Kerberos, Digest, or None.
HTTP proxy	Displays HTTP proxy or 'No' if not used.
Status	Web scenario status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it.
Tags	Web scenario tags are displayed. Up to three tags (name:value pairs) can be displayed. If there are more tags, a "..." link is displayed that allows all tags to be viewed on mouseover.

To configure a new web scenario, click the *Create web scenario* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



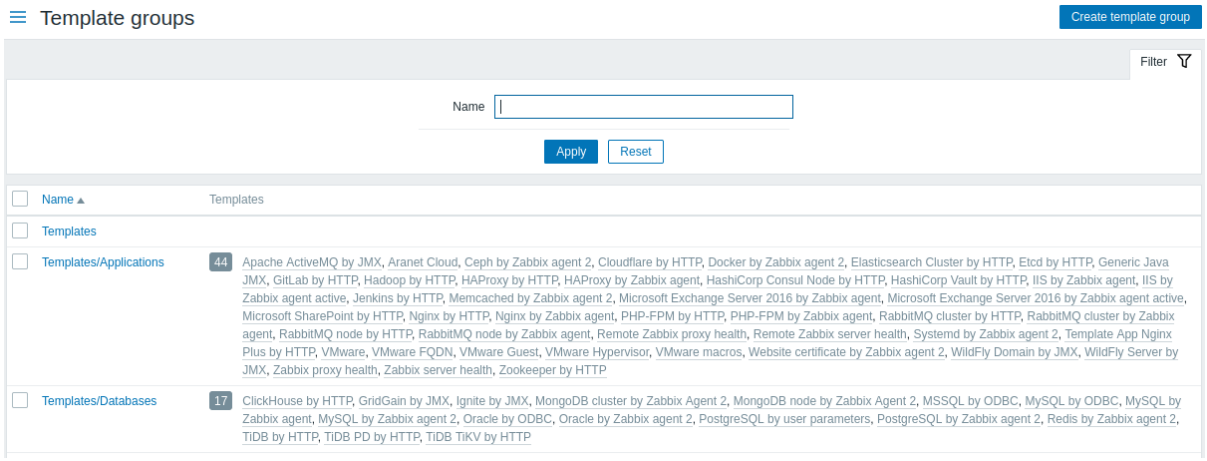
- *Enable* - change the scenario status to *Enabled*
- *Disable* - change the scenario status to *Disabled*
- *Delete* - delete the web scenarios

To use these options, mark the checkboxes before the respective web scenarios, then click the required button.

Using filter

You can use the filter to display only the scenarios you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of web scenarios. If you click it, a filter becomes available where you can filter scenarios by template group, template, status and tags.



Template groups

Overview

In the *Data collection* > *Templates groups* section users can configure and maintain template groups.

A listing of existing template groups with their details is displayed. You can search and filter template groups by name.

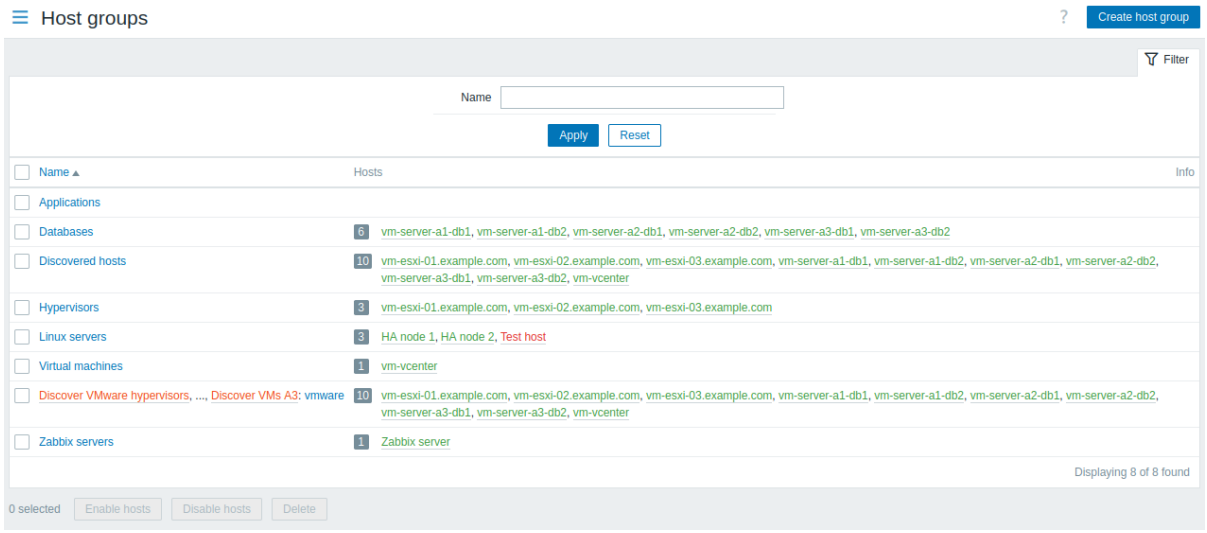
Displayed data:

Column	Description
Name	Name of the template group. Clicking the group name opens the template group configuration form.
Templates	Number of templates in the group (displayed in gray) followed by the list of group members. Clicking a template name will open the template configuration form. Clicking the number opens the list of templates in this group.

Mass editing options

To delete several template groups at once, mark the checkboxes before the respective groups, then click the Delete button below the list.

Using filter



You can use the filter to display only the template groups you are interested in. For better search performance, data is searched with macros unresolved.

Host groups

Overview

In the *Data collection* > *Host groups* section users can configure and maintain host groups.

A listing of existing host groups with their details is displayed. You can search and filter host groups by name.

Displayed data:

Column	Description
Name	Name of the host group. Clicking the group name opens the host group configuration form. Discovered host groups are displayed with low-level discovery rule names as a prefix. Clicking the LLD rule name opens the host prototype configuration form. Note that discovered host groups are deleted when all LLD rules that discovered it are deleted.
Hosts	Number of hosts in the group (displayed in gray) followed by the list of group members. Clicking a host name will open the host configuration form. Clicking the number will, in the whole listing of hosts, filter out those that belong to the group.
Info	Error information (if any) regarding the host group is displayed.

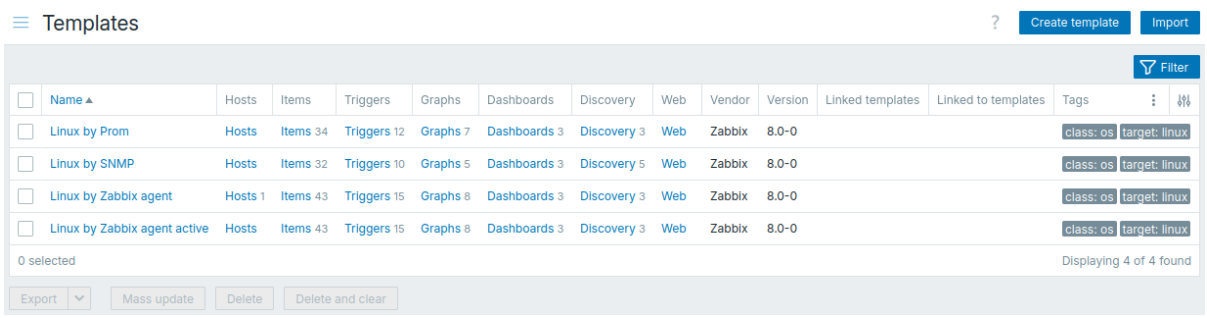
Mass editing options

Buttons below the list offer some mass-editing options:

- *Enable hosts* - change the status of all hosts in the group to "Monitored"
- *Disable hosts* - change the status of all hosts in the group to "Not monitored"
- *Delete* - delete the host groups

To use these options, mark the checkboxes before the respective host groups, then click the required button.

Using filter



You can use the filter to display only the host groups you are interested in. For better search performance, data is searched with macros unresolved.

Templates

Overview

In the *Data collection* > *Templates* section users can configure and maintain templates.

A listing of existing templates with their details is displayed.

Template details are displayed in a customizable table. The *Customize table* button in the table header lets you show, hide, or reorder columns, and reset the layout to default. You can also resize each column by dragging its right border; double-click the border to reset. All customizations are applied immediately and always remembered for the current user.

The following columns are available:

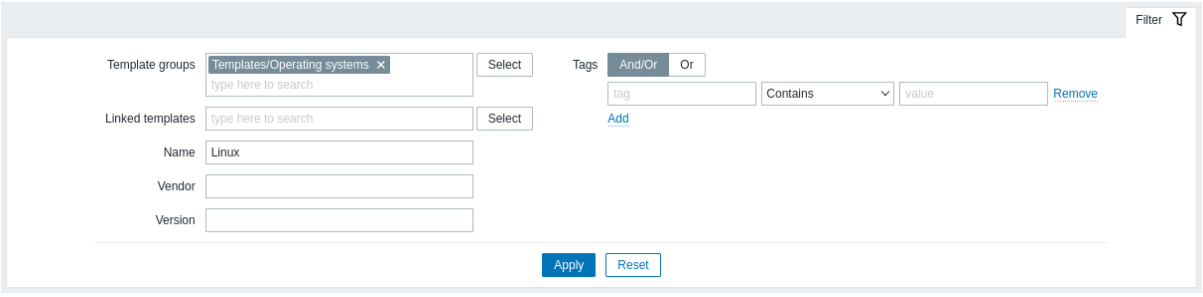
Column	Description
Name	Name of the template. Clicking the template name opens the template configuration form.
Hosts	Number of editable hosts to which the template is linked; read-only hosts are not included. Clicking *Hosts* will open the host list with only those hosts filtered that are linked to the template.
Entities (Items, Triggers, Graphs, Dashboards, Discovery, Web)	Number of the respective entities in the template (displayed in gray). Clicking the entity name will, in the whole listing of that entity, filter out those that belong to the template.
Linked templates	Templates that are linked to the template.
Linked to templates	Templates that the template is linked to.
Vendor, *Version*	Template vendor and version; displayed if the template configuration contains such information, and only for out-of-the-box templates, imported templates, or templates modified through the Template API. For out-of-the-box templates, version is displayed as follows: major version of Zabbix, delimiter ("-"), revision number (increased with each new version of the template, and reset with each major version of Zabbix). For example, 7.0-0, 7.0-3, 8.0-0, 8.0-3.
Tags	Template tags are displayed, with macros unresolved. Hovering or clicking the three dots icon after the displayed tags opens a pop-up with all tags. Clicking the *Options* button in the column header lets you set the number of tags displayed (1–3), choose how tag names are displayed (full, shortened, or none), set tag display priority, or duplicate the column (duplicated columns can be renamed or deleted).
Tag value	Template tag values are displayed, with macros unresolved. Clicking the *Options* button in the column header lets you rename the column, choose which tag values to display, or duplicate the column (duplicated columns can be renamed or deleted).
Custom text	Custom text, macro values, or a combination of both is displayed. Clicking the *Options* button in the column header lets you rename the column, enter the custom text or macros, or duplicate the column (duplicated columns can be renamed or deleted). Supported macros: `{HOST.ID}`, `{HOST.HOST}`, `{HOST.NAME}`, `{HOST.DESCRIPTION}`, and user macros.

To configure a new template, click the *Create template* button in the upper-right corner.

To import a template from a YAML, XML, or JSON file, click the *Import* button in the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



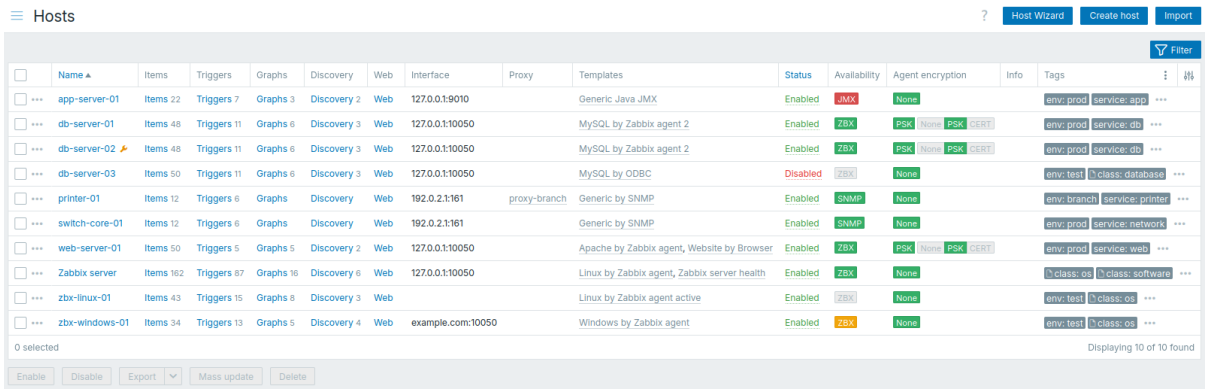
- *Export* - export the template to a YAML, XML or JSON file;
- *Mass update* - update several properties for a number of templates at once;
- *Delete* - delete the template while leaving its linked entities (items, triggers etc.) with the hosts;
- *Delete and clear* - delete the template and its linked entities from the hosts.

To use these options, mark the checkboxes before the respective templates, then click the required button.

Using filter

You can use the filter to display only the templates you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available below *Create template* and *Import* buttons. If you click it, a filter becomes available where you can filter templates by template group, linked templates, name and tags.



Parameter	Description
Template groups	Filter by one or more template groups. Specifying a parent template group implicitly selects all nested groups.
Linked templates	Filter by directly linked templates.
Name	Filter by template name.
Vendor	Filter by template vendor.
Version	Filter by template version.
Tags	Filter by template tag name and value. Filtering is possible only by template-level tags (not inherited ones). It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met.

Hosts

Overview

In the *Data collection* > *Hosts* section users can configure and maintain hosts.

A listing of existing hosts with their details is displayed.

Host details are displayed in a customizable table. The *Customize table* button in the table header lets you show, hide, or reorder columns, and reset the layout to default. You can also resize each column by dragging its right border; double-click the border to reset. All customizations are applied immediately and always remembered for the current user.

The following columns are available:

Column	Description
Name	Name of the host. Clicking the host name opens the host configuration form. An orange wrench icon after the host name indicates that this host is in maintenance. Maintenance details are displayed when the mouse pointer is positioned on the icon.
Entities (Items, Triggers, Graphs, Discovery, Web)	Clicking the entity name will display items, triggers, etc., of the host. The number of the respective entities is displayed in gray.
Interface	The main interface of the host is displayed.

Column	Description
Proxy	Assigned proxies are displayed in this column: <Proxy name> - host is monitored by standalone proxy (even if the proxy is part of proxy group); <Proxy group name: proxy name> - host is monitored by proxy group, and Zabbix server has assigned a proxy to monitor the host; <Proxy group name> - host is monitored by proxy group without any proxies, or if Zabbix server has not assigned a proxy to monitor the host; Nothing - host is not monitored by either proxy or proxy group. This column is only displayed if the *Monitored by* filter option is set to 'Any', 'Proxy', or 'Proxy group'.
Templates	The templates linked to the host are displayed. If other templates are contained in the linked template, those are displayed in parentheses, separated by a comma. Clicking a template name will open its configuration form.
Status	Host status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it manually. Discovered hosts that have been lost are marked with an info icon. The tooltip text provides details on their status.
Availability	Host availability per configured interface is displayed. Availability icons represent host interface current status on Zabbix server. Therefore, if you disable a host in the frontend, its availability will update after Zabbix server has synchronized the configuration changes. Similarly, if you enable a host, its availability will update after Zabbix server has synchronized the configuration changes and polled the host. Availability icons represent only those interface types (Agent, SNMP, IPMI, JMX) that are configured. Hovering over the icon displays a pop-up with a list of all interfaces of the same type with details, status, and errors. For Agent interface, the pop-up displays interfaces (passive) and active checks. If a host has active checks only, the Agent interface icon is displayed even if the host does not have an Agent interface configured. The column is empty for hosts with no interfaces. The status of a single host interface is determined by the connection between an enabled item using the interface and the host. The status can be: **Available** - the connection to the host was successful; **Not available** - the connection to the host was unsuccessful (timeout, firewall issues, etc.); **Unknown** - the connection to the host has not been attempted or the result is unknown. For additional details on how Zabbix server determines interface status, see Unknown interface status and Unreachable/unavailable host interface settings. The status of all host interfaces of a single type (Agent, SNMP, IPMI, JMX) is determined by those interfaces that are used by at least one enabled item. The status is indicated by the icon color: **Green** - all interfaces are available; **Yellow** - at least one interface is not available, and at least one is available or unknown; **Red** - all interfaces are not available; **Gray** - at least one interface is unknown, but none are not available. **Active check availability.** If at least one active check is enabled on the host, active checks also affect the total Agent interface availability as described above. To determine active check availability, heartbeat messages are sent in the agent active check thread. The frequency of heartbeat messages is controlled by the `HeartbeatFrequency` parameter in Zabbix agent or agent 2 configuration (default 60 seconds, range 0-3600). Active checks are considered not available when the active check heartbeat is older than 2 x HeartbeatFrequency seconds. **Note:** Zabbix agents older than version 6.2.x do not send active check heartbeats, so the availability of their hosts remains unknown.
Agent encryption	Encryption status for connections to the host and from the host is displayed: **None** - no encryption; **PSK** - using pre-shared key; **Cert** - using certificate.
Info	Error information (if any) regarding the host is displayed.

Column	Description
Tags	Host tags are displayed, with macros unresolved. Hovering or clicking the three dots icon after the displayed tags opens a pop-up with all tags. Clicking the *Options* button in the column header lets you set the number of tags displayed (1–3), choose how tag names are displayed (full, shortened, or none), set tag display priority, or duplicate the column (duplicated columns can be renamed or deleted).
Tag value	Host tag values are displayed, with macros unresolved. Clicking the *Options* button in the column header lets you rename the column, choose which tag values to display, or duplicate the column (duplicated columns can be renamed or deleted).
Custom text	Custom text, macro values, or a combination of both is displayed. Clicking the *Options* button in the column header lets you rename the column, enter the custom text or macros, or duplicate the column (duplicated columns can be renamed or deleted). Supported macros: `{HOST.*}` (except `{HOST.METADATA}`), `{INVENTORY.*}`, and user macros.

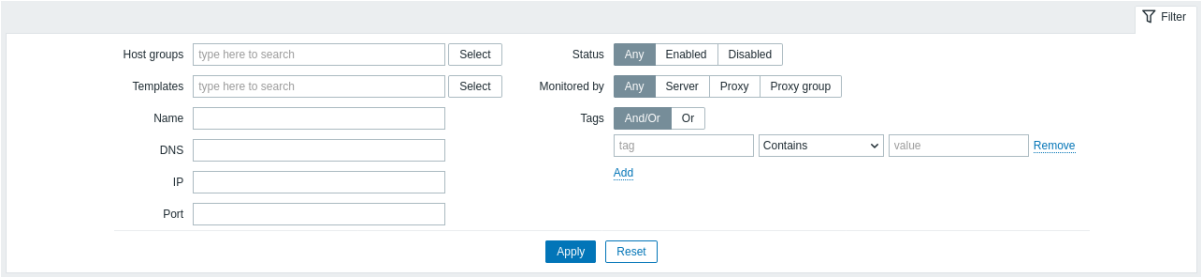
To open the host menu, click the *Options* button before the host name.

To configure a new host, click the *Host Wizard* or *Create host* button in the upper-right corner.

To import a host from a YAML, XML, or JSON file, click the *Import* button in the upper-right corner.

Mass editing options

Buttons below the list offer some mass editing options:



- *Enable* - change host status to *Monitored*;
- *Disable* - change host status to *Not monitored*;
- *Export* - export the hosts to a YAML, XML or JSON file;
- *Mass update* - update several properties for a number of hosts at once;
- *Delete* - delete the hosts.

To use these options, mark the checkboxes before the respective hosts, then click the required button.

Using filter

You can use the filter to display only the hosts you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the upper-right corner. Clicking it will open a filter where you can specify the desired filtering criteria.

Parameter	Description
Host groups	Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups.
Templates	Filter by linked templates.
Name	Filter by visible host name.
DNS	Filter by DNS name.
IP	Filter by IP address.
Port	Filter by port number.
Status	Filter by host status.
Monitored by	Filter hosts that are monitored by Zabbix server, proxy, or proxy group.
Proxies	Filter hosts that are monitored by the proxies specified here. This field is only available if "Proxy" is selected in the *Monitored by* field.
Proxy groups	Filter hosts that are monitored by the proxy groups specified here. This field is only available if "Proxy group" is selected in the *Monitored by* field.

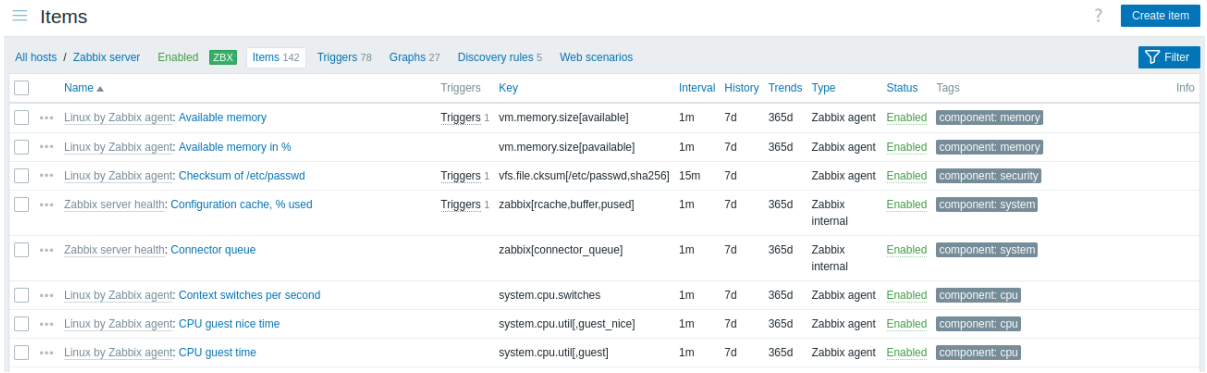
Parameter	Description
Tags	Filter by host tag name and value. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met.

Unknown interface status

Zabbix server displays the ”Unknown” status for a host interface (Agent, SNMP, IPMI, JMX) in the following cases:

- Host is disabled.
- Host is set to be monitored by proxy, different proxy, or server if it was previously monitored by proxy.
- Host is monitored by a proxy that appears to be offline (no updates received from the proxy during the maximum heartbeat interval - 1 hour).
- All host items with that interface type are disabled.
- No pollers for that interface type have been configured (for example, the `StartAgentPollers` or `StartSNMPPollers` server configuration parameter is set to 0).

Interface availability is set to ”Unknown” after Zabbix server configuration cache synchronization.



Interface availability (Available/Not available) on hosts monitored by proxies is restored after proxy configuration cache synchronization.

Items

Overview

The item list for a host can be accessed from *Data collection* > *Hosts* by clicking *Items* for the respective host.

A list of existing items is displayed.

Displayed data:

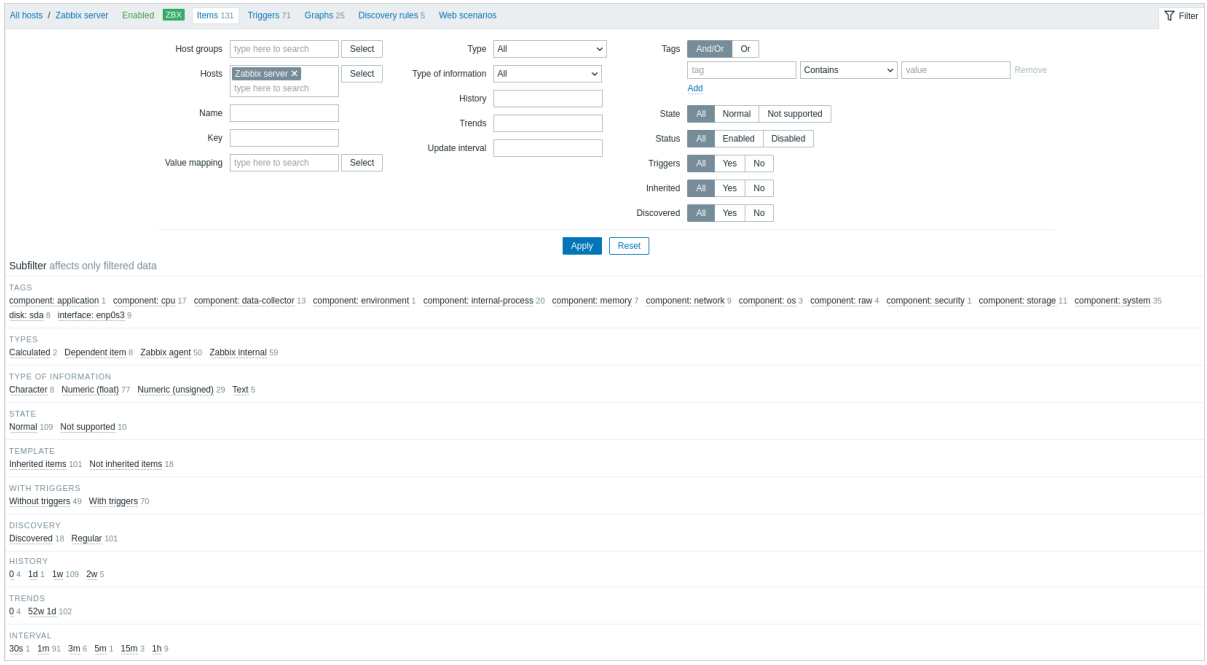
Column	Description
Item menu	Click the three-dot icon to open the item menu.

Column	Description
Host	Host of the item. Clicking the host name opens the host configuration form. This column is displayed only if multiple hosts or no hosts are selected in the filter.
Name	Name of the item displayed as a blue link to item details. Clicking the item name link opens the item configuration form. If the host item belongs to a template, the template name is displayed before the item name as a gray link. Clicking the template link will open the item list on the template level. If the item has been created from an item prototype, its name is preceded by the low-level discovery rule name, in orange. Clicking the discovery rule name will open the item prototype list.
Triggers	Moving the mouse over Triggers will display an infobox displaying the triggers associated with the item. The number of the triggers is displayed in gray.
Key	Item key is displayed.
Interval	Frequency of the check is displayed. *Note* that passive items can also be checked immediately by pushing the *Execute now* button.
History	How many days item data history will be kept is displayed.
Trends	How many days item trends history will be kept is displayed.
Type	Item type is displayed (Zabbix agent, SNMP agent, simple check, etc).
Status	Item status is displayed - *Enabled*, *Disabled* or *Not supported*. You can change the status manually by clicking it - from Enabled to Disabled (and back); from Not supported to Disabled (and back). Discovered items that have been lost are marked with an info icon. The tooltip text provides details on their status.
Tags	Item tags are displayed. Up to three tags (name:value pairs) can be displayed. If there are more tags, a "..." link is displayed that allows all tags to be viewed on mouseover.
Info	If the item is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description.

To configure a new item, click the *Create item* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



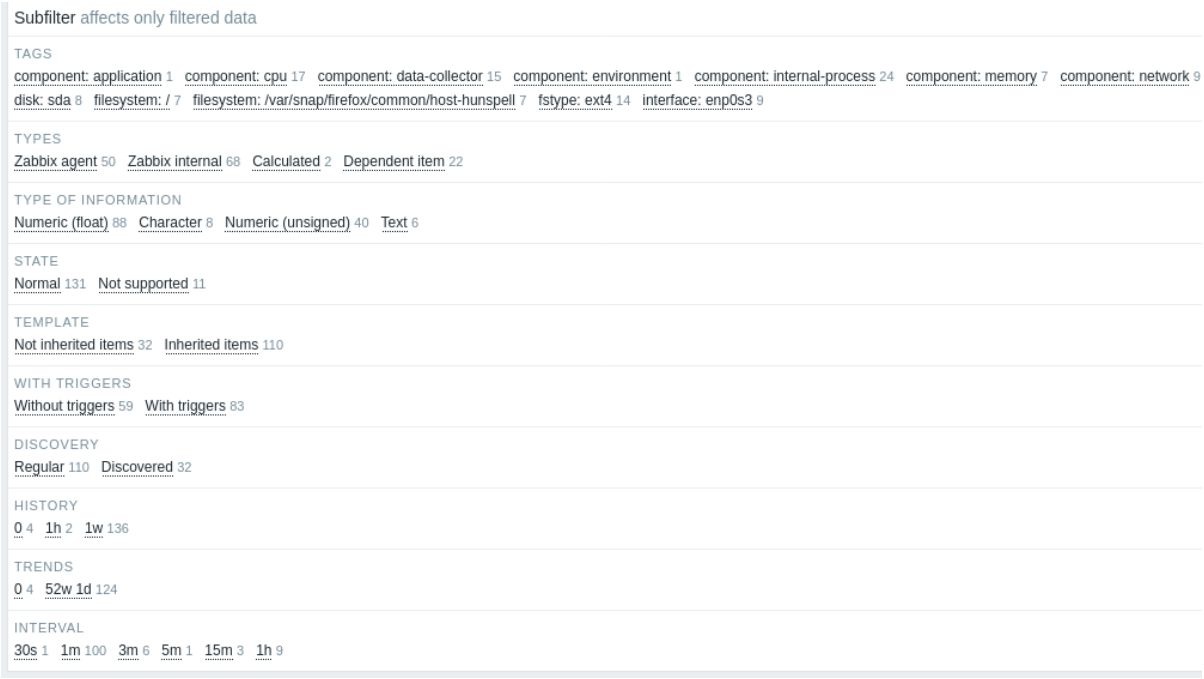
- *Enable* - change item status to *Enabled*
- *Disable* - change item status to *Disabled*
- *Execute now* - execute a check for new item values immediately. Supported for **passive** checks only (see more details). Note that when checking for values immediately, configuration cache is not updated, thus the values will not reflect very recent changes to item configuration.
- *Clear history and trends* - delete history and trend data for items.
- *Copy* - copy the items to other hosts or templates.
- *Mass update* - update several properties for a number of items at once.
- *Delete* - delete the items.

To use these options, mark the checkboxes before the respective items, then click the required button.

Using filter

You can use the filter to display only the items you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the upper-right corner. Clicking it will open a filter where you can specify the desired filtering criteria.



Parameter	Description
Host groups	Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups. Host groups containing templates only cannot be selected.
Hosts	Filter by one or more hosts.
Name	Filter by item name.
Key	Filter by item key.
Value mapping	Filter by the value map used. This parameter is not displayed if the *Hosts* option is empty.
Type	Filter by item type (Zabbix agent, SNMP agent, etc.).
Type of information	Filter by type of information (Numeric unsigned, float, etc.).
History	Filter by how long item history is kept.
Trends	Filter by how long item trends are kept.
Update interval	Filter by item update interval.
Tags	Specify tags to limit the number of items displayed. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names **Equals** - include the specified tag names and values (case-sensitive) **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) **Does not exist** - exclude the specified tag names **Does not equal** - exclude the specified tag names and values (case-sensitive) **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition **Or** - enough if one condition is met
State	Filter by item state - *Normal* or *Not supported*.
Status	Filter by item status - *Enabled* or *Disabled*.
Triggers	Filter items with (or without) triggers.
Inherited	Filter items inherited (or not inherited) from a template.
Discovery	Filter items discovered (or not discovered) by low-level discovery.

Using subfilter

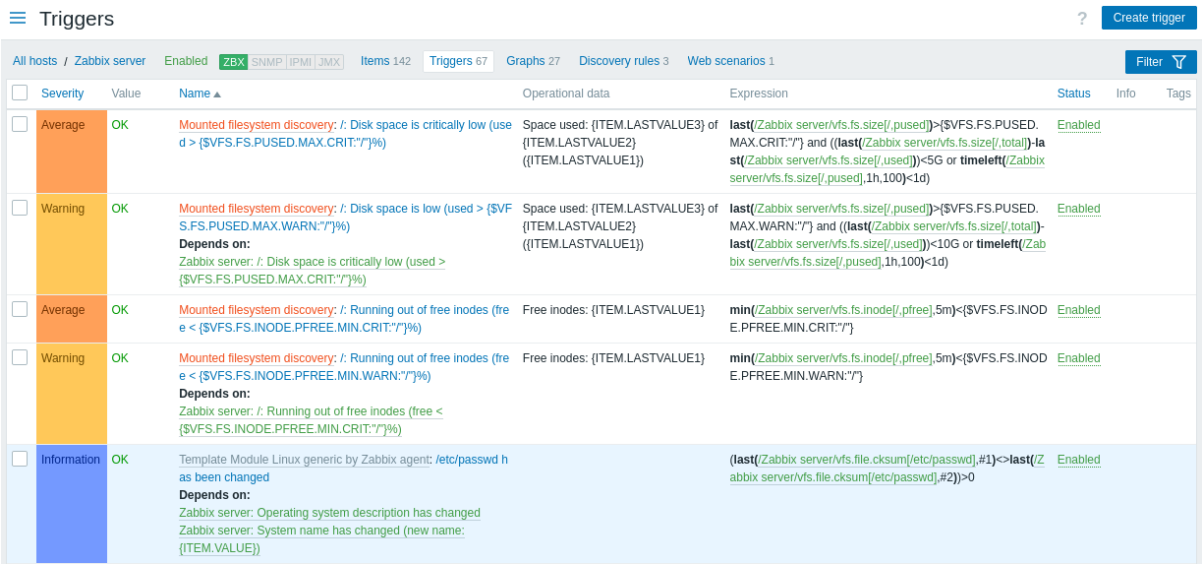
The subfilter further modification of the filtering applied by the main filter.

It contains clickable links for a quick access to related items. Items are related by common entity - tag, item type, item state, item

update interval, etc. When an entity is clicked, the entity is highlighted with a gray background, and items are immediately filtered (no need to click *Apply* in the main filter). Clicking another entity adds it to the filtered results. Clicking the entity again removes the filtering.

Subfilters are generated based on the filtered data, which is limited to 1000 records. If you want to see more records in the subfilter, you need to increase the value of *Limit for search and filter results* parameter (in *Administration > General > GUI*).

Unlike the main filter, the subfilter is updated with each table refresh request to always have up-to-date information of available filtering options and their counter numbers.



The number of entities displayed is limited to 100 horizontally. If there are more, a three-dot icon is displayed at the end; it is not clickable.

A number next to each clickable entity indicates the number of items grouped in it (based on the results of the main filter). When an entity is clicked, the numbers with other available entities are displayed with a plus sign indicating how many items may be added to the current selection. Entities without items are not displayed unless selected in the subfilter before.

Triggers

Overview

The trigger list for a host can be accessed from *Data collection > Hosts* by clicking *Triggers* for the respective host.

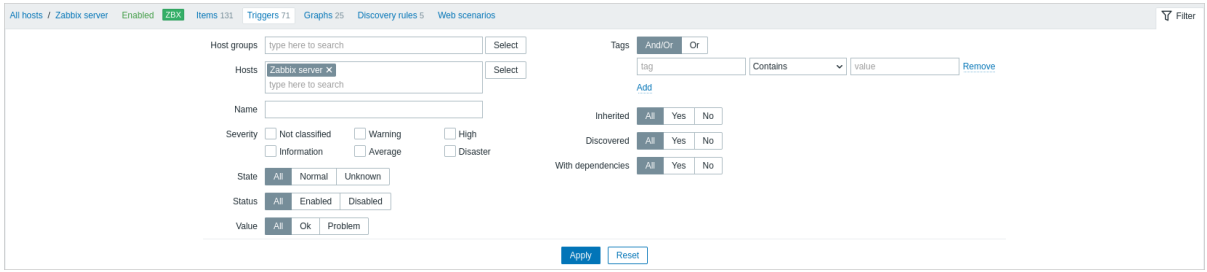
Displayed data:

Column	Description
Severity	Severity of the trigger is displayed by both name and cell background color.
Value	Trigger state is displayed: **OK** - OK state **PROBLEM** - Problem state
Host	Host of the trigger. Clicking the host name opens the host configuration form. This column is displayed only if multiple hosts or no hosts are selected in the filter.
Name	Name of the trigger, displayed as a blue link to trigger details. Clicking the trigger name link opens the trigger configuration form. If the host trigger belongs to a template, the template name is displayed before the trigger name as a gray link. Clicking the template link will open the trigger list on the template level. If the trigger has been created from a trigger prototype, its name is preceded by the low-level discovery rule name, in orange. Clicking the discovery rule name opens the trigger prototype list.
Operational data	Operational data definition of the trigger, containing arbitrary strings and macros that will resolve dynamically in *Monitoring* > *Problems*.
Expression	Trigger expression is displayed. The host-item part of the expression is displayed as a link, leading to the item configuration form.
Status	Trigger status is displayed - *Enabled*, *Disabled*, or *Unknown*. By clicking the status you can manually change it - from Enabled to Disabled (and back); from Unknown to Disabled (and back). Problems of a disabled trigger are no longer displayed in the frontend, but are not deleted. Discovered triggers that have been lost are marked with an info icon. The tooltip text provides details on their status.
Info	If everything is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description.
Tags	If a trigger contains tags, tag name and value are displayed in this column.

To configure a new trigger, click the *Create trigger* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



- *Enable* - change trigger status to *Enabled*.
- *Disable* - change trigger status to *Disabled*.
- *Copy* - copy the triggers to other hosts or templates.
- *Mass update* - update several properties for a number of triggers at once.
- *Delete* - delete the triggers.

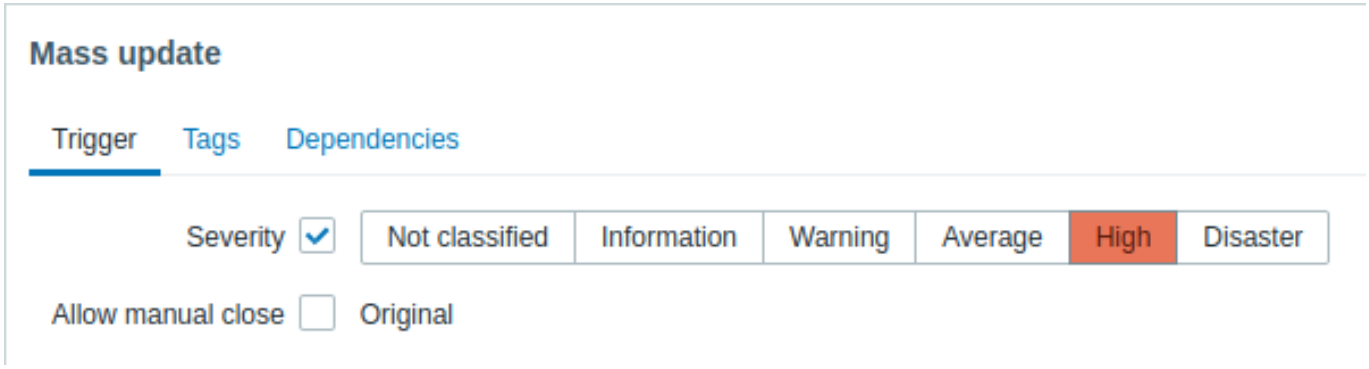
To use these options, mark the checkboxes before the respective triggers, then click the required button.

Using filter

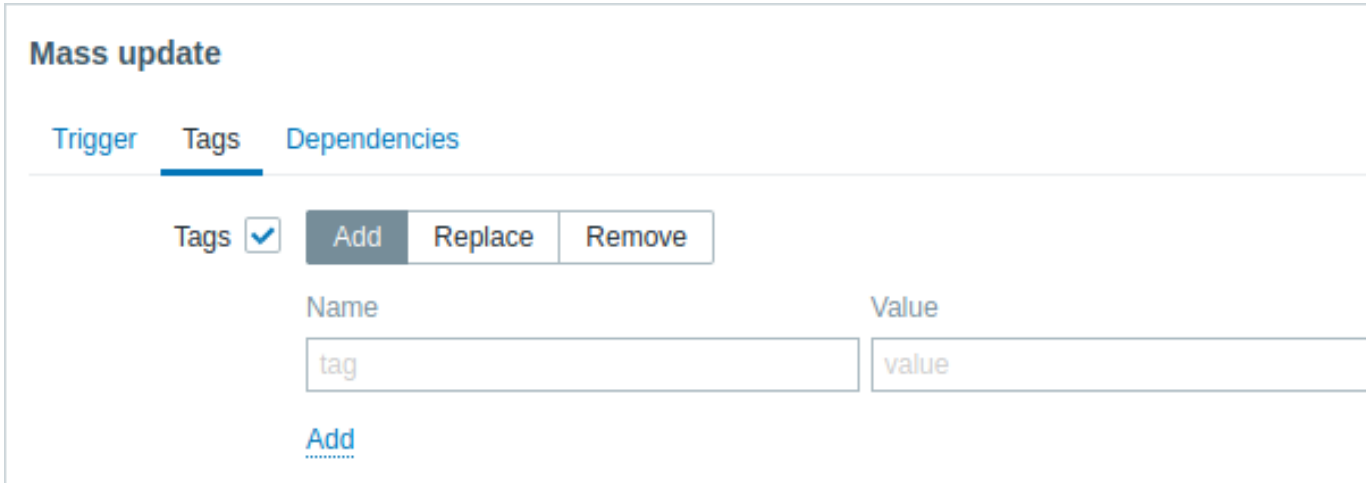
You can use the filter to display only the triggers you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* icon is available at the upper-right corner. Clicking it will open a filter where you can specify the desired filtering criteria.

Parameter	Description
Host groups	Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups. Host groups containing templates only cannot be selected.
Hosts	Filter by one or more hosts. If host groups are already selected above, host selection is limited to those groups.
Name	Filter by trigger name.



Parameter	Description
Severity	Select to filter by one or several trigger severities.
State	Filter by trigger expression state (Normal/Unknown).
Status	Filter by trigger activation status (Enabled/Disabled).
Value	Filter by trigger value.
Tags	Filter by trigger tag name and value. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names **Equals** - include the specified tag names and values (case-sensitive) **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive) **Does not exist** - exclude the specified tag names **Does not equal** - exclude the specified tag names and values (case-sensitive) **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive) There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition **Or** - enough if one condition is met Macros and macro functions are supported both in tag name and tag value fields.
Inherited	Filter triggers inherited (or not inherited) from a template.
Discovered	Filter triggers discovered (or not discovered) by low-level discovery.
With dependencies	Filter triggers with (or without) dependencies.

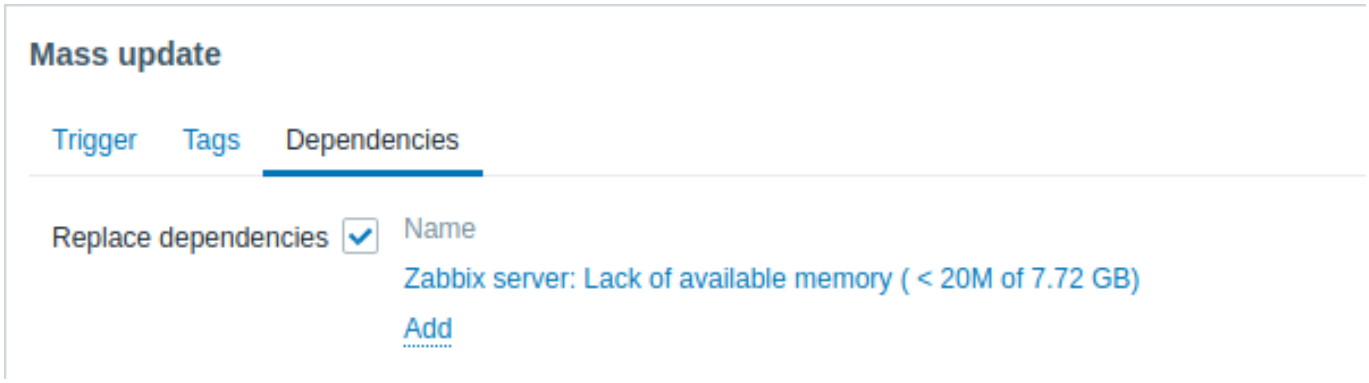


Using mass update

With mass update you may change some attribute for a number of triggers at once, saving you the need to open each individual trigger for editing.

To mass-update some triggers, do the following:

- Mark the checkboxes of the triggers you want to update in the list
- Click *Mass update* below the list
- Navigate to the tab with required attributes (*Trigger*, *Tags* or *Dependencies*)
- Mark the checkboxes of any attribute to update

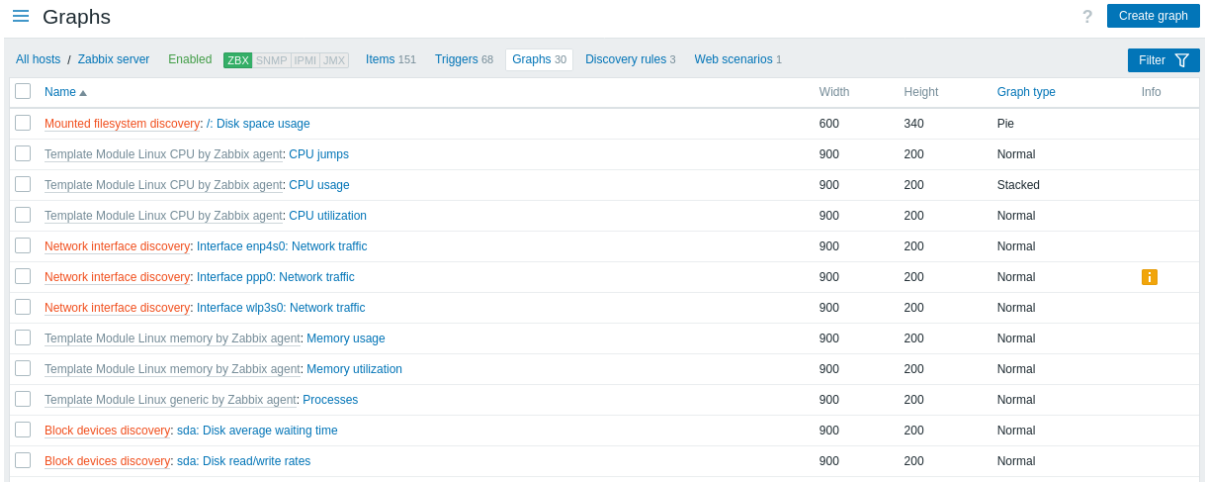


The following options are available when selecting the respective button for tag update:

- *Add* - add new tags for the triggers;
- *Replace* - remove any existing tags from the trigger and replace them with the one(s) specified below;
- *Remove* - remove specified tags from triggers.

Note that tags with the same name but different values are not considered 'duplicates' and can be added to the same trigger.

Replace dependencies - will remove any existing dependencies from the trigger and replace them with the one(s) specified.



Click *Update* to apply the changes.

Graphs

Overview

The custom graph list for a host can be accessed from *Data collection* > *Hosts* by clicking *Graphs* for the respective host.

A list of existing graphs is displayed.

Displayed data:

Column	Description
Host	Host of the graph. Clicking the host name opens the host configuration form. This column is displayed only if multiple hosts or no hosts are selected in the filter.
Name	Name of the custom graph, displayed as a blue link to graph details. Clicking the graph name link opens the graph configuration form. If the host graph belongs to a template, the template name is displayed before the graph name as a gray link. Clicking the template link will open the graph list on the template level. If the graph has been created from a graph prototype, its name is preceded by the low-level discovery rule name, in orange. Clicking the discovery rule name opens the graph prototype list.
Width	Graph width is displayed.
Height	Graph height is displayed.
Graph type	Graph type is displayed - *Normal*, *Stacked*, *Pie* or *Exploded*.

Column	Description
Info	If the graph is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description.

To configure a new graph, click the *Create graph* button at the upper-right corner.

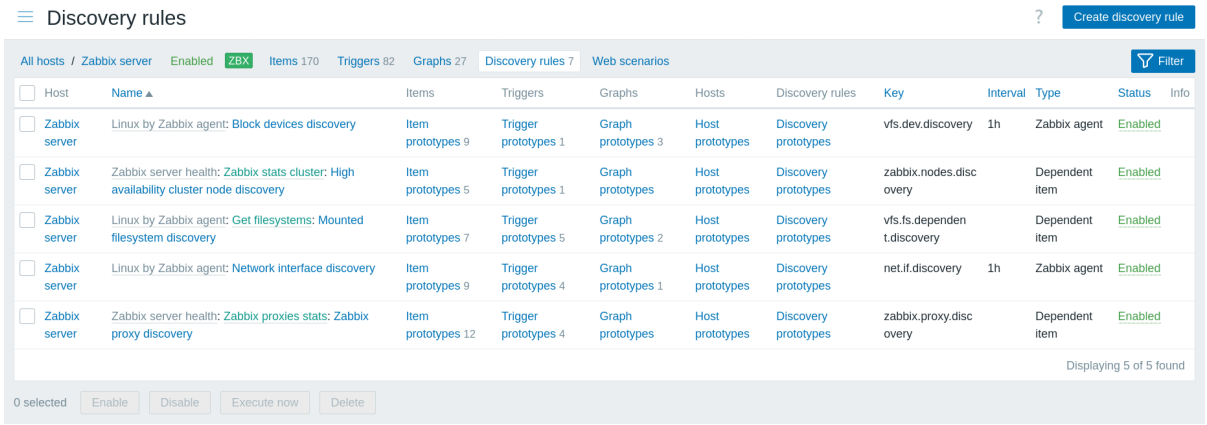
Mass editing options

Buttons below the list offer some mass-editing options:

- *Copy* - copy the graphs to other hosts or templates
- *Delete* - delete the graphs

To use these options, mark the checkboxes before the respective graphs, then click the required button.

Using filter



You can filter graphs by host group and host. For better search performance, data is searched with macros unresolved.

Discovery rules

Overview

The list of low-level discovery rules for a host can be accessed from *Data collection* > *Hosts* by clicking *Discovery* for the respective host.

A list of existing low-level discovery rules is displayed. It is also possible to see all discovery rules independently of the host, or all discovery rules of a specific host group by changing the filter settings.

Displayed data:

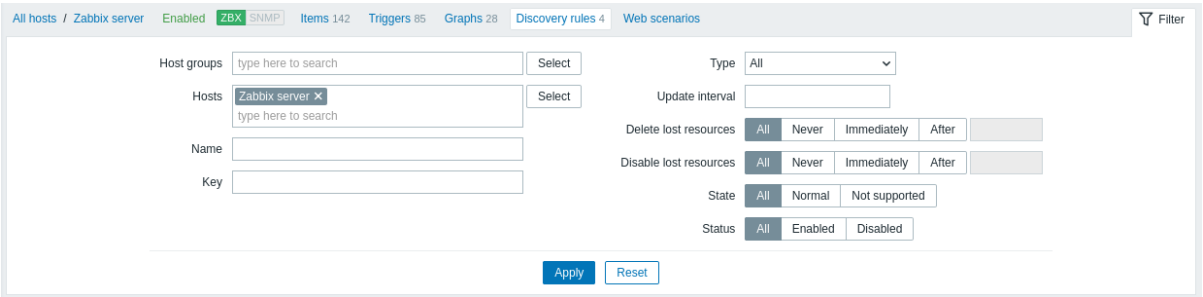
Column	Description
Host	The visible host name is displayed. Clicking the host name opens the host configuration form. In the absence of a visible host name, the technical host name is displayed.
Name	Name of the rule, displayed as a blue link. Clicking the rule name opens the low-level discovery rule configuration form. If the discovery rule belongs to a template, the template name is displayed before the rule name as a gray link. Clicking the template link opens the rule list on the template level.
Items	A link to the list of item prototypes is displayed. The number of existing item prototypes is displayed in gray.
Triggers	A link to the list of trigger prototypes is displayed. The number of existing trigger prototypes is displayed in gray.
Graphs	A link to the list of graph prototypes is displayed. The number of existing graph prototypes is displayed in gray.
Hosts	A link to the list of host prototypes is displayed. The number of existing host prototypes is displayed in gray.
Key	The item key used for discovery is displayed.

Column	Description
Interval	The frequency of performing discovery is displayed. *Note* that discovery can also be performed immediately by pushing the *Execute now* button below the list.
Type	The item type used for discovery is displayed (Zabbix agent, SNMP agent, etc).
Status	Discovery rule status is displayed - *Enabled*, *Disabled* or *Not supported*. By clicking the status you can change it - from Enabled to Disabled (and back); from Not supported to Disabled (and back).
Info	If everything is fine, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description.

To configure a new low-level discovery rule, click the *Create discovery rule* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



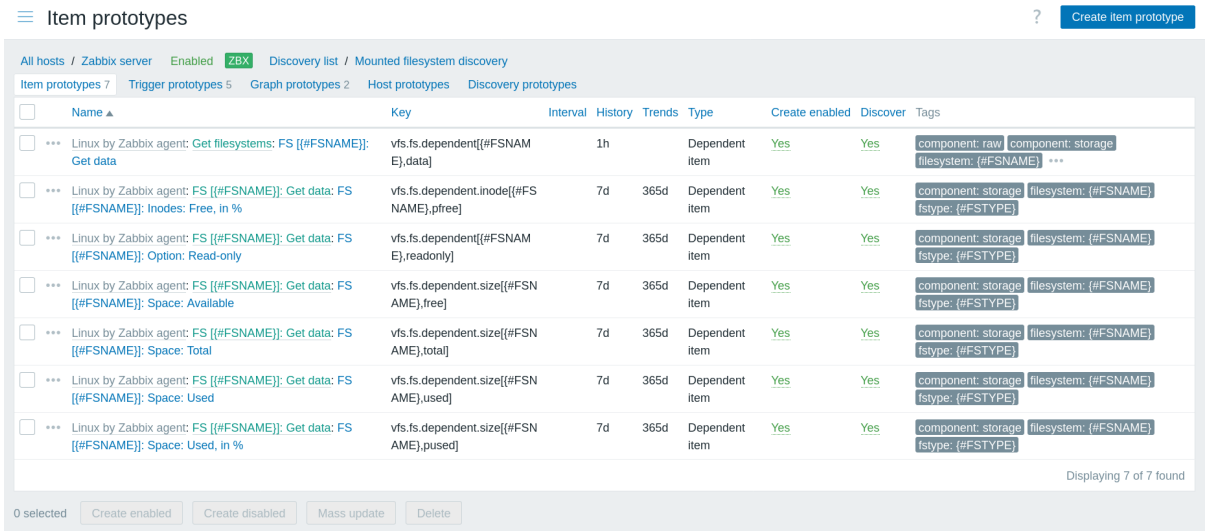
- *Enable* - change the low-level discovery rule status to *Enabled*.
- *Disable* - change the low-level discovery rule status to *Disabled*.
- *Execute now* - perform discovery based on the discovery rules immediately. See more details. Note that when performing discovery immediately, the configuration cache is not updated, thus the result will not reflect very recent changes to discovery rule configuration.
- *Delete* - delete the low-level discovery rules.

To use these options, mark the checkboxes before the respective discovery rules, then click the required button.

Using filter

You can use the filter to display only the discovery rules you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of discovery rules. If you click it, a filter becomes available where you can filter discovery rules by host group, host, name, item key, item type, and other parameters.



Parameter	Description
Host groups	Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups.
Hosts	Filter by one or more hosts.
Name	Filter by discovery rule name.
Key	Filter by discovery item key.
Type	Filter by discovery item type.
Update interval	Filter by update interval. Not available for Zabbix trapper and dependent items.
Delete lost resources	Filter by *Delete lost resources* period.
Disable lost resources	Filter by *Disable lost resources* period.
SNMP OID	Filter by SNMP OID. Only available if *SNMP agent* is selected as type.
State	Filter by discovery rule state (All/Normal/Not supported).
Status	Filter by discovery rule status (All/Enabled/Disabled).

Item prototypes

Overview

In this section the item prototypes of a low-level discovery rule on the host are displayed. Item prototypes are the basis of real host items that are created during low-level discovery.

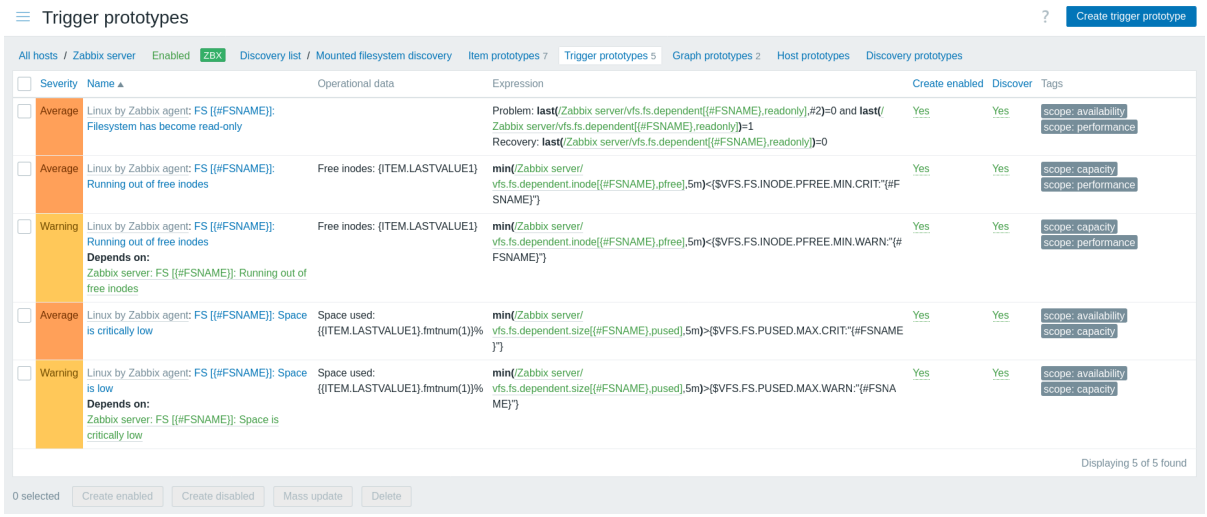
Displayed data:

Column	Description
Name	Name of the item prototype, displayed as a blue link. Clicking the name opens the item prototype configuration form. If the item prototype belongs to a template, the template name is displayed before the rule name as a gray link. Clicking the template link opens the item prototype list on the template level. If the item prototype is of the ”Dependent item” type, the master item name is displayed before the item prototype name in green.
Key	Key of the item prototype is displayed.
Interval	Frequency of the check is displayed.
History	How many days to keep item data history is displayed.
Trends	How many days to keep item trends history is displayed.
Type	Type of the item prototype is displayed (Zabbix agent, SNMP agent, simple check, etc).
Create enabled	Create the item based on this prototype as: **Yes** - enabled **No** - disabled. You can switch between ’Yes’ and ’No’ by clicking them.
Discover	Discover the item based on this prototype: **Yes** - discover **No** - do not discover. You can switch between ’Yes’ and ’No’ by clicking them.
Tags	Tags of the item prototype are displayed.

To configure a new item prototype, click the *Create item prototype* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



- *Create enabled* - create these items as *Enabled*
- *Create disabled* - create these items as *Disabled*
- *Mass update* - mass update these item prototypes
- *Delete* - delete these item prototypes

To use these options, mark the checkboxes before the respective item prototypes, then click the required button.

Trigger prototypes

Overview

In this section the trigger prototypes of a low-level discovery rule on the host are displayed. Trigger prototypes are the basis of real host triggers that are created during low-level discovery.

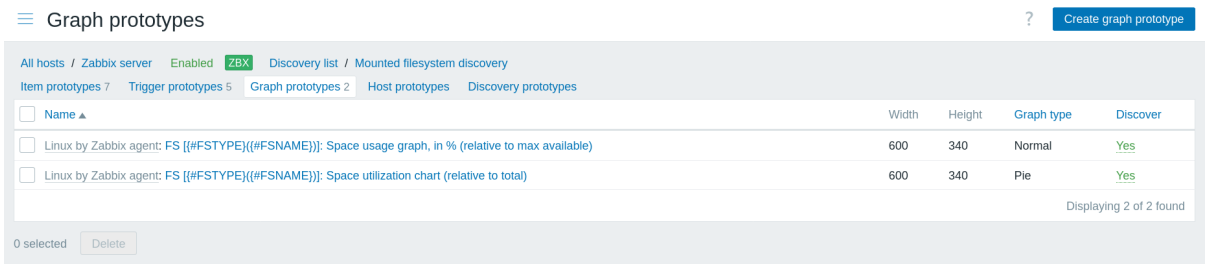
Displayed data:

Column	Description
Name	Name of the trigger prototype, displayed as a blue link. Clicking the name opens the trigger prototype configuration form. If the trigger prototype belongs to a linked template, the template name is displayed before the trigger name as a gray link. Clicking the template link opens the trigger prototype list on the linked template level.
Operational data	Format of the operational data of the trigger is displayed, containing arbitrary strings and macros that will resolve dynamically in *Monitoring* > *Problems*.
Create enabled	Create the trigger based on this prototype as: **Yes** - enabled **No** - disabled. You can switch between 'Yes' and 'No' by clicking them.
Discover	Discover the trigger based on this prototype: **Yes** - discover **No** - do not discover. You can switch between 'Yes' and 'No' by clicking them.
Tags	Tags of the trigger prototype are displayed.

To configure a new trigger prototype, click the *Create trigger prototype* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



- *Create enabled* - create these triggers as *Enabled*
- *Create disabled* - create these triggers as *Disabled*
- *Mass update* - mass update these trigger prototypes
- *Delete* - delete these trigger prototypes

To use these options, mark the checkboxes before the respective trigger prototypes, then click the required button.

Graph prototypes

Overview

In this section the graph prototypes of a low-level discovery rule on the host are displayed. Graph prototypes are the basis of real host graphs that are created during low-level discovery.

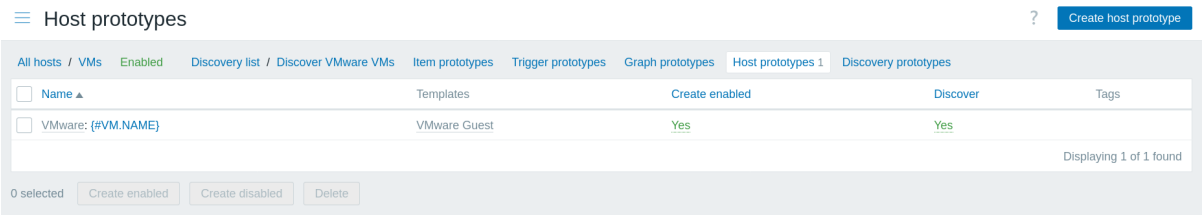
Displayed data:

Column	Description
Name	Name of the graph prototype, displayed as a blue link. Clicking the name opens the graph prototype configuration form. If the graph prototype belongs to a linked template, the template name is displayed before the graph name as a gray link. Clicking the template link opens the graph prototype list on the linked template level.
Width	Width of the graph prototype is displayed.
Height	Height of the graph prototype is displayed.
Type	Type of the graph prototype is displayed - *Normal*, *Stacked*, *Pie* or *Exploded*.
Discover	Discover the graph based on this prototype: **Yes** - discover **No** - do not discover. You can switch between 'Yes' and 'No' by clicking them.

To configure a new graph prototype, click the *Create graph prototype* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



- *Delete* - delete these graph prototypes

To use these options, mark the checkboxes before the respective graph prototypes, then click the required button.

Host prototypes

Overview

In this section the host prototypes of a low-level discovery rule on the host are displayed. Host prototypes are the basis of real hosts that are created during low-level discovery.

Displayed data:

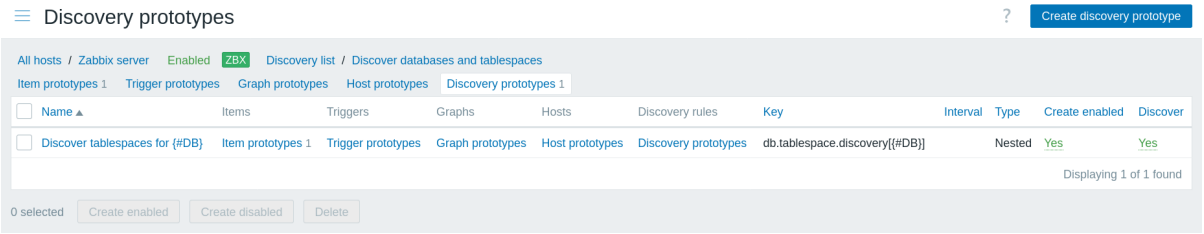
Column	Description
Name	Name of the host prototype, displayed as a blue link. Clicking the name opens the host prototype configuration form. If the host prototype belongs to a linked template, the template name is displayed before the host name as a gray link. Clicking the template link opens the host prototype list on the linked template level.
Templates	Templates of the host prototype are displayed.
Create enabled	Create the host based on this prototype as: **Yes** - enabled **No** - disabled. You can switch between 'Yes' and 'No' by clicking them.
Discover	Discover the host based on this prototype: **Yes** - discover **No** - do not discover. You can switch between 'Yes' and 'No' by clicking them.
Tags	Tags of the host prototype are displayed.

To configure a new host prototype, click the *Create host prototype* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Create enabled* - create these hosts as *Enabled*



- *Create disabled* - create these hosts as *Disabled*
- *Delete* - delete these host prototypes

To use these options, mark the checkboxes before the respective host prototypes, then click the required button.

Discovery prototypes

Overview

In this section the discovery prototypes of a low-level discovery rule on the host are displayed. Discovery prototypes are nested discovery rules of the parent discovery rule.

Displayed data:

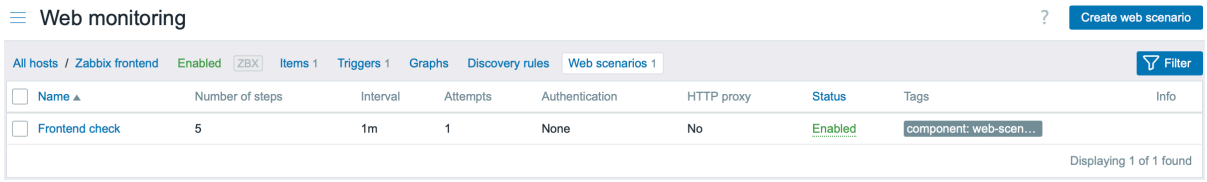
Column	Description
Name	Name of the discovery prototype, displayed as a blue link. Clicking the name opens the discovery prototype configuration form. If the discovery prototype belongs to a linked template, the template name is displayed before the host name as a gray link. Clicking the template link opens the discovery prototype list on the linked template level.
Items	A link to the list of item prototypes is displayed. The number of existing item prototypes is displayed in gray.
Triggers	A link to the list of trigger prototypes is displayed. The number of existing trigger prototypes is displayed in gray.
Graphs	A link to the list of graph prototypes is displayed. The number of existing graph prototypes is displayed in gray.
Hosts	A link to the list of host prototypes is displayed. The number of existing host prototypes is displayed in gray.
Discovery rules	A link to the list of discovery prototypes is displayed. The number of existing discovery prototypes is displayed in gray.
Key	The item key used for discovery is displayed.
Interval	The frequency of performing discovery is displayed. *Note* that discovery can also be performed immediately by pushing the *Execute now* button below the list.
Type	The item type used for discovery is displayed (Zabbix agent, SNMP agent, etc).
Create enabled	Discovery prototype creation status is displayed - create enabled (*Yes*) or create disabled (*No*). By clicking the status you can change it - from Yes to No (and back).
Discover	Discovery prototype discovery status is displayed - discover (*Yes*) or do not discover (*No*). By clicking the status you can change it - from Yes to No (and back).

To configure a new discovery prototype, click the *Create discovery prototype* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

- *Create enabled* - create these discovery prototypes as *Enabled*
- *Create disabled* - create these discovery prototypes as *Disabled*
- *Delete* - delete these discovery prototypes



To use these options, mark the checkboxes before the respective discovery prototypes, then click the required button.

Web scenarios

Overview

The web scenario list for a host can be accessed from *Data collection* > *Hosts* by clicking *Web* for the respective host.

A list of existing web scenarios is displayed.

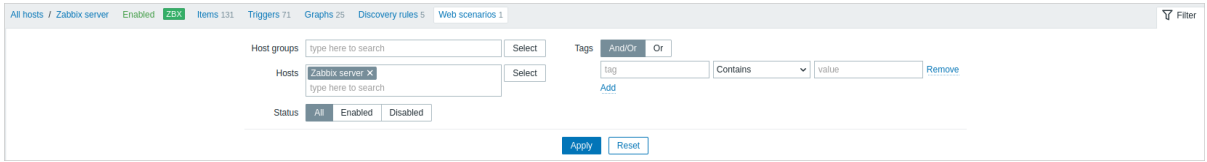
Displayed data:

Column	Description
Name	Name of the web scenario. Clicking the web scenario name opens the web scenario configuration form. If the host web scenario belongs to a template, the template name is displayed before the web scenario name as a gray link. Clicking the template link will open the web scenario list on the template level.
Number of steps	The number of steps the scenario contains.
Update interval	How often the scenario is performed.
Attempts	How many attempts for executing web scenario steps are performed.
Authentication	Authentication method is displayed - Basic, NTLM, Kerberos, Digest, or None.
HTTP proxy	Displays HTTP proxy or 'No' if not used.
Status	Web scenario status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it.
Tags	Web scenario tags are displayed. Up to three tags (name:value pairs) can be displayed. If there are more tags, a "..." link is displayed that allows all tags to be viewed on mouseover.
Info	If everything is working correctly, no icon is displayed in this column. In case of errors, a square icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description.

To configure a new web scenario, click the *Create web scenario* button at the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



- *Enable* - change the scenario status to *Enabled*
- *Disable* - change the scenario status to *Disabled*
- *Clear history and trends* - clear history and trend data for the scenarios
- *Delete* - delete the web scenarios

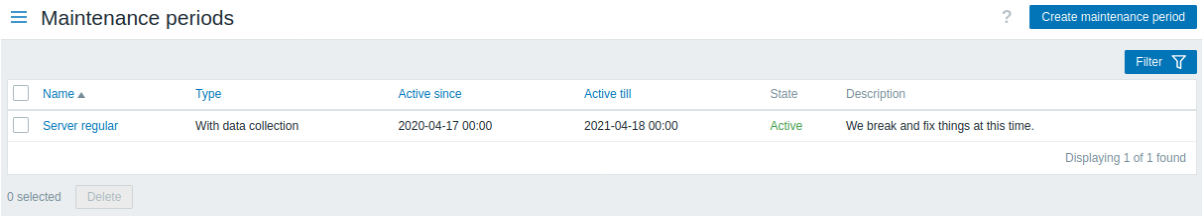
To use these options, mark the checkboxes before the respective web scenarios, then click the required button.

Using filter

You can use the filter to display only the scenarios you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of web scenarios. Clicking it will open a filter where you can specify the desired filtering criteria.

Parameter	Description
Host groups	Filter by one or more host groups. Specifying a parent host group implicitly selects all nested host groups.
Hosts	Filter by one or more hosts. If host groups are already selected above, host selection is limited to those groups.
Status	Filter by web scenario status.



Parameter	Description
Tags	Filter by web scenario tag name and value. It is possible to include as well as exclude specific tags and tag values. Several conditions can be set. Tag name matching is always case-sensitive. There are several operators available for each condition: **Exists** - include the specified tag names; **Equals** - include the specified tag names and values (case-sensitive); **Contains** - include the specified tag names where the tag values contain the entered string (substring match, case-insensitive); **Does not exist** - exclude the specified tag names; **Does not equal** - exclude the specified tag names and values (case-sensitive); **Does not contain** - exclude the specified tag names where the tag values contain the entered string (substring match, case-insensitive). There are two calculation types for conditions: **And/Or** - all conditions must be met, conditions having the same tag name will be grouped by the Or condition; **Or** - enough if one condition is met.

Maintenance

Overview

In the *Data collection* > *Maintenance* section users can configure and maintain maintenance periods for hosts.

A listing of existing maintenance periods with their details is displayed.

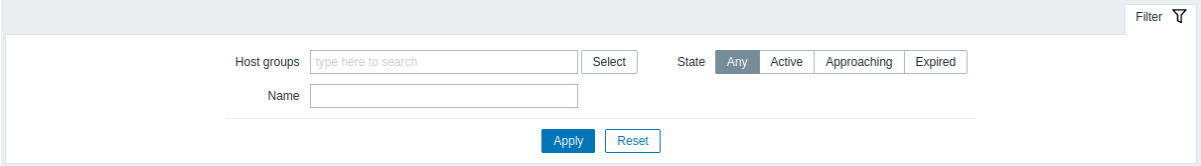
Displayed data:

Column	Description
Name	Name of the maintenance period. Clicking the maintenance period name opens the maintenance period configuration form.
Type	The type of maintenance is displayed: *With data collection* or *No data collection*
Active since	The date and time when executing maintenance periods becomes active. Note: This time does not activate a maintenance period; maintenance periods need to be set separately.
Active till	The date and time when executing maintenance periods stops being active.
State	The state of the maintenance period: **Upcoming** - will become active soon **Active** - is active **Expired** - is not active any more
Description	Description of the maintenance period is displayed.

To configure a new maintenance period, click the *Create maintenance period* button in the upper-right corner.

Mass editing options

A button below the list offers one mass-editing option:



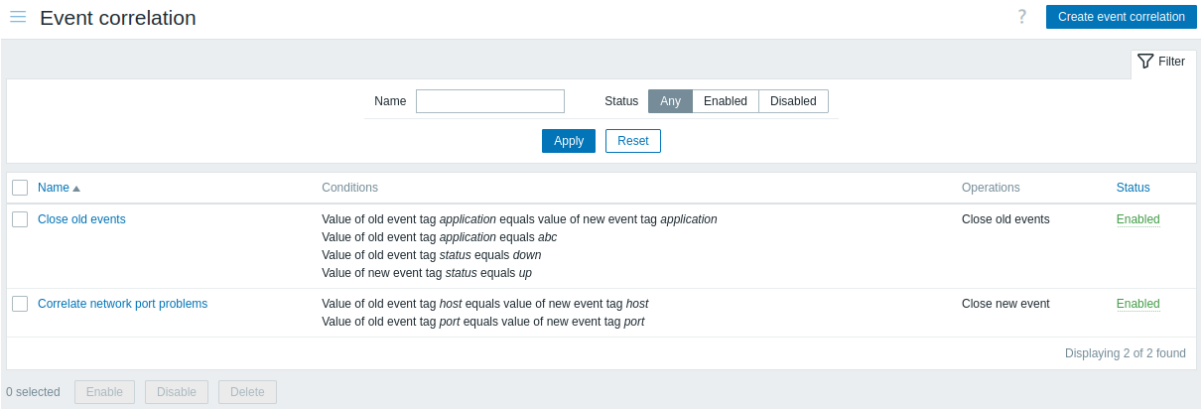
- *Delete* - delete the maintenance periods

To use this option, mark the checkboxes before the respective maintenance periods and click *Delete*.

Using filter

You can use the filter to display only the maintenance periods you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of maintenance periods. If you click it, a filter becomes available where you can filter maintenance periods by host group, name and state.



Calculation of queues during maintenance

Attention:
The Zabbix proxy is not aware of maintenance periods; see Calculation of queues during maintenance for details.

Event correlation

Overview

In the *Data collection* > *Event correlation* section users can configure and maintain global correlation rules for Zabbix events.

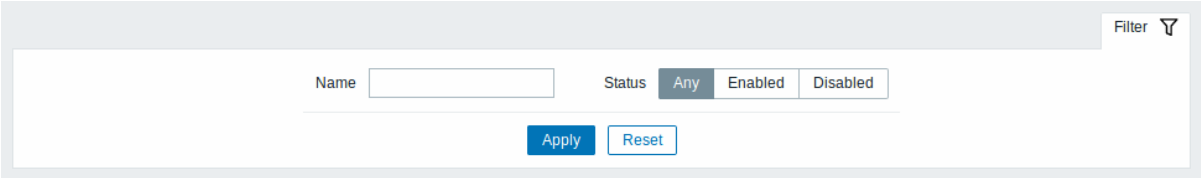
Displayed data:

Column	Description
Name	Name of the correlation rule. Clicking the correlation rule name opens the event correlation configuration form.
Conditions	Correlation rule conditions are displayed.
Operations	Correlation rule operations are displayed.
Status	Correlation rule status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it.

To configure a new correlation rule, click the *Create event correlation* button in the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



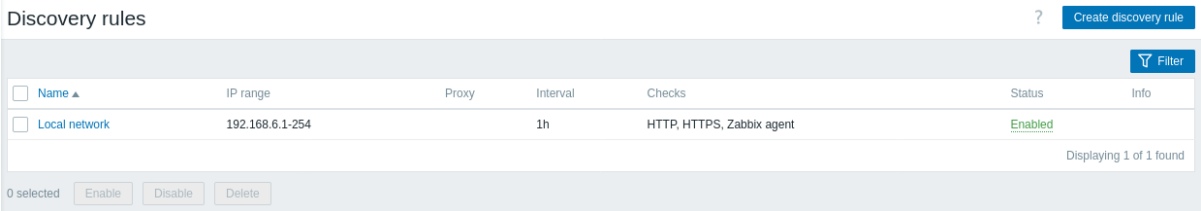
- *Enable* - change the correlation rule status to *Enabled*
- *Disable* - change the correlation rule status to *Disabled*
- *Delete* - delete the correlation rules

To use these options, mark the checkboxes before the respective correlation rules, then click the required button.

Using filter

You can use the filter to display only the correlation rules you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of correlation rules. If you click it, a filter becomes available where you can filter correlation rules by name and status.



Discovery

Overview

In the *Data collection* > *Discovery* section users can configure and maintain discovery rules.

A listing of existing discovery rules with their details is displayed.

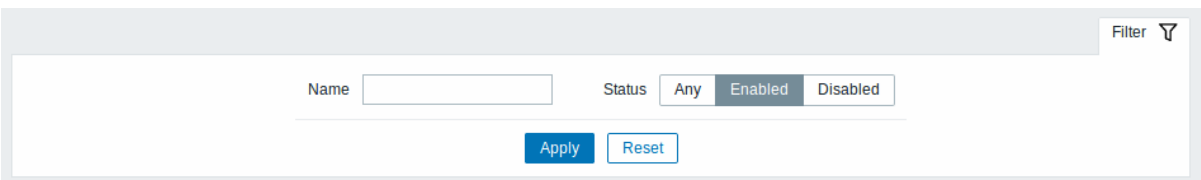
Displayed data:

Column	Description
Name	Name of the discovery rule. Clicking the discovery rule name opens the discovery rule configuration form.
IP range	The range of IP addresses to use for network scanning is displayed.
Proxy	The proxy name is displayed, if discovery is performed by the proxy.
Interval	The frequency of performing discovery displayed.
Checks	The types of checks used for discovery are displayed.
Status	The discovery rule status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it.
Info	If everything is working correctly, nothing is displayed in this column. In case of errors, a red info icon with the letter "i" is displayed. Hover over the icon to see a tooltip with the error description.

To configure a new discovery rule, click the *Create discovery rule* button in the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



- *Enable* - change the discovery rule status to *Enabled*
- *Disable* - change the discovery rule status to *Disabled*
- *Delete* - delete the discovery rules

To use these options, mark the checkboxes before the respective discovery rules, then click the required button.

Using filter

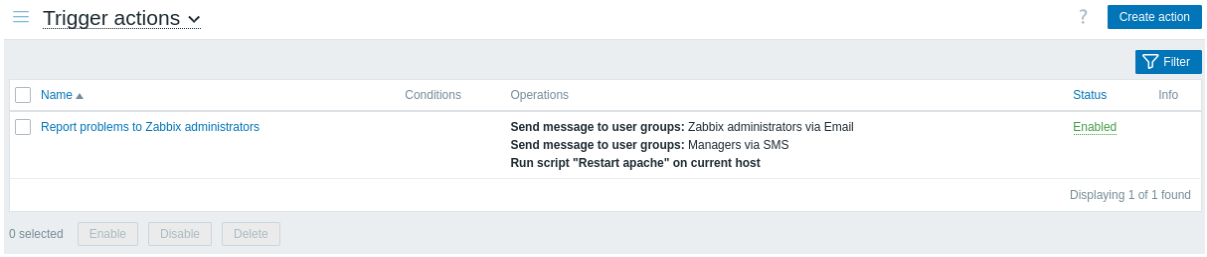
You can use the filter to display only the discovery rules you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of discovery rules. If you click it, a filter becomes available where you can filter discovery rules by name and status.

Alerts

Overview

This menu features sections that are related to configuring alerts in Zabbix.



Actions

Overview

In the *Alerts* > *Actions* section users can configure and maintain actions.

The actions displayed are actions assigned to the selected event source (trigger, services, discovery, autoregistration, internal actions).

To switch to a different event source, click *Actions* in the *Alerts* menu section. It is also possible to switch between sources by using the title dropdown in the upper-left corner.

Displayed data:

Column	Description
Name	Name of the action. Clicking the action name opens the action configuration form.
Conditions	Action conditions are displayed.
Operations	Action operations are displayed. The operation list also displays the media type (email, SMS or script) used for notification as well as the name and surname (in parentheses after the username) of a notification recipient. Action operation can both be a notification or a remote command depending on the selected type of operation.
Status	Action status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it. See the Escalations section for more details as to what happens if an action is disabled during an escalation in progress.
Info	If everything is working correctly, no icon is displayed in this column. In case of errors, such as missing action operations or conditions after upgrade/low-level discovery, a warning icon is displayed. Hover over the icon to see a tooltip with the error description.

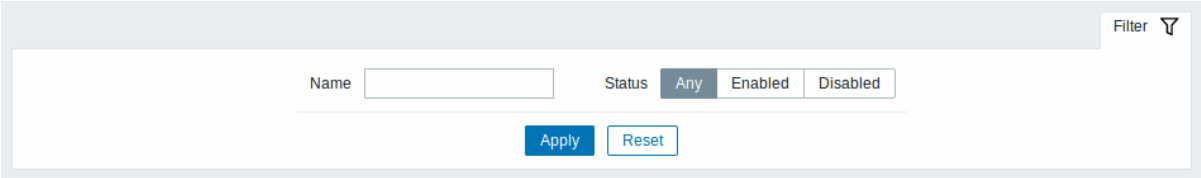
To configure a new action, click the *Create action* button in the upper-right corner.

For users without Super admin rights actions are displayed according to the permission settings. That means in some cases a user without Super admin rights isn't able to view the complete action list because of certain permission restrictions. An action is displayed to the user without Super admin rights if the following conditions are fulfilled:

- The user has read-write access to host groups, hosts, templates, and triggers in action conditions
- The user has read-write access to host groups, hosts, and templates in action operations, recovery operations, and update operations
- The user has read access to user groups and users in action operations, recovery operations, and update operations

Mass editing options

Buttons below the list offer some mass-editing options:



- *Enable* - change the action status to *Enabled*
- *Disable* - change the action status to *Disabled*
- *Delete* - delete the actions

To use these options, mark the checkboxes before the respective actions, then click the required button.

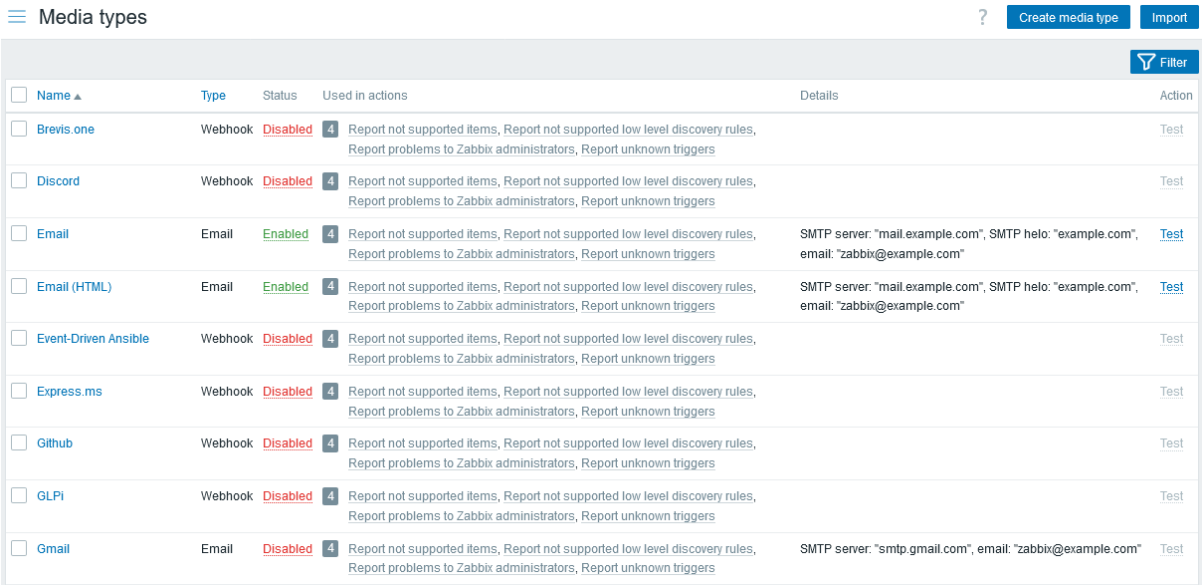
Using filter

You can use the filter to display only the actions you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of actions. If you click on it, a filter becomes available where you can filter actions by name and status.

Media types

Overview



In the *Alerts* > *Media types* section users can configure and maintain media type information.

This menu is available to SuperAdmin user type users only.

Media type information contains general instructions for using a medium as delivery channel for notifications. Specific details, such as the individual email addresses to send a notification to are kept with individual users.

A listing of existing media types with their details is displayed.

Note:
If delivery methods (*Email*, *SMS*, *Webhook*, *Script*, or *Push*) are specified in the `$ZBX_FEATURE_FLAGS['media_type_denylist']` feature flag in the frontend configuration file, the corresponding pre-configured media types are disabled in this section.

Displayed data:

Column	Description
Name	Name of the media type. Clicking the name opens the media type configuration form.
Type	Type of the media (email, SMS, etc) is displayed.
Status	Media type status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it.
Used in actions	Actions where the media type is used are displayed, preceded by the total number of these actions. Clicking the action name opens the action configuration form. If the user has no permissions to the action, the name is not clickable.
Details	Detailed information of the media type is displayed.

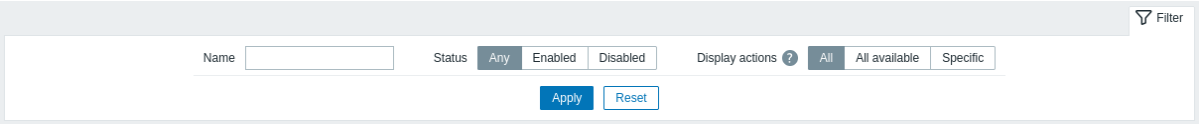
Column	Description
Actions	The following action is available: **Test** - click to open a testing form where you can enter media type parameters (e.g., a recipient address with test subject and body) and send a test message to verify that the configured media type works. See also: Media type testing.

To configure a new media type, click the *Create media type* button in the upper-right corner.

To import a media type, click the *Import* button in the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



- *Enable* - change the media type status to *Enabled*
- *Disable* - change the media type status to *Disabled*
- *Export* - export the media types to a YAML, XML or JSON file
- *Delete* - delete the media types

To use these options, mark the checkboxes before the respective media types, then click the required button.

Using filter

You can use the filter to display only the media types you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of media types. If you click it, a filter becomes available where you can filter media types by name and status. Additionally, you can use the filter to display actions in the *Used in actions* column based on the scope of their media type usage (defined by the *Send to media type* parameter in action operation details).

Scripts

Overview

In the *Alerts* > *Scripts* section user-defined global scripts can be configured and maintained.

This menu is available to SuperAdmin user type users only.

Global scripts, depending on the configured scope and also user permissions, are available for execution:

- From the host menu in various frontend locations (*Dashboard*, *Problems*, *Latest data*, *Maps*, etc.).
- From the event menu.
- Can be run as an action operation.

The scripts are executed by Zabbix agent, Zabbix server (proxy) or Zabbix server only. See also Command execution.

Remote commands are disabled by default on both the Zabbix agent and Zabbix proxy. They can be enabled as follows:

- For remote commands executed by Zabbix agent, add an `AllowKey=system.run[<command>,*]` or `AllowKeyRegexp=^system\.r` parameter for each allowed command in the agent configuration, where `*` matches either execution mode (`wait` or `nowait`).
- For remote commands executed by Zabbix proxy, set the `EnableRemoteCommands` parameter to `1` in the proxy configuration. Note that remote commands do not need to be enabled on Zabbix proxy when they are executed by Zabbix agent on a host monitored by the proxy.

Attention:
Do not use `AllowKey=system.run[*]` or `AllowKeyRegexp=^system\.run\[.*\]$` unless necessary, as it allows the execution of any command on the host. For security reasons, it is recommended to allow only exact commands, while `system.run[*]` is denied by default (`DenyKey=system.run[*]`).

Global script execution on Zabbix server can be disabled by setting `EnableGlobalScripts=0` in server configuration. For new installations starting with Zabbix 7.0, global script execution on Zabbix server is disabled by default.

A listing of existing scripts with their details is displayed.

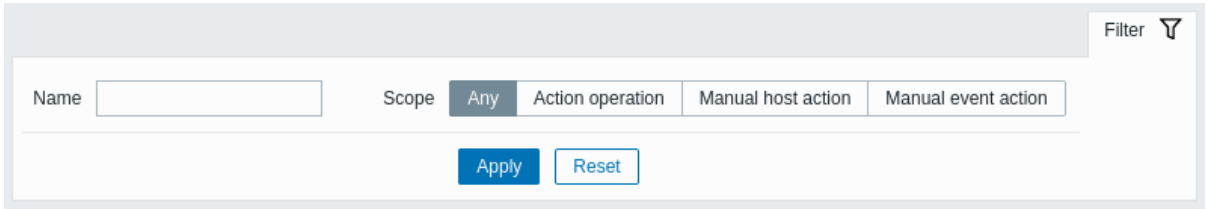
Displayed data:

Column	Description
Name	Name of the script. Clicking the script name opens the script configuration form.
Scope	Scope of the script - action operation, manual host action or manual event action. This setting determines where the script is available - in remote commands of action operations, from the host menu, or from the event menu respectively.
Used in actions	All actions where the script is used are displayed, preceded by the total number of these actions. Clicking the action name opens the action configuration form. If the user has no permissions to the action, the name is not clickable.
Type	Script type is displayed - *URL*, *Webhook*, *Script*, *SSH*, *Telnet* or *IPMI* command.
Execute on	It is displayed whether the script will be executed on Zabbix agent, Zabbix proxy or server, or Zabbix server only.
Commands	All commands to be executed within the script are displayed. Nothing is displayed here for webhooks.
User group	The user group that the script is available to is displayed (or *All* for all user groups).
Host group	The host group that the script is available for is displayed (or *All* for all host groups).
Host access	The permission level for the host group is displayed - *Read* or *Write*. Only users with the required permission level will have access to executing the script.

To configure a new script, click the *Create script* button in the upper-right corner.

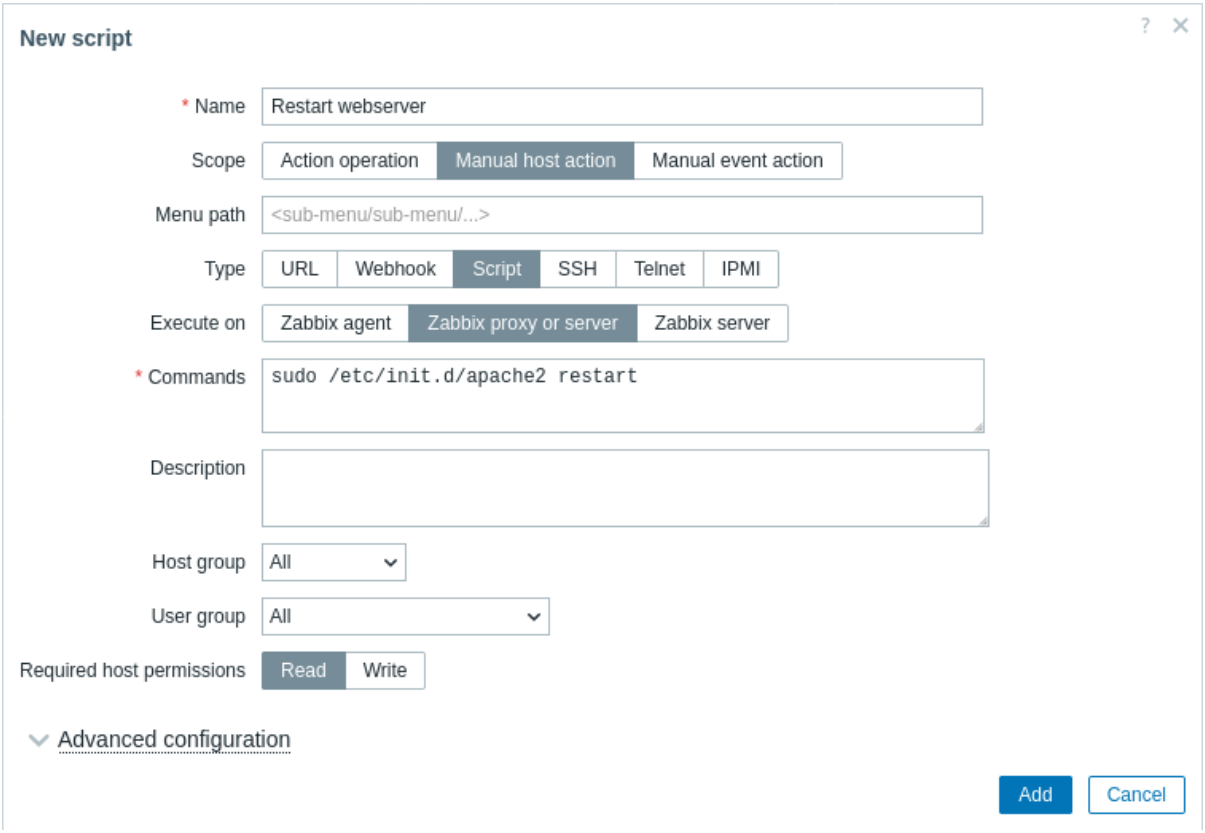
Mass editing options

A button below the list offers one mass-editing option:



- *Delete* - delete the scripts

To use this option, mark the checkboxes before the respective scripts and click *Delete*.



Using filter

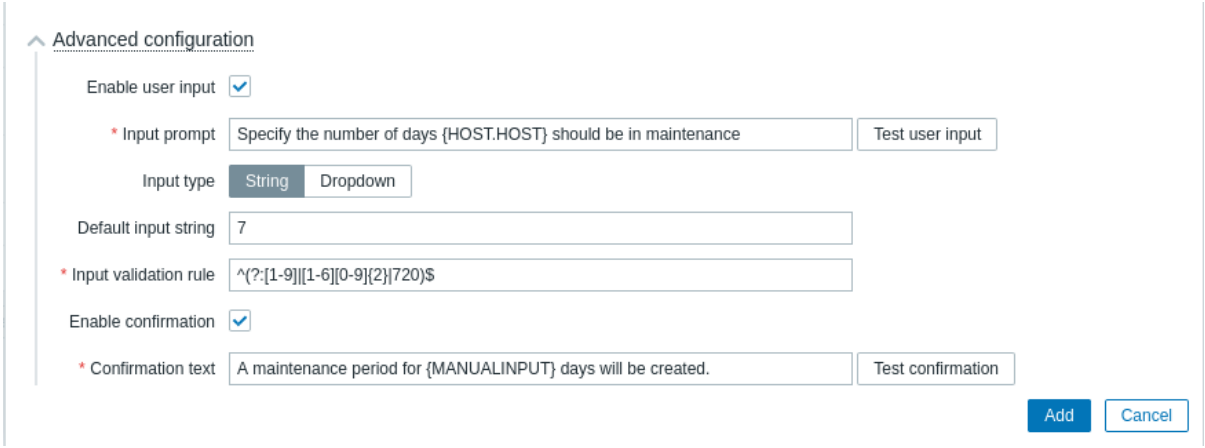
You can use the filter to display only the scripts you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of scripts. If you click it, a filter becomes available where you can filter scripts by name and scope.

Configuring a global script

Note:
It is recommended to use macro functions instead of plain macros in global scripts to enhance security, as macros are not automatically escaped.

Script attributes:



Parameter	Description
Name	Unique name of the script. E.g., `Clear /tmp filesystem`
Scope	Scope of the script - action operation, manual host action or manual event action. This setting determines where the script can be used - in remote commands of action operations, from the host menu or from the event menu respectively. Setting the scope to 'Action operation' makes the script available for all users with access to *Alerts* > *Actions*. If a script is actually used in an action, its scope cannot be changed away from 'action operation'. **Macro support** The scope affects the range of available macros. For example, user-related macros (`{USER.*}`) are supported in scripts to allow passing information about the user that launched the script. However, they are not supported if the script scope is action operation, as action operations are executed automatically. A `{MANUALINPUT}` macro allows you to specify manual input at script execution time. It is supported for manual host action and manual event action scripts. To find out which other macros are supported, do a search for 'Trigger-based notifications and commands/Trigger-based commands', 'Manual host action scripts' and 'Manual event action scripts' in the supported macro table. Note that if a macro may resolve to a value with spaces (for example, host name), don't forget to quote as needed.
Menu path	The desired menu path to the script. For example, `Default` or `Default/`, will display the script in the respective directory. Menus can be nested, e.g., `Main menu/Sub menu1/Sub menu2`. When accessing scripts through the host/event menu in monitoring sections, they will be organized according to the given directories. This field is displayed only if 'Manual host action' or 'Manual event action' is selected as *Scope*.

Parameter	Description
Type	Click the respective button to select script type: **URL**, **Webhook**, **Script**, **SSH**, **Telnet** or **IPMI** command. The type **URL** is available only when 'Manual host action' or 'Manual event action' is selected as *Scope*.
Script type: **URL**	
URL	Specify the URL for quick access from the host menu or event menu. Macros and custom user macros are supported. Macro support depends on the scope of the script (see *Scope* above). Use the {MANUALINPUT} macro in this field to be able to specify manual input at script execution time, for example: `http://{MANUALINPUT}/zabbix/zabbix.php?action=dashboard.view` Macro values must not be URL-encoded.
Open in new window	Determines whether the URL should be opened in a new or the same browser tab.
Script type: **Webhook**	
Parameters	Specify the webhook variables as attribute-value pairs. See also: Webhook media configuration. Macros and custom user macros are supported in parameter values. Macro support depends on the scope of the script (see *Scope* above).
Script	Enter the JavaScript code in the modal editor that opens when clicking in the parameter field or on the pencil icon next to it. Macro support depends on the scope of the script (see *Scope* above). See also: Webhook media configuration, Additional Javascript objects.
Timeout	JavaScript execution timeout (1-60s, default 30s). Time suffixes are supported (e.g., `30s`, `1m`).
Script type: **Script**	
Execute on	Click the respective button to execute the shell script on: **Zabbix agent** - the script will be executed by Zabbix agent (if the system.run item is allowed) on the host **Zabbix proxy or server** - the script will be executed by Zabbix proxy or server - depending on whether the host is monitored by proxy or server. It will be executed on the proxy if enabled by EnableRemoteCommands. It will be executed on the server if global scripts are enabled by the EnableGlobalScripts server parameter. **Zabbix server** - the script will be executed by Zabbix server only. This option will not be available if global scripts are disabled by the EnableGlobalScripts server parameter.
Commands	Enter full path to the commands to be executed within the script. Macro support depends on the scope of the script (see *Scope* above). Custom user macros are supported.
Script type: **SSH**	
Authentication method	Select authentication method - password or public key.
Username	Enter the username.
Password	Enter the password. This field is available if 'Password' is selected as the authentication method.
Public key file	Enter the path to the public key file. This field is available if 'Public key' is selected as the authentication method.
Private key file	Enter the path to the private key file. This field is available if 'Public key' is selected as the authentication method.
Passphrase	Enter the passphrase. This field is available if 'Public key' is selected as the authentication method.
Port	Enter the remote SSH service port on the target host that Zabbix will connect to.
Commands	Enter the commands. Macro support depends on the scope of the script (see *Scope* above). Custom user macros are supported.
Script type: **Telnet**	
Username	Enter the username.
Password	Enter the password.
Port	Enter the remote Telnet service port on the target host that Zabbix will connect to.
Commands	Enter the commands. Macro support depends on the scope of the script (see *Scope* above). Custom user macros are supported.

Parameter	Description
Script type: **IPMI**	
Command	Enter the IPMI command. Macro support depends on the scope of the script (see *Scope* above). Custom user macros are supported.
Description	Enter a description for the script.
Host group	Select the host group that the script will be available for (or *All* for all host groups).
User group	Select the user group that the script will be available to (or *All* for all user groups). This field is displayed only if 'Manual host action' or 'Manual event action' is selected as *Scope*.
Required host permissions	Select the permission level for the host group - *Read* or *Write*. Only users with the required permission level will have access to executing the script. This field is displayed only if 'Manual host action' or 'Manual event action' is selected as *Scope*.
Advanced configuration	Click the *Advanced configuration* header to display advanced configuration options. This field is displayed only if 'Manual host action' or 'Manual event action' is selected as *Scope*.

Advanced configuration

Advanced configuration options are available in a collapsible *Advanced configuration* section:

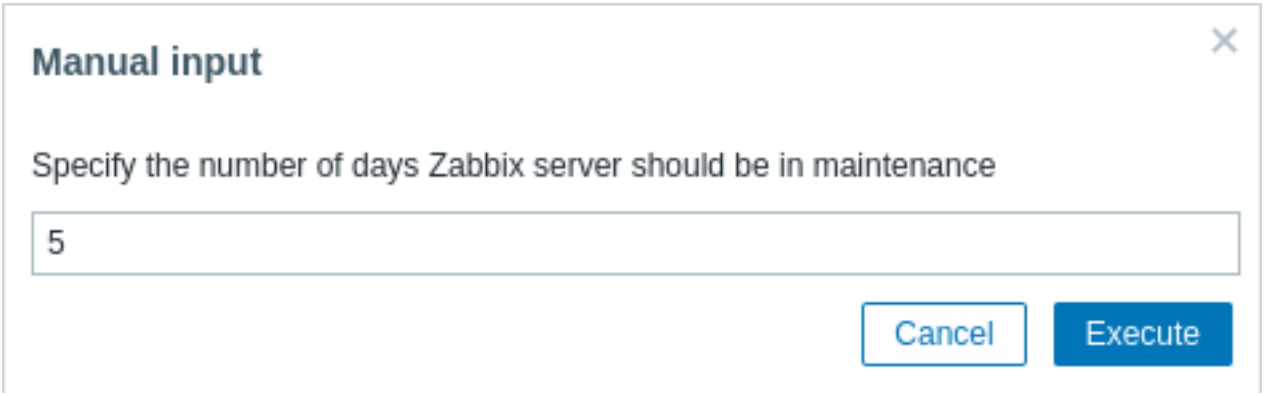
Parameter	Description
Enable user input	Mark the checkbox to enable manual user input before executing the script. Manual user input will replace the {MANUALINPUT} macro value in the script. See also: Manual user input.
Input prompt	Enter custom text prompting for custom user input. This text will be displayed above the input field in the *Manual input* popup. To see a preview of the *Manual input* popup, click *Test user input*. The preview also allows you to test if the input string complies with the input validation rule (see parameters below). Macro and user macro support depends on the scope of the script (see *Scope* in general script configuration parameters).
Input type	Select the manual input type: **String** - single string; **Dropdown** - value is selected from multiple dropdown options.
Dropdown options	Enter unique values for the user input dropdown in a comma-delimited list. To include an empty option in the dropdown, add an extra comma at the beginning, middle, or end of the list. This field is displayed only if 'Dropdown' is selected as *Input type*.

Parameter	Description
Default input string	Enter the default string for user input (or none). This field will be validated against the regular expression provided in the *Input validation rule* field. The value entered here will be displayed by default in the *Manual input* popup. This field is displayed only if 'String' is selected as *Input type*.
Input validation rule	Enter a regular expression to validate the user input string. Global regular expressions are supported. This field is displayed only if 'String' is selected as *Input type*.
Enable confirmation	Mark the checkbox to display a confirmation message before executing the script. This feature might be especially useful with potentially dangerous operations (like a reboot script) or ones that might take a long time.
Confirmation text	Enter custom confirmation text for the confirmation popup enabled with the checkbox above (for example, *Remote system will be rebooted. Are you sure?*). To see how the text will look like, click *Test confirmation* next to the field. Macros and custom user macros are supported. *Note:* the macros will not be expanded when testing the confirmation message.

If both manual user input and a confirmation message are configured, they will be displayed in consecutive popup windows.

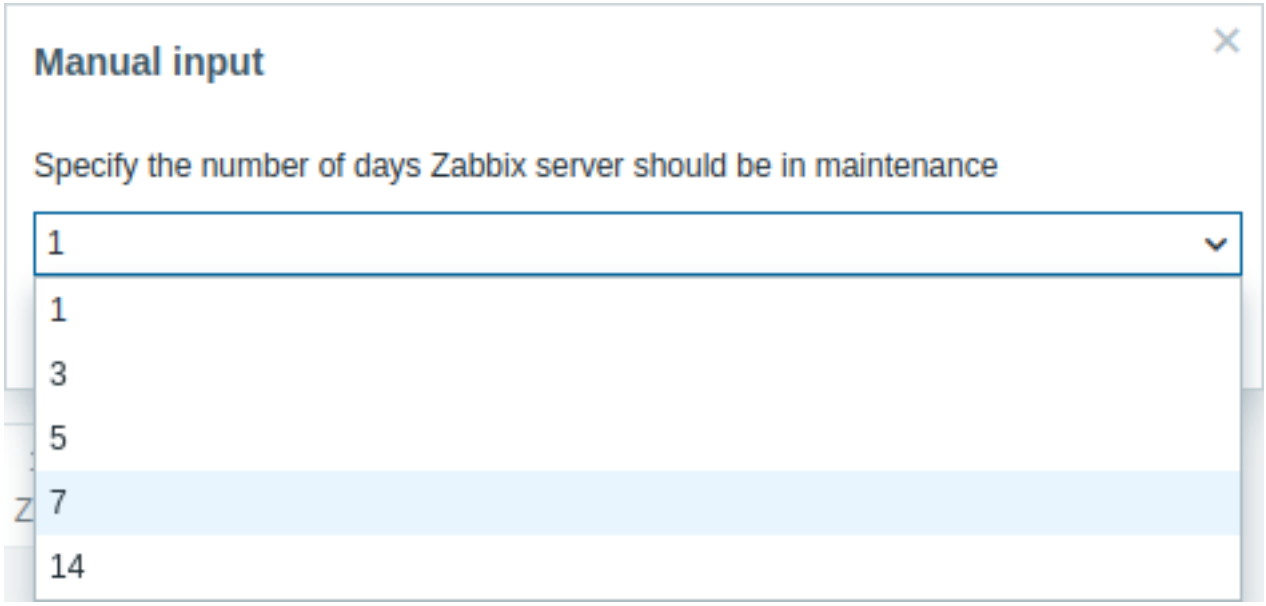
Manual user input

Manual user input allows a custom parameter to be supplied on each execution of the script. This saves the necessity to create multiple similar user scripts with only a single parameter difference.



For example, you may want to supply a different integer or a different URL address to the script during execution.

To enable manual user input:



- use the {MANUALINPUT} macro in the script (commands, script, script parameter) where required; or in the URL field of URL scripts;
- in advanced script configuration, enable manual user input and configure input options.

With user input enabled, before script execution, a *Manual input* popup will appear to the user asking to supply a custom value. The supplied value will replace {MANUALINPUT} in the script.

Depending on the configuration, the user will be asked to enter a string value:

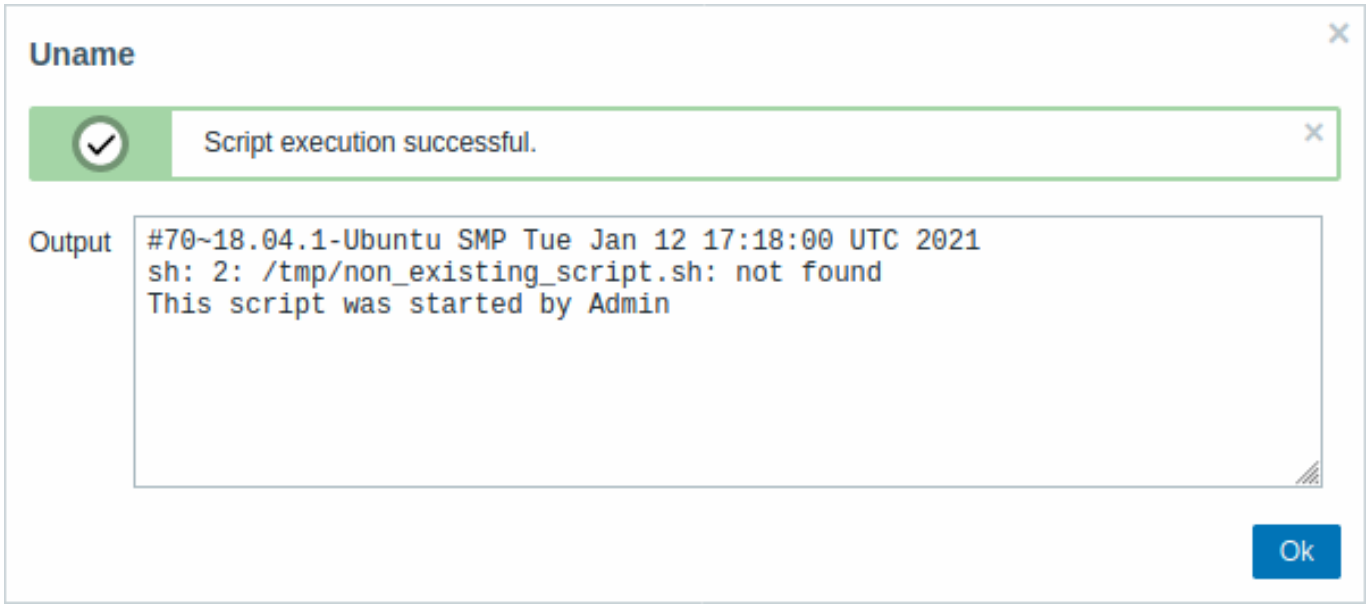
Or select the value from a dropdown of pre-determined options:

Manual user input is available only for scripts where the scope is 'Manual host action' or 'Manual event action'.

Script execution and result

Scripts run by Zabbix server are executed in the order described in the command execution page.

The script result is displayed in a pop-up window that appears after the script is run. The return value of the script is a standard output:



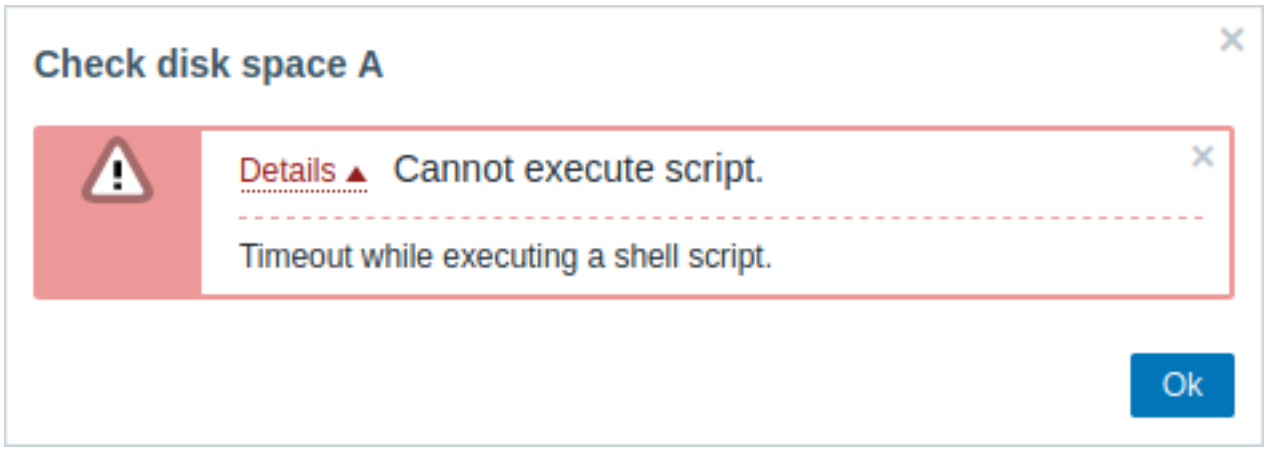
- If the script finishes successfully (exit code 0), the return value is limited to 16MB (including trailing whitespace that is truncated).
- If the script exits with an error (non-zero exit code), the return value is a standard error limited to 2KB.

Zabbix does not store extended script output by default. To preserve full output details, you can implement logging within the script itself (e.g., redirect output to a local log file).

Note that for scripts executed either on Zabbix server or Zabbix proxy, database limits also apply.

Below is an example of a script and the result window:

```
uname -v
/tmp/non_existing_script.sh
echo "This script was started by {USER.USERNAME}"
```



The script result does not display the script itself.

Script timeout on Zabbix agent

You may encounter a situation when a timeout occurs while executing a script.

See an example of a script running on Zabbix agent and the result window below:

```
sleep 5
df -h
```

The error message, in this case, is the following:

```
Timeout while executing a shell script.
```

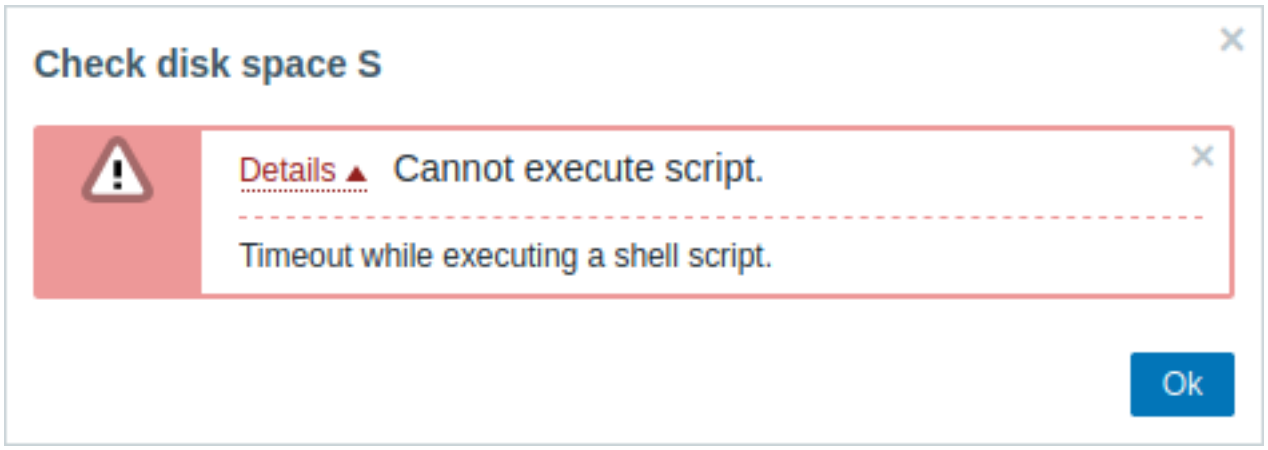
To avoid such situations, it is advised to optimize the script itself (in the example above, "5") instead of adjusting the `Timeout` parameter in Zabbix agent configuration and Zabbix server configuration.

In case the `Timeout` parameter has been changed in Zabbix agent configuration, the following error message will appear:

```
Get value from agent failed: ZBX_TCP_READ() timed out.
```

It means that the modification has been made in Zabbix agent configuration, but it is required to modify the `Timeout` parameter in Zabbix server configuration as well.

Script timeout on active agents



It is possible to execute scripts on agents operating in active mode only. Once the script execution is triggered by action operation or manual script execution, the command is included in active check configuration and executed once the active agent receives it.

Manual scripts are sent to the active agent along with the server/proxy timeout for script execution. Please increase the default server/proxy timeout for script execution. The timeout must be higher than the active check refresh frequency; otherwise, the timeout is exceeded before the active agent receives the script and is able to return the result.

Script timeout on Zabbix server/proxy

See an example of a script running on Zabbix server and the result window below:

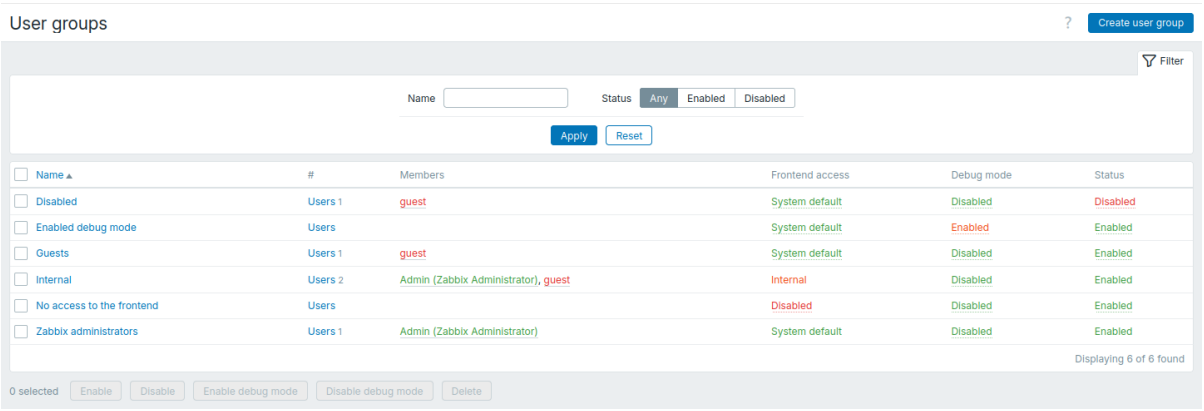
```
sleep 11
df -h
```

It is also advised to optimize the script itself (instead of adjusting `TrapperTimeout` parameter to a corresponding value (in our case, > 11) by modifying the Zabbix server configuration).

Users

Overview

This menu features sections that are related to configuring users in Zabbix. This menu is available to SuperAdmin user type users only.



User groups

Overview

In the *Users* > *User groups* section user groups of the system are maintained.

User groups

A listing of existing user groups with their details is displayed.

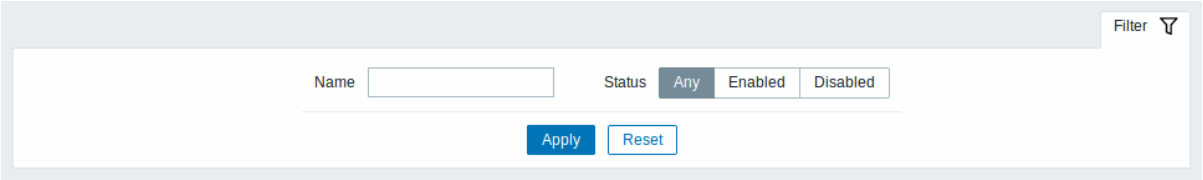
Displayed data:

Column	Description
Name	Name of the user group. Clicking the user group name opens the user group configuration form.
#	The number of users in the group. Clicking *Users* will display the respective users filtered out in the user list.
Members	Usernames of individual users in the user group (with name and surname in parentheses). Clicking the username will open the user configuration form. Users from disabled groups are displayed in red.
Frontend access	Frontend access level is displayed: **System default** - users are authenticated by Zabbix, LDAP or HTTP (depending on the authentication method set globally); **Internal** - users are authenticated by Zabbix; ignored if HTTP authentication is the global default; **LDAP** - users are authenticated by LDAP; ignored if HTTP authentication is the global default; **Disabled** - access to Zabbix frontend is forbidden for this group. By clicking the current level, you can change it.
Debug mode	Debug mode status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it.
Status	User group status is displayed - *Enabled* or *Disabled*. By clicking the status you can change it.

To configure a new user group, click the *Create user group* button in the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:



- *Enable* - change the user group status to *Enabled*
- *Disable* - change the user group status to *Disabled*
- *Enable debug mode* - enable debug mode for the user groups
- *Disable debug mode* - disable debug mode for the user groups
- *Delete* - delete the user groups

To use these options, mark the checkboxes before the respective user groups, then click the required button.

Using filter

You can use the filter to display only the user groups you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of user groups. If you click it, a filter becomes available where you can filter user groups by name and status.

User roles

Overview

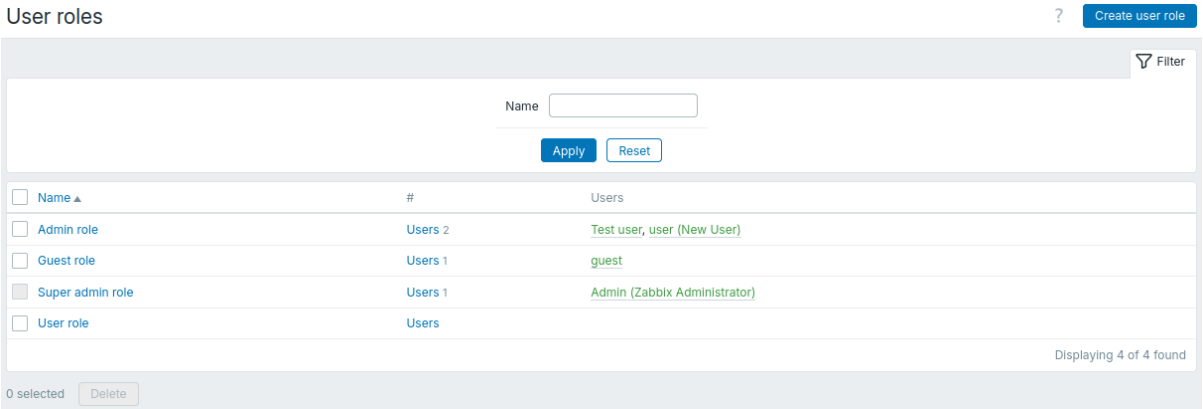
In the *Users* > *User roles* section you may create user roles.

User roles allow you to create fine-grained permissions based on the initially selected user type (*User*, *Admin*, *Super admin*).

Upon selecting a user type, all available permissions for this user type are granted (checked by default).

Permissions can only be revoked from the subset that is available for the user type; they cannot be extended beyond what is available for the user type.

Checkboxes for unavailable permissions are grayed out; users will not be able to access the element even by entering a direct URL to this element into the browser.



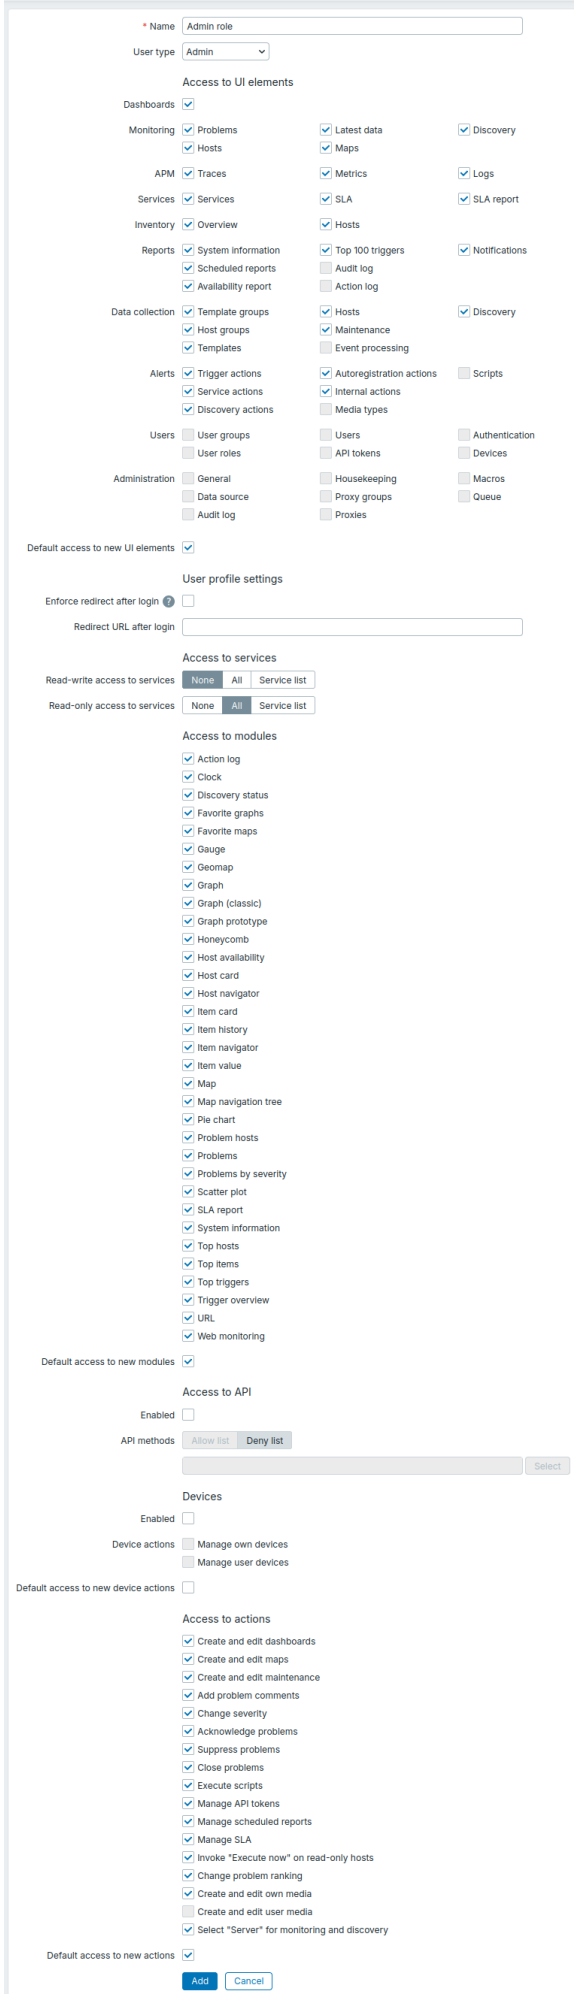
Note:
Restricting access to some UI elements only prevents opening that page—it does not remove the ability to access underlying data on other parts of the interface.

User roles can be assigned to system users. Each user may have only one role assigned.

Default user roles

By default, Zabbix is configured with four user roles, which have a pre-defined set of permissions:

- Guest role
- User role
- Admin role
- Super admin role



These are based on the main user types in Zabbix. The list of all users assigned the respective role is displayed. The users included in disabled groups are stated in red. The *Guest role* is a user-type role with the only permissions to view some frontend sections.

Note:
The default *Super admin role* cannot be modified or deleted, because at least one Super admin user with unlimited privileges must exist in Zabbix. Users of type *Super admin* can modify settings of their own role, but not the user type.

Configuration

To create a new role, click the *Create user role* button at the upper-right corner. To update an existing role, click the role name to open the configuration form.

Available permissions are displayed. To revoke a certain permission, unmark its checkbox.

Available permissions along with the defaults for each pre-configured user role in Zabbix are described below.

Default permissions

Access to UI elements

The default access to menu sections depends on the user type. See the Permissions page for details.

Access to other options

Some of the sections described in the table below may be hidden:

- *Access to modules* is hidden if `$ZBX_FEATURE_FLAGS['modules_config_enabled']` is set to `false` in the frontend configuration file.
- *Devices* is hidden if `EnableMobileDevices` is disabled.

Parameter	Description	Default user roles			
		Super admin role	*Admin role*	*User role*	*Guest role*
Default access to new UI elements	This option specifies how new menu sections will be accessible after a Zabbix upgrade. Existing menu sections of modules remain unaffected.	Yes	Yes	Yes	Yes
User profile settings					
Enforce redirect after login	Mark the checkbox to restrict users to redirect URL after login. If unmarked, users can set their personal URL after login in their profile; redirect URL after login is used only as fallback.	Yes	No	No	No
Redirect URL after login	Specify the redirect URL after login.				
Access to services					
Read-write access to services	Select read-write access to services: **None** - no access at all **All** - access to all services is read-write **Service list** - select services for read-write access The read-write access, if granted, takes precedence over the read-only access settings and is dynamically inherited by the child services.	All	All	None	None
Read-write access to services with tag	Specify tag name and, optionally, value to additionally grant read-write access to services matching the tag. This option is available if 'Service list' is selected in the *Read-write access to services* parameter. The read-write access, if granted, takes precedence over the read-only access settings and is dynamically inherited by the child services.				

Read-only access to services	Select read-only access to services: **None** - no access at all **All** - access to all services is read-only **Service list** - select services for read-only access The read-only access does not take precedence over the read-write access and is dynamically inherited by the child services.			All	All
Read-only access to services with tag	Specify tag name and, optionally, value to additionally grant read-only access to services matching the tag. This option is available if 'Service list' is selected in the *Read-only access to services* parameter. The read-only access does not take precedence over the read-write access and is dynamically inherited by the child services.				
Access to modules					
<Module name>	Allow/deny access to a specific module. Only enabled modules are shown in this section. It is not possible to grant or restrict access to a module that is currently disabled.	Yes	Yes	Yes	Yes
Default access to new modules	This option specifies how new modules and widgets will be accessible after a Zabbix upgrade. It also applies to modules and widgets added in the *Administration > General > Modules section*.				
Access to API					
Enabled	Enable/disable access to API.	Yes	No	No	No
API methods	Select either *Allow list* to allow, or *Deny list* to deny the API methods specified in the search field. Note that it is not possible to allow some API methods and deny others. In the search field, start typing the method name, then select the method from the auto-complete list. You can also click the *Select* button and select methods from the full list available for this user type. Note that if certain action from the Access to actions block is unchecked, users will not be able to use API methods related to this action. Wildcards are supported. Examples: `dashboard.*` (all methods of 'dashboard.' API service) `*` (any method), `*.export` (methods with '.export' name from all API services). If no methods are specified, *Allow list* denies access to all API methods, while *Deny list* allows access to all API methods available for the user type. To allow all methods with *Allow list*, specify `*`. To block API access completely, clear the *Enabled* checkbox instead of leaving the *Allow list* empty. The API methods list does not apply to methods that do not require authentication, such as `apiinfo.version` and `user.login`.				

Access to actions					
Create and edit dashboards	Clearing this checkbox will also revoke the rights to use `.create`, `.update` and `.delete` API methods for the corresponding elements.	Yes	Yes	Yes	No
Create and edit maps					
Create and edit maintenance				No	
Add problem comments	Clearing this checkbox will also revoke the rights to perform corresponding action via `event.acknowledge` API method.			Yes	
Change severity					
Acknowledge problems					
Suppress problems					
Close problems					
Execute scripts	Clearing this checkbox will also revoke the rights to use the `script.execute` API method.				
Manage API tokens	Clearing this checkbox will also revoke the rights to use all `token.` API methods.				
Manage scheduled reports	Clearing this checkbox will also revoke the rights to use all `report.` API methods.			No	
Manage SLA	Enable/disable the rights to manage SLA.				
Invoke "Execute now" on read-only hosts	Allow users to use the "Execute now" option in Latest data for items on read-only hosts.			Yes	
Change problem ranking	Allow users to change the problem ranking from cause to symptom and vice versa.				
Create and edit own media	Allow users to create and edit their own media.				
Create and edit user media	Allow users to create and edit media for other users. This option is only available for Super admin users.		No	No	
Select "Server" for monitoring and discovery	Clearing this checkbox restricts the creation of hosts monitored by the server and network discovery rules executed by the server, as well as the testing of items with the server. The *Server* option will be disabled in the host configuration for the *Monitored by* parameter, in the network discovery rule configuration for the *Discovery by* parameter, and in item testing for the *Test with* parameter.		Yes	No	
Default access to new actions	This option specifies how new actions will be accessible after a Zabbix upgrade.		Yes	Yes	
Devices					
Enabled	Enable/disable access to *User settings* > *Devices* (accessible to all users) and *Users* > *Devices* (accessible only to Super admins).	Yes	No	No	No
Manage own devices	Allow users to manage their own devices in *User settings* > *Devices*.				
Manage user devices	Allow users to manage devices belonging to other users in *Users* > *Devices*.				
Default access to new actions	This option specifies how new actions will be accessible after a Zabbix upgrade.

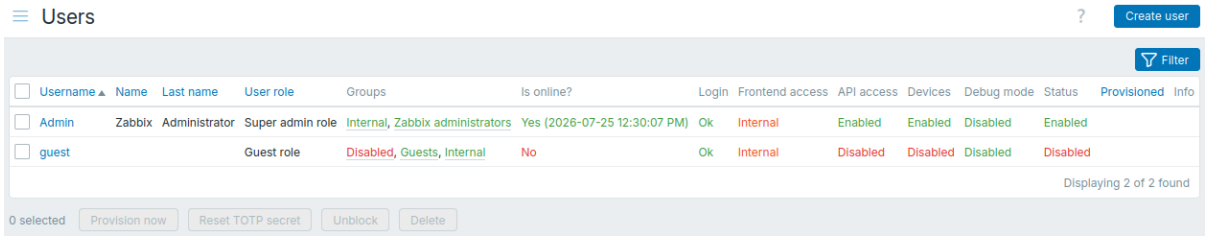
- Configuring a user



Users

Overview

In the *Users* > *Users* section users of the system are maintained.

Users

A listing of existing users with their details is displayed.

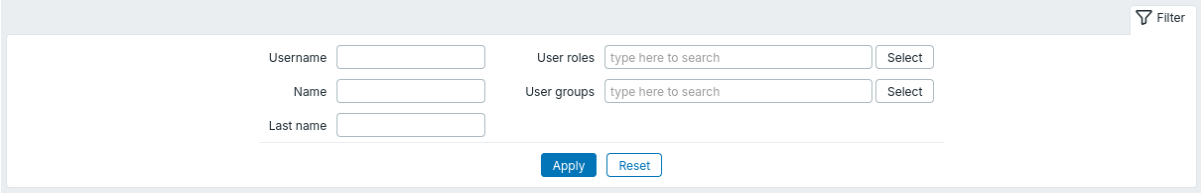
Displayed data:

Column	Description
Username	Username for logging into Zabbix. Clicking the username opens the user configuration form.
Name	First name of the user.
Last name	Second name of the user.
User role	User role is displayed.
Groups	Groups that the user is a member of are listed. Clicking the user group name opens the user group configuration form. Disabled groups are displayed in red.
Is online?	The on-line status of the user is displayed - *Yes* or *No*. The time of last user activity is displayed in parentheses.
Login	The login status of the user is displayed - *Ok* or *Blocked*. A user can become temporarily blocked upon exceeding the number of unsuccessful login attempts set in the *Administration > General > Other* section (five by default). By clicking *Blocked* you can unblock the user.
Frontend access	Frontend access level is displayed - *System default*, *Internal*, *LDAP*, or *Disabled*, depending on the one set for the whole user group.
API access	API access status is displayed - *Enabled* or *Disabled*, depending on the one set for the user role. If API access is enabled, mouseover on *Enabled* displays the API methods of the user role under *Allowed methods* or *Denied methods*, depending on the API methods mode. *None* is displayed if no methods are specified.
Devices	Device access status is displayed - *Enabled* or *Disabled*, depending on the one set for the user role. This column is displayed if `EnableMobileDevices` is enabled.
Debug mode	Debug mode status is displayed - *Enabled* or *Disabled*, depending on the one set for the whole user group.
Status	User status is displayed - *Enabled* or *Disabled*, depending on the one set for the whole user group.
Provisioned	The date when the user was last provisioned is displayed. Used for users created by JIT provisioning from LDAP/SAML.
Info	Information about errors is displayed. A yellow warning is displayed for users without user groups. A red warning is displayed for users without roles, and for users without roles and user groups.

To configure a new user, click the *Create user* button in the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

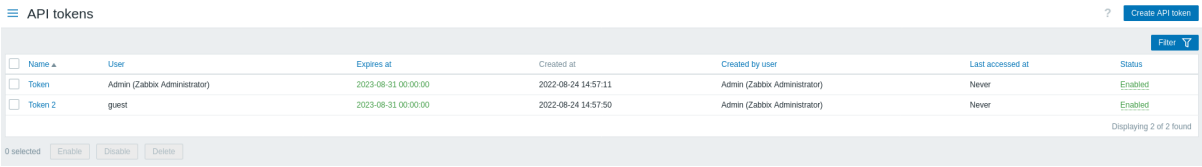


- *Provision now* - update user information from LDAP (this option is only enabled if an LDAP user is selected)
- *Reset TOTP secret* - reset user TOTP secrets for all TOTP methods and delete the user session (this option is only enabled if MFA is enabled; for users without TOTP secrets, their session will not be deleted)
- *Unblock* - re-enable system access to blocked users
- *Delete* - delete the users

To use these options, mark the check-boxes before the respective users, then click the required button.

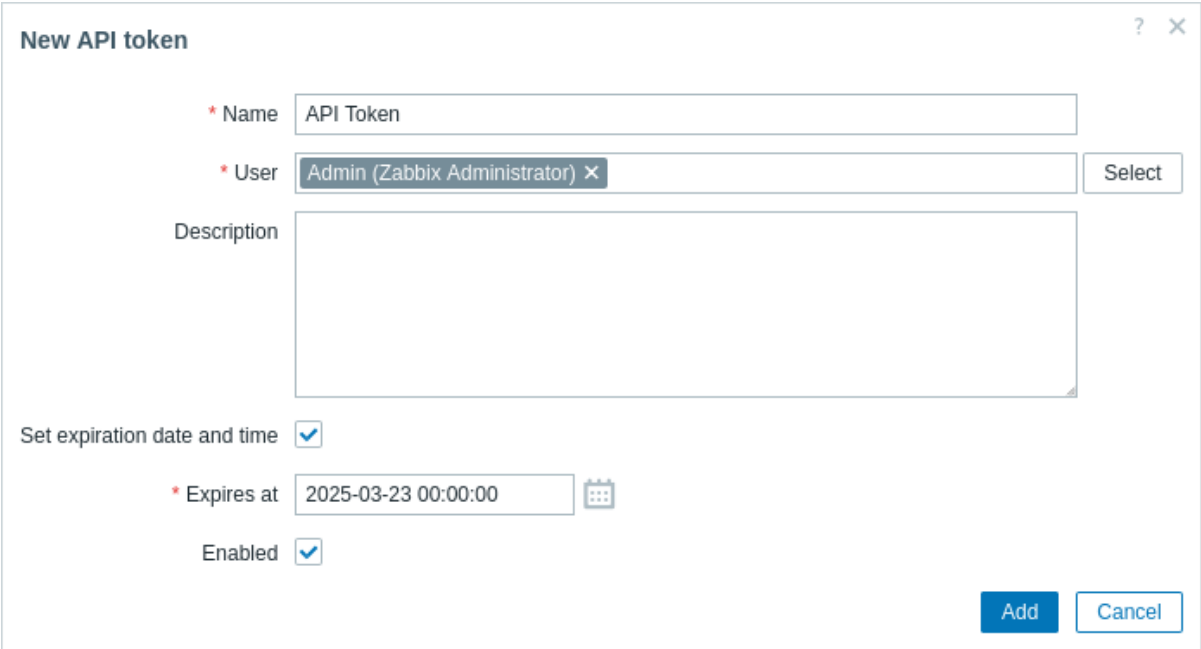
Using filter

You can use the filter to display only the users you are interested in. For better search performance, data is searched with macros unresolved.



The *Filter* link is available above the list of users. If you click it, a filter becomes available where you can filter users by username, name, last name, user role and user group.

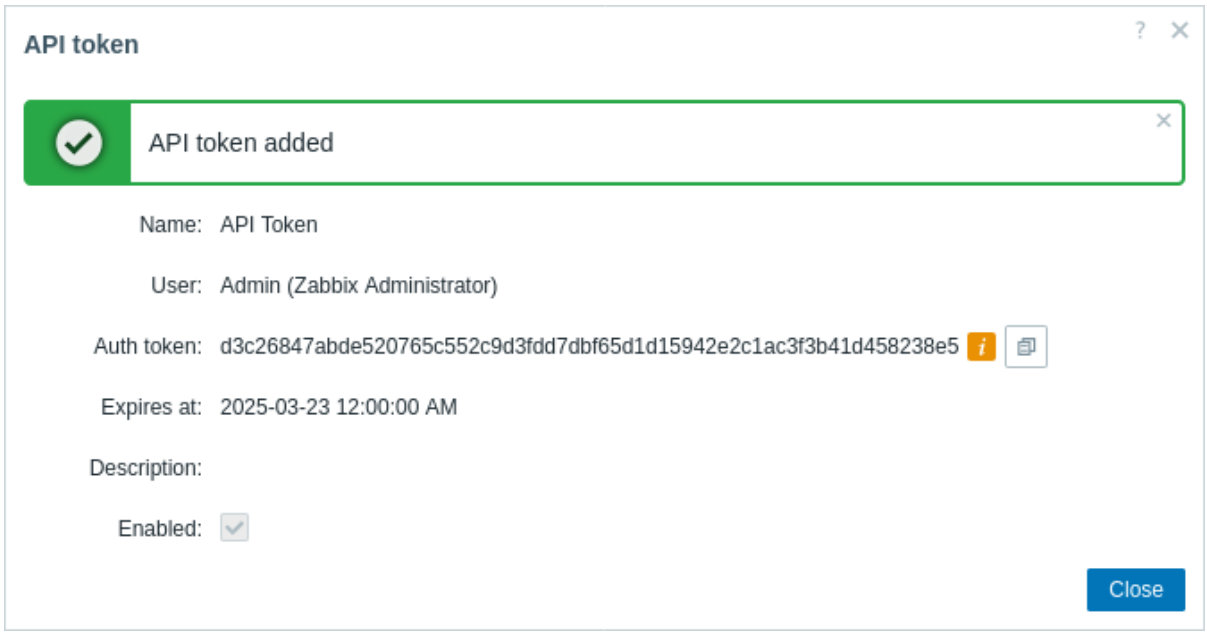
API tokens



Overview

This section allows you to create and manage API tokens.
 API tokens are used for authentication in the Zabbix API.
 Each API token is assigned to a single user and inherits that user's permissions. Requests authenticated with an API token are authorized according to the associated user's role and permissions.

You may filter API tokens by name, users to whom the tokens are assigned, expiry date, users that created tokens, or status (enabled/disabled). Click the token status in the list to quickly enable/disable a token. You may also mass enable/disable tokens by selecting them in the list and then clicking the *Enable/Disable* buttons below the list.



To create a new token, click the *Create API token* button at the upper-right corner, then fill out the required fields in the token configuration screen:

Parameter	Description
Name	Token's visible name.
User	User the token should be assigned to. To quickly select a user, start typing the username, first or last name, then select the required user from the auto-complete list. Alternatively, you can click the *Select* button and select a user from the full user list. A token can be assigned only to one user.
Description	Optional token description.
Set expiration date and time	Unmark this checkbox if a token should not have an expiry date.

Parameter	Description
Expiry date	Click the calendar icon to select token expiry date or enter the date manually in a format YYYY-MM-DD hh:mm:ss
Enabled	Unmark this checkbox if you need to create a token in a disabled state.

Click *Add* to create a token.

Copy the *Auth token* value and save in a safe place **before closing the page**, then click *Close*. The token will appear in the list.

Warning:
Auth token value cannot be viewed again later. It is only available immediately after creating a token. If you lose a saved token you will have to regenerate it and doing so will create a new authorization string.

Click the token name to edit the name, description, expiry date settings, or token status. Note that it is not possible to change to which user the token is assigned. Click the *Update* button to save changes. If a token has been lost or exposed, you may click the *Regenerate* button to generate new token value. A confirmation dialog box will appear, asking you to confirm this operation since after proceeding the previously generated token will become invalid.

Users without access to the *Administration* menu section can see and modify details of tokens assigned to them in the *User profile* > *API tokens* section only if *Manage API tokens* is allowed in their user role permissions.

Authentication

Overview

The *Users* > *Authentication* section allows you to specify the user authentication method for Zabbix and internal password requirements.

The available authentication methods are internal, HTTP, LDAP, SAML, and MFA authentication.

Default authentication

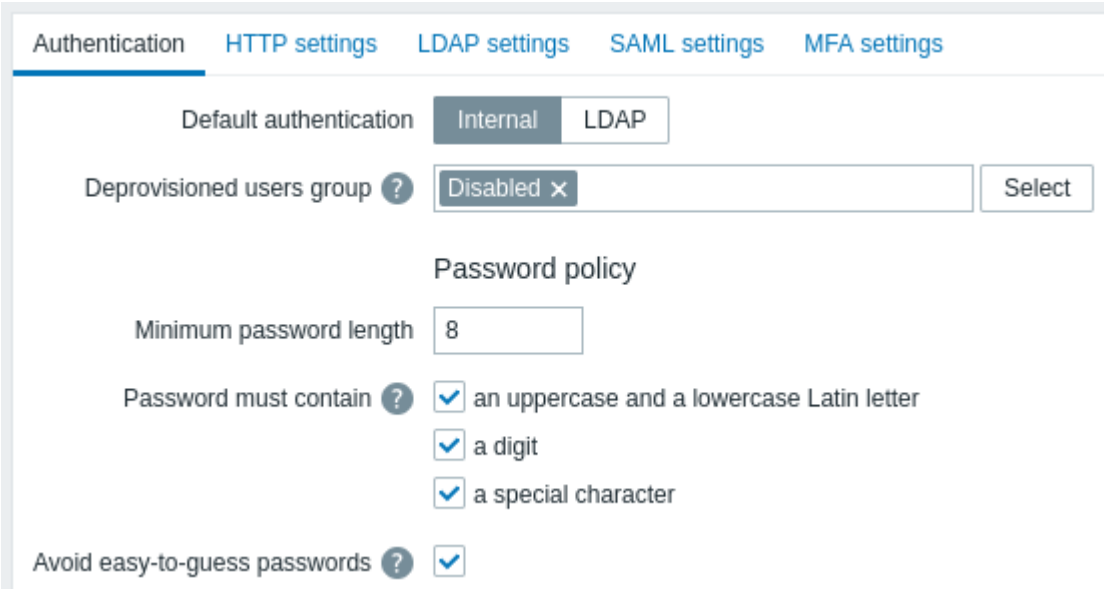
By default, Zabbix uses **internal** Zabbix authentication for all users.

It is possible to change the default authentication method to LDAP system-wide. To do so, navigate to the *LDAP* tab and configure LDAP parameters, then return to the *Authentication* tab and switch the *Default authentication* selector to LDAP.

Note that the authentication method can be fine-tuned on the user group level. Even if LDAP authentication is set globally, some user groups can still be authenticated by Zabbix. These groups must have frontend access set to Internal.

It is also possible to enable LDAP authentication only for specific user groups, if internal authentication is used globally. In this case LDAP authentication details can be specified and used for specific user groups whose frontend access must then be set to LDAP. If a user is included into at least one user group with LDAP authentication, this user will not be able to use the internal authentication method.

HTTP, SAML 2.0, and MFA authentication methods can be used in addition to the default authentication method.



Zabbix supports just-in-time (JIT) provisioning that allows you to create user accounts in Zabbix the first time an external user authenticates and provision these user accounts. JIT provisioning is supported for LDAP and SAML.

See also:

- HTTP authentication
- LDAP authentication
- SAML authentication
- MFA authentication

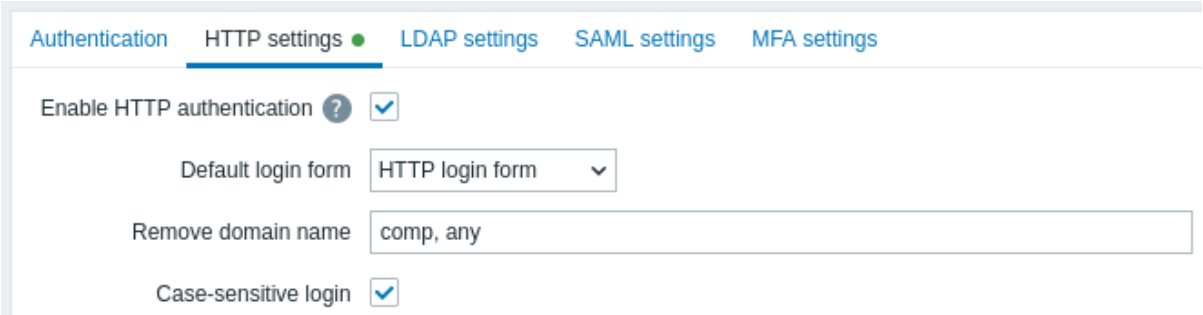
Configuration

The *Authentication* tab allows you to set the default authentication method, specify a group for deprovisioned users and set password complexity requirements for Zabbix users.

Configuration parameters:

Parameter	Description
Default authentication	Select the default authentication method for Zabbix - *Internal* or *LDAP*.
Deprovisioned users group	Specify a user group for deprovisioned users. This setting is required only for JIT provisioning, regarding users that were created in Zabbix from LDAP or SAML systems, but no longer need to be provisioned. A disabled user group must be specified.
Minimum password length	By default, the minimum password length is set to 8. Supported range: 1-70. Note that passwords longer than 72 characters will be truncated.
Password must contain	Mark one or several checkboxes to require usage of specified characters in a password: - an uppercase and a lowercase Latin letter - a digit - a special character Hover over the question mark to see a hint with the list of characters for each option.
Avoid easy-to-guess passwords	If marked, a password will be checked against the following requirements: - must not contain user's name, surname, or username - must not be one of the common or context-specific passwords. The list of common and context-specific passwords is generated automatically from the list of NCSC "Top 100k passwords", the list of SecLists "Top 1M passwords" and the list of Zabbix context-specific passwords. Internal users will not be allowed to set passwords included in this list as such passwords are considered weak due to their common use.

Changes in password complexity requirements will not affect existing user passwords, but if an existing user chooses to change a password, the new password will have to meet current requirements. A hint with the list of requirements will be displayed next to the *Password* field in the user profile and in the user configuration form accessible from the *Users* > *Users* menu.



Overview

HTTP or web server-based authentication (for example: BasicAuthentication, NTLM/Kerberos) can be used to check user names and passwords. Note that a user must exist in Zabbix as well, however its Zabbix password will not be used.

Attention:
Be careful! Make sure that web server authentication is configured and works properly before switching it on.

Note:
HTTP authentication configuration can be disabled by setting `$ZBX_FEATURE_FLAGS['http_auth_enabled'] = false` in the frontend configuration file (`zabbix.conf.php`). In this case, the *HTTP settings* tab with HTTP authentication options will be hidden.

Configuration

Configuration parameters:

Parameter	Description
Enable HTTP authentication	Mark the checkbox to enable HTTP authentication. Hovering the mouse over will bring up a hint box warning that in the case of web server authentication, all users (even with frontend access set to LDAP/Internal) will be authenticated by the web server, not by Zabbix.
Default login form	Specify whether to direct non-authenticated users to: **Zabbix login form** - standard Zabbix login page. **HTTP login form** - HTTP login page. It is recommended to enable web-server based authentication for the `index_http.php` page only. If *Default login form* is set to 'HTTP login page' the user will be logged in automatically if web server authentication module will set valid user login in the `$_SERVER` variable. Supported `$_SERVER` keys are `PHP_AUTH_USER`, `REMOTE_USER`, `AUTH_USER`.
Remove domain name	A comma-delimited list of domain names that should be removed from the username. E.g., `comp,any` - if username is 'Admin@any', 'comp\Admin', user will be logged in as 'Admin'; if username is 'notacompany\Admin', login will be denied.
Case-sensitive login	Unmark the checkbox to disable case-sensitive login for usernames (enabled by default). Disabling case-sensitive login allows, for example, logging in as "admin" even if the Zabbix user is "Admin" or "ADMIN". Please note that if case-sensitive login is disabled and there are multiple Zabbix users with similar usernames (e.g., Admin and admin), the login for those users will always be denied with the following error message: "Authentication failed: supplied credentials are not unique."

Note:
For internal users who are unable to log in using HTTP credentials (with HTTP login form set as default) leading to the 401 error, you may want to add a `ErrorDocument 401 /index.php?form=default` line to basic authentication directives, which will redirect to the regular Zabbix login form.

LDAP

Overview

External LDAP authentication can be used to check user names and passwords.

Zabbix LDAP authentication works at least with Microsoft Active Directory and OpenLDAP.

If only LDAP sign-in is configured, then the user must also exist in Zabbix, however, its Zabbix password will not be used. If authentication is successful, then Zabbix will match a local username with the username attribute returned by LDAP.

User provisioning

It is possible to configure JIT (just-in-time) **user provisioning** for LDAP users. In this case, it is not required that a user already exists in Zabbix. The user account can be created when the user logs into Zabbix for the first time.

When an LDAP user enters their LDAP login and password, Zabbix checks the *default* LDAP server if this user exists. If the user exists and does not have an account in Zabbix yet, a new user is created in Zabbix and the user is able to log in.

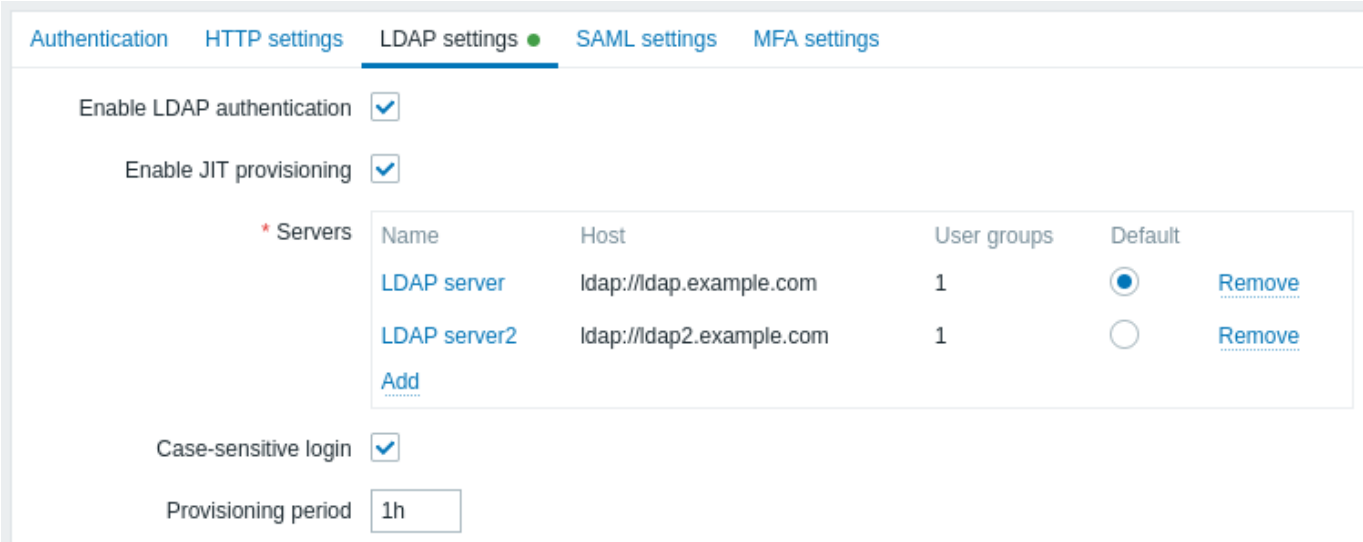
A user created via JIT provisioning is associated with the LDAP server (directory) that is set as the default at the time of creation. Changing the default LDAP server later does not change or update the LDAP server linked to users that were already provisioned.

Attention:
If JIT provisioning is enabled, a user group for deprovisioned users must be specified in the *Authentication* tab.

JIT provisioning also allows provisioned user accounts to be updated based on changes in LDAP. For example, if a user is moved from one LDAP group to another, the user will also be moved from one group to another in Zabbix; if a user is removed from an LDAP group, the user will also be removed from the group in Zabbix and, if not belonging to any other group, added to the user group for deprovisioned users. Provisioned user accounts are updated based on the configured provisioning period or when the user logs into Zabbix.

Note that background provisioning is done by Zabbix frontend when the user is interacting with it or at least has an open frontend page in the browser. There are no dedicated background processes to provision users.

LDAP supports three ways to bind to the directory for authentication and searches:

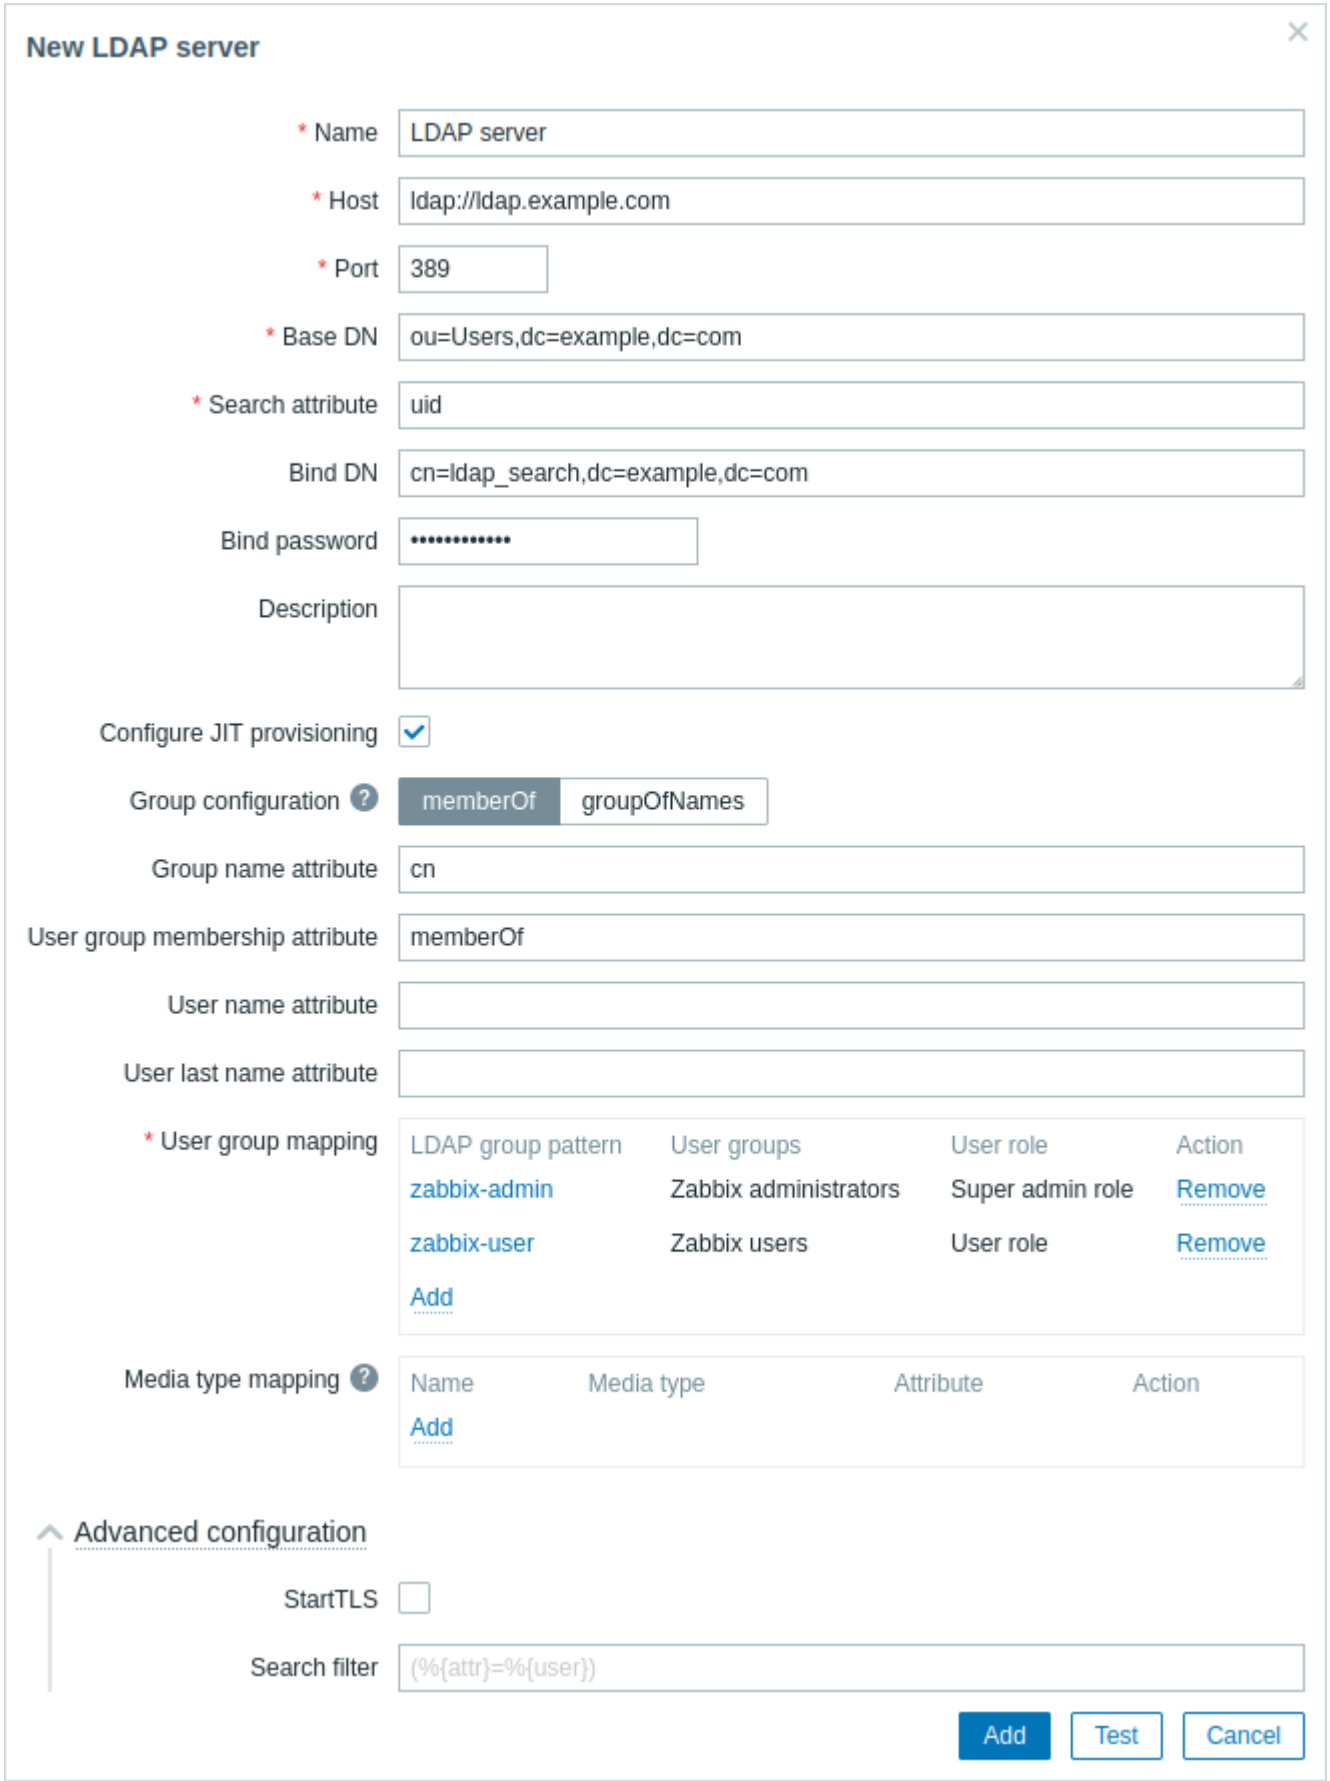


- Anonymous binding - no *Bind DN* / *Bind password* is provided and the LDAP server allows anonymous queries.
- Dedicated bind user (service account) - a specific LDAP account is set in *Bind DN* / *Bind password* and is used by Zabbix for searching and provisioning. This is the recommended and most flexible option because Zabbix can perform searches and background provisioning without end-user credentials.
- Direct user binding - Zabbix performs the bind using the credentials the user enters at login (no *Bind DN* / *Bind password* configured); this is configured by including a placeholder such as `uid=%{user}` in the Base DN. In this mode Zabbix only has access to the user's password during the interactive login. As a result, provisioning actions that require authenticating to LDAP outside of the user's login session (for example, using the *Provision now* button or running background provisioning when the user is not actively logged in) cannot authenticate and therefore will not work. Provisioning and updates for direct user binding happen only at the moment the user logs in.

Multiple servers

Several LDAP servers can be defined, if necessary. For example, a different server can be used to authenticate a different user group. Once LDAP servers are configured, in user group configuration it becomes possible to select the required LDAP server for the respective user group.

If a user is in multiple user groups and multiple LDAP servers, the first server in the list of LDAP servers sorted by name in ascending order will be used for authentication.



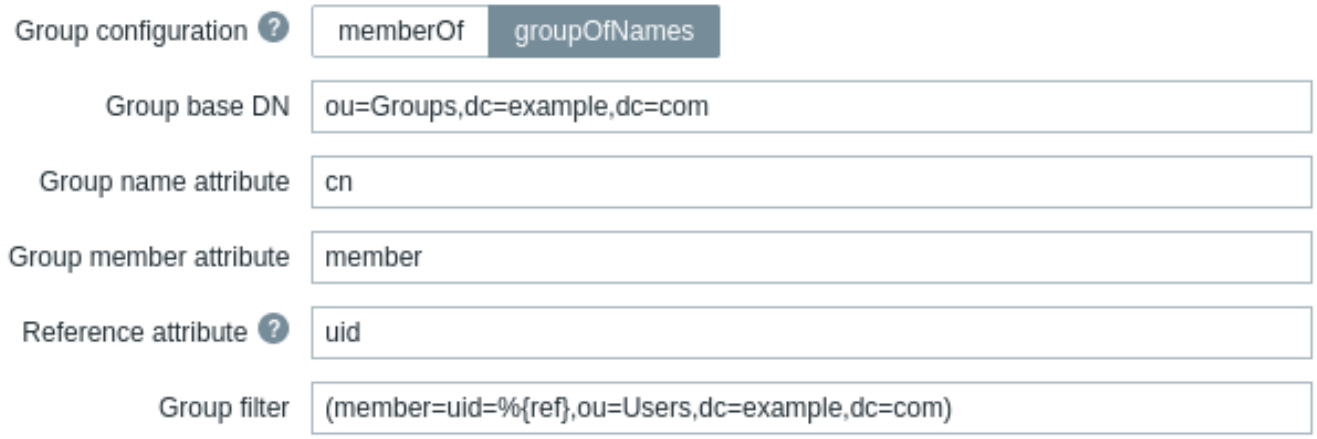
Configuration

Configuration parameters:

Parameter	Description
Enable LDAP authentication	Mark the checkbox to enable LDAP authentication.
Enable JIT provisioning	Mark the checkbox to enable JIT provisioning.
Servers	Click *Add* to configure an LDAP server (see LDAP server configuration below).
Case-sensitive login	Unmark the checkbox to disable case-sensitive login for usernames (enabled by default). Disabling case-sensitive login allows, for example, logging in as ”admin” even if the Zabbix user is ”Admin” or ”ADMIN”. Please note that if case-sensitive login is disabled and there are multiple Zabbix users with similar usernames (e.g., Admin and admin), the login for those users will always be denied with the following error message: ”Authentication failed: supplied credentials are not unique.”
Provisioning period	Set the provisioning period, i.e. how often the logged in user will be provisioned while working with the frontend.

LDAP server configuration

LDAP server configuration parameters:



Parameter	Description
Name	Name of the LDAP server in Zabbix configuration.

Parameter	Description
Host	Hostname, IP or URI of the LDAP server. Examples: ldap.example.com, 127.0.0.1, ldap://ldap.example.com For secure LDAP server, use *ldaps* protocol and hostname. Example: ldaps://ldap.example.com With OpenLDAP 2.x.x and later, a full LDAP URI of the form ldap://hostname:port or ldaps://hostname:port may be used.
Port	Port of the LDAP server. Default is 389. For secure LDAP connection port number is normally 636. Not used when using full LDAP URIs.
Base DN	Base path to user accounts in LDAP server: ou=Users,ou=system (for OpenLDAP), DC=company,DC=com (for Microsoft Active Directory) uid=%{user},dc=example,dc=com (for direct user binding, see a note below)
Search attribute	LDAP account attribute used for search: uid (for OpenLDAP), sAMAccountName (for Microsoft Active Directory)
Bind DN	LDAP account for binding and searching over the LDAP server, examples: uid=ldap_search,ou=system (for OpenLDAP), CN=ldap_search,OU=user_group,DC=company,DC=com (for Microsoft Active Directory) Anonymous binding is also supported. Note that anonymous binding potentially opens up domain configuration to unauthorized users (information about users, computers, servers, groups, services, etc.). For security reasons, disable anonymous binds on LDAP hosts and use authenticated access instead.
Bind password	LDAP password of the account for binding and searching over the LDAP server.
Description	Description of the LDAP server.
Configure JIT provisioning	Mark this checkbox to show options related to JIT provisioning.
Group configuration	Select the group configuration method: **memberOf** - by searching users and their group membership attribute **groupOfNames** - by searching groups through the member attribute Note that memberOf is preferable as it is faster; use groupOfNames if your LDAP server does not support `memberOf` or group filtering is required.
Group name attribute	Specify the attribute to get the group name from all objects in the `memberOf` attribute (see the *User group membership attribute* field) The group name is necessary for user group mapping.
User group membership attribute	Specify the attribute that contains information about the groups that the user belongs to (e.g., `memberOf`). For example, the memberOf attribute may hold information like this: `memberOf=cn=zabbix-admin,ou=Groups,dc=example,dc=com` This field is available only for the memberOf method.
User name attribute	Specify the attribute that contains the user's first name.
User last name attribute	Specify the attribute that contains the user's last name.
User group mapping	Map an LDAP user group pattern to Zabbix user group and user role. This is required to determine what user group/role the provisioned user will get in Zabbix. Click *Add* to add a mapping. The *LDAP group pattern* field supports wildcards. The group name must match an existing group. If an LDAP user matches several Zabbix user groups, the user becomes a member of all of them. If a user matches several Zabbix user roles, the user will get the one with the highest permission level among them.
Media type mapping	Map the user's LDAP media attributes (e.g., email) to Zabbix user media for sending notifications (the attribute value is used as the media *Send to* field).
Advanced configuration	Click the *Advanced configuration* header to display advanced configuration options (see below).
StartTLS	Mark the checkbox to use the StartTLS operation when connecting to LDAP server. The connection will fall if the server doesn't support StartTLS. StartTLS cannot be used with servers that use the *ldaps* protocol.

Parameter	Description
Search filter	Define a custom string when authenticating a user in LDAP. The following placeholders are supported: `%{attr}` - search attribute name (uid, sAMAccountName) `%{user}` - user username value to authenticate For example, to carry out a case-sensitive search within the case-insensitive LDAP or Microsoft Active Directory environment, the string can be defined as follows: `(%{attr}:caseExactMatch:=%{user})`. If the filter is not customized, LDAP will use the default: `(%{attr}=%{user})`.

Note:
To configure an LDAP server for **direct user binding**, append an attribute uid=%{user} to the *Base DN* parameter (for example,*uid=%{user},dc=example,dc=com*) and leave *BindDN* and *Bind password* parameters empty. When authenticating, a placeholder %{user} will be replaced by the username entered during login.
 With direct user binding Zabbix only has access to the user's credentials during the interactive login. Therefore, provisioning tasks that operate without an interactive login (for example, the *Provision now* button or the `user.provision` API method) will ignore users that authenticate using direct user binding because Zabbix cannot bind on their behalf. Use anonymous binding or a dedicated bind user (service account) if you need provisioning and LDAP searches to work from the frontend without requiring the end-user to be logged in.

The following fields are specific to "groupOfNames" as the *Group configuration* method:

Parameter	Description
Group base DN	Base path to the groups in LDAP server.
Group name attribute	Specify the attribute to get the group name in the specified base path to groups. The group name is necessary for user group mapping.
Group member attribute	Specify the attribute that contains information about the members of the group in LDAP (e.g., `member`).
Reference attribute	Specify the reference attribute for the group filter (see the *Group filter* field). Then use `%{ref}` in the group filter to get values for the attribute specified here.
Group filter	Specify the filter to retrieve the group that the user is member of. For example, `(member=uid=%{ref},ou=Users,dc=example,dc=com)` will match "User1" if the member attribute of the group is `uid=User1,ou=Users,dc=example,dc=com` and will return the group that "User1" is a member of.

Warning:
In case of trouble with certificates, to make a secure LDAP connection (ldaps) work you may need to add a `TLS_REQCERT allow` line to the `/etc/openldap/ldap.conf` configuration file. It may decrease the security of connection to the LDAP catalog.

Note:
It is recommended to create a separate LDAP account (*Bind DN*) to perform binding and searching over the LDAP server with minimal privileges in the LDAP instead of using real user accounts (used for logging in Zabbix frontend).
 Such an approach provides more security and does not require changing the *Bind password* when the user changes his own password in the LDAP server.
 In the table above it's the *ldap_search* account name.

Testing access

The *Test* button allows you to test user access:

Parameter	Description
Login	LDAP user name to test (prefilled with the current user name from Zabbix frontend). This user name must exist in the LDAP server. Zabbix will not activate LDAP authentication if it is unable to authenticate the test user.
User password	LDAP user password to test.

SAML

Overview

SAML 2.0 authentication can be used to sign in to Zabbix.

If SAML sign-in is configured without JIT user provisioning, the user must already exist in Zabbix; the user's Zabbix password is not used for authentication. After successful SAML authentication, Zabbix matches the username attribute received from SAML with an existing local Zabbix username.

User provisioning

It is possible to configure JIT (just-in-time) **user provisioning** for SAML users. In this case, it is not required that a user already exists in Zabbix. The user account can be created when the user logs into Zabbix for the first time.

Attention:
If JIT provisioning is enabled, a user group for deprovisioned users must be specified in the *Authentication* tab.

On top of JIT provisioning it is also possible to enable and configure SCIM (System for Cross-domain Identity Management) provisioning - *continuous* user account management for those users that have been created by user provisioning. SCIM provisioning requires a Zabbix API token (with Super admin permissions) for authentication into Zabbix.

For example, if a user is moved from one SAML group to another, the user will also be moved from one group to another in Zabbix; if a user is removed from a SAML group, the user will also be removed from the group in Zabbix and, if not belonging to any other group, added to the user group for deprovisioned users.

If SCIM is enabled and configured, a SAML user will be provisioned at the moment the user logs into Zabbix and continuously updated based on changes in SAML. Already existing SAML users will not be provisioned, and only provisioned users will be updated. Note that only valid media will be added to a user when the user is provisioned or updated.

If SCIM is not enabled, a SAML user will be provisioned (and later updated) at the moment the user logs into Zabbix.

Note:
If SAML authentication is enabled, users will be able to choose between logging in locally or via SAML single sign-on. If JIT provisioning is used, then only single sign-on is possible.

Setting up identity provider

In order to work with Zabbix, a SAML identity provider (onelogin.com, auth0.com, okta.com, etc.) needs to be configured in the following way:

- *Assertion Consumer URL* should be set to `<path_to_zabbix_ui>/index_sso.php?acs`
- *Single Logout URL* should be set to `<path_to_zabbix_ui>/index_sso.php?sls`

`<path_to_zabbix_ui>` examples: `https://example.com/zabbix/ui`, `http://another.example.com/zabbix`, `http://<any_public_ip_address>/zabbix`

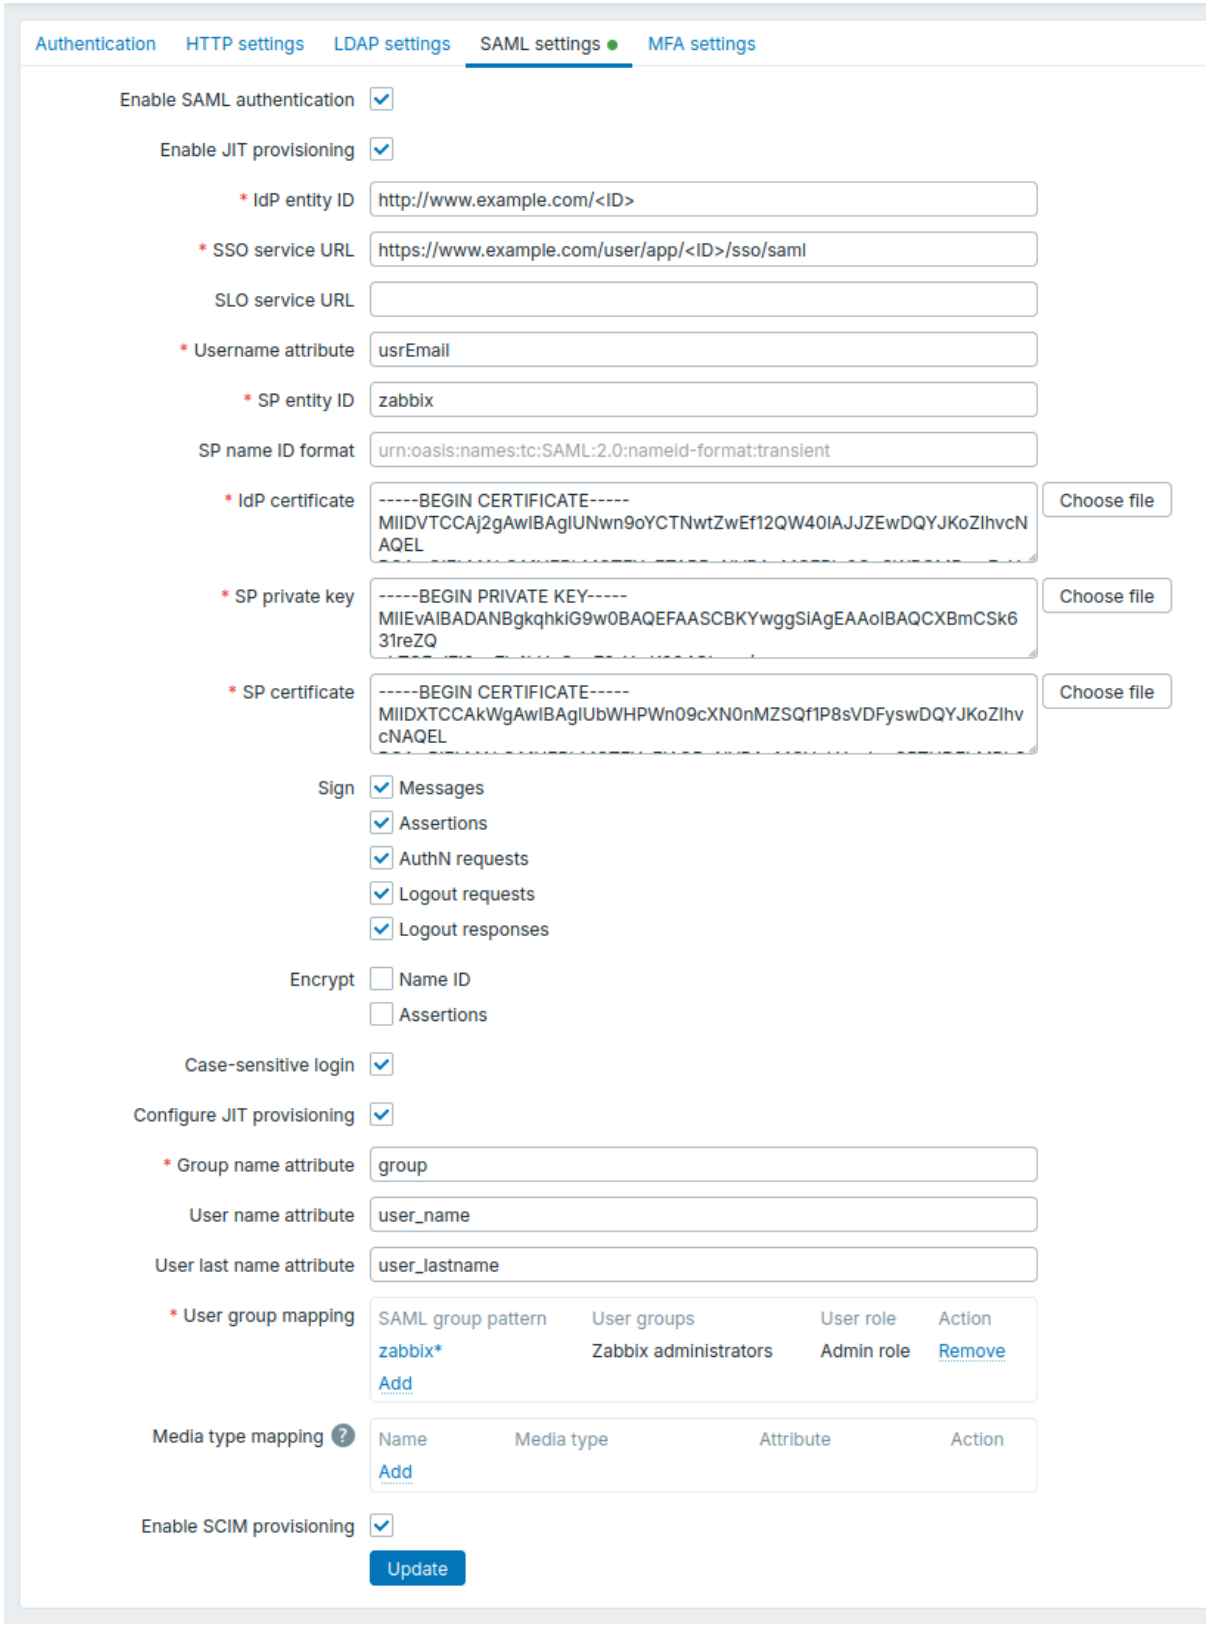
Setting up Zabbix

Attention:
It is required to install php-openssl if you want to use SAML authentication in the frontend.

To use SAML authentication Zabbix should be configured in the following way:

1. Provide the SP private key and certificates. An IdP certificate must be provided (paste or choose file) to activate SAML via the frontend. An SP certificate and SP private key must be provided if *Sign* or *Encrypt* options are selected.

If `$SSO['CERT_STORAGE'] = 'database'` is set in the frontend configuration file (`zabbix.conf.php`), you can paste the certificate text or upload the certificate file in the frontend during SAML configuration—no files are required on the filesystem.



If `$SSO['CERT_STORAGE'] = 'file'` is set in the configuration file, the certificate must be made available on the filesystem (by default in `ui/conf/certs` or the path configured in the configuration file) and the frontend will not store certificates in the database. Note that if `$SSO['CERT_STORAGE']` is not set or is commented out, file storage is assumed.

By default, Zabbix will look in the following locations:

- ui/conf/certs/sp.key - SP private key file
- ui/conf/certs/sp.crt - SP cert file
- ui/conf/certs/idp.crt - IDP cert file

Attention:
Certificate material may be imported via the frontend by pasting text or uploading files. Although unencrypted imports are allowed for convenience in some environments, using encrypted transport is strongly recommended (for example, enable HTTPS/TLS for the Zabbix frontend). When SAML certificates/keys are stored in the database, enable TLS/SSL for database connections to protect traffic between the application and the database.
 Encrypt database backups that may contain SAML certificates or private keys, and limit access to backup files and to the database tables that store SAML material. Restrict database user privileges to the minimum necessary.

2. All of the most important settings can be configured in the Zabbix frontend. However, it is possible to specify additional settings in the configuration file.

Configuration parameters, available in the Zabbix frontend:

Parameter	Description
Enable SAML authentication	Mark the checkbox to enable SAML authentication.
Enable JIT provisioning	Mark the checkbox to enable JIT user provisioning.
IDP entity ID	The unique entity identifier within the SAML identity provider.
SSO service URL	The URL users will be redirected to when logging in.
SLO service URL	The URL users will be redirected to when logging out. If left empty, the SLO service will not be used.

Parameter	Description
Username attribute	SAML attribute to be used as a username when logging into Zabbix. The list of supported values is determined by the identity provider. Examples: uid userprincipalname samaccountname username userusername urn:oid:0.9.2342.19200300.100.1.1 urn:oid:1.3.6.1.4.1.5923.1.1.1.13 urn:oid:0.9.2342.19200300.100.1.44
SP entity ID	The unique service provider identifier (if not matching, the operation will be rejected). It is possible to specify a URL or any string of data.
SP name ID format	Request a particular name ID format in the response. Examples: urn:oasis:names:tc:SAML:2.0:nameid-format:persistent urn:oasis:names:tc:SAML:2.0:nameid-format:unspecified urn:oasis:names:tc:SAML:2.0:nameid-format:transient
IdP certificate	Contents of the service provider (SP) certificate for SAML single sign-on (SSO) service setup.
SP private key	Contents of the service provider (SP) Private Key for SAML single sign-on (SSO) service setup. Provides secure authentication and data exchange with the Identity Provider (IdP).
SP certificate	Contents of the service provider (SP) certificate for SAML single sign-on (SSO) service setup.
Sign	Unmark the checkboxes to disable SAML signatures for the corresponding entities: *Messages* *Assertions* *AuthN requests* *Logout requests* *Logout responses*
Encrypt	Mark the checkboxes to select entities for which SAML encryption should be enabled: *Name ID* *Assertions*
Case-sensitive login	Unmark the checkbox to disable case-sensitive login for usernames (enabled by default). Disabling case-sensitive login allows, for example, logging in as ”admin” even if the Zabbix user is ”Admin” or ”ADMIN”. Please note that if case-sensitive login is disabled and there are multiple Zabbix users with similar usernames (e.g., Admin and admin), the login for those users will always be denied with the following error message: ”Authentication failed: supplied credentials are not unique.”
Configure JIT provisioning	Mark this checkbox to show options related to JIT user provisioning.
Group name attribute	Specify the group name attribute for JIT user provisioning.
User name attribute	Specify the user name attribute for JIT user provisioning.
User last name attribute	Specify the user last name attribute for JIT user provisioning.
User group mapping	Map a SAML user group pattern to Zabbix user group and user role. This is required to determine what user group/role the provisioned user will get in Zabbix. Click *Add* to add a mapping. The *SAML group pattern* field supports wildcards. The group name must match an existing group. If a SAML user matches several Zabbix user groups, the user becomes a member of all of them. If a user matches several Zabbix user roles, the user will get the highest permission level among them.
Media type mapping	Map the user’s SAML media attributes (e.g., email) to Zabbix user media for sending notifications.
Enable SCIM provisioning	Mark this checkbox to enable SCIM 2.0 provisioning.

See examples of configuring SAML identity providers for sign-in and user provisioning into Zabbix with:

- Microsoft Azure AD
- Okta
- Onelogin

Notes on SCIM provisioning

For SCIM provisioning specify the path to the Zabbix frontend and append `api_scim.php` to it, on the identity provider side, i.e.:

`https://<path-to-zabbix-ui>/api_scim.php`

User attributes that are used in Zabbix (username, user name, user lastname and media attributes) need to be added as custom attributes and, if necessary, external namespace should be the same as user schema: `urn:ietf:params:scim:schemas:core:2.0:User`.

Advanced settings

Additional SAML parameters can be configured in the Zabbix frontend configuration file (`zabbix.conf.php`):

- `$SSO['SP_KEY']`
- `$SSO['SP_CERT']`
- `$SSO['IDP_CERT']`
- `$SSO['SETTINGS']`

Configuration examples

Example 1: Connecting to a Zabbix instance with a load balancer using TLS/SSL

If a load balancer is used to connect to a Zabbix instance, and the load balancer uses TLS/SSL while Zabbix does not, specify the `baseurl`, `strict`, and `use_proxy_headers` parameters as follows:

```
$SSO['SETTINGS'] = [
    'strict' => false,
    'baseurl' => 'https://zabbix.example.com/zabbix/',
    'use_proxy_headers' => true
];
```

Example 2: Configuring custom SAML signature and digest algorithms

```
$SSO['SETTINGS'] = [
    'security' => [
        'signatureAlgorithm' => 'http://www.w3.org/2001/04/xmldsig-more#rsa-sha384'
        'digestAlgorithm' => 'http://www.w3.org/2001/04/xmldsig-more#sha384',
        // ...
    ],
    // ...
];
```

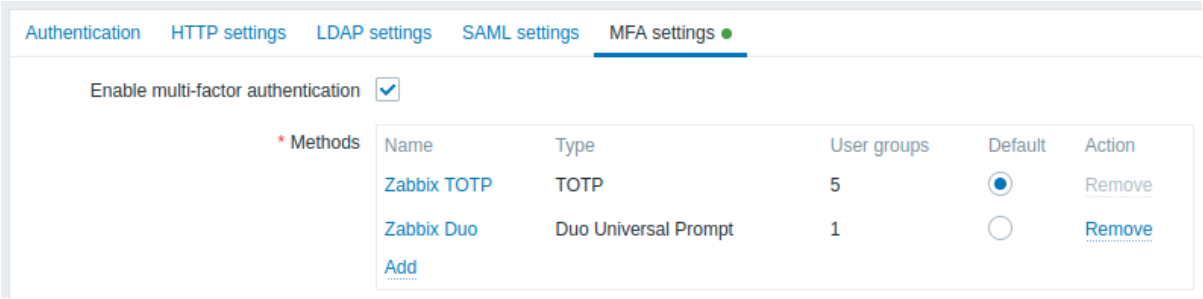
Example 3: Configuring SSO with Kerberos authentication using ADFS

```
$SSO['SETTINGS'] = [
    'security' => [
        'requestedAuthnContext' => [
            'urn:oasis:names:tc:SAML:2.0:ac:classes:Kerberos',
        ],
        'requestedAuthnContextComparison' => 'exact'
    ]
];
```

In this case, in the SAML configuration *SP name ID* field set:

```
urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified
```

MFA

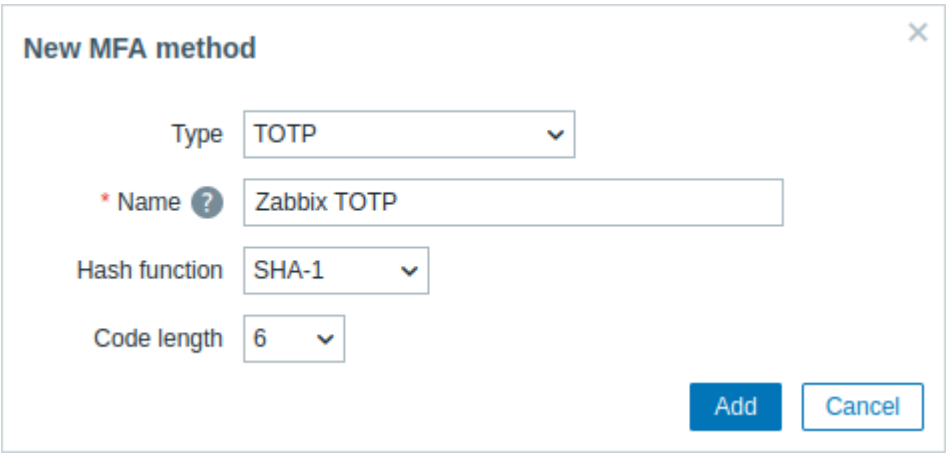


Overview

Multi-factor authentication (MFA) can be used to sign in to Zabbix, providing an additional layer of security beyond just a username and password.

With MFA, the user must exist in Zabbix, must provide Zabbix credentials when logging in, and must also prove their identity by other means, usually, a code generated by an authenticator app on the user's phone.

Multiple MFA methods are available, allowing users to choose the option that best fits their security requirements and preferences. These methods are Time-Based One-Time Password (TOTP) and Duo Universal Prompt.



Configuration

Configuration parameters:

Parameter	Description
Enable multi-factor authentication	Mark the checkbox to enable multi-factor authentication.
Methods	Click *Add* to configure an MFA method (see method configuration below).

Method configuration

Method configuration parameters:

Parameter	Description
Type	Select the type of MFA method: **TOTP** - use an authenticator app to generate time-based one-time passwords; **Duo Universal Prompt** - use the Duo authentication service to provide multi-factor authentication.
Name	Enter a name that is displayed as the account name to all MFA users in authenticator apps (for example, ”Zabbix”).
Hash function	Select the hash function (SHA-1, SHA-256, or SHA-512) for generating TOTP codes. This parameter is available if the MFA method type is set to ”TOTP”. Note that choosing SHA-256 or SHA-512 may significantly limit compatibility, as many applications currently do not support these functions.
Code length	Select the verification code length (6 or 8). This parameter is available if MFA method type is set to ”TOTP”.
API hostname	Enter the API hostname provided by the Duo authentication service. This parameter is available if MFA method type is set to ”Duo Universal Prompt”.
Client ID	Enter the client ID provided by the Duo authentication service. This parameter is available if MFA method type is set to ”Duo Universal Prompt”.
Client secret	Enter the client secret provided by the Duo authentication service. This parameter is available if MFA method type is set to ”Duo Universal Prompt”.

Configuration examples

This section provides examples of configuring MFA using Time-Based One-Time Password (TOTP) and Duo Universal Prompt.

TOTP

For TOTP, users must verify their identity using an authenticator app (for example, the Google Authenticator app).

1. Go to the MFA settings in Zabbix under *Users* > *Authentication* and enable multi-factor authentication.

2. Add a new MFA method with the following configuration:

    - Type: TOTP
    - Name: Zabbix TOTP
    - Hash function: SHA-1
    - Code length: 6

3. Click the *Add* button and then the *Update* button.

4. Go to *Users* > *User groups* and create a new user group with the following configuration:

    - Group name: TOTP group
    - Users: Admin
    - Multi-factor authentication: Default (or ”Zabbix TOTP” if it is not set as default)

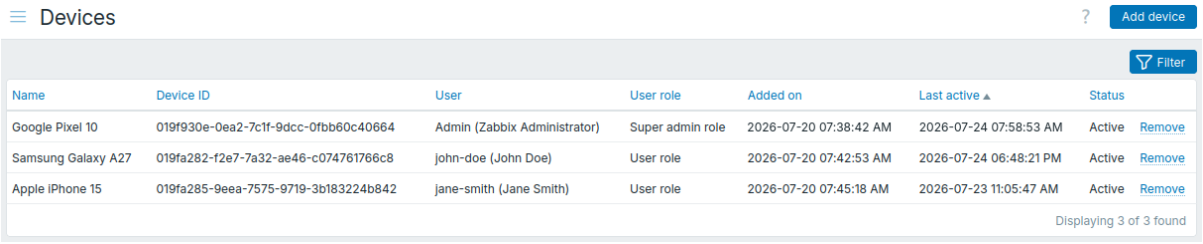
5. Log out of Zabbix and log back in using your credentials. Upon successful login, you will be prompted to enroll in MFA, displaying a QR code and a secret key.

6. Scan the QR code or enter the secret key into the Google Authenticator app. The app will generate a verification code which you should enter to complete the login process.

7. For subsequent logins, retrieve the verification code from the Google Authenticator app and enter it during login.

Duo Universal Prompt

For Duo Universal Prompt, users must verify their identity using the Duo Mobile authenticator app.



Attention:
The Duo Universal Prompt MFA method requires the installation of the php-curl extension, access to Zabbix over HTTPS, and permission for outbound connections to Duo servers. Moreover, if you have enabled Content Security Policy (CSP) on the web server, make sure to add "duo.com" to the CSP directive in your virtual host's configuration file.

1. Signup for a free Duo admin account at Duo Signup.
2. Open the Duo Admin Panel, go to *Applications* > *Protect an Application*, search for the *Web SDK* application, and click *Protect*.
3. Note the credentials (Client ID, Client secret, API hostname) required for configuring the MFA method in Zabbix.
4. Go to MFA settings in Zabbix under *Users* > *Authentication* and enable multi-factor authentication.
5. Add a new MFA method with the following configuration:
   - Type: Duo Universal Prompt
   - Name: Zabbix Duo
   - API hostname: (use API hostname from Duo)
   - Client ID: (use Client ID from Duo)
   - Client secret: (use Client secret from Duo)
6. Click the *Add* button and then the *Update* button.
7. Go to *Users* > *User groups* and create a new user group with the following configuration:
   - Group name: Duo group
   - Users: Admin
   - Multi-factor authentication: Default (or "Zabbix Duo" if it is not set as default)
8. Log out of Zabbix and log back in using your credentials. Upon successful login, you will be prompted to enroll in MFA and redirected to Duo. Complete the Duo setup and verify your user with your phone's Duo app to log in.
9. For subsequent logins, use the appropriate MFA method provided by the Duo app (such as retrieving a verification code, responding to push notifications, or using hard keys), and enter the required information during login.

Devices

This section lets Super admins manage mobile devices to be used with Zabbix mobile app.

This section is displayed if `EnableMobileDevices` is enabled.

To add a device:

1. Click *Add device*.
2. Select a user, then click *Add*. The user must have access to devices enabled.
3. A QR code appears. The user must scan this code in their Zabbix mobile app.

Note:
When you add a device for a user, Zabbix also adds the push notification media type to their user media. When you remove the device, that user media is also removed. If you have multiple push notification media types configured, Zabbix adds the one that is enabled and that comes first alphabetically.

Added devices appear in a list, which you can filter.

You can also remove devices. When you remove a device, its access credentials are revoked and removed from Zabbix, after which it can no longer access Zabbix.

The list shows these details:

Column	Description
Name	Device name.
Device ID	Device ID.
User	User that the device was added for, or *Inaccessible user* if this user has been deleted.
User role	User role.
Added on	Date and time when the device was added.
Last active	Date and time when the device was last active.
Status	Device status: **New** - device was added without scanning the QR code, and will need to be added again. **New (Token expired)** - device was added without scanning the QR code, and the token in the QR code has expired; the device will need to be added again. **Active** - device was added, the QR code was scanned, and it may use Zabbix mobile app. **Unassigned** - device was added, but its user was deleted, and it may not use Zabbix mobile app.

Users with enough permissions can also manage their own devices in *User settings* > *Devices*.

Administration

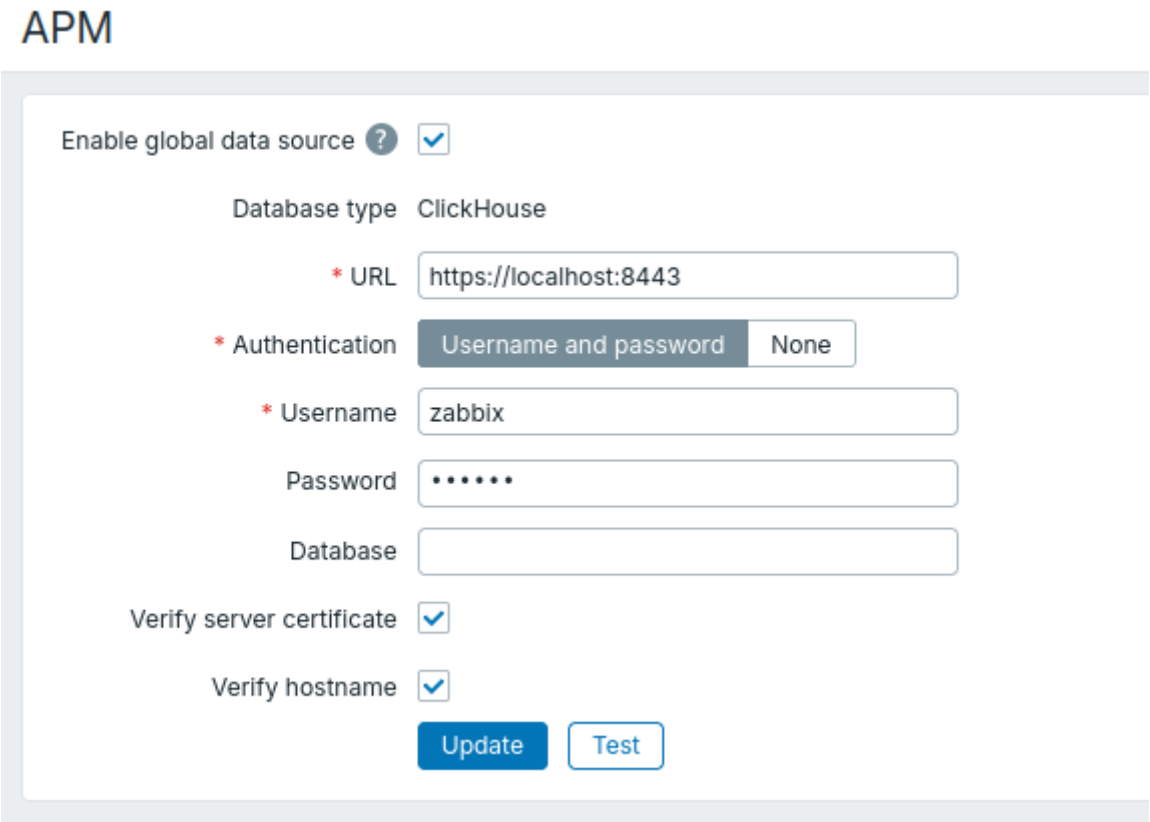
Overview

The Administration menu is for administrative functions of Zabbix. This menu is available to SuperAdmin user type users only.

Data source

Overview

The *Administration* > *Data source* section lets you specify the telemetry data source, that is, the database that holds telemetry data (traces, metrics, and logs). Telemetry data is used for application performance monitoring (APM), which helps you see how requests flow through your applications and services, measure their performance, and find the cause of slow or failed operations.



The telemetry data source must support OpenTelemetry.

The telemetry data source specified in this section is called the global data source, because it is shared by Zabbix server, proxy, and frontend. However, you can override it for any of these components by specifying a different telemetry data source in the server, proxy, or frontend configuration.

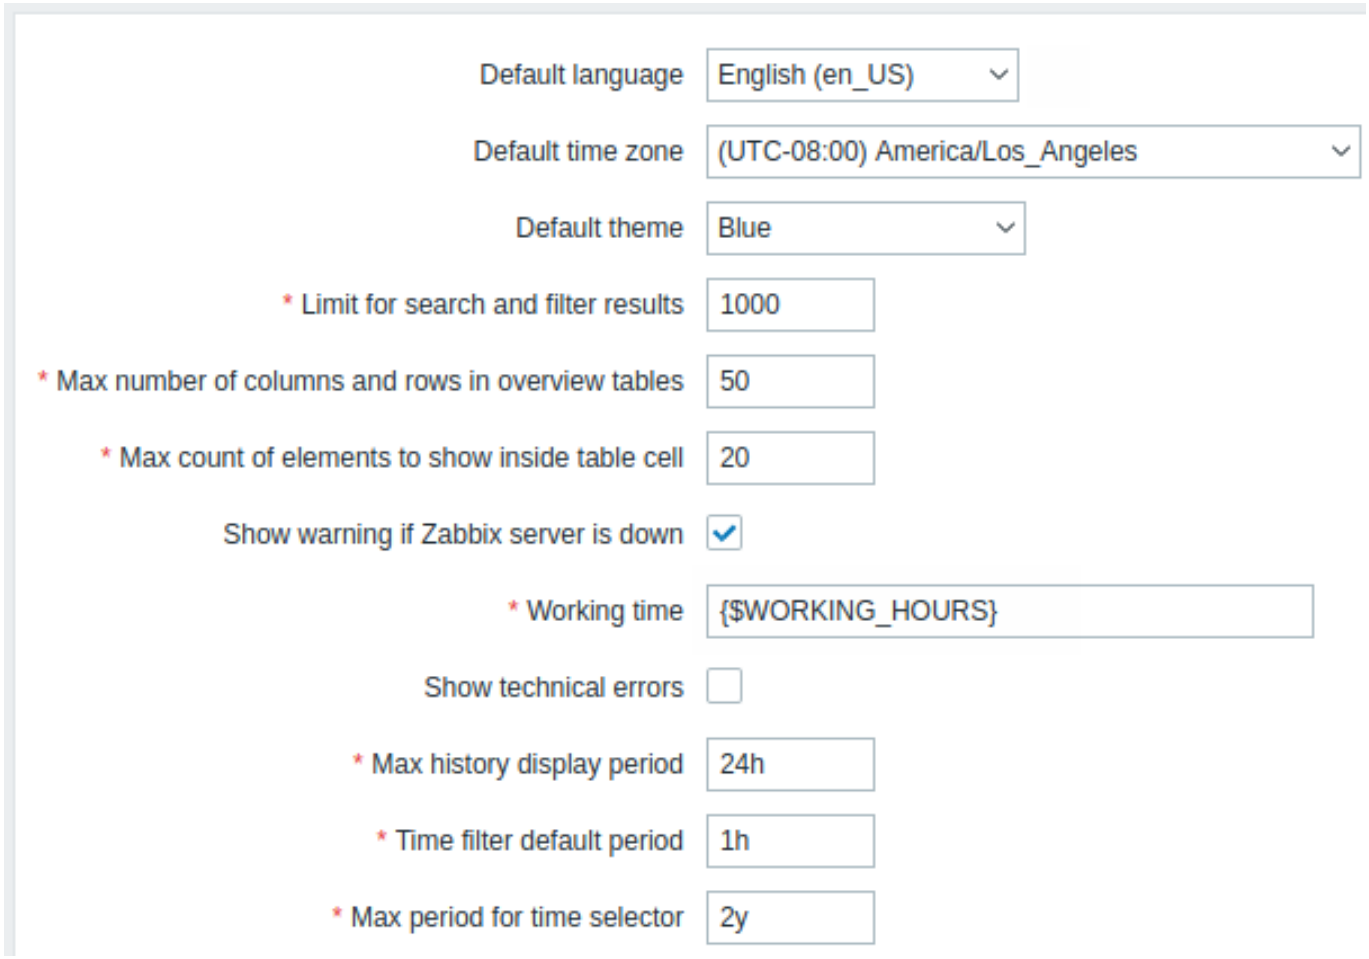
The telemetry query item queries this data source, unless a different one is specified in the component configuration.

APM

To specify the global data source, mark the *Enable global data source* checkbox and fill in the parameters described below. Before saving, you can click *Test* to check the connection to this data source (requires the php-curl extension).

Parameter	Description
Database type	The database type is hardcoded to *ClickHouse* and cannot be changed. See also: Requirements and ClickHouse setup.
URL	Enter the HTTP or HTTPS URL used to connect to the database.
Authentication	Select the authentication method used to log in to the database: *Username and password* or *None*.
Username	Specify the username used to log in to the database. This parameter is available if *Authentication* is set to *Username and password*.
Password	Specify the password used to log in to the database, or leave empty if the database user has no password. The password is reset when you change the URL. This parameter is available if *Authentication* is set to *Username and password*.
Database	Enter the name of the database that holds the telemetry data. If left empty, Zabbix uses the default database configured in ClickHouse for the user.
Verify server certificate	Mark the checkbox to verify the server certificate. If marked, the related TLS options must be set in the server, proxy, or frontend configuration. This parameter is available if *URL* contains an HTTPS URL.
Verify hostname	Mark the checkbox to verify that the hostname in *URL* matches the hostname in the server certificate. If marked, the related TLS options must be set in the server, proxy, or frontend configuration. This parameter is available if *URL* contains an HTTPS URL.

General



Overview

The *Administration* > *General* section contains a number of subsections for setting frontend-related defaults and customizing Zabbix.

The list of available subsections appears upon clicking *General* in the *Administration* menu section. It is also possible to switch between subsections by using the title dropdown in the upper-left corner.

GUI

This section provides customization of several frontend-related defaults.

Configuration parameters:

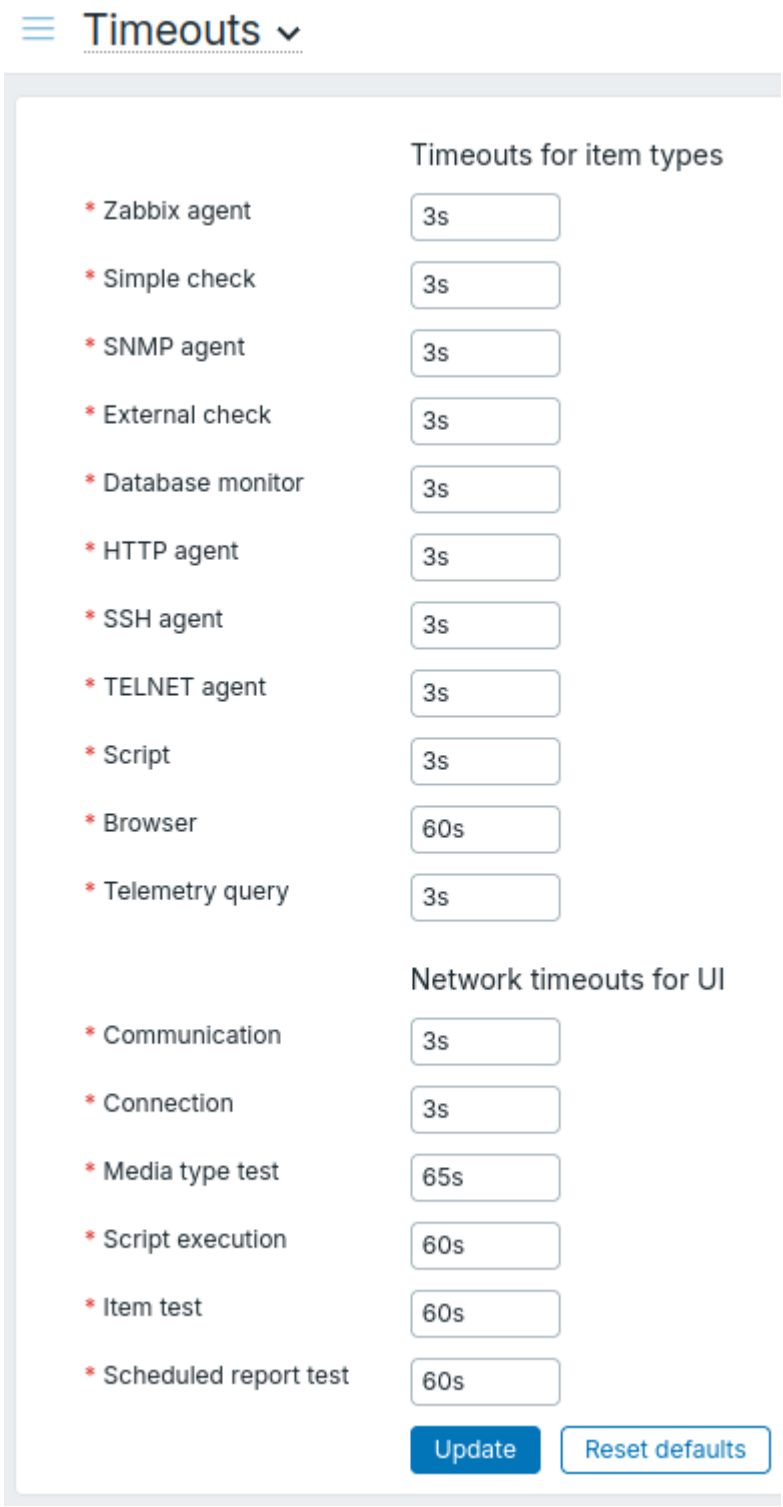
Parameter	Description
Default language	Default language for users who have not specified a language in their profiles and guest users. For more information, see Installation of additional frontend languages.
Default time zone	Default time zone for users who have not specified a time zone in their profiles and guest users.
Default theme	Default theme for users who have not specified a theme in their profiles and guest users.
Limit for search and filter results	Maximum amount of elements (rows) that will be displayed in a web-interface list, for example, in *Data collection > Hosts*. *Note*: If set to, for example, '50', only the first 50 elements will be displayed in all affected frontend lists. If some list contains more than fifty elements, the indication of that will be the '+' sign in *"Displaying 1 to 50 of **50+** found"*. Also, if filtering is used and still there are more than 50 matches, only the first 50 will be displayed. Note that increasing the value of this parameter may lead to decreased performance and increased memory consumption on the web server side.
Max number of columns and rows in overview tables	Maximum number of columns and rows to display in the *Trigger overview* dashboard widget. The same limit applies to both columns and rows. If more rows and/or columns than shown exist, the system will display a warning at the bottom of the table: "Not all results are displayed. Please provide more specific search criteria."
Max count of elements to show inside table cell	For entries that are displayed in a single table cell, no more than configured here will be shown.
Show warning if Zabbix server is down	This parameter enables a warning message to be displayed in a browser window if the Zabbix server cannot be reached (possibly down). The message remains visible even if the user scrolls down the page. When hovered over, the message is temporarily hidden to reveal the contents underneath it.
Working time	This system-wide parameter defines working hours. In graphs, working time is displayed as a white background and non-working time is displayed as gray. See Time period specification page for description of the time format. User macros are supported.

Parameter	Description
Show technical errors	If checked, all registered users will be able to see technical errors (PHP/SQL). If unchecked, the information is only available to Zabbix Super Admins and users belonging to the user groups with enabled debug mode.
Max history display period	Maximum time period for which to display historical data in *Monitoring* > *Latest data*, host web scenario information in *Monitoring* > *Hosts*, and in the *Top items* dashboard widget. Allowed range: 24 hours (default) - 1 week. Time suffixes, e.g., 1w (one week), 36h (36 hours), are supported.
Time filter default period	Time period to be used in graphs and dashboards by default. Allowed range: 1 minute - 10 years (default: 1 hour). Time suffixes, e.g., 10m (ten minutes), 5w (five weeks), are supported. Note: when a user changes the time period while viewing a graph, this time period is stored as user preference, replacing the global default or a previous user selection.
Max period for time selector	Maximum available time period for graphs and dashboards. Users will not be able to visualize older data. Allowed range: 1 year - 10 years (default: 2 years). Time suffixes, e.g., 1y (one year), 365w (365 weeks), are supported.

Autoregistration

In this section, you can configure the encryption level for active agent autoregistration.

Parameters marked with an asterisk are mandatory.



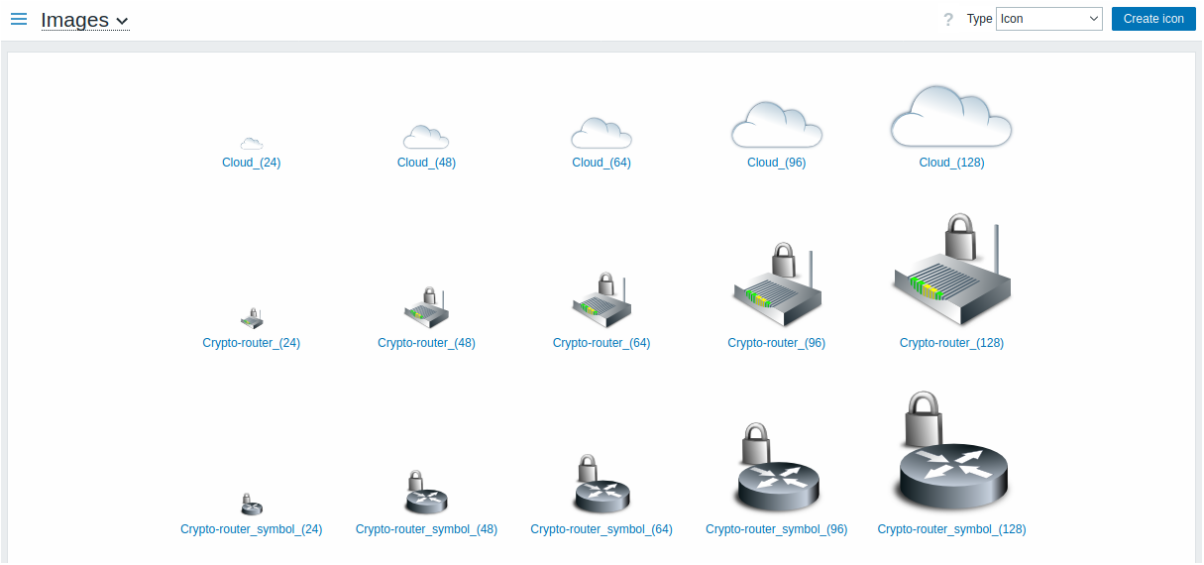
Configuration parameters:

Parameter	Description
Encryption level	Select one or both options for encryption level: **No encryption** - unencrypted connections are allowed **PSK** - TLS encrypted connections with a pre-shared key are allowed
PSK identity	Enter the pre-shared key identity string. This field is only available if 'PSK' is selected as *Encryption level*. Do not put sensitive information in the PSK identity, it is transmitted unencrypted over the network to inform a receiver which PSK to use.
PSK	Enter the pre-shared key (an even number of hexadecimal characters). Maximum length: 512 hex-digits (256-byte PSK) if Zabbix uses GnuTLS or OpenSSL library, 64 hex-digits (32-byte PSK) if Zabbix uses mbed TLS (PolarSSL) library. Example: 1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952 This field is only available if 'PSK' is selected as *Encryption level*.

See also: Secure autoregistration

Timeouts

In this section, it is possible to set global item-type timeouts and network timeouts. All fields in this form are mandatory.



Parameter	Description
Timeouts for item types	How many seconds Zabbix should wait before aborting the check (based on its type). For additional details and limitations, see item timeout. Allowed range: 1 - 600s (default: 3s; default for browser items: 60s). Time suffixes, e.g., 30s, 1m, and user macros are supported. Note that proxy-level timeouts, if configured, override these global settings. Furthermore, if timeouts for specific items are configured, they override both global and proxy settings.
Network timeouts for UI	
Communication	How many seconds to wait before closing an idle socket (if a connection to Zabbix server has been established earlier, but frontend cannot finish data reading/sending operation during this time, the connection will be dropped). Allowed range: 1 - 300s (default: 3s).

Parameter		Description
	Connection	How many seconds to wait before stopping an attempt to connect to Zabbix server. Allowed range: 1 - 30s (default: 3s).
	Media type test	How many seconds to wait for a response when testing a media type. Allowed range: 1 - 300s (default: 65s).
	Script execution	How many seconds to wait for a response when executing a script. Allowed range: 1 - 300s (default: 60s). This timeout is for the entire script execution chain, which can be of various length. For example, if the script is executed on the agent, it is a roundtrip through server (possibly also proxy) to the agent and back. For scripts that are executed on the agent, the server or proxy timeout applies. For scripts that are executed on an active agent only, it is likely that the default server/proxy timeout must be raised. The server/proxy timeout must be higher than the active check refresh frequency; otherwise, the server/proxy timeout may be exceeded before the active agent even receives the script. See also: Script timeout.
	Item test	How many seconds to wait for returned data when testing an item. Allowed range: 1 - 600s (default: 60s).
	Scheduled report test	How many seconds to wait for returned data when testing a scheduled report. Allowed range: 1 - 300s (default: 60s).

Images

The Images section displays all the images available in Zabbix. Images are stored in the database.

The *Type* dropdown allows you to switch between icon and background images:

- Icons are used to display network map elements.
- Backgrounds are used as background images of network maps.

Adding image

You can add your own image by clicking the *Create icon* or *Create background* button in the upper-right corner.

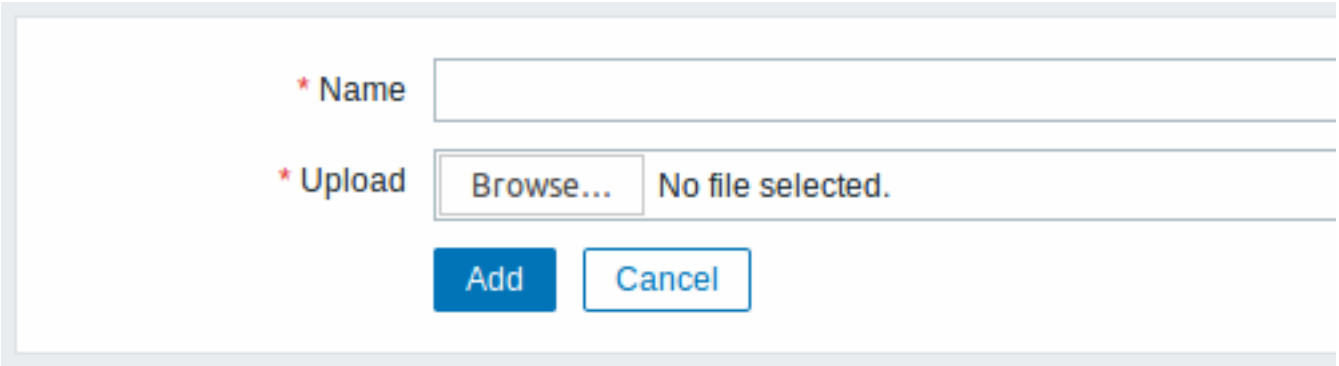


Image attributes:

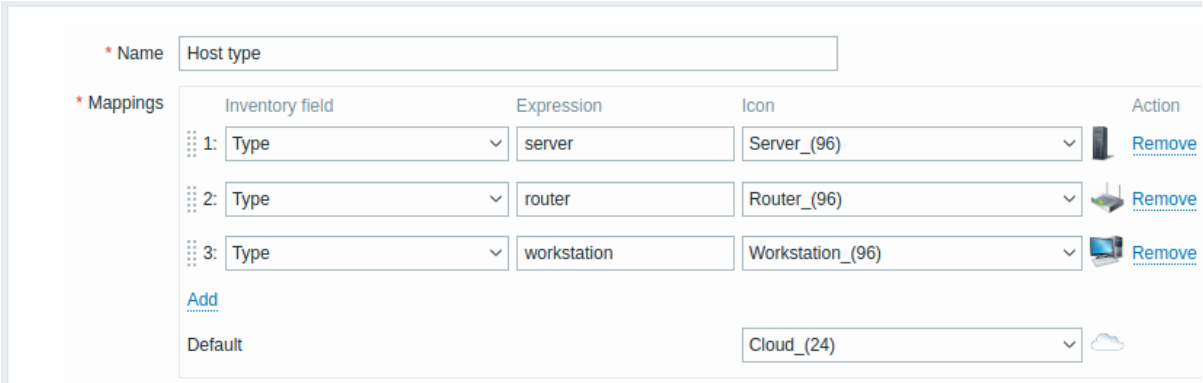
Parameter	Description
Name	Unique name of an image.
Upload	Select the file (PNG, JPEG, GIF, or WebP) from a local system to be uploaded to Zabbix. *Note* that it may be possible to upload other formats that will be converted to PNG during upload. GD library is used for image processing, therefore formats that are supported depend on the library version used (2.0.28 or higher is required by Zabbix).



Note:
Maximum size of the upload file is limited by the value of `ZBX_MAX_IMAGE_SIZE` that is 1024x1024 bytes or 1 MB.
The upload of an image may fail if the image size is close to 1 MB and the `max_allowed_packet` MySQL configuration parameter is at a default of 1MB. In this case, increase the `max_allowed_packet` parameter.

Icon mapping

This section allows creating the mapping of certain hosts with certain icons. Host inventory field information is used to create the mapping.

The mappings can then be used in network map configuration to assign appropriate icons to matching hosts automatically.

To create a new icon map, click *Create icon map* in the upper-right corner.

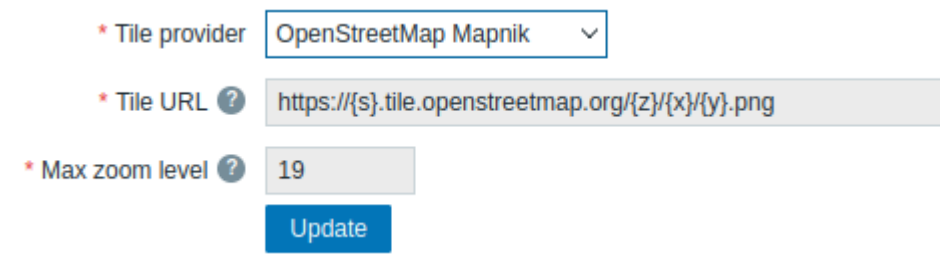
Configuration parameters:

Parameter	Description
Name	Unique name of icon map.
Mappings	A list of mappings. The order of mappings determines which one will have priority. You can move mappings up and down the list with drag-and-drop.
Inventory field	Host inventory field that will be looked into to seek a match.
Expression	Regular expression describing the match.
Icon	Icon to use if a match for the expression is found.
Default	Default icon to use.

Regular expressions

This section allows creating custom regular expressions that can be used in several places in the frontend. See Regular expressions section for details.

Trigger displaying options



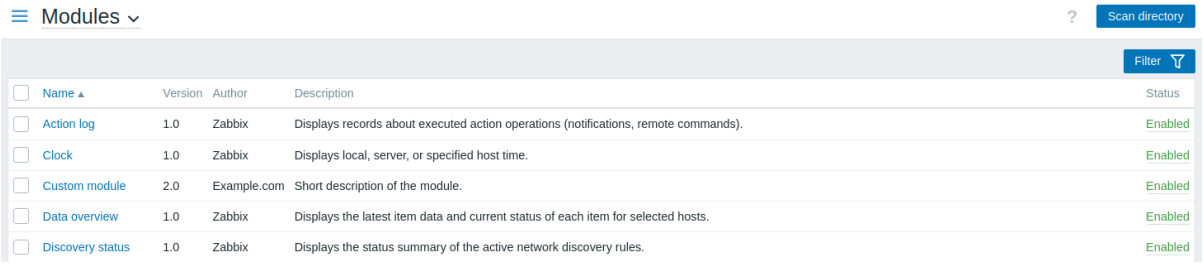
This section allows customizing how trigger state is displayed in the frontend and trigger severity names and colors.

Parameter	Description
Use custom event status colors	Checking this parameter turns on the customization of colors for acknowledged/unacknowledged problems.
Unacknowledged PROBLEM events, *Acknowledged PROBLEM events*, *Unacknowledged RESOLVED events*, *Acknowledged RESOLVED events*	Enter new color code or click the color to select a new one from the provided palette. If *blinking* checkbox is marked, triggers will blink for some time upon the change of state to become more visible.
Display OK triggers for	Time period for displaying OK triggers. Allowed range: 0 - 24 hours. Time suffixes, e.g., 5m, 2h, 1d, are supported.
On status change triggers blink for	Length of trigger blinking. Allowed range: 0 - 24 hours. Time suffixes, e.g., 5m, 2h, 1d, are supported.
Not classified, *Information*, *Warning*, *Average*, *High*, *Disaster*	Custom severity names and/or colors to display instead of system default. Enter new color code or click the color to select a new one from the provided palette. Note that custom severity names entered here will be used in all locales. If you need to translate them to other languages for certain users, see Customizing trigger severities page.

Geographical maps

This section allows selecting geographical map tile service provider and configuring service provider settings for the Geomap dashboard widget. To provide visualization using the geographical maps, Zabbix uses open-source JavaScript interactive maps library Leaflet. Please note that Zabbix has no control over the quality of images provided by third-party tile providers, including the predefined tile providers.

Parameter	Description
Tile provider	Select one of the available tile service providers or select *Other* to add another tile provider or self-hosted tiles (see Using a custom tile service provider).
Tile URL	The URL template (up to 2048 characters) for loading and displaying the tile layer on geographical maps. This field is editable only if *Tile provider* is set to *Other*. The following placeholders are supported: *{s}* represents one of the available subdomains; *{z}* represents zoom level parameter in the URL; *{x}* and *{y}* represent tile coordinates; *{r}* can be used to add "@2x" to the URL to load retina tiles. Example: `https://{s}.example.com/{z}/{x}/{y}{r}.png`
Attribution text	Tile provider attribution text to be displayed in a small text box on the map. This field is visible only if *Tile provider* is set to *Other*.
Max zoom level	Maximum zoom level of the map. This field is editable only if *Tile provider* is set to *Other*.

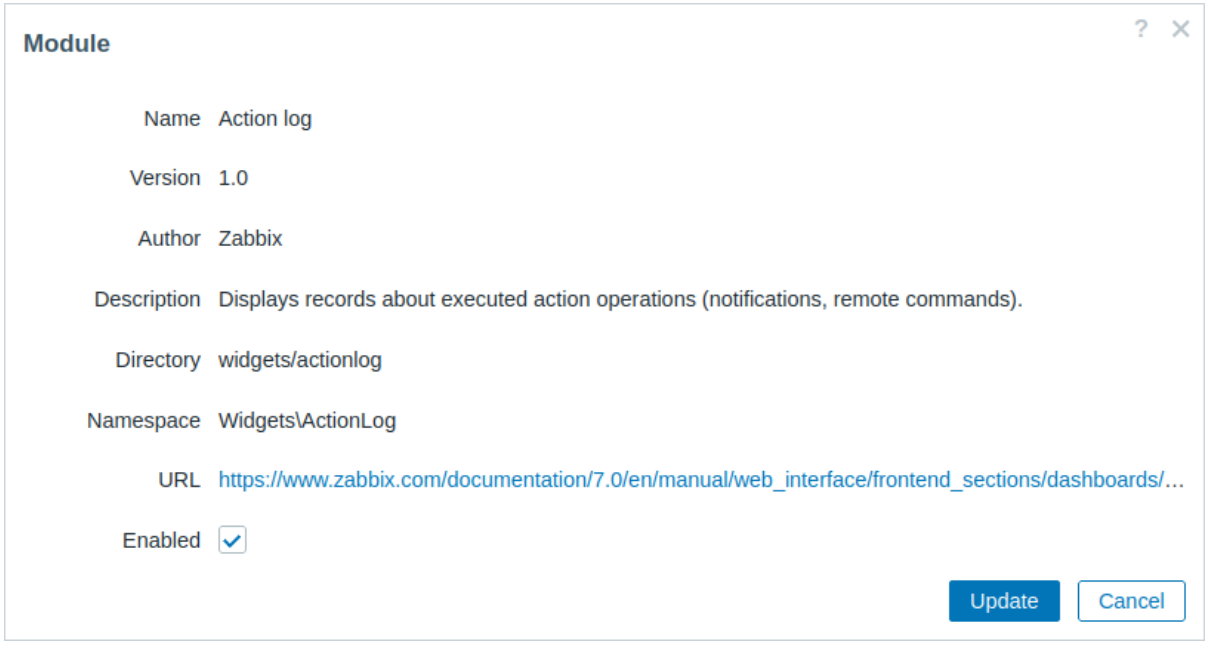


Using a custom tile service provider

The Geomap widget is capable to load raster tile images from a custom self-hosted or a third-party tile provider service. To use a custom third-party tile provider service or a self-hosted tile folder or server, select *Other* in the *Tile provider* field and specify the custom URL in the *Tile URL* field using proper placeholders.

Modules

This section allows you to administer custom, as well as built-in frontend modules.

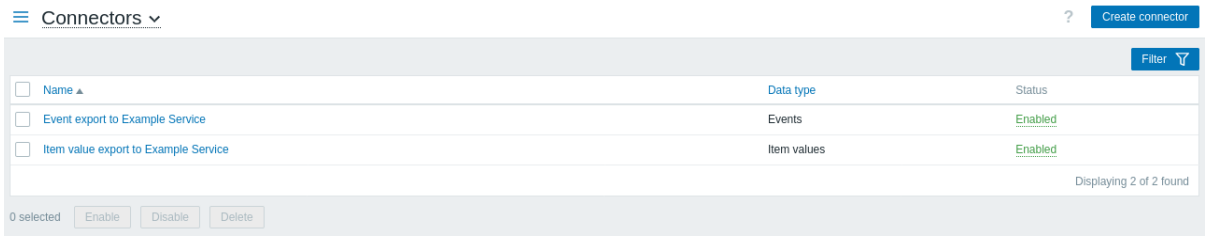


Note:
If the `$ZBX_FEATURE_FLAGS['modules_config_enabled']` feature flag is set to `false` in the frontend configuration file, access to this section is disabled.

Click *Scan directory* to register/unregister any custom modules. Registered modules will appear in the list; unregistered modules will be removed from the list.

Click the module status in the list to enable/disable a module. You may also mass enable/disable modules by selecting them in the list and then clicking the *Enable/Disable* buttons below the list.

Click the module name in the list to view its details in a pop-up window.



Module status can also be updated in the module details pop-up window; to do this, mark/unmark the *Enabled* checkbox and then click *Update*.

You may filter modules by name or status (enabled/disabled).

Connectors

This section allows you to configure connectors for Zabbix data streaming to external systems over HTTP.

Click *Create connector* to configure a new connector.

You may filter connectors by name or status (enabled/disabled). Click the connector status in the list to enable/disable a connector. You may also mass enable/disable connectors by selecting them in the list and then clicking the *Enable/Disable* buttons below the list.

Other

This section allows configuring miscellaneous other frontend parameters.

Parameter	Description
Frontend URL	URL (up to 2048 characters) to Zabbix web interface. This parameter is used by Zabbix web service for communication with frontend and should be specified to enable scheduled reports.
Group for discovered hosts	Hosts discovered by network discovery and agent autoregistration will be automatically placed in the host group, selected here.
Default host inventory mode	Default mode for host inventory. It will be followed whenever a new host or host prototype is created by server or frontend unless overridden during host discovery/autoregistration by the *Set host inventory mode* operation.

Parameter	Description
User group for database down message	User group for sending the database down alarm message. Zabbix server depends on the availability of the backend database. It cannot work without a database. If the database is down, selected users can be notified by Zabbix. Notifications will be sent to the user group set here using the enabled user media entries. Notifications are transmitted using the following media types (when enabled): email; SMS; custom alert scripts. Even if a webhook media entry is configured and enabled, it will not trigger notifications. Zabbix server will not stop; it will wait until the database is back again to continue processing. Notification consists of the following content: `[MySQL|PostgreSQL] database <DB Name> [on <DB Host>:<DB Port>] is not available: <error message depending on the type of DBMS (database)>` <DB Host> is not added to the message if it is defined as an empty value and <DB Port> is not added if it is the default value ("0"). The alert manager (a special Zabbix server process) tries to establish a new connection to the database every 10 seconds. If the database is still down the alert manager repeats sending alerts, but not more often than every 15 minutes.
Log unmatched SNMP traps	Log SNMP trap if no corresponding SNMP interfaces have been found.

Authorization

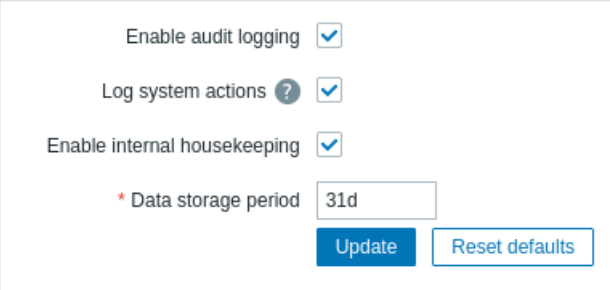
Parameter	Description
Login attempts	Number of unsuccessful login attempts before the possibility to log in gets blocked.
Login blocking interval	Period of time for which logging in will be prohibited when *Login attempts* limit is exceeded. Allowed range: 30 - 3600 seconds. Time suffixes, e.g., 90s, 5m, 1h, are supported.

Storage of secrets

Parameter	Description
Vault provider	Select the secret management software for storing user macro values - *HashiCorp Vault* (default) or *CyberArk Vault*.
Resolve secret vault macros by	Resolve secret vault macros by: **Zabbix server** - secrets are retrieved by Zabbix server and forwarded to proxies when needed (default); **Zabbix server and proxy** - secrets are retrieved by both Zabbix server and proxies, allowing them to resolve macros independently.

See also: Storage of secrets.

Security



Parameter	Description
Validate URI schemes	Unmark this checkbox to disable URI scheme validation (enabled by default). If marked, you can specify a comma-separated list of allowed URI schemes (default: http,https,ftp,file,mailto,tel,ssh). Applies to all fields in the frontend where URIs are used (for example, map element URLs).
Use X-Frame-Options HTTP header	Unmark this checkbox to disable the HTTP X-Frame-options header (not recommended). If marked, you can specify the value of the HTTP X-Frame-options header. Supported values: **SAMEORIGIN** (default) or **'self'** (must be single-quoted) - the page can only be displayed in a frame on the same origin as the page itself; **DENY** or **'none'** (must be single-quoted) - the page cannot be displayed in a frame, regardless of the site attempting to do so; **a string of space-separated hostnames**; adding **'self'** (must be single-quoted) to the list allows the page to be displayed in a frame on the same origin as the page itself. Note that using **'self'** or **'none'** without single quotes will result in them being regarded as hostnames.

Parameter	Description
Use iframe sandboxing	Unmark this checkbox to disable putting the retrieved URL content into sandbox (not recommended). If marked, you can specify the iframe sandboxing exceptions; unspecified restrictions will still be applied. If this field is empty, all sandbox attribute restrictions apply. For more information, see the description of the `sandbox` attribute.

Audit log

Overview

This section allows configuring audit log settings.

The following parameters are available:

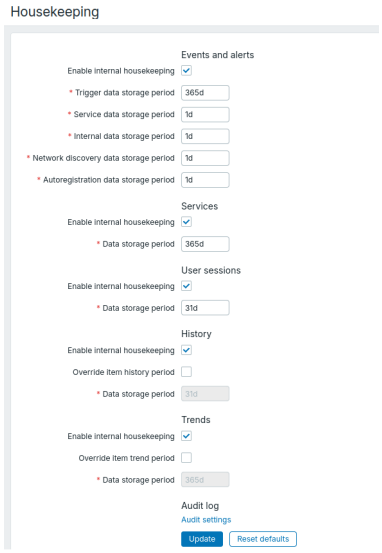
Parameter	Description
Enable audit logging	Enable (default) or disable audit logging.
Log system actions	Enable (default) or disable audit logging of low-level discovery, network discovery and autoregistration activities performed by the server (System user).
Enable internal housekeeping	Enable (default) or disable internal housekeeping for audit log records.
Data storage period	Amount of days audit log records should be kept before being removed by the housekeeper. Mandatory if housekeeping is enabled. Default: 31 days.

The audit log compression parameters are available in the *Administration* > *Housekeeping* section, within the *History, trends and audit log compression* block, which becomes visible when TimescaleDB is used.

Housekeeping

Overview

The *Administration* > *Housekeeping* section lets you configure Zabbix internal housekeeping that automatically removes outdated or user-deleted data from the database. This prevents the database from growing indefinitely, which would consume unnecessary disk space and degrade database performance.



Housekeeping can be enabled and configured for the following types of data:

- Events and alerts from triggers, services, internal data, network discovery, and autoregistration
- Services
- User sessions
- History and trends for items

Note:
Audit log housekeeping is configured separately.

Configuration

The following parameters are available:

Parameter	Description
Enable internal housekeeping	Enable or disable internal housekeeping (enabled by default). If enabled, the housekeeping procedure automatically removes data from the database that exceeds the *Data storage period*.
Data storage period	Specify how long to keep data before it is removed by the housekeeper. Mandatory if internal housekeeping is enabled. Range: 1 day (1 hour for history) - 25 years; or "0". Time suffixes (e.g., 1d, 1w) are supported. For *Events and alerts*, the data storage period is set separately for triggers, services, internal data, network discovery, and autoregistration. The housekeeper removes only those events that are not associated with problems. For example, a problem/recovery event older than *Data storage period* will not be removed if it's associated with an unresolved problem. When the housekeeper removes outdated entities, it first removes problems, then events. For *History* and *Trends*, the data storage periods also determine how long data remains visible in *Monitoring* > *Latest data*, even if internal housekeeping is disabled. Note that when an item or trigger is deleted, its problems and associated events are also deleted.
Override item history period	If enabled, the history/trend storage period specified in the item configuration is overridden by the *Data storage period* setting (except for items with the *Do not store* option enabled). This option can be used even when internal housekeeping is disabled and an external housekeeper is used.
Override item trend period	

If using **ClickHouse**, the *ClickHouse data storage period* section becomes available. It shows the data storage period for each item value type. To change the period, see Configuring ClickHouse data storage period. Note that the housekeeper does not delete data from ClickHouse.

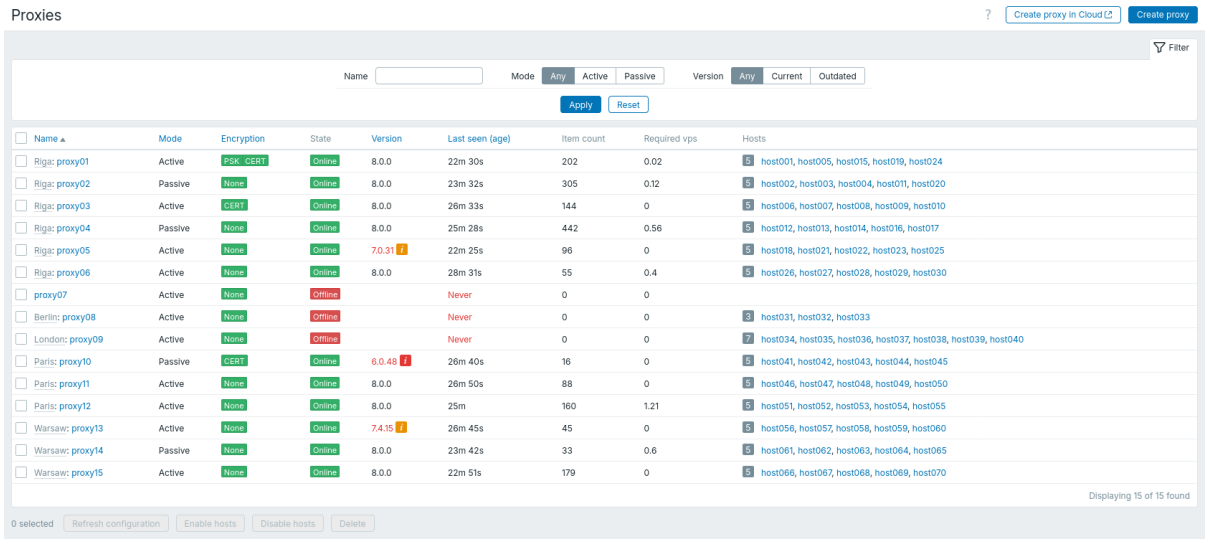
If using **Elasticsearch**, the *Elasticsearch data storage period* section becomes available. It shows the item value types saved in Elasticsearch, with the data storage period displayed as *Unknown*. To control how long data is kept, see Index Lifecycle Management. Note that the housekeeper does not delete data from Elasticsearch.

If using **TimescaleDB**, the *History, trends and audit log compression* section becomes available.

Note:
For TimescaleDB, enable *Override item history period*, *Override item trend period*, and *Enable internal housekeeping* for history and trends to fully benefit from automatic partitioning. If these options are disabled, data kept in history and trends tables will still be partitioned, but the housekeeper will not drop outdated partitions, and configuration warnings will appear. When dropping of outdated partitions is enabled, Zabbix server and frontend will no longer track deleted items, and history for those items will be cleared when an outdated partition is deleted.

The housekeeper is executed automatically every hour by default. You can change the execution frequency by setting the `HousekeepingFrequency` Zabbix server configuration parameter.

The *Reset defaults* button lets you revert any changes made.



Proxies

Overview

In the *Administration* > *Proxies* section proxies for distributed monitoring can be configured in the Zabbix frontend.

Proxies

A listing of existing proxies with their details is displayed.

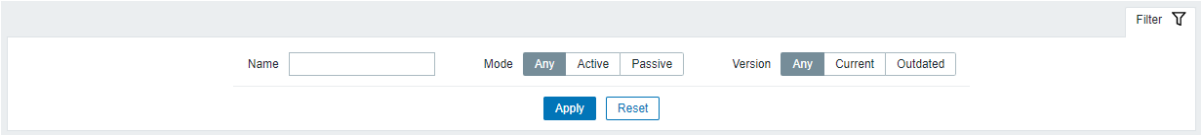
Displayed data:

Column	Description
Name	Name of the proxy. Clicking the proxy name opens the proxy configuration form. If the proxy belongs to a proxy group, the group name is displayed before the proxy name as a gray link. Clicking the group name opens the proxy group configuration form.
Mode	Proxy mode - *Active* or *Passive*.
Encryption	Encryption status for connections from the proxy: **None** - no encryption; **PSK** - using pre-shared key; **Cert** - using certificate.
State	State of the proxy: **Unknown** - proxy was created while Zabbix server was down, or server has not yet updated the state; **Online** - proxy has communicated with Zabbix server (passive proxy responded to server request; active proxy sent request) within the failover period; **Offline** - proxy has not communicated with Zabbix server within the failover period.
Version	Proxy version (three digit version number). If proxy is outdated or unsupported, version number is highlighted (red) and info status icon (yellow or red) is displayed. Hover over the icon for details.
Last seen (age)	The time when the proxy was last seen by the server.
Item count	The number of enabled items on enabled hosts assigned to the proxy.
Required vps	Required proxy performance (the number of values that need to be collected per second).
Hosts	Count of enabled hosts assigned to the proxy and a list of hosts monitored by the proxy. Clicking the host name opens the host configuration form.

To configure a new proxy, click the *Create proxy* button in the upper-right corner. To deploy a new proxy in Zabbix Cloud, click the *Create proxy in Cloud* button next to it. This opens Zabbix Cloud in a new browser tab, where you can create a proxy node. Once the proxy node is created, configure the proxy using the *Create proxy* button. For more information, see Set up a Zabbix Cloud proxy.

Mass editing options

Buttons below the list offer some mass-editing options:



- *Refresh configuration* - refresh configuration of the proxies;
- *Enable hosts* - change the status of hosts monitored by the proxy to *Monitored*;
- *Disable hosts* - change the status of hosts monitored by the proxy to *Not monitored*;
- *Delete* - delete the proxies.

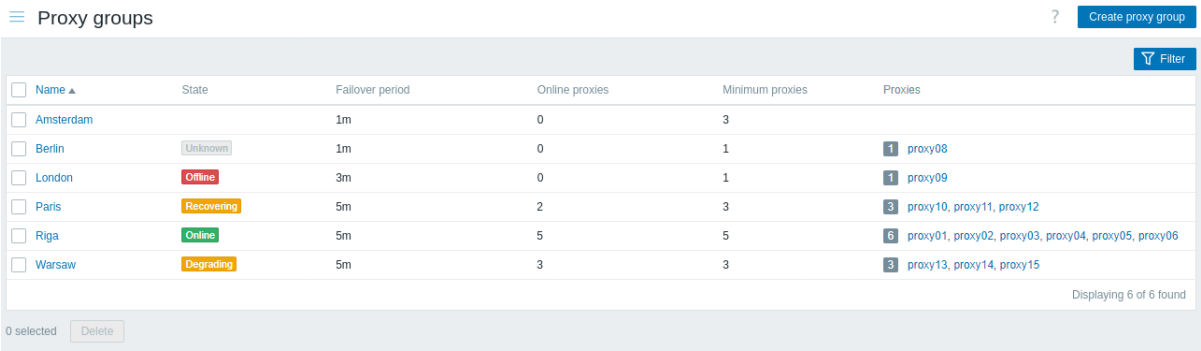
To use these options, mark the checkboxes before the respective proxies, then click the required button.

Using filter

You can use the filter to display only the proxies you are interested in. For better search performance, data is searched with macros unresolved.

The *Filter* link is available above the list of proxies. If you click it, a filter becomes available where you can filter proxies by name, mode and version. Note that the filter option *Outdated* displays both outdated (partially supported) and unsupported proxies.

Proxy groups



Overview

In *Administration* > *Proxy groups* it is possible to configure proxy groups.

Proxy groups are used in proxy load balancing with automated distribution of hosts between proxies and high availability between proxies.

Proxy groups

A listing of existing proxy groups with their details is displayed.

Displayed data:

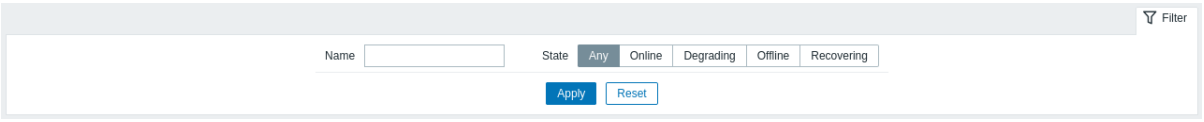
Column	Description
Name	Name of the proxy group. Clicking the proxy group name opens the proxy group configuration form.
State	State of the proxy group (displayed if group contains at least one proxy): **Unknown** - group was created while Zabbix server was down, or server has not yet updated the state; **Online** - minimum number of proxies have communicated with Zabbix server within the failover period; **Degrading** - group is going offline shortly due to online proxies falling below the *Minimum proxies* threshold; **Offline** - fewer than minimum number of proxies have communicated with Zabbix server within the failover period; **Recovering** - group is coming back online shortly due to online proxies reaching the *Minimum proxies* threshold. Proxy group state can be monitored with zabbix[proxy group,<name>,state] and zabbix[proxy group,discovery] items.

Column	Description
Failover period	Period during which a proxy in the proxy group must communicate with Zabbix server to be considered online.
Online proxies	Number of online proxies (displayed in red if below the group minimum).
Minimum proxies	Minimum number of online proxies required to keep the proxy group online.
Proxies	Count of proxies in the group and a list of proxies in the group, with links to the proxy configuration form. The maximum number of listed proxies is limited by the *Max count of elements to show inside table cell* value.

To configure a new proxy group, click the *Create proxy groups* button in the upper-right corner.

Mass editing options

Buttons below the list offer some mass-editing options:

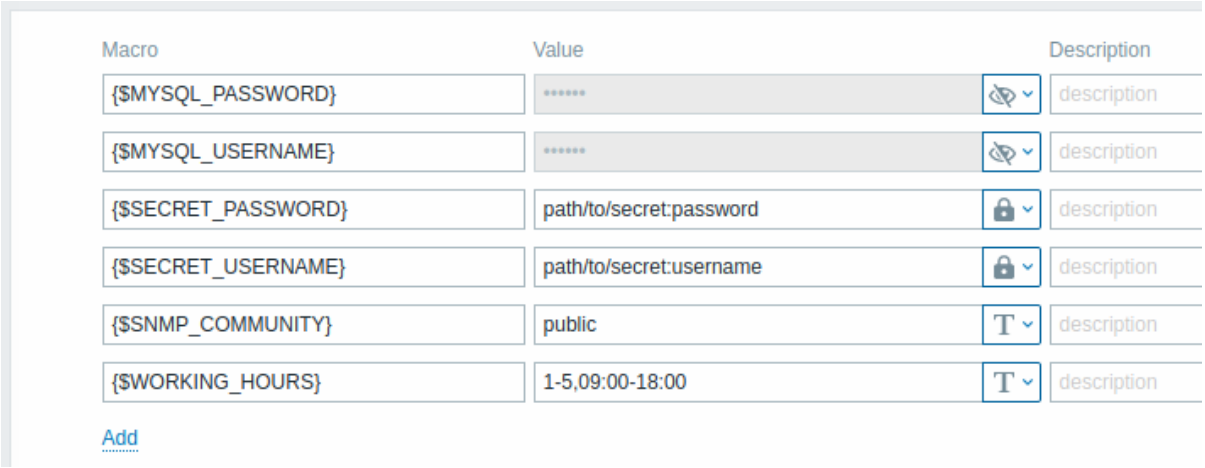


- *Delete* - delete the proxy groups.

To use these options, mark the checkboxes before the respective proxy groups, then click the required button.

Using filter

You can use the filter to display only the proxy groups you are interested in. For better search performance, data is searched with macros unresolved.



The *Filter* link is available above the list of proxy groups. If you click it, a filter becomes available where you can filter proxy groups by name and status.

Macros

Overview

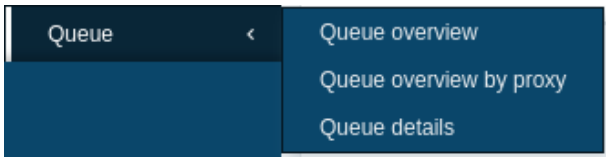
This section allows you to define system-wide user macros as name-value pairs. Note that macro values can be kept as plain text, secret text or Vault secret. Adding a description is also supported.

Queue

Overview

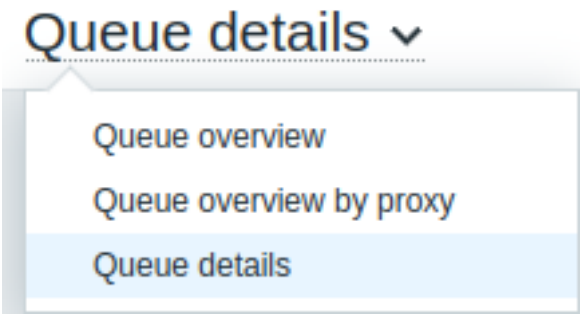
In the *Administration* > *Queue* section items that are waiting to be updated are displayed.

Ideally, when you open this section it should all be ”green” meaning no items in the queue. If all items are updated without delay, there are none waiting. However, due to lacking server performance, some items may get delayed and the information is displayed in this section. For more details, see the Queue section.



Note:
The Zabbix proxy is not aware of maintenance periods; see Calculation of queues during maintenance for details.

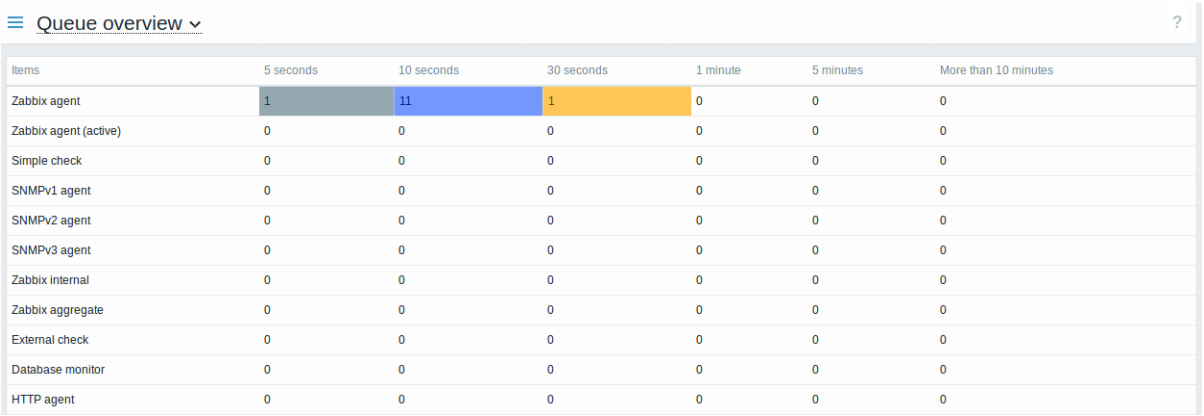
Note:
The queue is available only if Zabbix server is running. Items are not counted in the queue if the item interface becomes unavailable due to connection problems or agent not working properly.



The *Administration* > *Queue* section contains the following pages:

- Queue overview - displays queue by item type;
- Queue overview by proxy - displays queue by proxy;
- Queue details - displays a list of delayed items.

The list of available pages appears upon clicking *Queue* in the *Administration* menu section. It is also possible to switch between pages by using a title dropdown in the upper-left corner.

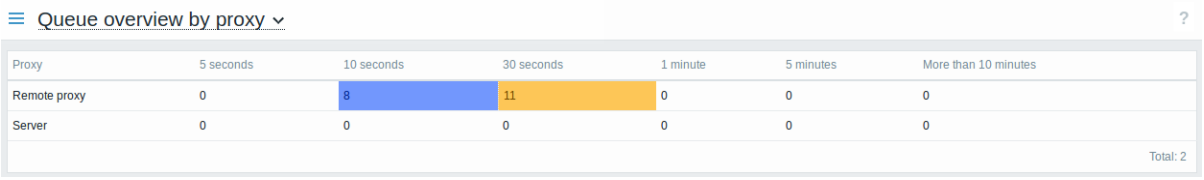


Third-level menu.

Title dropdown.

Overview by item type

In this screen it is easy to locate if the problem is related to one or several item types.



Queue overview

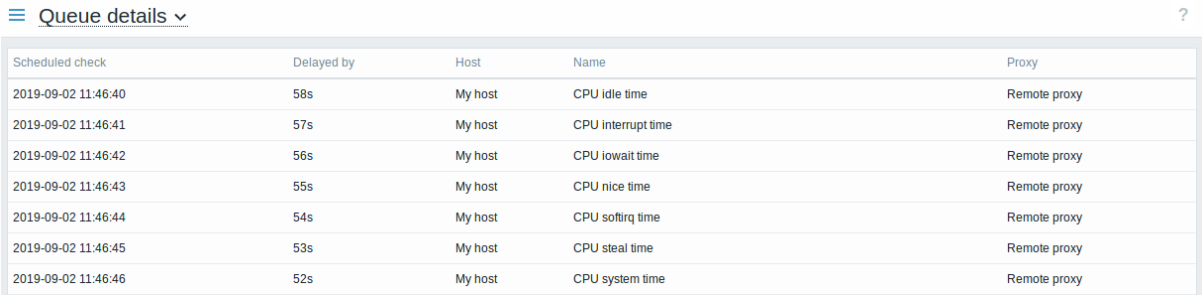
Items	5 seconds	10 seconds	30 seconds	1 minute	5 minutes	More than 10 minutes
Zabbix agent	1	11	1	0	0	0
Zabbix agent (active)	0	0	0	0	0	0
Simple check	0	0	0	0	0	0
SNMPv1 agent	0	0	0	0	0	0
SNMPv2 agent	0	0	0	0	0	0
SNMPv3 agent	0	0	0	0	0	0
Zabbix internal	0	0	0	0	0	0
Zabbix aggregate	0	0	0	0	0	0
External check	0	0	0	0	0	0
Database monitor	0	0	0	0	0	0
HTTP agent	0	0	0	0	0	0

Each line contains an item type. Each column shows the number of waiting items - waiting for 5-10 seconds/10-30 seconds/30-60 seconds/1-5 minutes/5-10 minutes or over 10 minutes respectively.

Overview by proxy

In this screen it is easy to locate if the problem is related to one of the proxies or the server.

Queue overview by proxy



Proxy	5 seconds	10 seconds	30 seconds	1 minute	5 minutes	More than 10 minutes
Remote proxy	0	8	11	0	0	0
Server	0	0	0	0	0	0

Total: 2

Each line contains a proxy, with the server last in the list. Each column shows the number of waiting items - waiting for 5-10 seconds/10-30 seconds/30-60 seconds/1-5 minutes/5-10 minutes or over 10 minutes respectively.

List of waiting items

In this screen, each waiting item is listed.

Displayed data:

Column	Description
Scheduled check	The time when the check was due is displayed.
Delayed by	The length of the delay is displayed.
Host	Host of the item is displayed.
Name	Name of the waiting item is displayed.
Proxy	The proxy name is displayed, if the host is monitored by proxy.

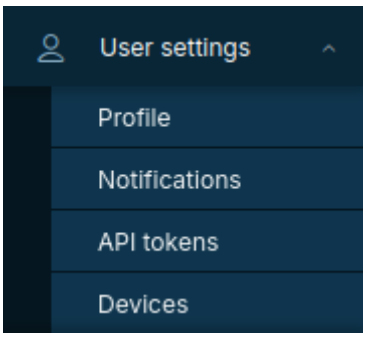
Possible error messages

You may encounter a situation when no data is displayed and the following error message appears:

Error message in this case is the following:

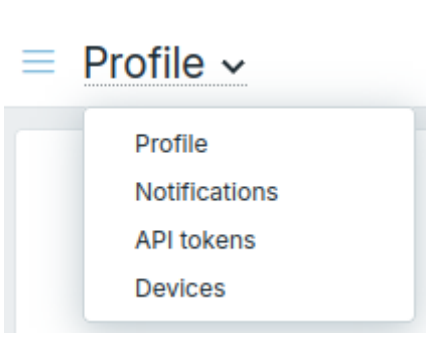
```
Cannot display item queue. Permission denied
```

This happens when the PHP configuration parameters in the frontend configuration file file - `$ZBX_SERVER` or both `$ZBX_SERVER` and `$ZBX_SERVER_PORT` - point to an existing Zabbix server that uses a different database.



User settings

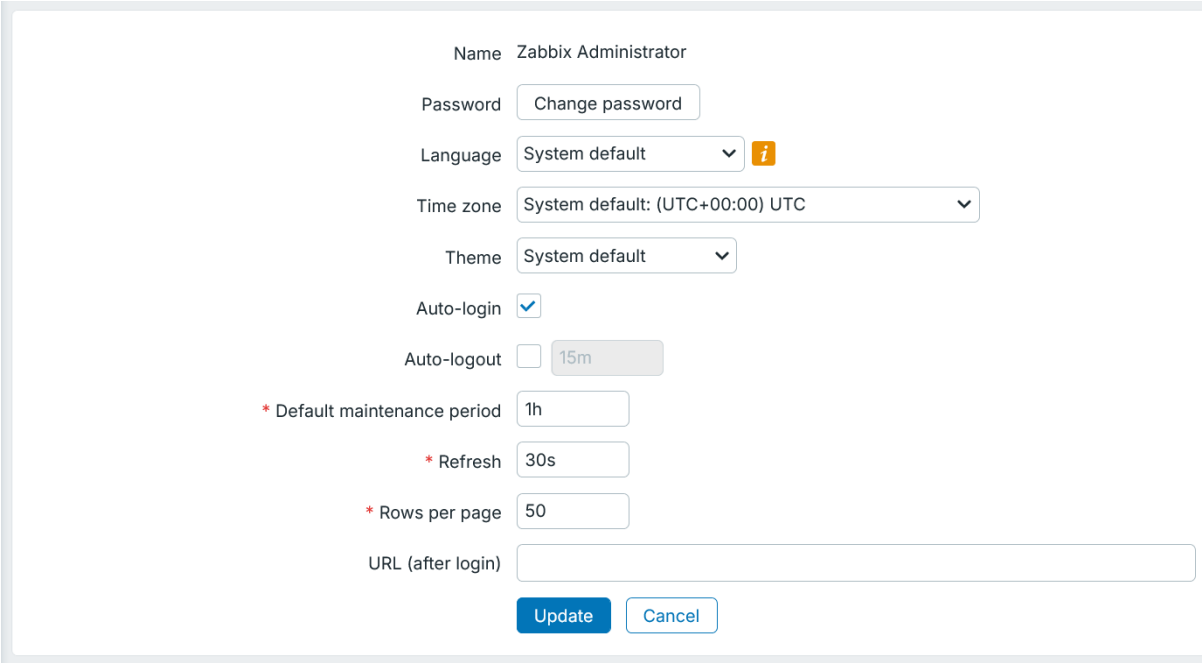
Overview



Depending on your user role, the *User settings* section may contain the following pages:

- *Profile* or *User profile* - for customizing certain Zabbix frontend features;
- *Notifications* - for customizing current user notifications;
- *API tokens* - for managing API tokens assigned to the current user;
- *Devices* - for managing mobile devices belonging to the current user.

The list of available pages appears upon clicking the user icon near the bottom of the Zabbix menu (not available for the *guest* user). It is also possible to switch between pages by using the title dropdown in the upper-left corner.

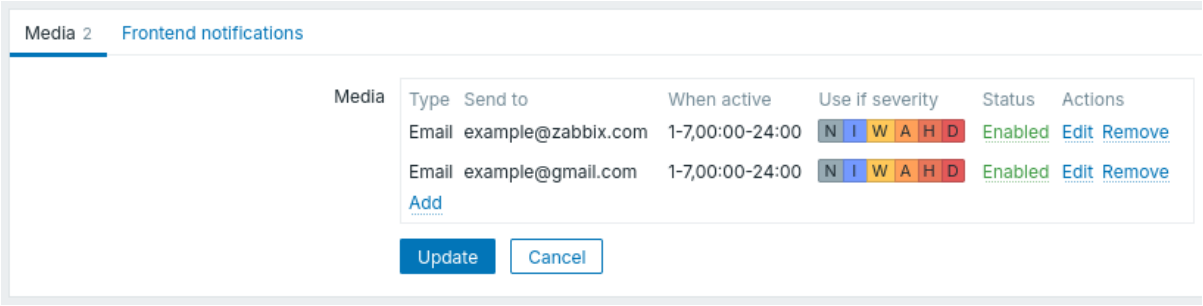


Third-level menu.

Title dropdown.

User profile

The *User profile* section provides options to set a custom interface language, color theme, number of rows displayed in the lists, etc. The changes made here will be applied to the current user only.



Parameter	Description
Name	User name and surname are displayed. In the absence of name and surname, the username is displayed.
Password	Click the *Change password* button to open three fields: *Old password*, *New password*, *New password (once again)*. On a successful password change, the user will be logged out of all active sessions. Note that the password can only be changed for users using Zabbix internal authentication.
Language	Select the interface language of your choice or select **System default** to use default system settings. Selecting *English (en_US)* will also enable the US time/date format in the frontend. For more information, see Installation of additional frontend languages.
Time zone	Select the time zone to override the global time zone on the user level or select **System default** to use global time zone settings.
Theme	Select a color theme specifically for your profile: **System default** - use default system settings; **Blue** - standard blue theme; **Blue (classic)** - standard blue theme using legacy fonts; **Dark** - alternative dark theme; **Dark blue** - dark blue theme; **Dark (classic)** - alternative dark theme using legacy fonts; **High-contrast light** - light theme with high contrast; **High-contrast dark** - dark theme with high contrast.
Auto-login	Mark this checkbox to make Zabbix remember you and log you in automatically for 30 days. When logging in with *Remember for 30 days* enabled: - Auto-logout timer is reset (session persists until the 30-day period ends). - Auto-login is enabled on subsequent visits within 30 days. When logging in without *Remember for 30 days*: - Auto-login parameter is cleared. - Auto-logout follows the configured timeout as usual. Browser cookies are used for this.

Parameter	Description
Auto-logout	With this checkbox marked, you will be logged out automatically after the set amount of seconds (minimum 90 seconds, maximum 1 day). Time suffixes are supported, for example: 90s, 5m, 2h, 1d. Note that this option will not work in the following cases: * When the *Monitoring* menu pages perform background information refreshes. In case pages that are refreshing data in a specific time interval (dashboards, graphs, latest data, etc.) are left open, the session lifetime is extended, respectively disabling the auto-logout feature. * If logging in with the *Remember me for 30 days* option checked; in this case the auto-logout timer is overridden, keeping your session active for the full period. * When authentication is performed via an SSO Identity Provider (IdP), auto-logout ends only the Zabbix session. The SSO session with the IdP remains active, so the user may be able to log back in without entering a password. *Auto-logout* can also accept "0", meaning that the auto-logout feature becomes disabled after profile settings update.
Default maintenance period	Set the default maintenance period for ad-hoc maintenance.
Refresh	Set how often the information on the *Monitoring* menu pages will be refreshed (minimum 0 seconds, maximum 1 hour). Time suffixes are supported, for example: 30s, 90s, 1m, 1h.
Rows per page	Set how many rows will be displayed per page in the lists. Fewer rows (and fewer records to display) result in faster loading times.
URL (after login)	Set a specific URL to be displayed after login. Instead of the default *Dashboards*, it can be, for example, the URL of *Monitoring* > *Triggers*. This field is disabled, if the URL after login is restricted to a specific page for your user role by a *Super admin* user. If the field is disabled or the user does not specify any value, the default is displayed below the field, e.g. `zabbix.php?action=dashboard.view`

Notifications

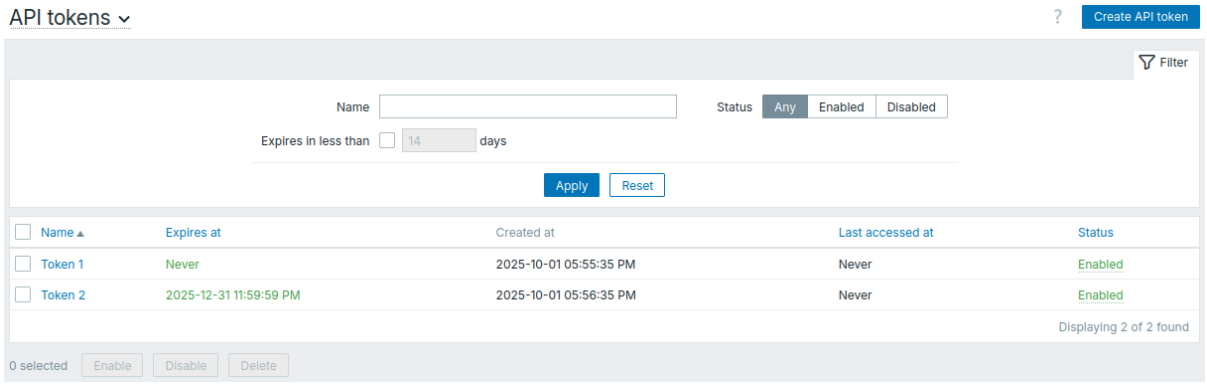
The *Notifications* section provides options for customizing current user notifications.

The *Media* tab allows you to specify media details for the user, such as media types and addresses to use and when to use them to deliver notifications.

If the media type has been disabled:

- a yellow info icon is displayed after the name;
- "Disabled" is displayed in the *Status* column.

Note:
User permissions to change media details for themselves can be granted/revoked based on their user role (see *Create and edit own media* option). Super admin user permissions to change media details for others can also be granted/revoked based on their user role (see *Create and edit user media* option)



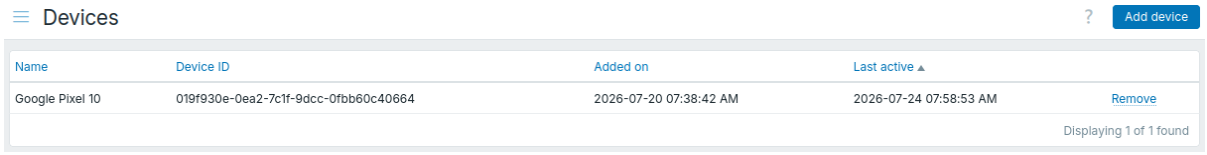
Note that for provisioned users:

- provisioned user media cannot be deleted;
- provisioned user media can be disabled/enabled;
- such provisioned user media fields as *When active*, *Use if severity* and *Enabled* can be manually edited;
- additional user media can be added (for example, additional email addresses) for provisioned users manually;
- manually added user media can be deleted.

The *Frontend notifications* tab allows you to set global notifications.

API tokens

The *API tokens* section allows you to view tokens assigned to the user, edit token details and create new tokens. This section is available to a user only if the *Manage API tokens* action is allowed in the user role settings.



You can filter API tokens by name, expiry date, or status (*Enabled/Disabled*). Click the token status in the list to quickly enable/disable a token. You can also enable/disable multiple tokens at once by selecting them in the list and then clicking the *Enable/Disable* buttons below the list.

Attention:
Users cannot view the *Auth token* value of the tokens assigned to them in Zabbix. The *Auth token* value is displayed only once - immediately after creating a token. If the token has been lost, it has to be regenerated.

Devices

The *Devices* section lets you add or remove your mobile devices to be used with Zabbix mobile app.

This section is displayed if `EnableMobileDevices` is enabled.

To add a device:

1. Click *Add device*.
2. Scan the QR code in your Zabbix mobile app.

Note:
When you add a device, Zabbix also adds the push notification media type to your user media. When you remove the device, that user media is also removed. If you have multiple push notification media types configured, Zabbix adds the one that is enabled and that comes first alphabetically.

Added devices appear in a list. It shows their name, ID, and the dates and times when they were added and last active.

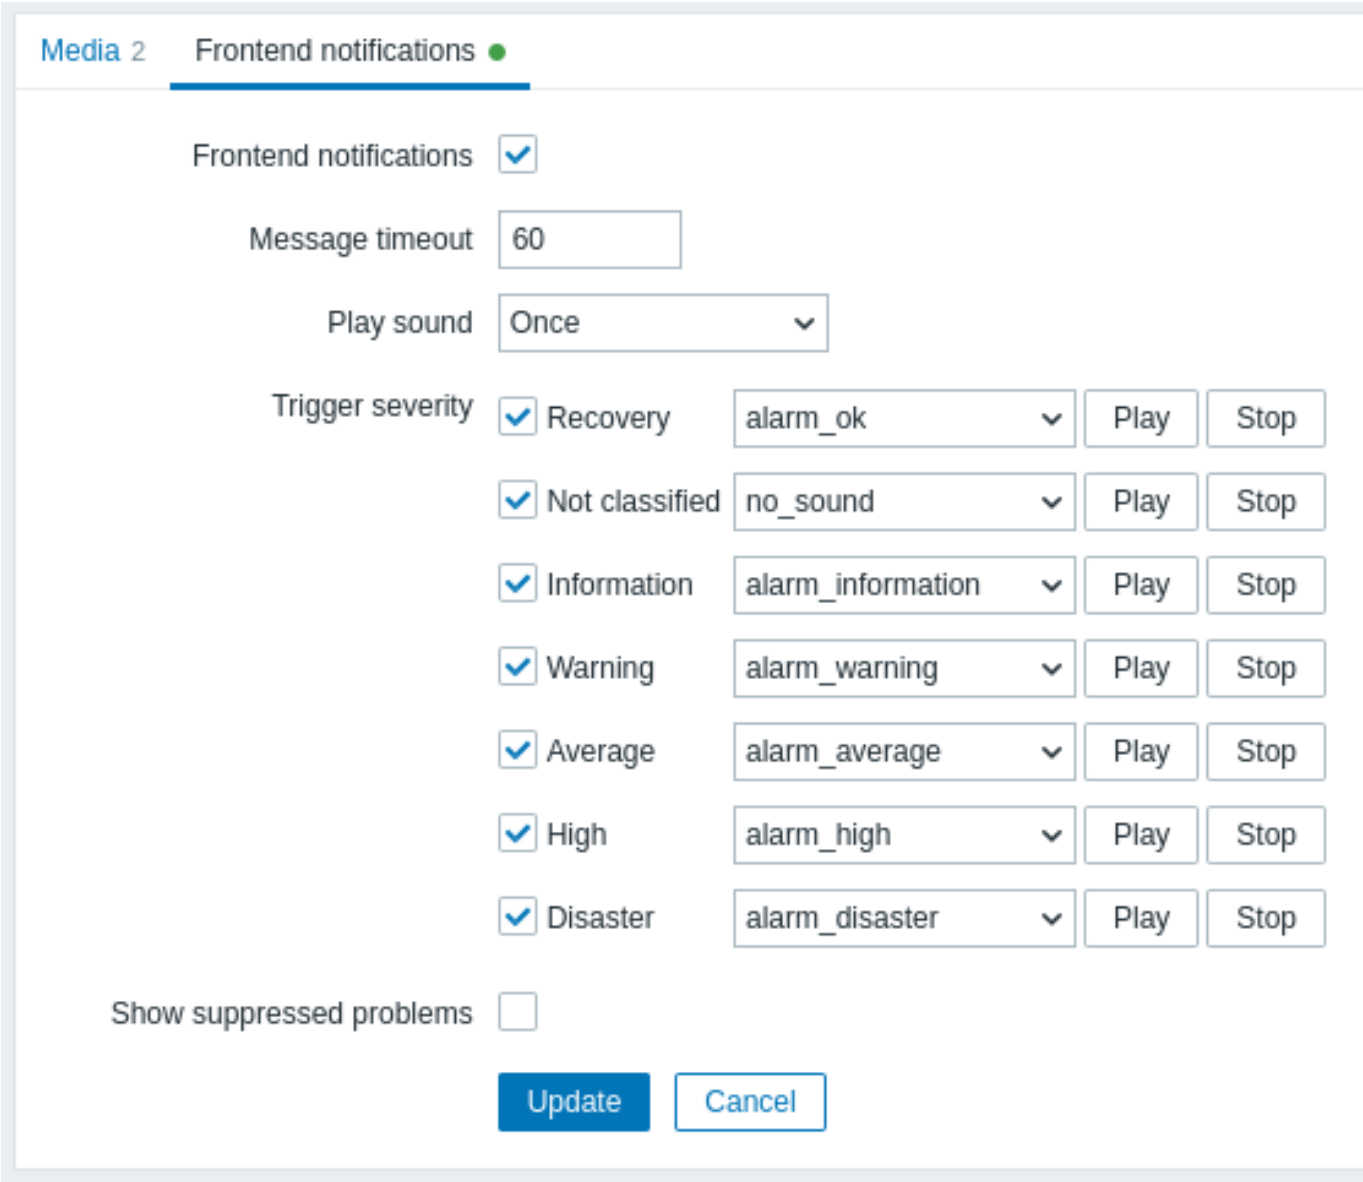
You can also remove devices. When you remove a device, its access credentials are revoked and removed from Zabbix, after which it can no longer access Zabbix.

Super admins can also manage other user devices in *Users* > *Devices*.

Global notifications

Overview

Global notifications provide a way to display real-time issues directly on your current screen within Zabbix frontend.



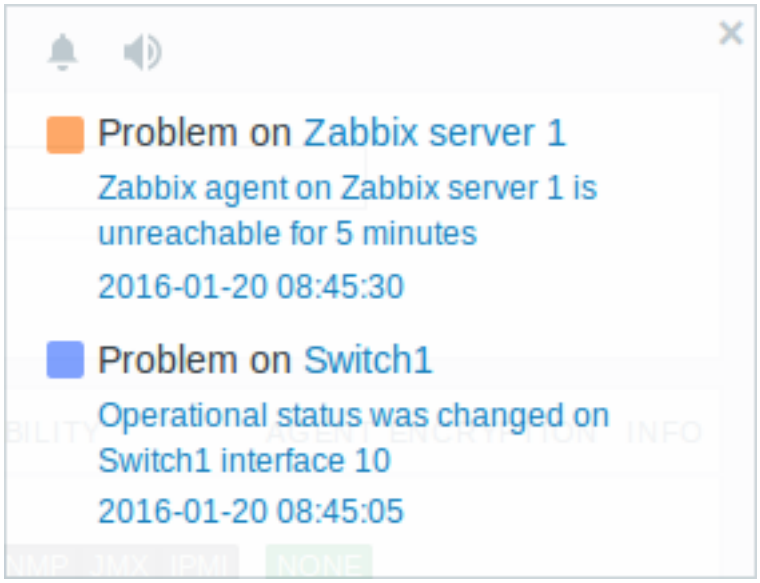
Without global notifications, when working outside the *Problems* or *Dashboard* sections, you would not receive any information about current issues. Global notifications ensure that this information is displayed, regardless of your current location within the Zabbix frontend.

Global notifications include both displaying a message and playing a sound.

Attention:
The autoplay of sounds might be disabled (by default) in recent browser versions. In such cases, you need to enable this setting manually.

Configuration

Global notifications can be enabled per user in the **Frontend notifications** tab of Notifications section.



Parameter	Description
Frontend notifications	Mark the checkbox to enable global notifications.
Message timeout	Set the duration for which the message will be displayed. By default, messages remain on the screen for 60 seconds. Time suffixes are supported, for example: 30s, 5m, 2h, 1d.
Play sound	Set the duration for which the sound will be played. **Once** - sound is played once and fully; **10 seconds** - sound is repeated for 10 seconds; **Message timeout** - sound is repeated while the message is visible.
Trigger severity	Set the trigger severities for which global notifications and sounds will be activated. You can also select sounds appropriate for various severities. If no severity is marked, no messages will be displayed. Additionally, recovery messages will only be displayed for marked severities. For instance, if *Recovery* and *Disaster* are marked, global notifications will be displayed for problems and recoveries of *Disaster* severity triggers.

Parameter	Description
Show suppressed problems	Mark the checkbox to display notifications for problems that would otherwise be suppressed (not shown) due to host maintenance.

Global messages displayed

As messages arrive, they are displayed in a floating section on the right-hand side. You can freely reposition this section by dragging the section header.

For this section, several controls are available:

-  **Snooze** button silences the currently active alarm sound;
-  **Mute/Unmute** button switches between playing and not playing the alarm sounds at all.

Sound in browsers

Overview

Sound is used in global notifications.

For the sounds to be played in Zabbix frontend, *Frontend notifications* must be enabled in the user profile's *Frontend notifications* tab, with all trigger severities checked. Additionally, sounds should be enabled in the global notification pop-up window.

If, for any reason, audio cannot be played on the device, the  button in the global notification pop-up window will remain permanently in the "mute" state, accompanied by the message "Cannot support notification audio for this device" upon hovering over the  button.

Sounds, including the default audio clips, are supported in MP3 format only.

The sounds of Zabbix frontend have been successfully tested in recent Firefox and Opera browsers on Linux, and in Chrome, Firefox, Microsoft Edge, and Opera browsers on Windows.

Attention:
The autoplay of sounds might be disabled (by default) in recent browser versions. In such cases, you need to enable this setting manually.

Global search

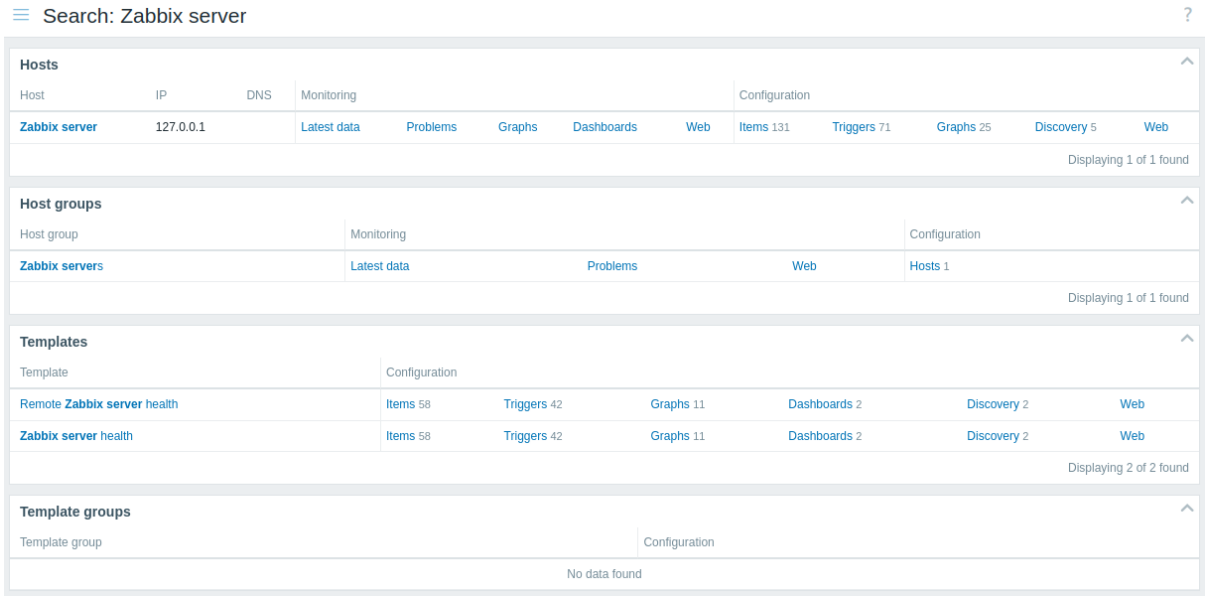
It is possible to search Zabbix frontend for hosts, host groups, templates and template groups.

The search input box is located below the Zabbix logo in the menu. The search can be started by pressing *Enter* or clicking the search icon.

If there is a host that contains the entered string in any part of the name, a dropdown will appear, listing all such hosts (with the matching part highlighted in orange). The dropdown will also list a host if that host's visible name is a match to the technical name entered as a search string; the matching host will be listed, but without any highlighting.

Searchable attributes

Hosts can be searched by the following properties:



- Host name
- Visible name
- IP address
- DNS name

Templates can be searched by name or visible name. If you search by a name that is different from the visible name (of a template/host), in the search results it is displayed below the visible name in parentheses.

Host and template groups can be searched by name. Specifying a parent group implicitly selects all nested groups.

Search results

Search results consist of four separate blocks for hosts, host groups, templates and template groups.

It is possible to collapse/expand each individual block. The entry count is displayed at the bottom of each block, for example, *Displaying 13 of 13 found*. If there are no entries, the entry count is not displayed. Total entries displayed within one block are limited to 100.

Each entry provides links to monitoring and configuration data. See the full list of links.

For all configuration data (such as items, triggers, graphs) the amount of entities found is displayed by a number next to the entity name, in gray. **Note** that if there are zero entities, no number is displayed.

Enabled hosts are displayed in blue, disabled hosts in red.

Links available

For each entry the following links are available:

- Hosts
  - Monitoring
    - Latest data
    - Problems
    - Graphs
    - Host dashboards
    - Web scenarios
  - Configuration
    - Items
    - Triggers
    - Graphs
    - Discovery rules
    - Web scenarios
- Host groups

    - Problems
    - Web scenarios
  - Configuration
    - Hosts
- Templates
  - Configuration
    - Items
    - Triggers
    - Graphs
    - Template dashboards
    - Discovery rules
    - Web scenarios
- Template groups
  - Configuration
    - Templates

Frontend maintenance mode

Overview

It is possible to temporarily disable Zabbix frontend to restrict access. This is useful for protecting Zabbix database from user-initiated changes, preserving its integrity.

While Zabbix frontend is in maintenance mode, you can safely stop the database and perform maintenance tasks.

Users from defined IP addresses will be able to interact with the frontend normally during maintenance mode.

Configuration

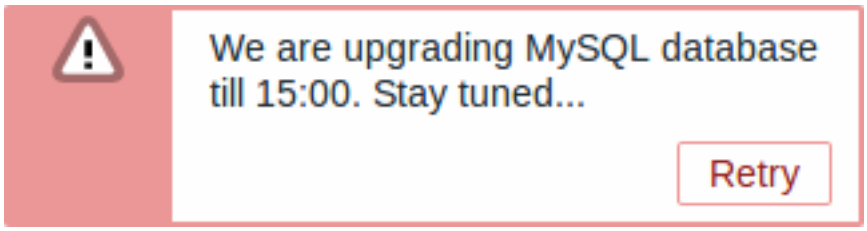
To enable maintenance mode, open the `maintenance.inc.php` file (located in `/conf` of the Zabbix HTML document directory on the web server) and uncomment the following lines:

```
// Maintenance mode.
define('ZBX_DENY_GUI_ACCESS', 1);

// Array of IP addresses allowed to connect to the frontend (optional).
$ZBX_GUI_ACCESS_IP_RANGE = array('127.0.0.1');

// Message shown on warning screen (optional).
$ZBX_GUI_ACCESS_MESSAGE = 'We are upgrading MySQL database till 15:00. Stay tuned...';
```

Note:
In most cases, the `maintenance.inc.php` file is located in `/conf` of the Zabbix HTML document directory on the web server. However, some operating systems and web servers may use a different location.
For example, the location for:



- SUSE and RedHat is `/etc/zabbix/web/maintenance.inc.php`.
- Debian-based systems is `/usr/share/zabbix/conf/`.

See also Copying PHP files.

Parameter	Details
ZBX_DENY_GUI_ACCESS	If defined with any value, maintenance mode will be enabled. To disable maintenance mode, comment out or delete.
ZBX_GUI_ACCESS_IP_RANGE	Array of IP addresses allowed to connect to the frontend (optional). For example: `array('192.168.1.1', '192.168.1.2')`
ZBX_GUI_ACCESS_MESSAGE	A message to inform users about the maintenance (optional). If undefined, the default message *'Zabbix is under maintenance'* will be used.

Display

Users will see the following screen when trying to access Zabbix frontend while in maintenance mode. The screen is refreshed every 30 seconds in order to return to a normal state without user intervention when the maintenance is over.

IP addresses defined in *ZBX_GUI_ACCESS_IP_RANGE* will be able to access the frontend as usual.

Page parameters

Overview

Most Zabbix web interface pages support various HTTP GET parameters that control what will be displayed. They may be passed by specifying parameter=value pairs after the URL, separated from the URL by a question mark (?) and from each other by ampersands (&).

Monitoring > Problems

The following parameters are supported:

Parameter	Description	Example
show	Filter option *Show*. Possible values: 1 - recent problems; 2 - all; 3 - in problem state.	show=1
name	Filter option *Problem*: freeform string.	name=Zabbix agent

Parameter	Description	Example
severities	Filter option *Severity*: array of selected severities in the format `severities[*]=*` (replace `*` with severity level). Possible values: 0 - not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster.	severities[3]=3
inventory	Filter option *Host inventory*: array of inventory fields `[field],[value]`	inventory[0][field]=type&invento
evaltype	Filter option *Tags*: tag evaluation method. Possible values: 0 - and/or; 2 - or.	evaltype=0
tags	Filter option *Tags*: array of defined tags `[tag], [operator], [value]` Possible operator values: 0 - contains; 1 - equals; 2 - does not contain; 3 - does not equal; 4 - exists; 5 - does not exist.	tags[0][tag]=target&tags[0][ope
show_tags	Filter option *Show tags*. Possible values: 0 - none; 1 - one; 2 - two; 3 - three.	show_tags=3
tag_name_format	Filter option *Tag name*. Possible values: 0 - full name; 1 - shortened name; 2 - none.	tag_name_format=1
tag_priority	Filter option *Tag display priority*: comma-separated string of tag display priority	tag_priority=customer, target
show_suppressed	Filter option *Show suppressed problems*. Possible values: 1 - show; 2 - do not show.	show_suppressed=1
acknowledgement_status	Filter option *Acknowledgement status*. Possible values: 0 - all; 1 - unacknowledged; 2 - acknowledged.	acknowledgement_status=0
acknowledged_by_me	Filter option *By me*; supported only with `acknowledgement_status=2`. Possible values: 0 - disabled; 1 - enabled.	acknowledged_by_me=1
compact_view	Filter option *Compact view*. Possible values: 0 - disabled; 1 - enabled.	compact_view=1

Parameter	Description	Example
highlight_row	Filter option *Highlight whole row*. Possible values: 0 - disabled; 1 - enabled.	highlight_row=1
filter_name	Filter properties option *Name*: freeform string	filter_name=Databases
filter_show_counter	Filter properties option *Show number of records*. Possible values: 0 - disabled; 1 - enabled.	filter_show_counter=1
filter_custom_time	Filter properties option *Set custom time period*. Possible values: 0 - disabled; 1 - enabled.	filter_custom_time=1
sort	Column to sort by. Possible values: clock - sort by *Time* column; host - sort by *Host* column; severity - sort by *Severity* column; name - sort by *Problem* column.	sort=clock
sortorder	Sort order of results. Possible values: DESC - descending; ASC - ascending.	sortorder=DESC
age_state	Filter option *Age less than*; supported only with `show`=3. Possible values: 0 - disable age parameter; 1 - enable age parameter.	age_state=1
age	Filter option *Age less than*: integer, number of days; supported only with `age_state`=1 and `show`=3.	age=7
groupids	Filter option *Host groups*: array of host group IDs.	groupids[]=4
hostids	Filter option *Hosts*: array of host IDs	hostids[]=10084
triggerids	Filter option *Triggers*: array of trigger IDs	triggerids[]=22382
show_timeline	Filter option *Show timeline*; not supported with `compact_view`=1. Possible values: 0 - do not show; 1 - show.	show_timeline=1
details	Filter option *Show details*. Possible values: 0 - do not show; 1 - show.	details=1
from	Date range start, can be relative (e.g., now-1m); supported only with `filter_custom_time`=1	from=now-2h
to	Date range end, can be relative (e.g., now-1m); supported only with `filter_custom_time`=1	to=now

See also: Problems page filter options.

Kiosk mode

The kiosk mode in supported frontend pages can be activated using URL parameters. For example, in dashboards:

- `/zabbix.php?action=dashboard.view&kiosk=1` - activate kiosk mode
- `/zabbix.php?action=dashboard.view&kiosk=0` - activate normal mode

Slideshow

It is possible to activate a slideshow in the dashboard:

- `/zabbix.php?action=dashboard.view&slideshow=on` - activate slideshow

Definitions

Overview

While many things in the frontend can be configured using the frontend itself, some customizations are currently only possible by editing a definitions file.

This file is `defines.inc.php` located in /include of the Zabbix HTML document directory.

Parameters

Parameters in this file that could be of interest to users:

- ZBX_MIN_PERIOD

Minimum graph period, in seconds. One minute by default.

- GRAPH_YAXIS_SIDE_DEFAULT

Default location of Y axis in simple graphs and default value for drop down box when adding items to custom graphs. Possible values: 0 - left, 1 - right.

Default: 0

- ZBX_SESSION_NAME

String used as the name of the Zabbix frontend session cookie.

Default: zbx_sessionid

- ZBX_DATA_CACHE_TTL

TTL timeout in seconds used to invalidate data cache of Vault response. Set 0 to disable Vault response caching.

Default: 60

- SUBFILTER_VALUES_PER_GROUP

Number of subfilter values per group (For example, in the latest data subfilter).

Default: 1000

- ZBX_MAX_WIDGET_LINES

Maximum number of widget lines to display.

Default: 1000

Additional frontend languages

Overview In order to use any other language than English in Zabbix web interface, its locale should be installed on the web server. Additionally, the PHP gettext extension is required for the translations to work.

Installing locales To list all installed languages, run:

```
locale -a
```

If some languages that are needed are not listed, open the `/etc/locale.gen` file and uncomment the required locales. As Zabbix uses UTF-8 encoding, you need to select locales with UTF-8 charset.

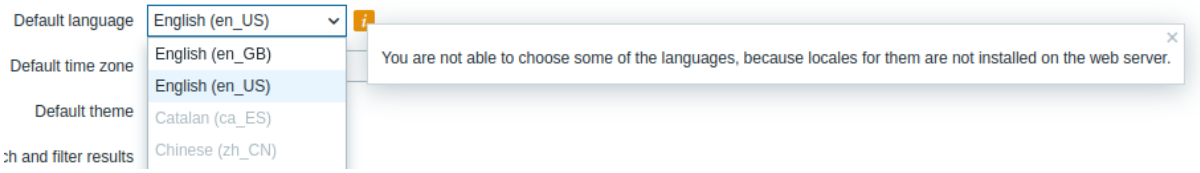
Now run:

```
locale-gen
```

Restart the web server. Note that if PHP-FPM is installed and used by the web server, it also needs to be restarted along with the web server.

The locales should now be installed. It may be required to reload Zabbix frontend page in browser using `Ctrl + F5` for new languages to appear.

Installing Zabbix If installing Zabbix directly from Zabbix git repository, translation files should be generated manually. To generate translation files, run:



```
make gettext
locale/make_mo.sh
```

This step is not needed when installing Zabbix from packages or source `tar.gz` files.

Selecting a language There are several ways to select a language in Zabbix web interface:

- When installing web interface - in the frontend installation wizard. Selected language will be set as system default.
- After the installation, system default language can be changed in the *Administration* > *General* > *GUI*.
- Language for a particular user can be changed in the user profile.

If a locale for a language is not installed on the machine, this language will be greyed out in Zabbix language selector. An orange icon is displayed next to the language selector if at least one locale is missing. Upon clicking this icon the following message will be displayed: "You are not able to choose some of the languages, because locales for them are not installed on the web server."

Creating your own theme

Overview

By default, Zabbix provides a number of predefined frontend themes. To create a custom theme, follow the step-by-step procedure provided here.

Step 1: Create your theme

To create your own theme:

1. Create a CSS file from scratch or copy an existing theme (such as `blue-theme.css`, `dark-theme.css`, or another one) from the `assets/styles/` directory and modify it.
2. Save your theme (for example, `custom-theme.css`) in the `assets/styles/` directory.

Step 2: Enable your theme in the Theme list

To make your custom theme available in the frontend, you must add it to the list of themes returned by the `APP::getThemes()` method. This is done by overriding the `ZBase::getThemes()` method inside the APP class as follows:

1. Open the `include/classes/core/APP.php` file and locate the APP class:

```
class APP extends ZBase {

}
```

2. Inside the class, before its final closing brace }, add the following method:

```
public static function getThemes() {
        return array_merge(parent::getThemes(), [
            'custom-theme' => _('Custom theme')
        ]);
}
```

where:

- `custom-theme` - the internal identifier of your theme and must match the name of your CSS file without the `.css` extension;
- `Custom theme` - the display name you will see in the frontend.

To add multiple themes, list them in the array, separating each entry with a comma. A trailing comma after the last entry is optional.

For example:

```
	public static function getThemes() {
		return array_merge(parent::getThemes(), [
			'custom-theme' => _('Custom theme'),
			'anothertheme' => _('Another theme'),
			'onemoretheme' => _('One more theme')
		]);
	}
```

Step 3: Change graph colors

To change graph colors, a record for the new theme must be added to the `graph_theme` database table.

Example of adding a record to a MySQL/MariaDB database:

```
    mysql -u zabbix -p
    # Enter password:
```

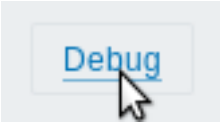
```
mysql> USE zabbix;
mysql> INSERT INTO graph_theme (
    graphthemeid,
    theme,
    backgroundcolor,
    graphcolor,
    gridcolor,
    maingridcolor,
    gridbordercolor,
    textcolor,
    highlightcolor,
    leftpercentilecolor,
    rightpercentilecolor,
    nonworktimecolor,
    colorpalette
)
SELECT
    MAX(graphthemeid) + 1,
    'custom-theme',
    'FFFFFF',
    'FFFFFF',
    'CCD5D9',
    'ACBBC2',
    'ACBBC2',
    '1F2C33',
    'CC745E',
    '5ECCAB',
    'CC745E',
    'EBEBEB',
    '329F7E,C2583D,346D91,B26E44,CC6C91,7A6DC2,C4AA56,7C2731,BF75B8,73A350,B04833,633A60,879CCC,7FAD6C,324
FROM graph_theme;
```

Step 4: Use the new theme

In the Zabbix frontend, you can either set this theme as the default theme or select it in a user profile.

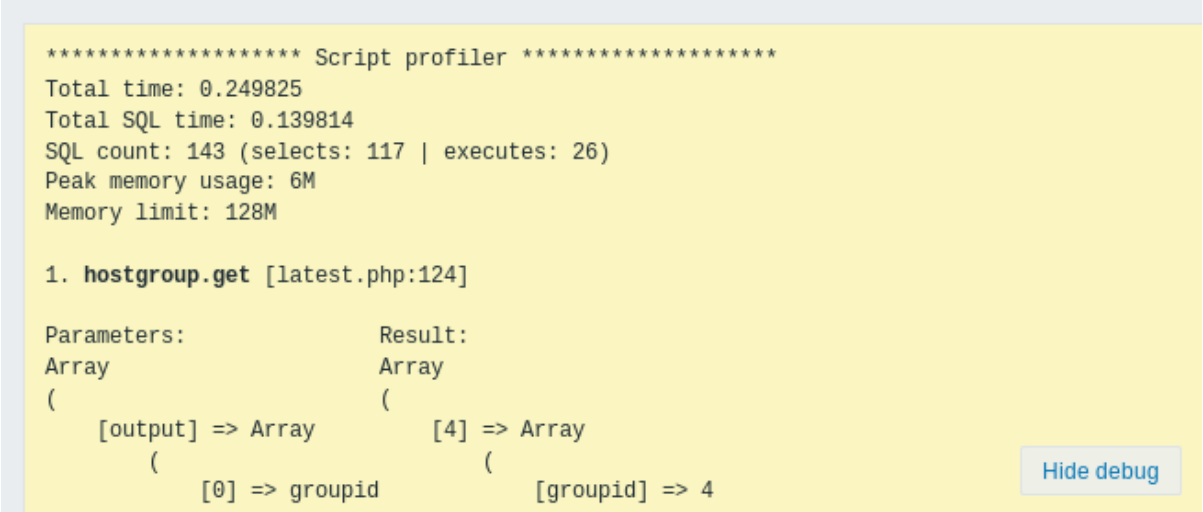
Debug mode

Overview



Debug mode may be used to diagnose performance problems with frontend pages.

Configuration



Debug mode can be activated for individual users who belong to a user group:

- when configuring a user group;
- when viewing configured user groups.

When *Debug mode* is enabled for a user group, its users will see a *Debug* button in the lower-right corner of the browser window:

Clicking the *Debug* button opens a new window below the page contents which contains the SQL statistics of the page, along with a list of API calls and individual SQL statements:

In case of performance problems with the page, this window may be used to search for the root cause of the problem.

Warning:
Enabled *Debug mode* negatively affects frontend performance.

Cookies used by Zabbix

Overview

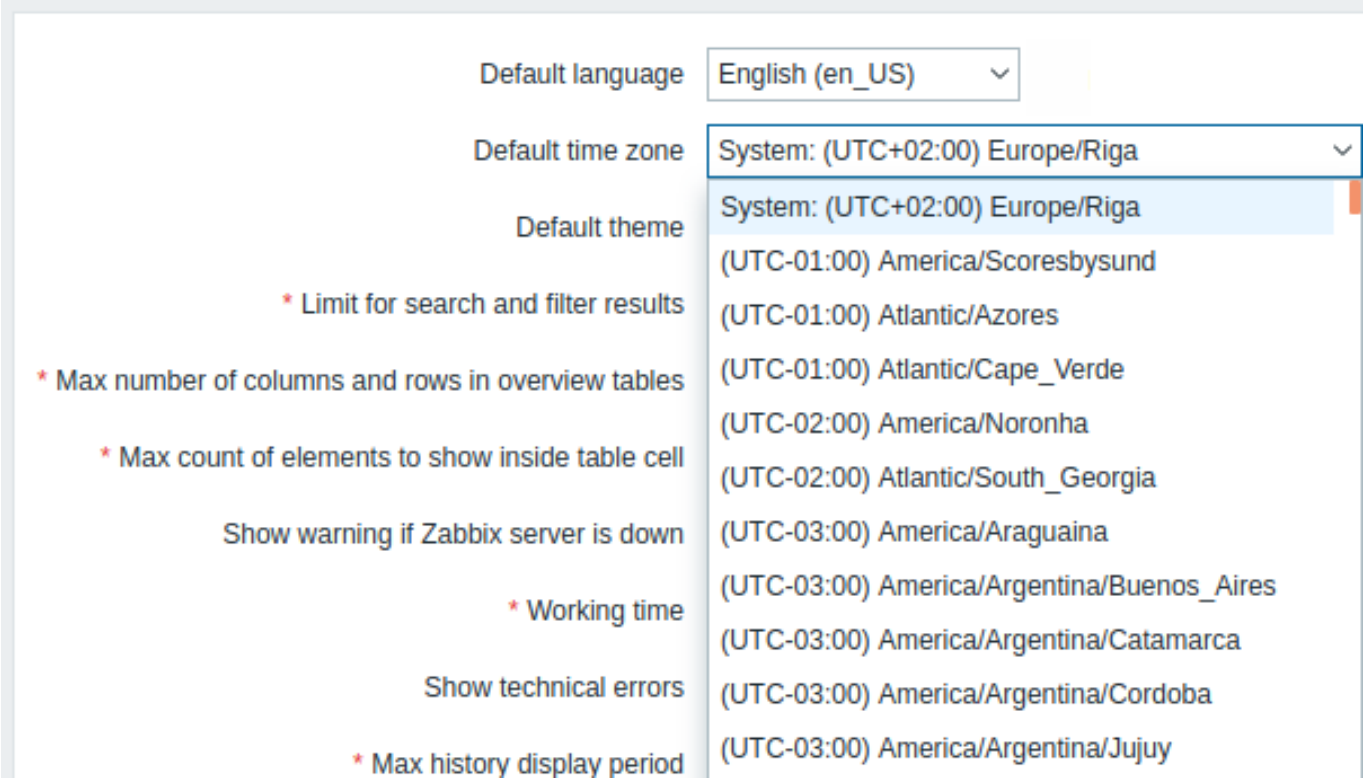
This page provides a list of cookies used by Zabbix.

Name	Description	Values	Expires/Max-Age	HttpOnly[1]	Secure[2]
ZBX_SESSION_ZABBIX	Zabbix frontend session data, stored as JSON encoded by base64		Session (expires when the browsing session ends)	+	+ (only if HTTPS is enabled on a web server)
tab	Active tab number; this cookie is only used on pages with multiple tabs (e.g., *Host*, *Trigger* or *Action* configuration page) and is created, when a user navigates from a primary tab to another tab (such as *Tags* or *Dependencies* tab). 0 is used for the primary tab.	Example: 1	Session (expires when the browsing session ends)	-	-
browserwarning_ignore	Whether a warning about using an outdated browser should be ignored.	yes	Session (expires when the browsing session ends)	-	-

Name	Description	Values	Expires/Max-Age	HttpOnly[1]	Secure[2]
system-message-ok	A message to show as soon as page is reloaded.	Plain text message	Session (expires when the browsing session ends) or as soon as page is reloaded	+	-
system-message-error	An error message to show as soon as page is reloaded.	Plain text message	Session (expires when the browsing session ends) or as soon as page is reloaded	+	-

Note:
Forcing 'HttpOnly' flag on Zabbix cookies by a webserver directive is not supported.

Footnotes



[1] When `HttpOnly` is 'true' the cookie will be made accessible only through the HTTP protocol. This means that the cookie won't be accessible by scripting languages, such as JavaScript. This setting can effectively help to reduce identity theft through XSS attacks (although it is not supported by all browsers).

[2] `Secure` indicates that the cookie should only be transmitted over a secure HTTPS connection from the client. When set to 'true', the cookie will only be set if a secure connection exists.

Time zones

Overview

The frontend time zone can be set globally in the frontend and adjusted for individual users.

If *System* is selected, the web server time zone will be used for the frontend (including the value of `date.timezone` in `php.ini`, if set), while Zabbix server will use the time zone of the machine it is running on.

Note:
Zabbix server will only use the specified global/user time zone when expanding macros in notifications (e.g., `{EVENT.TIME}` can expand to a different time zone per user) and for the time limit when notifications are sent (see "When active" setting in the user media configuration).

The choice of time zone does not affect the frontend time/date format. Instead, you may adjust the interface language (either at installation or under user settings) - selecting *English (en_US)* will also enable the US time/date format in the frontend.

Configuration

The global time zone:

- Can be set manually when installing the frontend.
- Can be modified in *Administration* > *General* > *GUI*.

User-level time zone:

- Can be set when configuring/updating a user.
- Can be set by each user in their user profile.

See also: Aligning time zones when using scheduling intervals.

Resetting password

Overview This section describes the steps for resetting user passwords in Zabbix.

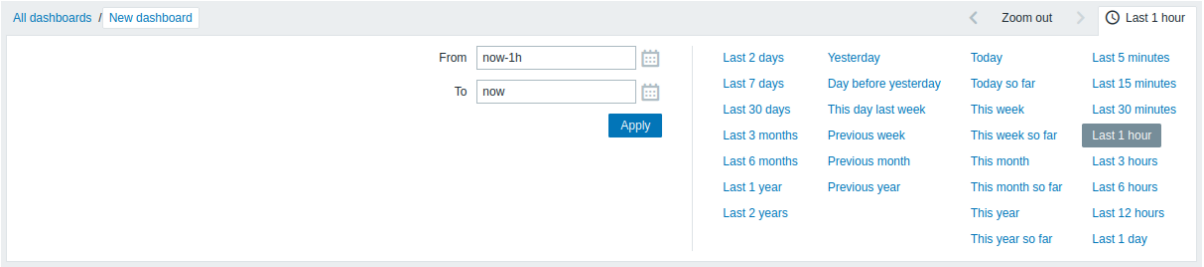
Steps Turn to your Zabbix administrator if you have forgotten your Zabbix password and cannot log in.

A Super administrator user can change passwords for all users in the user configuration form.

If a Super administrator has forgotten their password and cannot log in, the following SQL query must be run to apply the default password to the Super admin user (replace 'Admin' with the appropriate Super admin username):

```
UPDATE users SET passwd = '$2a$10$ZXIvHAEP2ZM.dLXTm6uPHOMVlARXX7cqjbhM6Fn0cANzkCQBWpMrS' WHERE username =
```

After running this query, the user password will be set to *zabbix*. Make sure to change the default password on the first login.



Time period and host selectors

Overview

This page describes the time period and host selectors available on dashboards. These selectors allow the displayed data to be dynamically adjusted across all compatible dashboard widgets without editing individual widget settings.

Time period selector

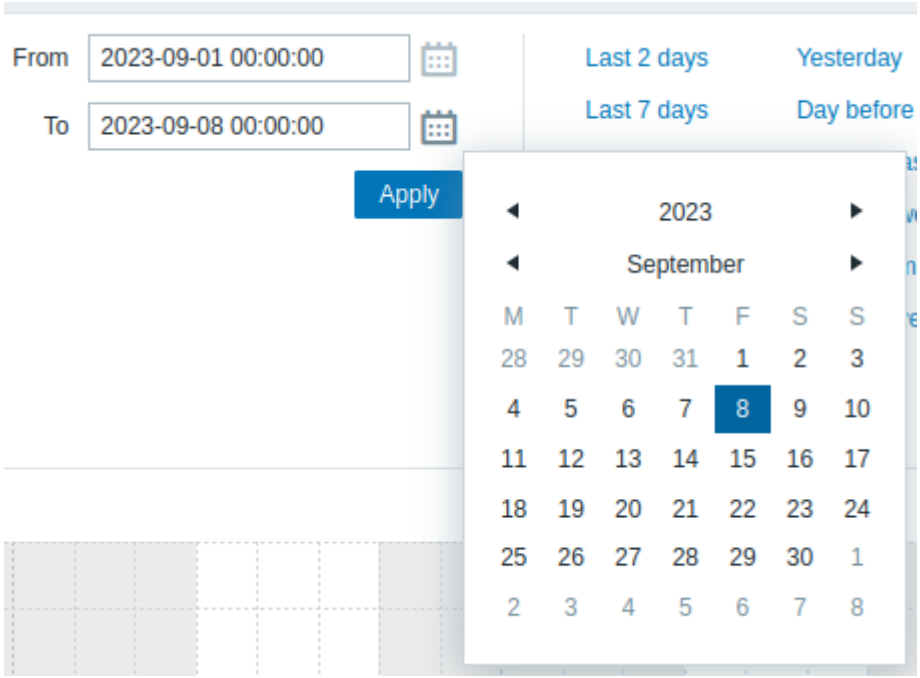
The time period selector allows you to select often required periods with one mouse click. It can be expanded or collapsed by clicking the time period selector button in the upper-right corner of the dashboard.

Options such as *Today*, *This week*, etc., display the whole period, including the hours/days in the future. Options such as *Today so far*, *This week so far*, etc., display only the hours passed.

Once a period is selected, it can be moved back and forth in time by clicking the arrow buttons. The *Zoom out* button allows you to zoom out the period by 50% in each direction.

> **Note:**
> For graphs (except those with the *Custom* time period), selecting the displayed time period is also possible by highlighting an area in the graph with the left mouse button. Once you release the left mouse button, the graph will zoom into the highlighted area. Zooming out is also possible by double-clicking in the graph.

The *From/To* fields display the selected period in either absolute time syntax (in format `Y-m-d H:i:s`) or relative time syntax. A relative time period can contain one or several mathematical operations (- or +), for example, `now-1d` or `now-1d-2h+5m`.



The following relative time abbreviations are supported:

- now
- s (seconds)
- m (minutes)
- h (hours)
- d (days)
- w (weeks)
- M (months)
- y (years)

Precision is supported in the time period selector (for example, /M in now-1d/M). Details of precision:

Precision	From	To
m	Y-m-d H:m:00	Y-m-d H:m:59
h	Y-m-d H:00:00	Y-m-d H:59:59
d	Y-m-d 00:00:00	Y-m-d 23:59:59
w	Monday of the week 00:00:00	Sunday of the week 23:59:59
M	First day of the month 00:00:00	Last day of the month 23:59:59
y	1st of January of the year 00:00:00	31st of December of the year 23:59:59

It is also possible to select a time period using the date picker. To open it, click the calendar icon next to the *From/To* fields.

Note:
Within the date picker, you can navigate between year/month/date using Tab, Shift+Tab, and keyboard arrow buttons. Pressing Enter confirms the selection.

Examples:

From	To	Selected period
now/d	now/d	00:00 - 23:59 today
now/d	now/d+1d	00:00 today - 23:59 tomorrow
now/w	now/w	Monday 00:00:00 - Sunday 23:59:59 this week
now-1y/w	now-1y/w	The week of Monday 00:00:00 - Sunday 23:59:59 one year ago

Attention:
Using "now/M+1M" for the *To* parameter may add 31 days, which can result in the date shifting by 1-3 days depending on the number of days in the month. For example, if used in January, the result may be 02 March instead of the expected 28 February. To avoid this issue, use "now/M-3d+1M/M", which adjusts for month length accurately. Similarly, if configuring *From* to go backward, use "now/M+3d-1M/M".

Host selector

The host selector lets you select a host to have its data displayed in compatible dashboard widgets.

It becomes available after editing and saving a dashboard, if at least one widget is configured with the *Override host* parameter set to use the dashboard as a data source.

Configuration parameters: Zabbix frontend

Overview Configuration parameters allow customizing Zabbix frontend behavior.

Specify parameter values in the frontend configuration file (`zabbix.conf.php`).

This page is structured as:

- Parameter overview (to see full details of a parameter, click its name)
- Parameter details

Parameter	Description
$DB['TYPE']	Database type.
$DB['SERVER']	Database host name or IP address.
$DB['PORT']	Database port.
$DB['DATABASE']	Database name used by the Zabbix frontend to connect to the configured database.
$DB['USER']	Username used by the Zabbix frontend to connect to the database.
$DB['PASSWORD']	Password used by the Zabbix frontend to connect to the database.
$DB['SCHEMA']	Database schema name used for PostgreSQL.
$DB['ENCRYPTION']	Enable or disable TLS encryption for connections between the Zabbix frontend and the database.
$DB['KEY_FILE']	Path to the client private key file used for the database TLS connection.
$DB['CERT_FILE']	Path to the client certificate file used for the database TLS connection.
$DB['CA_FILE']	Path to the CA certificate file used for the database TLS connection.
$DB['VERIFY_HOST']	Enable or disable verification of the database server hostname in the TLS certificate.
$DB['CIPHER_LIST']	List of allowed TLS ciphers for the database connection.
$DB['VAULT']	Specify the Vault secrets manager used to store database credentials.
$DB['VAULT_URL']	URL of the Vault secrets manager used to retrieve database credentials.
$DB['VAULT_PREFIX']	Prefix for the Vault path or query used to retrieve database credentials.
$DB['VAULT_DB_PATH']	Path to the database credentials in the Vault secrets manager.
$DB['VAULT_TOKEN']	Authentication token used to access the Vault secrets manager.
$DB['VAULT_APP_ROLE_ID']	AppRole role ID used to authenticate to HashiCorp Vault.
$DB['VAULT_APP_SECRET_ID']	AppRole secret ID used to authenticate to HashiCorp Vault.
$DB['VAULT_CERT_FILE']	Path to the client certificate file used to authenticate to the Vault secrets manager.
$DB['VAULT_KEY_FILE']	Path to the client private key file used to authenticate to the Vault secrets manager.
$DB['VAULT_CACHE']	Enables or disables caching of credentials retrieved from the Vault secrets manager.
$ZBX_SERVER	Specify a value to override the Zabbix hostname/IP address.
$ZBX_SERVER_PORT	Specify a value to override the Zabbix server port.
$ZBX_SERVER_NAME	Zabbix server name.
$IMAGE_FORMAT_DEFAULT	Default image format.
$HISTORY_PROVIDERS[]	Configuration of history storage providers for Elasticsearch or ClickHouse.
$SSO['SETTINGS']	Configuration settings for SAML sign-in.
$SSO['CERT_STORAGE']	Specify where SAML certificates are stored.
$SSO['SP_KEY']	Path to the SAML service provider (SP) private key file when the private key is stored on the filesystem.
$SSO['SP_CERT']	Path to the SAML service provider (SP) certificate file when the certificate is stored on the filesystem.
$SSO['IDP_CERT']	Path to the SAML identity provider certificate file when the certificate is stored on the filesystem.
$ZBX_FEATURE_FLAGS['banners_enabled']	Enable or disable support for banners.
$ZBX_FEATURE_FLAGS['http_auth_enabled']	Enable or disable user HTTP authentication.
$ZBX_FEATURE_FLAGS['modules_enabled']	Enable or disable access to modules.
$ZBX_FEATURE_FLAGS['media_type_edit_disabled']	Disable editing of specific pre-configured media types.
$ZBX_SERVER_TLS['ACTIVE']	Specifies whether TLS is enabled for connections to the Zabbix server.

Parameter	Description
$ZBX_SERVER_TLS['CA_FILE']	Path to the Certificate Authority (CA) certificate file used to verify the server certificate.
$ZBX_SERVER_TLS['KEY_FILE']	Path to the client private key file corresponding to the client certificate.
$ZBX_SERVER_TLS['CERT_FILE']	Path to the client certificate file when mutual TLS authentication is required.
$ZBX_SERVER_TLS['CERTIFICATE_ISSUER']	Distinguished Name (DN) of the issuer to match against the server certificate.
$ZBX_SERVER_TLS['CERTIFICATE_SUBJECT']	Distinguished Name (DN) of the subject to match against the server certificate.
$TELEMETRY_PROVIDERS[]	Configuration of a telemetry data source.

Parameter details

$DB['TYPE']

Database type.

Values: `MYSQL` - MySQL, `POSTGRESQL` - PostgreSQL.

$DB['SERVER']

Database host name or IP address.

If `$DB['SERVER']` is not defined, the default Unix-domain socket is used. For MySQL, setting `$DB['SERVER']` to `localhost` also results in a connection via the default Unix socket.
 For PostgreSQL, `$DB['SERVER']` can contain multiple `host:port` entries separated by commas. If a port is not defined for a host in the comma-separated list, the value defined in `$DB['PORT']` is used as the default port. If a socket path is specified in `$DB['SERVER']` (for example, `/var/run/pgbouncer`), that Unix-domain socket is used.

Examples:

```
$DB['SERVER'] = 'localhost';
$DB['SERVER'] = 127.0.0.1;
```

$DB['PORT']

Database port.

If not defined, the value 0 is used.

$DB['DATABASE']

Database name used by the Zabbix frontend to connect to the configured database.

Example:

```
$DB['DATABASE'] = 'zabbix';
```

$DB['USER']

Username used by the Zabbix frontend to connect to the database.

$DB['PASSWORD']

Password used by the Zabbix frontend to connect to the database.

$DB['SCHEMA']

Database schema name used for PostgreSQL.

$DB['ENCRYPTION']

Enable or disable encryption for connections between the Zabbix frontend and the database.

Values: `true` - enabled, `false` - disabled.

$DB['KEY_FILE']

Path to the client private key file used for the database TLS connection.

Example:

```
// For MySQL:
$DB['KEY_FILE'] = '/etc/ssl/mysql/client-key.pem';
```

$DB['CERT_FILE']

Path to the client certificate file used for the database TLS connection.

Example:

```
// For MySQL:
$DB['CERT_FILE'] = '/etc/ssl/mysql/client-cert.pem';
```

$DB['CA_FILE']

Path to the CA certificate file used for the database TLS connection.

Examples:

```
// For MySQL:
$DB['CA_FILE'] = '/etc/ssl/mysql/ca.pem';
// For PostgreSQL:
$DB['CA_FILE'] = '/etc/ssl/pgsql/root.crt';
```

$DB['VERIFY_HOST']

Enable or disable verification of the database server hostname in the TLS certificate.

Values: `true` - enabled, `false` - disabled.

$DB['CIPHER_LIST']

List of allowed TLS ciphers for the database connection.

Examples:

```
// For MySQL:
$DB['CIPHER_LIST'] = 'TLS_AES_256_GCM_SHA384:TLS_CHACHA20_POLY1305_SHA256:TLS_AES_128_GCM_SHA256:TLS_AES_1
```

$DB['VAULT']

Specify the Vault secrets manager used to store database credentials.

Values: `CyberArk` or `HashiCorp`.

Examples:

```
// For CyberArk:
$DB['VAULT'] = 'CyberArk';
// For HashiCorp:
$DB['VAULT'] = 'HashiCorp';
```

$DB['VAULT_URL']

URL of the Vault secrets manager used to retrieve database credentials.

Examples:

```
// For CyberArk:
$DB['VAULT_URL'] = 'https://127.0.0.1:1858';
// For HashiCorp:
$DB['VAULT_URL'] = 'https://localhost:8200';
```

$DB['VAULT_PREFIX']

Prefix for the Vault path or query used to retrieve database credentials.

Example:

```
// For HashiCorp:
$DB['VAULT_PREFIX'] = '/v1/secret/data/zabbix/';
```

$DB['VAULT_DB_PATH']

Path to the database credentials in the Vault secrets manager.

Examples:

```
// For CyberArk:
$DB['VAULT_DB_PATH'] = 'AppID=foo&Query=Safe=bar;Object=buzz';
// For HashiCorp:
$DB['VAULT_DB_PATH'] = 'database';
```

$DB['VAULT_TOKEN']

Authentication token used to access the Vault secrets manager.

Example:

```
// For HashiCorp:
$DB['VAULT_TOKEN'] = 'hvs.CAESIIG_PILmULFYOsEyWHxkZ2mF2a8VPKNLE8eHqd4autYGGh4KHGh2cy5aeTYONFNSaUp3ZnpWbDF1
```

$DB['VAULT_APP_ROLE_ID']

VaultAppSecretID role ID used to authenticate to HashiCorp Vault.

Example:

```
$DB['VAULT_APP_ROLE_ID'] = '6f1567f1-538d-7d70-e8e4-5d3e59471b2e';
```

$DB['VAULT_APP_SECRET_ID']

VaultAppSecretID used to authenticate to HashiCorp Vault.

Example:

```
$DB['VAULT_APP_SECRET_ID'] = '89dac8b1-f7d6-96a7-2ecf-f94d2de3d6f1';
```

$DB['VAULT_CERT_FILE']

Path to the client certificate file used to authenticate to the Vault secrets manager.

Example:

```
// For CyberArk:
$DB['VAULT_CERT_FILE'] = 'conf/certs/cyberark-cert.pem';
```

$DB['VAULT_KEY_FILE']

Path to the client private key file used to authenticate to the Vault secrets manager.

Example:

```
// For CyberArk:
$DB['VAULT_KEY_FILE'] = 'conf/certs/cyberark-key.pem';
```

$DB['VAULT_CACHE']

Enables or disables caching of credentials retrieved from the Vault secrets manager.

Values: `true` - enabled, `false` - disabled.

$ZBX_SERVER

Specify a value to override the Zabbix hostname/IP address.
 If $ZBX_SERVER is specified without $ZBX_SERVER_PORT, the default port (10051) is used.

$ZBX_SERVER_PORT

Specify a value to override the Zabbix server port.
 This parameter is used together with $ZBX_SERVER.

$ZBX_SERVER_NAME

Zabbix server name.

$IMAGE_FORMAT_DEFAULT

Default image format.

Default: IMAGE_FORMAT_PNG
 Values: - IMAGE_FORMAT_PNG - PNG format - IMAGE_FORMAT_JPEG - JPEG format - IMAGE_FORMAT_GIF - GIF format

$HISTORY_PROVIDERS[]

Configuration of history storage providers for Elasticsearch or ClickHouse.

Supported configuration parameters: - `types` - array of data types to be stored in the external storage; - `provider` - history provider type: `elasticsearch` or `clickhouse`; - `url` - history provider URL; - `db` - database name (used for ClickHouse); - `username` - database user (used for ClickHouse); - `password` - database password (used for ClickHouse).

Examples:

```
// For ClickHouse:
$HISTORY_PROVIDERS[] = [
    'types' => ['uint', 'dbl', 'str', 'log', 'text', 'json'],
    'provider' => 'clickhouse',
    'url' => 'http://localhost:8123',
    'db' => 'zabbix',
    'username' => 'zabbix',
    'password' => 'zabbix'
];
// For Elasticsearch:
$HISTORY_PROVIDERS[] = [
    'types' => ['uint', 'dbl', 'str', 'log', 'text', 'json'],
    'provider' => 'elasticsearch',
    'url' => 'http://localhost:9200'
];
```

$SSO['SETTINGS']

Configuration settings for SAML sign-in. The `$SSO['SETTINGS']` array must follow the structure expected by the *SAML PHP Toolkit* library (supplied with Zabbix).

Only the following options can be specified in `$SSO['SETTINGS']`:

- strict
- baseurl
- compress
- contactPerson
- organization
- sp (only options specified in this list)
    - attributeConsumingService
    - x509certNew
- idp (only options specified in this list)
    - singleLogoutService (only one option)
        * responseUrl
    - certFingerprint
    - certFingerprintAlgorithm
    - x509certMulti
- security (only options specified in this list)
    - signMetadata
    - wantNameId
    - requestedAuthnContext
    - requestedAuthnContextComparison
    - wantXMLValidation
    - relaxDestinationValidation
    - destinationStrictlyMatches
    - rejectUnsolicitedResponsesWithInResponseTo
    - signatureAlgorithm
    - digestAlgorithm
    - lowercaseUrlencoding

All other options are taken from the database and cannot be overridden. The debug option will be ignored.

If the Zabbix UI is behind a proxy or load balancer, the custom `use_proxy_headers` option can be used:

- `false` (default) - ignore the `X-Forwarded-*` HTTP headers;
- `true` - use the `X-Forwarded-*` HTTP headers to build the base URL.

For a full description of available configuration options, refer to the official library documentation.

Example:

```
$SSO['SETTINGS'] = [
    'security' => [
        'signatureAlgorithm' => 'http://www.w3.org/2001/04/xmldsig-more#rsa-sha384',
        'digestAlgorithm' => 'http://www.w3.org/2001/04/xmldsig-more#sha384',
        // ...
    ],
```

```
    // ...
];
```

$SSO['CERT_STORAGE']

Specify where SAML certificates are stored.

Default: `file`
 Values: - `database` - the private key and certificates are stored in the database; - `file` - the private key and certificates are stored on the filesystem.

Example:

```
$SSO['CERT_STORAGE'] = 'database';
```

$SSO['SP_KEY']

Path to the SAML service provider (SP) private key file when the private key is stored on the filesystem.

Example:

```
$SSO['SP_KEY'] = 'conf/certs/sp.key';
```

$SSO['SP_CERT']

Path to the SAML service provider (SP) certificate file when the certificate is stored on the filesystem.

Example:

```
$SSO['SP_CERT'] = 'conf/certs/sp.crt';
```

$SSO['IDP_CERT']

Path to the SAML identity provider certificate file when the certificate is stored on the filesystem.

Example:

```
$SSO['IDP_CERT'] = 'conf/certs/idp.crt';
```

$ZBX_FEATURE_FLAGS['banners_enabled']

Enable or disable support for banners.

Default: `true`
 Values: `true` - enabled, `false` - disabled.

$ZBX_FEATURE_FLAGS['http_auth_enabled']

Enable or disable user HTTP authentication.

Default: `true`
 Values: `true` - enabled, `false` - disabled.

$ZBX_FEATURE_FLAGS['modules_config_enabled']

Enable or disable access to modules.

Default: `true`
 Values: `true` - enabled, `false` - disabled.

$ZBX_FEATURE_FLAGS['media_type_denylist']

Disable editing of specific pre-configured media types.

Values: `email`, `script`, `sms`, `webhook`, `push`.

Example:

```
$ZBX_FEATURE_FLAGS['media_type_denylist'] = ['webhook','push'];
```

$ZBX_SERVER_TLS['ACTIVE']

Specifies whether a TLS connection between the Zabbix frontend and Zabbix server is enabled.

Default: `false`
 Values: `true` - enabled, `false` - disabled.

$ZBX_SERVER_TLS['CA_FILE']

Path to the Certificate Authority (CA) certificate file used to verify the server certificate.

Example:

```
$ZBX_SERVER_TLS['CA_FILE'] = '/etc/zabbix/ssl/ca.crt';
```

$ZBX_SERVER_TLS['KEY_FILE']

Path to the client private key file corresponding to the client certificate used for mutual TLS authentication.

Example:

```
$ZBX_SERVER_TLS['KEY_FILE'] = '/etc/zabbix/ssl/frontend.key';
```

$ZBX_SERVER_TLS['CERT_FILE']

Path to the client certificate file when mutual TLS authentication is required.

Example:

```
$ZBX_SERVER_TLS['CERT_FILE'] = '/etc/zabbix/ssl/frontend.crt';
```

$ZBX_SERVER_TLS['CERTIFICATE_ISSUER']

Distinguished Name (DN) of the issuer to match against the server certificate.

Example:

```
$ZBX_SERVER_TLS['CERTIFICATE_ISSUER']  = 'CN=MyZabbixCA';
```

$ZBX_SERVER_TLS['CERTIFICATE_SUBJECT']

Distinguished Name (DN) of the subject to match against the server certificate.

Example:

```
$ZBX_SERVER_TLS['CERTIFICATE_SUBJECT'] = 'CN=zabbix-server.example.com';
```

$TELEMETRY_PROVIDERS[]

Configuration of a telemetry data source.

Supported configuration parameters for ClickHouse: - `url` - set the HTTP or HTTPS URL used to connect to the telemetry data source. - `db` - set the name of the database. - `username` - set the username used to log in to the database. - `password` - set the password used to log in to the database. - `ssl_cert_file`, `ssl_key_file`, `ssl_key_password`, `ssl_verify_peer`, `ssl_verify_host`, `ssl_ca_location`, `ssl_ca_file` - set these options to configure a secure (TLS/SSL) connection to the database. - `vault_path` - set the path to a Vault secret holding the `username` and `password` values. Do not use together with the `username` and `password` options.

Example:

```
$TELEMETRY_PROVIDERS[] = [
    'provider' => 'clickhouse',
    'url' => 'http://localhost:8123',
    'db' => 'zabbix',
    'username' => 'zabbix',
    'password' => 'zabbix'
];
```

API

Overview The Zabbix API allows you to programmatically retrieve and modify configuration of Zabbix and provides access to historical data. It is widely used to:

- Create new applications to work with Zabbix.
- Integrate Zabbix into a third-party software.
- Automate routine tasks.

The Zabbix API is an HTTP-based API, and it is shipped as a part of the web frontend. It uses the JSON-RPC 2.0 protocol, which means two things:

- The API consists of a set of separate methods.
- Requests and responses between the clients and the API are encoded using the JSON format.

For more information about the protocol and JSON, see the JSON-RPC 2.0 specification and the JSON format homepage.

For more information about integrating Zabbix functionality into your Python applications, see Python library for Zabbix.

Note:
User access in Zabbix, including both configuration and historical data, depends on the user type, the assigned user role, and user groups.

Structure The API consists of a number of methods that are nominally grouped into separate APIs. Each of the methods performs one specific task. For example, the `host.create` method belongs to the *host* API and is used to create new hosts. Historically, APIs are sometimes referred to as "classes".

Most APIs contain at least four methods: `get`, `create`, `update` and `delete` for retrieving, creating, updating and deleting data respectively, but some APIs may provide a totally different set of methods.

Performing requests Once you have set up the frontend, you can use remote HTTP requests to call the API. To do that, you need to send HTTP POST requests to the `api_jsonrpc.php` file located in the frontend directory.
 For example, if your Zabbix frontend is installed under `https://example.com/zabbix`, an HTTP request to call the `apiinfo.version` method may look like this:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Content-Type: application/json-rpc' \
  --data '{"jsonrpc":"2.0","method":"apiinfo.version","params":{},"id":1}'
```

The request must have the `Content-Type` header set to one of these values: `application/json-rpc`, `application/json` or `application/jsonrequest`.

The request object must contain the following properties:

- `jsonrpc` - the version of the JSON-RPC protocol used by the API (Zabbix API implements JSON-RPC version 2.0);
- `method` - the API method being called;
- `params` - the parameters that will be passed to the API method;
- `id` - an arbitrary identifier of the request (if omitted, the API treats the request as a notification).

If the request is correct, the response returned by the API should look like this:

```
{
    "jsonrpc": "2.0",
    "result": "8.0.0",
    "id": 1
}
```

The response object, in turn, contains the following properties:

- `jsonrpc` - the version of the JSON-RPC protocol;
- `result` - the data returned by the method;
- `id` - an identifier of the corresponding request.

Authentication To access any data in Zabbix, you need to either:

- Use an existing API token created in the Zabbix frontend, *Users* > *API tokens* section, or created using the Token API.
- Use an authentication token obtained with the `user.login` method.

For example, if you wanted to obtain a new authentication token by logging in as a standard *Admin* user, then a JSON request would look like this:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Content-Type: application/json-rpc' \
  --data '{"jsonrpc":"2.0","method":"user.login","params":{"username":"Admin","password":"zabbix"},"id":1}
```

If you provided the credentials correctly, the response returned by the API should contain the user authentication token:

```
{
    "jsonrpc": "2.0",
    "result": "0424bd59b807674191e7d77572075f33",
    "id": 1
}
```

Authorization methods By "Authorization" header

All API requests require an authentication or an API token. You can provide the credentials by using the Authorization header in the request:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Authorization: Bearer 0424bd59b807674191e7d77572075f33'
```

Attention:
If you are experiencing authentication issues, see Authorization header forwarding.

Zabbix API accepts headers in a case-insensitive way (e.g., `authorization`, `Authorization`, and `AUTHORIZATION` are treated the same).

The Authorization header is supported in cross-origin requests (CORS).

By Zabbix cookie

A *"zbx_session"* cookie is used to authorize an API request from Zabbix UI performed using JavaScript (from a module or a custom widget).

Example workflow The following section walks you through several usage examples in greater detail.

Retrieving hosts Now you have a valid user authentication token (represented as a variable in the following examples) that can be used to access the data in Zabbix. For example, you can use the `host.get` method to retrieve the IDs, host names and interfaces of all the configured hosts:

Request:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
  --header 'Content-Type: application/json-rpc' \
  --data @data.json
```

Note:
`data.json` is a file that contains a JSON query. Instead of a file, you can pass the query in the `--data` argument.

`data.json`

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": [
            "hostid",
            "host"
        ],
        "selectInterfaces": [
            "interfaceid",
            "ip"
        ]
    },
    "id": 2
}
```

The response object will contain the requested data about the hosts:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10084",
            "host": "Zabbix server",
            "interfaces": [
                {
```

```
                    "interfaceid": "1",
                    "ip": "127.0.0.1"
                }
            ]
        }
    ],
    "id": 2
}
```

Note:
For performance reasons it is always recommended to list the object properties you want to retrieve. Thus, you will avoid retrieving everything.

Creating a new item Now, create a new item on the host "Zabbix server" using the data you have obtained from the previous `host.get` request. This can be done using the `item.create` method:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
  --header 'Content-Type: application/json-rpc' \
  --data '{"jsonrpc":"2.0","method":"item.create","params":{"name":"Free disk space on /home/joe/","key_":
```

A successful response will contain the ID of the newly created item, which can be used to reference the item in the following requests:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "24759"
        ]
    },
    "id": 3
}
```

Note:
The `item.create` method as well as other *create methods* can also accept arrays of objects and create multiple items with one API call.

Creating multiple triggers Thus, if *create methods* accept arrays, you can add multiple triggers, for example, this one:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
  --header 'Content-Type: application/json-rpc' \
  --data '{"jsonrpc":"2.0","method":"trigger.create","params":[{"description":"Processor load is too high
```

The successful response will contain the IDs of the newly created triggers:

```
{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "17369",
            "17370"
        ]
    },
    "id": 4
}
```

Updating an item Enable an item by setting its status to 0:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
  --header 'Content-Type: application/json-rpc' \
  --data '{"jsonrpc":"2.0","method":"item.update","params":{"itemid":"10092","status":0},"id":5}'
```

The successful response will contain the ID of the updated item:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "10092"
        ]
    },
    "id": 5
}
```

Note:
The `item.update` method as well as other *update methods* can also accept arrays of objects and update multiple items with one API call.

Updating multiple triggers Enable multiple triggers by setting their status to 0:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
  --header 'Content-Type: application/json-rpc' \
  --data '{"jsonrpc":"2.0","method":"trigger.update","params":[{"triggerid":"13938","status":0},{"triggeri
```

The successful response will contain the IDs of the updated triggers:

```
{
    "jsonrpc": "2.0",
    "result": {
        "triggerids": [
            "13938",
            "13939"
        ]
    },
    "id": 6
}
```

Error handling Up to the present moment, everything you have tried has worked fine. But what would happen if you tried making an incorrect call to the API? Try to create another host by calling `host.create` but omitting the mandatory `groups` parameter:

```
curl --request POST \
  --url 'https://example.com/zabbix/api_jsonrpc.php' \
  --header 'Authorization: Bearer ${AUTHORIZATION_TOKEN}' \
  --header 'Content-Type: application/json-rpc' \
  --data '{"jsonrpc":"2.0","method":"host.create","params":{"host":"Linux server","interfaces":[{"type":1,
```

The response will then contain an error message:

```
{
    "jsonrpc": "2.0",
    "error": {
        "code": -32602,
        "message": "Invalid params.",
        "data": "No groups for host \"Linux server\"."
    },
    "id": 7
}
```

If an error has occurred, instead of the `result` property, the response object will contain the `error` property with the following data:

- `code` - an error code;
- `message` - a short error summary;
- `data` - a more detailed error message.

Errors can occur in various cases, such as, using incorrect input values, a session timeout or trying to access non-existing objects. Your application should be able to gracefully handle these kinds of errors.

API versions To simplify API versioning, since Zabbix 2.0.4, the version of the API matches the version of Zabbix itself. You can use the `apiinfo.version` method to find out the version of the API you are working with. This can be useful for adjusting your application to use version-specific features.

Zabbix guarantees feature backward compatibility inside a major version. When making backward incompatible changes between major releases, Zabbix usually leaves the old features as deprecated in the next release, and only removes them in the release after that. Occasionally, Zabbix may remove features between major releases without providing any backward compatibility. It is important that you never rely on any deprecated features and migrate to newer alternatives as soon as possible.

> **Note:**
> You can follow all the changes made to the API in the API changelog.

Further reading Now, you have enough knowledge to start working with the Zabbix API, however, do not stop here. For further reading you are advised to have a look at the list of available APIs.

Method reference

This section provides an overview of the functions provided by the Zabbix API and will help you find your way around the available classes and methods.

Monitoring The Zabbix API allows you to access history and other data gathered during monitoring.

Dashboards

Manage dashboards and make scheduled reports based on them.

Dashboard API | Template dashboard API | Report API

High availability cluster

Retrieve a list of server nodes and their status.

High availability cluster API

History

Retrieve historical values gathered by Zabbix monitoring processes for presentation or further processing.

History API

Trends

Retrieve trend values calculated by Zabbix server for presentation or further processing.

Trend API

Events

Retrieve events generated by triggers, network discovery and other Zabbix systems for more flexible situation management or third-party tool integration.

Event API

Problems

Retrieve problems according to the given parameters.

Problem API

Maps

Configure maps to create detailed dynamic representations of your IT infrastructure.

Map API

Tasks

Interact with Zabbix server task manager, creating tasks and retrieving response.

Task API

APM The Zabbix API allows you to access telemetry data collected for application performance monitoring (APM).

Traces

Retrieve traces and the spans they consist of.

APM trace API | APM span API

Metrics

Retrieve metric data points.

APM metric API

Logs

Retrieve log records.

APM log API

Services The Zabbix API allows you to access data gathered during service monitoring.

Service Level Agreement

Define Service Level Objectives (SLO), retrieve detailed Service Level Indicators (SLI) information about service performance.

SLA API

Services

Manage services for service-level monitoring and retrieve detailed SLA information about any service.

Service API

Data collection The Zabbix API allows you to manage the configuration of your monitoring system.

Hosts and host groups

Manage host groups, hosts and everything related to them, including host interfaces, host macros and maintenance periods.

Host API | Host group API | User macro API | Value map API | Maintenance API

Items

Define items to monitor.

Item API

Triggers

Configure triggers to notify you about problems in your system. Manage trigger dependencies.

Trigger API

Graphs

Edit graphs or separate graph items for better presentation of the gathered data.

Graph API | Graph item API

Templates and template groups

Manage templates and link them to hosts or other templates.

Template API | Template group API | Value map API

Low-level discovery

Configure low-level discovery rules as well as item, trigger and graph prototypes to monitor dynamic entities.

LLD rule API | Item prototype API | Trigger prototype API | Graph prototype API | Host prototype API

Event correlation

Create custom event correlation rules.

Correlation API

Network discovery

Manage network-level discovery rules to automatically find and monitor new hosts. Gain full access to information about discovered services and hosts.

Discovery rule API | Discovery check API | Discovered host API | Discovered service API

Export and import

Export and import Zabbix configuration data for configuration backups, migration or large-scale configuration updates.

Configuration API

Web monitoring

Configure web scenarios to monitor your web applications and services.

Web scenario API

Alerts The Zabbix API allows you to manage the actions and alerts of your monitoring system.

Actions and alerts

Define actions and operations to notify users about certain events or automatically execute remote commands. Gain access to information about generated alerts and their receivers.

Action API | Alert API

Media types

Configure media types and multiple ways users will receive alerts.

Media type API

Scripts

Configure and execute scripts to help you with your daily tasks.

Script API

Users The Zabbix API allows you to manage users of your monitoring system.

Users and user groups

Add users that will have access to Zabbix, assign them to user groups and grant permissions. Make roles for granular management of user rights.

User API | User group API | User directory API | User role API

API Tokens

Manage authorization tokens.

Token API

Authentication

Change authentication configuration options.

Authentication API

Devices

Manage mobile devices for use with Zabbix mobile app.

Device API

Administration With the Zabbix API you can change administration settings of your monitoring system.

General

Change certain global configuration options.

Autoregistration API | Icon map API | Image API | Settings API | Regular expression API | Module API | Connector API

Audit log

Track configuration changes each user has done.

Audit log API

Housekeeping

Configure housekeeping.

Housekeeping API

Proxies and proxy groups

Manage the proxies used in your distributed monitoring setup.

Proxy API | Proxy group API

Macros

Manage macros.

User macro API

Zabbix information Retrieve the Zabbix API version or the time of the last update from Zabbix server.

API info API | Server info API

Action

This class is designed to work with actions.

Object references:

- Action
- Action operation
  - Action operation message
  - Action operation condition
- Action recovery operation
- Action update operation
- Action filter
  - Action filter condition

Available methods:

- action.create - create new actions
- action.delete - delete actions
- action.get - retrieve actions
- action.update - update actions

Action object

The following objects are directly related to the `action` API.

Action

The action object has the following properties.

Property	Type	Description
actionid	ID	ID of the action. Property behavior: - *read-only* - *required* for update operations

Property	Type	Description
esc_period	string	Default operation step duration. Must be at least 60 seconds. Accepts a number of seconds (e.g., 60, 300), a value with a time suffix (e.g., 30s, 1m, 2h), or a user macro. Property behavior: - *supported* if `eventsource` is set to ”event created by a trigger”, ”internal event”, or ”event created on service status update”
eventsource	integer	Type of events that the action will handle. Refer to the event `source` property for a list of supported event types. Property behavior: - *constant* - *required* for create operations
name	string	Name of the action. Property behavior: - *required* for create operations
status	integer	Whether the action is enabled or disabled. Possible values: 0 - *(default)* enabled; 1 - disabled.
pause_symptoms	integer	Whether to pause escalation if event is a symptom event. Possible values: 0 - Don’t pause escalation for symptom problems; 1 - *(default)* Pause escalation for symptom problems. Property behavior: - *supported* if `eventsource` is set to ”event created by a trigger”
pause_suppressed	integer	Whether to pause escalation during maintenance periods or not. Possible values: 0 - Don’t pause escalation; 1 - *(default)* Pause escalation. Property behavior: - *supported* if `eventsource` is set to ”event created by a trigger”
notify_if_canceled	integer	Whether to notify when escalation is canceled. Possible values: 0 - Don’t notify when escalation is canceled; 1 - *(default)* Notify when escalation is canceled. Property behavior: - *supported* if `eventsource` is set to ”event created by a trigger”

Action operation

The action operation object defines an operation that will be performed when an action is executed. It has the following properties.

Property	Type	Description
operationtype	integer	Type of operation. Possible values: 0 - send message; 1 - global script; 2 - add host; 3 - remove host; 4 - add to host group; 5 - remove from host group; 6 - link template; 7 - unlink template; 8 - enable host; 9 - disable host; 10 - set host inventory mode; 13 - add host tags; 14 - remove host tags. Possible values if `eventsource` of Action object is set to ”event created by a trigger” or ”event created on service status update”: 0 - ”send message”; 1 - ”global script”. Possible values if `eventsource` of Action object is set to ”internal event”: 0 - ”send message”. Property behavior: - *required*
esc_period	string	Duration of an escalation step in seconds. Must be greater than 60 seconds. Accepts a number of seconds (e.g., 60, 300), a value with a time suffix (e.g., 30s, 1m, 2h), or a user macro. If set to 0 or 0s, the default action escalation period will be used. Default: 0s. Property behavior: - *supported* if `eventsource` of Action object is set to ”event created by a trigger”, ”internal event”, or ”event created on service status update”
esc_step_from	integer	Step to start escalation from. Default: 1. Property behavior: - *supported* if `eventsource` of Action object is set to ”event created by a trigger”, ”internal event”, or ”event created on service status update”
esc_step_to	integer	Step to end escalation at. Default: 1. Property behavior: - *supported* if `eventsource` of Action object is set to ”event created by a trigger”, ”internal event”, or ”event created on service status update”
evaltype	integer	Operation condition evaluation method. Possible values: 0 - *(default)* And/Or; 1 - And; 2 - Or.

Property	Type	Description
opcommand	object	Global script to execute. The global script must have the `scriptid` property defined. Property behavior: - *required* if `operationtype` is set to ”global script”
opcommand_grp	array	Host groups to run global scripts on. The host groups must have the `groupid` property defined. Property behavior: - *required* if `operationtype` is set to ”global script” and `opcommand_hst` is not set
opcommand_hst	array	Host to run global scripts on. The hosts must have the `hostid` property defined. Property behavior: - *required* if `operationtype` is set to ”global script” and `opcommand_grp` is not set
opconditions	array	Operation conditions used for trigger actions. The operation condition object is described in detail below.
opgroup	array	Host groups to add hosts to. The host groups must have the `groupid` property defined. Property behavior: - *required* if `operationtype` is set to ”add to host group” or ”remove from host group”
opmessage	object	Object containing the data about the message sent by the operation. The operation message object is described in detail below. Property behavior: - *required* if `operationtype` is set to ”send message”
opmessage_grp	array	User groups to send messages to. The user groups must have the `usrgrpid` property defined. Property behavior: - *required* if `operationtype` is set to ”send message” and `opmessage_usr` is not set
opmessage_usr	array	Users to send messages to. The users must have the `userid` property defined. Property behavior: - *required* if `operationtype` is set to ”send message” and `opmessage_grp` is not set
optemplate	array	Templates to link to the hosts. The templates must have the `templateid` property defined. Property behavior: - *required* if `operationtype` is set to ”link template” or ”unlink template”

Property	Type	Description
opinventory	object	Inventory mode set host to. The inventory must have the `inventory_mode` property defined. Property behavior: - *required* if `operationtype` is set to ”set host inventory mode”
optag	array	Host tags to add or remove. Tags must have `tag` property defined. The `value` property is optional. Property behavior: - *supported* if `operationtype` is set to ”add host tags” or ”remove host tags”.

Action operation message

The operation message object contains data about the message that will be sent by the operation. It has the following properties.

Property	Type	Description
default_msg	integer	Whether to use the default action message text and subject. Possible values: 0 - use the data from the operation; 1 - *(default)* use the data from the media type.
mediatypeid	ID	ID of the media type that will be used to send the message. Property behavior: - *supported* if `operationtype` of Action operation object, Action recovery operation object, or Action update operation object is set to ”send message”, or if `operationtype` of Action update operation object is set to ”notify all involved”
message	string	Operation message text. Property behavior: - *supported* if `default_msg` is set to ”use the data from the operation”
subject	string	Operation message subject. Property behavior: - *supported* if `default_msg` is set to ”use the data from the operation”

Action operation condition

The action operation condition object defines a condition that must be met to perform the current operation. It has the following properties.

Property	Type	Description
conditiontype	integer	Type of condition. Possible values: 14 - event acknowledged. Property behavior: - *required*
value	string	Value to compare with. Property behavior: - *required*

Property	Type	Description
operator	integer	Condition operator. Possible values: 0 - *(default)* =

The following operators and values are supported for each operation condition type.

Condition	Condition name	Supported operators	Expected value
14	Event acknowledged	=	Whether the event is acknowledged. Possible values: 0 - not acknowledged; 1 - acknowledged.

Action recovery operation

The action recovery operation object defines an operation that will be performed when a problem is resolved. Recovery operations are possible **only** for trigger, internal and service actions. It has the following properties.

Property	Type	Description
operationtype	integer	Type of operation. Possible values if `eventsource` of Action object is set to ”event created by a trigger” or ”event created on service status update”: 0 - send message; 1 - global script; 11 - notify all involved. Possible values if `eventsource` of Action object is set to ”internal event”: 0 - send message; 11 - notify all involved. Property behavior: - *required*
opcommand	object	Global script to execute. The global script must have the `scriptid` property defined. Property behavior: - *required* if `operationtype` is set to ”global script”
opcommand_grp	array	Host groups to run global scripts on. The host groups must have the `groupid` property defined. Property behavior: - *required* if `eventsource` of Action object is set to ”event created by a trigger”, and `operationtype` is set to ”global script”, and `opcommand_hst` is not set
opcommand_hst	array	Host to run global scripts on. The hosts must have the `hostid` property defined. Property behavior: - *required* if `eventsource` of Action object is set to ”event created by a trigger”, and `operationtype` is set to ”global script”, and `opcommand_grp` is not set

Property	Type	Description
opmessage	object	Object containing the data about the message sent by the recovery operation. The operation message object is described in detail above. Property behavior: - *required* if `operationtype` is set to ”send message”
opmessage_grp	array	User groups to send messages to. The user groups must have the `usrgrpid` property defined. Property behavior: - *required* if `operationtype` is set to ”send message” and `opmessage_usr` is not set
opmessage_usr	array	Users to send messages to. The users must have the `userid` property defined. Property behavior: - *required* if `operationtype` is set to ”send message” and `opmessage_grp` is not set

Action update operation

The action update operation object defines an operation that will be performed when a problem is updated (commented upon, acknowledged, severity changed, or manually closed). Update operations are possible **only** for trigger and service actions. It has the following properties.

Property	Type	Description
operationtype	integer	Type of operation. Possible values: 0 - send message; 1 - global script; 12 - notify all involved. Property behavior: - *required*
opcommand	object	Global script to execute. The global script must have the `scriptid` property defined. Property behavior: - *required* if `operationtype` is set to ”global script”
opcommand_grp	array	Host groups to run global scripts on. The host groups must have the `groupid` property defined. Property behavior: - *required* if `eventsource` of Action object is set to ”event created by a trigger”, and `operationtype` is set to ”global script”, and `opcommand_hst` is not set
opcommand_hst	array	Host to run global scripts on. The hosts must have the `hostid` property defined. Property behavior: - *required* if `eventsource` of Action object is set to ”event created by a trigger”, and `operationtype` is set to ”global script”, and `opcommand_grp` is not set

Property	Type	Description
opmessage	object	Object containing the data about the message sent by the update operation. The operation message object is described in detail above.
opmessage_grp	array	User groups to send messages to. The user groups must have the `usrgrpid` property defined. Property behavior: - *required* if `operationtype` is set to "send message" and `opmessage_usr` is not set
opmessage_usr	array	Users to send messages to. The users must have the `userid` property defined. Property behavior: - *required* if `operationtype` is set to "send message" and `opmessage_grp` is not set

Action filter

The action filter object defines a set of conditions that must be met to perform the configured action operations. It has the following properties.

Property	Type	Description
conditions	array	Set of filter conditions to use for filtering results. The conditions will be sorted in the order of their placement in the formula. Property behavior: - *required*
evaltype	integer	Filter condition evaluation method. Possible values: 0 - And/Or; 1 - And; 2 - Or; 3 - Custom expression. Property behavior: - *required*
eval_formula	string	Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its `formulaid`. The value of `eval_formula` is equal to the value of `formula` for filters with a custom expression. Property behavior: - *read-only*
formula	string	User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its `formulaid`. The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted. Property behavior: - *required* if `evaltype` is set to "custom expression"

Action filter condition

The action filter condition object defines a specific condition that must be checked before running the action operations.

Property	Type	Description
conditiontype	integer	Type of condition. Possible values if `eventsource` of Action object is set to ”event created by a trigger”: 0 - host group; 1 - host; 2 - trigger; 3 - event name; 4 - trigger severity; 6 - time period; 13 - host template; 16 - problem is suppressed; 25 - event tag; 26 - event tag value. Possible values if `eventsource` of Action object is set to ”event created by a discovery rule”: 7 - host IP; 8 - discovered service type; 9 - discovered service port; 10 - discovery status; 11 - uptime or downtime duration; 12 - received value; 18 - discovery rule; 19 - discovery check; 20 - proxy; 21 - discovery object; 29 - proxy group. Possible values if `eventsource` of Action object is set to ”event created by active agent autoregistration”: 20 - proxy; 22 - host name; 24 - host metadata; 29 - proxy group. Possible values if `eventsource` of Action object is set to ”internal event”: 0 - host group; 1 - host; 13 - host template; 23 - event type; 25 - event tag; 26 - event tag value. Possible values if `eventsource` of Action object is set to ”event created on service status update”: 25 - event tag; 26 - event tag value; 27 - service; 28 - service name. Property behavior: - *required*
value	string	Value to compare with. Property behavior: - *required*

Property	Type	Description
value2	string	Secondary value to compare with. Property behavior: - *required* if `eventsource` of Action object is set to ”event created by a trigger”, `conditiontype` is set to any possible value for trigger actions, and the type of condition (see below) is ”26” - *required* if `eventsource` of Action object is set to ”internal event”, `conditiontype` is set to any possible value for internal actions, and the type of condition (see below) is ”26” - *required* if `eventsource` of Action object is set to ”event created on service status update”, `conditiontype` is set to any possible value for service actions, and the type of condition (see below) is ”26”
formulaid	string	Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward.
operator	integer	Condition operator. Possible values: 0 - *(default)* equals; 1 - does not equal; 2 - contains; 3 - does not contain; 4 - in; 5 - is greater than or equals; 6 - is less than or equals; 7 - not in; 8 - matches; 9 - does not match; 10 - Yes; 11 - No.

Note:
To better understand how to use filters with various types of expressions, see examples on the action.get and action.create method pages.

The following operators and values are supported for each condition type.

Condition	Condition name	Supported operators	Expected value
0	Host group	equals, does not equal	Host group ID.
1	Host	equals, does not equal	Host ID.
2	Trigger	equals, does not equal	Trigger ID.
3	Event name	contains, does not contain	Event name.
4	Trigger severity	equals, does not equal, is greater than or equals, is less than or equals	Trigger severity. Refer to the trigger `severity` property for a list of supported trigger severities.
5	Trigger value	equals	Trigger value. Refer to the trigger `value` property for a list of supported trigger values.
6	Time period	in, not in	Time when the event was triggered as a time period.
7	Host IP	equals, does not equal	One or several IP ranges to check, separated by commas. Refer to the network discovery configuration section for more information on supported formats of IP ranges.

Condition	Condition name	Supported operators	Expected value
8	Discovered service type	equals, does not equal	Type of discovered service. The type of service matches the type of the discovery check used to detect the service. Refer to the discovery check `type` property for a list of supported types.
9	Discovered service port	equals, does not equal	One or several port ranges, separated by commas.
10	Discovery status	equals	Status of a discovered object. Possible values: 0 - host or service up; 1 - host or service down; 2 - host or service discovered; 3 - host or service lost.
11	Uptime or downtime duration	is greater than or equals, is less than or equals	Time indicating how long has the discovered object been in the current status in seconds.
12	Received values	equals, does not equal, is greater than or equals, is less than or equals, contains, does not contain	Value returned when performing a Zabbix agent, SNMPv1, SNMPv2 or SNMPv3 discovery check.
13	Host template	equals, does not equal	Linked template ID.
16	Problem is suppressed	Yes, No	No value required: using the ”Yes” operator means that problem must be suppressed, ”No” - not suppressed.
18	Discovery rule	equals, does not equal	ID of the discovery rule.
19	Discovery check	equals, does not equal	ID of the discovery check.
20	Proxy	equals, does not equal	ID of the proxy.
21	Discovery object	equals	Type of object that triggered the discovery event. Possible values: 1 - discovered host; 2 - discovered service.
22	Host name	contains, does not contain, matches, does not match	Host name. Using a regular expression is supported for operators *matches* and *does not match* in autoregistration conditions.
23	Event type	equals	Specific internal event. Possible values: 0 - item in ”not supported” state; 1 - item in ”normal” state; 2 - LLD rule in ”not supported” state; 3 - LLD rule in ”normal” state; 4 - trigger in ”unknown” state; 5 - trigger in ”normal” state.
24	Host metadata	contains, does not contain, matches, does not match	Metadata of the auto-registered host. Using a regular expression is supported for operators *matches* and *does not match*.
25	Tag	equals, does not equal, contains, does not contain	Event tag.

Condition	Condition name	Supported operators	Expected value
26	Tag value	equals, does not equal, contains, does not contain	Event tag value.
27	Service	equals, does not equal	Service ID.
28	Service name	equals, does not equal	Service name.
29	Proxy group	equals, does not equal	ID of the proxy group.

action.create

Description

`object action.create(object/array actions)`

This method allows you to create new actions.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Actions to create.

Additionally to the standard action properties, the method accepts the following parameters.

Parameter	Type	Description
filter	object	Action filter object for the action.
operations	array	Action operations to create for the action.
recovery_operations	array	Action recovery operations to create for the action.
update_operations	array	Action update operations to create for the action.

Return values

`(object)` Returns an object containing the IDs of the created actions under the `actionids` property. The order of the returned IDs matches the order of the passed actions.

Examples

Create a trigger action

Create a trigger action that will begin once a trigger (with the word ”memory” in its name) from host ”10084” goes into a PROBLEM state. The action will have 4 configured operations. The first and immediate operation will send a message to all users in user group ”7” via media type ”1”. If the event is not resolved in 30 minutes, the second operation will run script ”5” (script with scope ”Action operation”) on all hosts in group ”2”. If the event is resolved, a recovery operation will notify all users who received any messages regarding the problem. If the event is updated, an acknowledge/update operation will notify (with a custom subject and message) all users who received any messages regarding the problem.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "action.create",
    "params": {
        "name": "Trigger action",
        "eventsource": 0,
        "esc_period": "30m",
        "filter": {
            "evaltype": 0,
            "conditions": [
```

```
                {
                    "conditiontype": 1,
                    "operator": 0,
                    "value": "10084"
                },
                {
                    "conditiontype": 3,
                    "operator": 2,
                    "value": "memory"
                }
            ]
        },
        "operations": [
            {
                "operationtype": 0,

                }
            }
        ],
        "update_operations": [
            {
                "operationtype": "12",
                "opmessage": {
                    "default_msg": 0,
                    "message": "Custom update operation message body",
```

```
                    "subject": "Custom update operation message subject"
                }
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "actionids": [
            "17"
        ]
    },
    "id": 1
}
```

Create a discovery action

Create a discovery action that will link template ”10001” to discovered hosts.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "action.create",
    "params": {
        "name": "Discovery action",
        "eventsource": 1,
        "filter": {
            "evaltype": 0,
            "conditions": [
                {
                    "conditiontype": 21,
                    "operator": 0,
                    "value": "1"
                },
                {
                    "conditiontype": 10,
                    "operator": 0,
                    "value": "2"
                }
            ]
        },
        "operations": [
            {
                "operationtype": 6,
                "optemplate": [
                    {
                        "templateid": "10001"
                    }
                ]
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
```

```
        "actionids": [
            "18"
        ]
    },
    "id": 1
}
```

Using a custom expression filter

Create a trigger action that uses a custom expression - ”A and (B or C)” - for evaluating action conditions. Once a trigger with a severity higher or equal to ”Warning” from host ”10084” or host ”10106” goes into a PROBLEM state, the action will send a message to all users in user group ”7” via media type ”1”. The formula IDs ”A”, ”B” and ”C” have been chosen arbitrarily.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "action.create",
    "params": {
        "name": "Trigger action",
        "eventsource": 0,
        "esc_period": "15m",
        "filter": {
            "evaltype": 3,
            "formula": "A and (B or C)",
            "conditions": [
                {
                    "conditiontype": 4,
                    "operator": 5,
                    "value": "2",
                    "formulaid": "A"
                },
                {
                    "conditiontype": 1,
                    "operator": 0,
                    "value": "10084",
                    "formulaid": "B"
                },
                {
                    "conditiontype": 1,
                    "operator": 0,
                    "value": "10106",
                    "formulaid": "C"
                }
            ]
        },
        "operations": [
            {
                "operationtype": 0,
                "esc_step_from": 1,
                "esc_step_to": 1,
                "opmessage_grp": [
                    {
                        "usrgrpid": "7"
                    }
                ],
                "opmessage": {
                    "default_msg": 1,
                    "mediatypeid": "1"
                }
            }
        ]
    },
    "id": 1
```

```
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "actionids": [
            "18"
        ]
    },
    "id": 1
}
```

Create agent autoregistration rule

Create an autoregistration action that adds a host to host group ”2” when the host name contains ”SRV” or metadata contains ”AlmaLinux”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "action.create",
    "params": {
        "name": "Register Linux servers",
        "eventsource": "2",
        "filter": {
            "evaltype": "2",
            "conditions": [
                {
                    "conditiontype": "22",
                    "operator": "2",
                    "value": "SRV"
                },
                {
                    "conditiontype": "24",
                    "operator": "2",
                    "value": "AlmaLinux"
                }
            ]
        },
        "operations": [
            {
                "operationtype": "4",
                "opgroup": [
                    {
                        "groupid": "2"
                    }
                ]
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "actionids": [
            19
        ]
    },
    "id": 1
```

```
}
```

Create agent autoregistration rule with host tags

Create an autoregistration action that adds a host to host group ”2” and adds two host tags.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "action.create",
    "params": {
        "name": "Register Linux servers with tags",
        "eventsource": "2",
        "operations": [
            {
                "operationtype": "4",
                "opgroup": [
                    {
                        "groupid": "2"
                    }
                ]
            },
            {
                "operationtype": "13",
                "optag": [
                    {
                        "tag": "location",
                        "value": "office"
                    },
                    {
                        "tag": "city",
                        "value": "Riga"
                    }
                ]
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "actionids": [
            20
        ]
    },
    "id": 1
}
```

action.delete

Description

`object action.delete(array actionIds)`

This method allows you to delete actions.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.
 The user will not be able to delete an action that contains an inaccessible proxy or proxy group in its filter conditions. See user group configuration (*Proxy access list*) for more information.

Parameters

`(array)` IDs of the actions to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted actions under the `actionids` property.

Examples

Delete multiple actions

Delete two actions.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "action.delete",
    "params": [
        "17",
        "18"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "actionids": [
            "17",
            "18"
        ]
    },
    "id": 1
}
```

Source

CAction::delete() in *ui/include/classes/api/services/CAction.php*.

action.get

Description

`integer/array action.get(object parameters)`

The method allows you to retrieve actions according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
actionids	ID/array	Return only actions with the given IDs.
groupids	ID/array	Return only actions that use the given host groups in action conditions.
hostids	ID/array	Return only actions that use the given hosts in action conditions.
triggerids	ID/array	Return only actions that use the given triggers in action conditions.
mediatypeids	ID/array	Return only actions that use the given media types to send messages.
usrgrpids	ID/array	Return only actions that are configured to send messages to the given user groups.
userids	ID/array	Return only actions that are configured to send messages to the given users.
scriptids	ID/array	Return only actions that are configured to run the given scripts.
selectFilter	query	Return a `filter` property with the action condition filter.
selectOperations	query	Return an `operations` property with action operations.
selectRecoveryOperations	query	Return a `recovery_operations` property with action recovery operations.
selectUpdateOperations	query	Return an `update_operations` property with action update operations.
sortfield	string/array	Sort the result by the given properties. Possible values: `actionid`, `name`, `status`.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve trigger actions

Retrieve all configured trigger actions together with action conditions and operations.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "action.get",
    "params": {
        "output": "extend",
        "selectOperations": "extend",
        "selectRecoveryOperations": "extend",
        "selectUpdateOperations": "extend",
        "selectFilter": "extend",
        "filter": {
            "eventsource": 0
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "actionid": "3",
            "name": "Report problems to Zabbix administrators",
            "eventsource": "0",
            "status": "1",
            "esc_period": "1h",
            "pause_suppressed": "1",
            "filter": {
                "evaltype": "0",
                "formula": "",
                "conditions": [],
                "eval_formula": ""
            },
            "operations": [
                {
                    "operationid": "3",
                    "actionid": "3",
                    "operationtype": "0",
                    "esc_period": "0",
                    "esc_step_from": "1",

                        {
                            "hostid": "10084"
                        }
                    ],
                    "opcommand_grp": []
                }
            ]
        }
    ],
    "id": 1
}
```

Retrieve discovery actions

Retrieve all configured discovery actions together with action conditions and operations. The filter uses the ”and” evaluation type, so the `formula` property is empty and `eval_formula` is generated automatically.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "action.get",
    "params": {
        "output": "extend",
        "selectOperations": "extend",
        "selectFilter": "extend",
        "filter": {
            "eventsource": 1
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "actionid": "2",
            "name": "Auto discovery. Linux servers.",
            "eventsource": "1",
            "status": "1",
            "esc_period": "0s",
            "pause_suppressed": "1",
            "filter": {
                "evaltype": "0",
                "formula": "",
                "conditions": [
                    {
                        "conditiontype": "10",
                        "operator": "0",
                        "value": "0",
                        "value2": "",
                        "formulaid": "B"
                    },
                    {
                        "conditiontype": "8",
                        "operator": "0",
                        "value": "9",
                        "value2": "",

action.update

Description

`object action.update(object/array actions)`

This method allows you to update existing actions.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Action properties to be updated.

The `actionid` property must be defined for each action, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard action properties, the method accepts the following parameters.

Parameter	Type	Description
filter	object	Action filter object to replace the current filter.
operations	array	Action operations to replace existing operations.
recovery_operations	array	Action recovery operations to replace existing recovery operations. Parameter behavior: - *supported* if `eventsource` of Action object is set to ”event created by a trigger”, ”internal event”, or ”event created on service status update”
update_operations	array	Action update operations to replace existing update operations. Parameter behavior: - *supported* if `eventsource` of Action object is set to ”event created by a trigger” or ”event created on service status update”

Return values

`(object)` Returns an object containing the IDs of the updated actions under the `actionids` property.

Examples

Disable action

Disable an action, that is, set its status to ”1”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "action.update",
    "params": {
        "actionid": "2",
        "status": "1"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "actionids": [
            "2"
        ]
    },
    "id": 1
}
```

Alert

This class is designed to work with alerts.

Object references:

- Alert

Available methods:

- alert.get - retrieve alerts

Alert object

The following objects are directly related to the `alert` API.

Alert

> **Note:**
> Alerts are created by Zabbix server and cannot be modified via the API.

The alert object contains information about whether certain action operations have been executed successfully. It has the following properties.

Property	Type	Description
alertid	ID	ID of the alert.
actionid	ID	ID of the action that generated the alert.
alerttype	integer	Alert type. Possible values: 0 - message; 1 - remote command.
clock	timestamp	Time when the alert was generated.

Property	Type	Description
error	string	Error text if there are problems sending a message or running a command.
esc_step	integer	Action escalation step during which the alert was generated.
eventid	ID	ID of the event that triggered the action.
mediatypeid	ID	ID of the media type that was used to send the message.
message	text	Message text. Property behavior: - *supported* if `alerttype` is set to ”message”
retries	integer	Number of times Zabbix tried to send the message.
sendto	string	Address, user name or other identifier of the recipient. Property behavior: - *supported* if `alerttype` is set to ”message”
status	integer	Status indicating whether the action operation has been executed successfully. Possible values if `alerttype` is set to ”message”: 0 - message not sent; 1 - message sent; 2 - failed after a number of retries; 3 - new alert is not yet processed by alert manager. Possible values if `alerttype` is set to ”remote command”: 0 - command not run; 1 - command run; 2 - tried to run the command on Zabbix agent, but it was unavailable.
subject	string	Message subject. Property behavior: - *supported* if `alerttype` is set to ”message”
userid	ID	ID of the user that the message was sent to.
p_eventid	ID	ID of problem event, which generated the alert.
acknowledgeid	ID	ID of acknowledgment, which generated the alert.

alert.get

Description

`integer/array alert.get(object parameters)`

The method allows you to retrieve alerts according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
alertids	ID/array	Return only alerts with the given IDs.
actionids	ID/array	Return only alerts generated by the given actions.
eventids	ID/array	Return only alerts generated by the given events.
groupids	ID/array	Return only alerts generated by objects from the given host groups.
hostids	ID/array	Return only alerts generated by objects from the given hosts.
mediatypeids	ID/array	Return only message alerts that used the given media types.
objectids	ID/array	Return only alerts generated by the given objects

Parameter	Type	Description
userids	ID/array	Return only message alerts that were sent to the given users.
eventobject	integer	Return only alerts generated by events related to objects of the given type. See event `object` for a list of supported object types. Default: 0 - trigger.
eventsource	integer	Return only alerts generated by events of the given type. See event `source` for a list of supported event types. Default: 0 - trigger events.
time_from	timestamp	Return only alerts that have been generated after the given time.
time_till	timestamp	Return only alerts that have been generated before the given time.
selectHosts	query	Return a `hosts` property with data of hosts that triggered the action operation.
selectMediatypes	query	Return a `mediatypes` property with an array of the media types that were used for the message alert. See `mediatype.get` for restrictions based on user type.
selectUsers	query	Return a `users` property with an array of the users that the message was addressed to. See `user.get` for restrictions based on user type.
sortfield	string/array	Sort the result by the given properties. Possible values: `alertid`, `clock`, `eventid`, `mediatypeid`, `sendto`, `status`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve alerts by action ID

Retrieve all alerts generated by action "3".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "alert.get",
    "params": {
        "output": "extend",
        "actionids": "3"
    },
```

```
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "alertid": "1",
            "actionid": "3",
            "eventid": "21243",
            "userid": "1",
            "clock": "1362128008",
            "mediatypeid": "1",
            "sendto": "support@company.com",
            "subject": "PROBLEM: Zabbix agent on Linux server is unreachable for 5 minutes: ",
            "message": "Trigger: Zabbix agent on Linux server is unreachable for 5 minutes: \nTrigger stat
            "status": "0",

API info

This class is designed to retrieve meta information about the API.

Available methods:

- apiinfo.version - retrieve the version of Zabbix API

apiinfo.version

Description

`string apiinfo.version(array)`

This method allows you to retrieve the version of the Zabbix API.

> **Attention:**
> This method is only available to unauthenticated users.

Parameters

`(array)` The method accepts an empty array.

Return values

`(string)` Returns the version of the Zabbix API.

Note:
Starting from Zabbix 2.0.4 the version of the API matches the version of Zabbix.

Examples

Retrieving the version of the API

Retrieve the version of the Zabbix API.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "apiinfo.version",
    "params": [],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": "8.0.0",
    "id": 1
}
```

APM log

This class is designed to work with logs collected for application performance monitoring (APM).

Object references:

- APM log

Available methods:

- apmlog.get - retrieve log records

APM log object

The following objects are directly related to the `apmlog` API.

Note:
Each property corresponds to the column with the same name in the `otel_logs` table of the telemetry data source (e.g., `severity_text` property corresponds to the `SeverityText` column). For the list of columns, see Supported telemetry data columns.

APM log

The APM log object represents a log record (a text record of an event, such as a failed payment or a database timeout). A log record contains information about an event that occurred at a specific time, including its severity, message, and attributes. If a log record was produced during an operation that is part of a trace, it also contains the IDs of that trace and span.

The APM log object has the following properties:

Property	Type	Description
timestamp	integer	Unix time (in nanoseconds) when the event occurred. Property behavior: - *read-only*

Property	Type	Description
traceid	string	ID, if any, of the trace during which the log record was produced. Property behavior: - *read-only*
spanid	string	ID, if any, of the span during which the log record was produced. Property behavior: - *read-only*
trace_flags	integer	Trace flags of the trace context of the log record, as a bitmask. If the least significant bit is set (value 1), the trace is sampled. Property behavior: - *read-only*
severity_text	string	Severity level of the log record, as provided by the application (e.g., `INFO`, `WARN`, or `ERROR`). Property behavior: - *read-only*
severity_number	integer	Severity level of the log record, as a number. Possible values: 0 - UNSPECIFIED; 1-4 - TRACE; 5-8 - DEBUG; 9-12 - INFO; 13-16 - WARN; 17-20 - ERROR; 21-24 - FATAL. Property behavior: - *read-only*
service_name	string	Name of the service that produced the log record (e.g., `zabbix-frontend`), taken from the OpenTelemetry `service.name` resource attribute. Property behavior: - *read-only*
body	string	Message of the log record. Property behavior: - *read-only*
resource_schema_url	string	URL, if any, of the OpenTelemetry schema of the resource attributes. Property behavior: - *read-only*
resource_attributes	object	Key-value resource attributes of the log record (e.g., `host.name: eabf8c2a5ddc`). Property behavior: - *read-only*
scope_schema_url	string	URL, if any, of the OpenTelemetry schema of the instrumentation scope and its attributes. Property behavior: - *read-only*
scope_name	string	Name of the instrumentation scope that produced the log record. Property behavior: - *read-only*

Property	Type	Description
scope_version	string	Version, if any, of the instrumentation scope. Property behavior: - *read-only*
scope_attributes	object	Key-value attributes of the instrumentation scope. Property behavior: - *read-only*
log_attributes	object	Key-value log attributes of the log record (e.g., `log.file.path: /var/log/zabbix/zabbix_frontend.log`). Property behavior: - *read-only*
event_name	string	Name, if any, of the event type that the log record represents. Property behavior: - *read-only*

apmlog.get

Description

`integer/array apmlog.get(object parameters)`

The method allows you to retrieve log records according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
time_from	timestamp	Return only log records of events that occurred at or after the given time. Parameter behavior: - *required*
time_till	timestamp	Return only log records of events that occurred before the given time. Parameter behavior: - *required*
traceids	string/array	Return only log records produced during the given traces.
spanids	string/array	Return only log records produced during the given spans.
with_flags_on	integer	Return only log records that have all of the given trace flags set. To specify several flags, use the sum of their values.
with_flags_off	integer	Return only log records that have none of the given trace flags set. To specify several flags, use the sum of their values.

Parameter	Type	Description
resource_attributes	object/array	Return only log records with the given resource attributes. Format: `[{"key": "<key>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all log records. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
resource_attributes_evaltype	integer	Evaluation method for the conditions in `resource_attributes`. Possible values: 0 - *(default)* And/Or; 2 - Or.
scope_attributes	object/array	Return only log records with the given scope attributes. Format: `[{"key": "<key>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all log records. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
scope_attributes_evaltype	integer	Evaluation method for the conditions in `scope_attributes`. Possible values: 0 - *(default)* And/Or; 2 - Or.
log_attributes	object/array	Return only log records with the given log attributes. Format: `[{"key": "<key>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all log records. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
log_attributes_evaltype	integer	Evaluation method for the conditions in `log_attributes`. Possible values: 0 - *(default)* And/Or; 2 - Or.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Supported properties: `traceid`, `spanid`, `trace_flags`, `severity_text`, `severity_number`, `service_name`, `resource_schema_url`, `scope_schema_url`, `scope_name`, `scope_version`, `event_name`.

Parameter	Type	Description
search	object	Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%…%"` search. Supported properties: `severity_text`, `service_name`, `body`, `resource_schema_url`, `scope_schema_url`, `scope_name`, `scope_version`, `event_name`.
sortfield	string/array	Sort the result by the given properties. Possible values: `timestamp`, `traceid`, `spanid`, `trace_flags`, `severity_text`, `severity_number`, `service_name`, `resource_schema_url`, `scope_schema_url`, `scope_name`, `scope_version`, `event_name`.
offset	integer	Number of records to skip before returning the result.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
limit	integer	
output	query	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving error logs of a trace

Retrieve log records with the `ERROR` severity (severity numbers 17-20) that are associated with the trace "8a4f1c7e2b9d4e6fa0c3b5d7e9f1a2c

Request:

```
{
    "jsonrpc": "2.0",
    "method": "apmlog.get",
    "params": {

            },
            "event_name": ""
        }
    ],
    "id": 1
}
```

Searching log messages

Retrieve the time, service, and message of the 10 latest log records whose message contains ”timeout”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "apmlog.get",
    "params": {
        "output": ["timestamp", "service_name", "severity_text", "body"],
        "time_from": 1790848800,
        "time_till": 1790852400,
        "search": {
            "body": "timeout"
        },
        "sortfield": "timestamp",
        "sortorder": "DESC",
        "limit": 10
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "timestamp": "1790849305091452376",
            "service_name": "zabbix-frontend",
            "severity_text": "ERROR",
            "body": "mysqli_query(): (HY000/1205): Lock wait timeout exceeded; try restarting transaction"
        },
        {
            "timestamp": "1790848961730284115",
            "service_name": "zabbix-frontend",
            "severity_text": "ERROR",
```

```
            "body": "mysqli_query(): (HY000/1205): Lock wait timeout exceeded; try restarting transaction"
        }
    ],
    "id": 1
}
```

APM metric

This class is designed to work with metrics collected for application performance monitoring (APM).

Object references:

- APM metric
- Exemplar

Available methods:

- apmmetric.get - retrieve metric data points

APM metric object

The following objects are directly related to the `apmmetric` API.

Note:
Each property, except `type`, corresponds to a column in the metric tables (`otel_metrics_gauge`, `otel_metrics_sum`, `otel_metrics_histogram`, and `otel_metrics_exponential_histogram`) of the telemetry data source. Most properties correspond to the column with the same name (e.g., `metric_name` property corresponds to the `MetricName` column). Where the names differ, the data source columns are specified in the tables below. For the list of columns, see Supported telemetry data columns.

APM metric

The APM metric object represents a data point of a metric (the value, or aggregated values, of a measurement at a specific time).

The APM metric object has the following properties:

Property	Type	Description
type	integer	Type of the data point. Possible values: 0 - Gauge; 1 - Sum; 2 - Histogram; 3 - Exponential histogram. The type is determined by the table that holds the data point: `otel_metrics_gauge`, `otel_metrics_sum`, `otel_metrics_histogram`, or `otel_metrics_exponential_histogram`. Property behavior: - *read-only*

Property	Type	Description
resource_attributes	object	Key-value resource attributes of the data point (e.g., `host.name: eabf8c2a5ddc`). Property behavior: - *read-only*
resource_schema_url	string	URL, if any, of the OpenTelemetry schema of the resource attributes. Property behavior: - *read-only*
scope_name	string	Name of the instrumentation scope that produced the data point. Property behavior: - *read-only*
scope_version	string	Version, if any, of the instrumentation scope. Property behavior: - *read-only*
scope_attributes	object	Key-value attributes of the instrumentation scope. Property behavior: - *read-only*
scope_schema_url	string	URL, if any, of the OpenTelemetry schema of the instrumentation scope and its attributes. Property behavior: - *read-only*
service_name	string	Name of the service that produced the data point (e.g., `zabbix-frontend`), taken from the OpenTelemetry `service.name` resource attribute. Property behavior: - *read-only*
metric_name	string	Name of the metric that the data point belongs to (e.g., `http.server.request.duration`). Property behavior: - *read-only*
metric_description	string	Description, if any, of the metric. Property behavior: - *read-only*
metric_unit	string	Unit, if any, of the metric values (e.g., `s` or `By`; see UCUM). Property behavior: - *read-only*
attributes	object	Key-value data point attributes (e.g., `http.request.method: POST`). Property behavior: - *read-only*
start_time_unix	integer	Unix time (in nanoseconds) when the measurement period of the data point started. Property behavior: - *read-only*
time_unix	integer	Unix time (in nanoseconds) of the data point. For *Sum*, *Histogram*, and *Exponential histogram* data points, this is the end of the measurement period. Property behavior: - *read-only*

Property	Type	Description
value	float	Value of the data point. Applies to *Gauge* and *Sum* data points. Default: 0. Property behavior: - *read-only*
flags	integer	Bitmask of data point flags. If the least significant bit is set (value 1), no value was recorded for the data point. Property behavior: - *read-only*
exemplars	array	Array of exemplar objects, that is, individual measurements kept as examples, with the trace and span during which they were recorded. Property behavior: - *read-only*
aggregation_temporality	integer	How the values of the data point are aggregated over time. Applies to *Sum*, *Histogram*, and *Exponential histogram* data points. Possible values: 0 - *(default)* Unspecified; 1 - Delta (aggregated over the period since the previous data point); 2 - Cumulative (aggregated over the period since `start_time_unix`). Property behavior: - *read-only*
is_monotonic	boolean	Whether the sum can only increase or stay the same over time. Applies to *Sum* data points. Default: `false`. Property behavior: - *read-only*
count	integer	Number of measurements in the data point. Applies to *Histogram* and *Exponential histogram* data points. Default: 0. Property behavior: - *read-only*
sum	float	Sum of all measurements in the data point. Applies to *Histogram* and *Exponential histogram* data points. Default: 0. Property behavior: - *read-only*
bucket_counts	array	Array of integers with the number of measurements in each histogram bucket. The buckets are defined by `explicit_bounds`. Applies to *Histogram* data points. Default: `[]`. Property behavior: - *read-only*

Property	Type	Description
explicit_bounds	array	Array of floats with the boundaries between histogram buckets. Applies to *Histogram* data points. Default: `[]`. Property behavior: - *read-only*
min	float	Smallest of the measurements in the data point. Applies to *Histogram* and *Exponential histogram* data points. Default: 0. Property behavior: - *read-only*
max	float	Largest of the measurements in the data point. Applies to *Histogram* and *Exponential histogram* data points. Default: 0. Property behavior: - *read-only*
scale	integer	Scale of the exponential histogram, which determines the bucket boundaries and resolution. A higher scale gives narrower buckets and finer resolution; a lower scale gives wider buckets and coarser resolution. Applies to *Exponential histogram* data points. Default: 0. Property behavior: - *read-only*
zero_count	integer	Number of measurements in the zero bucket of the exponential histogram. Applies to *Exponential histogram* data points. Default: 0. Property behavior: - *read-only*
positive_bucket_counts	array	Array of integers with the number of positive measurements in each exponential histogram bucket. The bucket boundaries are determined by `scale`; the index of the first bucket is set in `positive_offset`. Applies to *Exponential histogram* data points. Default: `[]`. Property behavior: - *read-only*
positive_offset	integer	Index of the first bucket in `positive_bucket_counts`. Applies to *Exponential histogram* data points. Default: 0. Property behavior: - *read-only*

Property	Type	Description
negative_bucket_counts	array	Array of integers with the number of negative measurements in each exponential histogram bucket. The bucket boundaries are determined by `scale`; the index of the first bucket is set in `negative_offset`. Applies to *Exponential histogram* data points. Default: `[]`. Property behavior: - *read-only*
negative_offset	integer	Index of the first bucket in `negative_bucket_counts`. Applies to *Exponential histogram* data points. Default: 0. Property behavior: - *read-only*

Exemplar

The exemplar object has the following properties:

Property	Type	Description
traceid	string	ID, if any, of the trace during which the measurement was recorded. Data source column: `Exemplars.TraceId`.
spanid	string	ID, if any, of the span during which the measurement was recorded. Data source column: `Exemplars.SpanId`.
value	float	Value of the measurement. Data source column: `Exemplars.Value`.
time_unix	integer	Unix time (in nanoseconds) when the measurement was recorded. Data source column: `Exemplars.TimeUnix`.
filtered_attributes	object	Key-value attributes of the measurement that are not included in the `attributes` of the data point. Data source column: `Exemplars.FilteredAttributes`.

apmmetric.get

Description

`integer/array apmmetric.get(object parameters)`

The method allows you to retrieve metric data points according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
time_from	timestamp	Return only data points whose time is at or after the given time. Parameter behavior: - *required*

Parameter	Type	Description
time_till	timestamp	Return only data points whose time is before the given time. Parameter behavior: - *required*
types	integer/array	Return only data points of the given types. Refer to the APM metric object page for a list of supported metric types.
with_flags_on	integer	Return only data points that have all of the given flags set. To specify several flags, use the sum of their values.
with_flags_off	integer	Return only data points that have none of the given flags set. To specify several flags, use the sum of their values.
resource_attributes	object/array	Return only data points with the given resource attributes. Format: `[{"key": "<key>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all data points. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
resource_attributes_evaltype	integer	Evaluation method for the conditions in `resource_attributes`. Possible values: 0 - *(default)* And/Or; 2 - Or.
scope_attributes	object/array	Return only data points with the given scope attributes. Format: `[{"key": "<key>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all data points. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
scope_attributes_evaltype	integer	Evaluation method for the conditions in `scope_attributes`. Possible values: 0 - *(default)* And/Or; 2 - Or.
attributes	object/array	Return only data points with the given attributes. Format: `[{"key": "<key>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all data points. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
attributes_evaltype	integer	Evaluation method for the conditions in `attributes`. Possible values: 0 - *(default)* And/Or; 2 - Or.

Parameter	Type	Description
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Supported properties: `resource_schema_url`, `scope_schema_url`, `scope_name`, `scope_version`, `service_name`, `metric_name`, `metric_unit`, `flags`.
search	object	Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%…%"` search. Supported properties: `resource_schema_url`, `scope_schema_url`, `scope_name`, `scope_version`, `service_name`, `metric_name`, `metric_description`, `metric_unit`.
sortfield	string/array	Sort the result by the given properties. Possible values: `type`, `resource_schema_url`, `scope_schema_url`, `scope_name`, `scope_version`, `service_name`, `metric_name`, `metric_unit`, `start_time_unix`, `time_unix`.
offset	integer	Number of records to skip before returning the result.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
limit	integer	
output	query	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving histogram data points

Retrieve the latest data point of the `http.server.request.duration` histogram metric of the `zabbix-frontend` service.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "apmmetric.get",
    "params": {
        "output": ["metric_name", "metric_unit", "time_unix", "count", "sum", "min", "max", "explicit_boun
        "time_from": 1790848800,
        "time_till": 1790852400,
        "types": 2,
        "filter": {
            "service_name": "zabbix-frontend",
            "metric_name": "http.server.request.duration"
        },
        "sortfield": "time_unix",
        "sortorder": "DESC",
        "limit": 1
    },
```

```
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "metric_name": "http.server.request.duration",
            "metric_unit": "s",
            "time_unix": "1790852390000000000",
            "count": "1842",
            "sum": "412.773",
            "min": "0.0061",
            "max": "1.098",
            "explicit_bounds": ["0.005", "0.05", "0.1", "0.25", "0.5", "1"],
            "bucket_counts": ["0", "211", "904", "512", "167", "41", "7"],
            "exemplars": [
                {
                    "traceid": "dee625f33cb0994e86c5cd4640e3b09c",

APM span

This class is designed to work with spans collected for application performance monitoring (APM).

Object references:

- APM span

Available methods:

- apmspan.get - retrieve spans

APM span object

The following objects are directly related to the `apmspan` API.

> **Note:**
> Each property corresponds to a column in the `otel_traces` table of the telemetry data source. For the list of columns, see Supported telemetry data columns.

APM span

The APM span object represents a span (a single operation within a trace, such as an HTTP request, a database query, or a function call).

Spans form a hierarchy, starting from the root span, which represents the first operation of the request. Every other span is a child span of the span during which its operation was started.

The APM span object has the following properties:

Property	Type	Description
timestamp	integer	Unix time (in nanoseconds) when the span started. Property behavior: - *read-only*
traceid	string	ID of the trace that the span belongs to. Property behavior: - *read-only*
spanid	string	ID of the span. Property behavior: - *read-only*
parent_spanid	string	ID of the parent span. Empty for the root span. Property behavior: - *read-only*
trace_state	string	Additional data, if any, that tracing tools attach to the trace (see W3C Trace Context). Property behavior: - *read-only*
span_name	string	Name of the operation that the span represents (e.g., `mysqli_query`). Property behavior: - *read-only*
span_kind	string	Role of the span. Possible values: `Unspecified` - span kind is not specified; `Internal` - operation performed within an application; `Server` - handling of an incoming request; `Client` - outgoing request; `Producer` - creation of an asynchronous operation (e.g., sending a message); `Consumer` - processing of an asynchronous operation. Property behavior: - *read-only*
service_name	string	Name of the service that produced the span (e.g., `zabbix-frontend`), taken from the OpenTelemetry `service.name` resource attribute. Property behavior: - *read-only*
resource_attributes	object	Key-value resource attributes of the span (e.g., `host.name: eabf8c2a5ddc`). Property behavior: - *read-only*
scope_name	string	Name of the instrumentation scope that produced the span. Property behavior: - *read-only*
scope_version	string	Version of the instrumentation scope. Property behavior: - *read-only*

Property	Type	Description
span_attributes	object	Key-value span attributes of the span (e.g., `db.system: mysql`). Property behavior: - *read-only*
duration	integer	Nanoseconds of the duration of the span. Property behavior: - *read-only*
status_code	string	Status of the operation that the span represents. Possible values: `Unset` - no explicit status has been assigned to the span; `Ok` - the operation was completed successfully; `Error` - the operation was completed with an error. Property behavior: - *read-only*
status_message	string	Additional information, if any, about the status of the span. Property behavior: - *read-only*
events	array	Array of event objects of the span, that is, notable points in time during the operation (e.g., exceptions). Property behavior: - *read-only*
links	array	Array of link objects of the span, which point to related spans in the same or another trace. Property behavior: - *read-only*

apmspan.get

Description

`integer/array apmspan.get(object parameters)`

The method allows you to retrieve spans according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
time_from	timestamp	Return only spans that started at or after the given time. Parameter behavior: - *required*
time_till	timestamp	Return only spans that started before the given time. Parameter behavior: - *required*
traceids	string/array	Return only spans that belong to the given traces.
spanids	string/array	Return only spans with the given IDs.

Parameter	Type	Description
parent_spanids	string/array	Return only spans with the given parent spans.
resource_attributes	object/array	Return only spans with the given resource attributes. Format: `[{"key": "<key>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all spans. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
resource_attributes_evaltype	integer	Evaluation method for the conditions in `resource_attributes`. Possible values: 0 - *(default)* And/Or; 2 - Or.
span_attributes	object/array	Return only spans with the given span attributes. Format: `[{"key": "<key>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all spans. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
span_attributes_evaltype	integer	Evaluation method for the conditions in `span_attributes`. Possible values: 0 - *(default)* And/Or; 2 - Or.
min_duration	integer	Return only spans whose duration is greater than or equal to the given value, in nanoseconds.
max_duration	integer	Return only spans whose duration is less than the given value, in nanoseconds.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Supported properties: `traceid`, `spanid`, `parent_spanid`, `trace_state`, `span_name`, `span_kind`, `service_name`, `scope_name`, `scope_version`, `status_code`, `status_message`.
search	object	Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%...%"` search. Supported properties: `trace_state`, `span_name`, `service_name`, `scope_name`, `scope_version`, `status_message`.
sortfield	string/array	Sort the result by the given properties. Possible values: `timestamp`, `traceid`, `spanid`, `parent_spanid`, `trace_state`, `span_name`, `span_kind`, `service_name`, `scope_name`, `scope_version`, `duration`, `status_code`, `status_message`.

Parameter	Type	Description
offset	integer	Number of records to skip before returning the result.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
limit	integer	
output	query	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving the span hierarchy of a trace

Retrieve the first four spans of the trace "dee625f33cb0994e86c5cd4640e3b09c", sorted by start time. The `parent_spanid` property shows how the spans are related: the root span has no parent, and each other span refers to the span that started it.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "apmspan.get",
    "params": {
        "output": ["spanid", "parent_spanid", "service_name", "span_name", "duration", "status_code"],
        "time_from": 1790848800,
        "time_till": 1790852400,
        "traceids": "dee625f33cb0994e86c5cd4640e3b09c",
        "sortfield": "timestamp",
        "sortorder": "ASC",
        "limit": 4
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "spanid": "7c1a9e2f4b6d8a03",
            "parent_spanid": "",
            "service_name": "zabbix-nginx",
            "span_name": "POST /zabbix.php",
            "duration": "1104826531",
            "status_code": "Unset"
        },
        {
            "spanid": "3f8b2c6d1e9a7054",

APM trace

This class is designed to work with traces collected for application performance monitoring (APM).

Object references:

- APM trace
- Event
- Link

Available methods:

- apmtrace.get - retrieve traces

APM trace object

The following objects are directly related to the `apmtrace` API.

Note:
Each property, except `span_count` and `error_count`, corresponds to a column in the `otel_traces` table of the telemetry data source. Most properties correspond to the column with the same name (e.g., `span_name` property corresponds to the `SpanName` column). Where the names differ, the data source columns are specified in the tables below. For the list of columns, see Supported telemetry data columns.

APM trace

The APM trace object represents a trace (the path that a request takes through your applications and services). A trace consists of one or more spans; each span represents a single operation.

The APM trace object is based on the root span of the trace (the span that starts the trace and has no parent span). All properties contain data of the root span, except `span_count` and `error_count`, which are calculated from all spans of the trace.

The APM trace object has the following properties:

Property	Type	Description
timestamp	integer	Unix time (in nanoseconds) when the root span started. Property behavior: - *read-only*
traceid	string	ID of the trace, shared by all spans that belong to the trace. Property behavior: - *read-only*
spanid	string	ID of the root span. Property behavior: - *read-only*
trace_state	string	Additional data, if any, that tracing tools attach to the trace (see W3C Trace Context). Property behavior: - *read-only*
span_name	string	Name of the operation that the root span represents (e.g., `POST /zabbix.php`). Property behavior: - *read-only*
span_kind	string	Role of the root span. Possible values: `Unspecified` - span kind is not specified; `Internal` - operation performed within an application; `Server` - handling of an incoming request; `Client` - outgoing request; `Producer` - creation of an asynchronous operation (e.g., sending a message); `Consumer` - processing of an asynchronous operation. Property behavior: - *read-only*
service_name	string	Name of the service that produced the root span (e.g., `zabbix-nginx`), taken from the OpenTelemetry `service.name` resource attribute. Property behavior: - *read-only*
resource_attributes	object	Key-value resource attributes of the root span (e.g., `host.name: eabf8c2a5ddc`). Property behavior: - *read-only*
scope_name	string	Name of the instrumentation scope that produced the root span. Property behavior: - *read-only*
scope_version	string	Version of the instrumentation scope. Property behavior: - *read-only*
span_attributes	object	Key-value span attributes of the root span (e.g., `http.method: POST`). Property behavior: - *read-only*

Property	Type	Description
duration	integer	Nanoseconds of the duration of the trace. Property behavior: - *read-only*
status_code	string	Status of the operation that the root span represents. Possible values: `Unset` - no explicit status has been assigned to the root span; `Ok` - the operation was completed successfully; `Error` - the operation was completed with an error. Property behavior: - *read-only*
status_message	string	Additional information, if any, about the status of the root span. Property behavior: - *read-only*
events	array	Array of event objects of the root span, that is, notable points in time during the operation (e.g., exceptions). Property behavior: - *read-only*
links	array	Array of link objects of the root span, which point to related spans in the same or another trace. Property behavior: - *read-only*
span_count	integer	Total number of spans in the trace. Property behavior: - *read-only*
error_count	integer	Number of spans in the trace with `status_code` set to `Error`. Property behavior: - *read-only*

Event

The event object has the following properties.

Property	Type	Description
timestamp	integer	Unix time (in nanoseconds) when the event occurred. Data source column: `Events.Timestamp`
name	string	Name of the event. Data source column: `Events.Name`
attributes	object	Key-value attributes with additional information, if any, about the event. Data source column: `Events.Attributes`

Link

The link object has the following properties.

Property	Type	Description
traceid	string	ID of the trace that contains the linked span. Data source column: `Links.TraceId`
spanid	string	ID of the linked span. Together with `traceid`, uniquely identifies the linked span. Data source column: `Links.SpanId`

Property	Type	Description
trace_state	string	Trace state, if any, of the linked span (see W3C Trace Context). Data source column: `Links.TraceState`
attributes	object	Key-value attributes with additional information about the link. Data source column: `Links.Attributes`

apmtrace.get

Description

`integer/array apmtrace.get(object parameters)`

The method allows you to retrieve traces according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
time_from	timestamp	Return only traces whose root span started at or after the given time. Parameter behavior: - *required*
time_till	timestamp	Return only traces whose root span started before the given time. Parameter behavior: - *required*
traceids	string/array	Return only traces with the given IDs.
resource_attributes	object/array	Return only traces whose root span has the given resource attributes. Format: `[{"key": "<key>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all traces. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
resource_attributes_evaltype	integer	Evaluation method for the conditions in `resource_attributes`. Possible values: 0 - *(default)* And/Or; 2 - Or.

Parameter	Type	Description
span_attributes	object/array	Return only traces whose root span has the given span attributes. Format: `[{"key": "<key>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all traces. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
span_attributes_evaltype	integer	Evaluation method for the conditions in `span_attributes`. Possible values: 0 - *(default)* And/Or; 2 - Or.
min_duration	integer	Return only traces whose root span `duration` is greater than or equal to the given value, in nanoseconds.
max_duration	integer	Return only traces whose root span `duration` is less than the given value, in nanoseconds.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Supported properties: `traceid`, `spanid`, `trace_state`, `span_name`, `span_kind`, `service_name`, `scope_name`, `scope_version`, `status_code`, `status_message`.
search	object	Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%...%"` search. Supported properties: `trace_state`, `span_name`, `service_name`, `scope_name`, `scope_version`, `status_message`.
sortfield	string/array	Sort the result by the given properties. Possible values: `timestamp`, `traceid`, `spanid`, `trace_state`, `span_name`, `span_kind`, `service_name`, `scope_name`, `scope_version`, `duration`, `status_code`, `status_message`.
offset	integer	Number of records to skip before returning the result.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
limit	integer	
output	query	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving slow traces

Retrieve the two slowest traces of the `zabbix-nginx` service. Search traces from 10:00 to 11:00 on October 1, 2026 (UTC), and include only those that took 1 second or longer.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "apmtrace.get",
    "params": {
        "output": ["timestamp", "traceid", "span_name", "service_name", "duration", "status_code", "span_c
        "time_from": 1790848800,
        "time_till": 1790852400,
        "filter": {
            "service_name": "zabbix-nginx"
        },
        "min_duration": 1000000000,
        "sortfield": "duration",
        "sortorder": "DESC",
        "limit": 2
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "timestamp": "1790849274910226417",
            "traceid": "8a4f1c7e2b9d4e6fa0c3b5d7e9f1a2c4",
            "span_name": "POST /zabbix.php",
            "service_name": "zabbix-nginx",
            "duration": "30412907815",
            "status_code": "Error",
            "span_count": "49",
            "error_count": "2"
        },
        {
            "timestamp": "1790850512338104952",
            "traceid": "dee625f33cb0994e86c5cd4640e3b09c",
            "span_name": "POST /zabbix.php",
            "service_name": "zabbix-nginx",
            "duration": "1104826531",
            "status_code": "Unset",
            "span_count": "27",
            "error_count": "0"
        }
    ],
    "id": 1
}
```

Audit log

This class is designed to work with audit log.

Object references:

- Audit log

Available methods:

- auditlog.get - retrieve audit log records

Audit log object

The following objects are directly related to the `auditlog` API.

Audit log

The audit log object contains information about user actions. It has the following properties.

Property	Type	Description
auditid	ID	ID of audit log entry. Generated using CUID algorithm.
userid	ID	Audit log entry author userid.
username	string	Audit log entry author username.
clock	timestamp	Audit log entry creation timestamp.
ip	string	Audit log entry author IP address.
action	integer	Audit log entry action. Possible values: 0 - Add; 1 - Update; 2 - Delete; 4 - Logout; 7 - Execute; 8 - Login; 9 - Failed login; 10 - History clear; 11 - Config refresh; 12 - Push.

Property	Type	Description
resourcetype	integer	Audit log entry resource type. Possible values: 0 - User; 3 - Media type; 4 - Host; 5 - Action; 6 - Graph; 11 - User group; 13 - Trigger; 14 - Host group; 15 - Item; 16 - Image; 17 - Value map; 18 - Service; 19 - Map; 22 - Web scenario; 23 - Discovery rule; 25 - Script; 26 - Proxy; 27 - Maintenance; 28 - Regular expression; 29 - Macro; 30 - Template; 31 - Trigger prototype; 32 - Icon mapping; 33 - Dashboard; 34 - Event correlation; 35 - Graph prototype; 36 - Item prototype; 37 - Host prototype; 38 - Autoregistration; 39 - Module; 40 - Settings; 41 - Housekeeping; 42 - Authentication; 43 - Template dashboard; 44 - User role; 45 - API token; 46 - Scheduled report; 47 - High availability node; 48 - SLA; 49 - User directory; 50 - Template group; 51 - Connector; 52 - LLD rule; 53 - History; 54 - Multi-factor authentication; 55 - Proxy group; 56 - LLD rule prototype.
resourceid	ID	Audit log entry resource identifier.
resource_cuid	ID	Audit log entry resource unique identifier generated using the CUID algorithm.
resourcename	string	Audit log entry resource human readable name.
recordsetid	ID	Audit log entry recordset ID. The audit log records created during the same operation will have the same recordset ID. Generated using CUID algorithm.

Property	Type	Description
details	text	Audit log entry details. The details are stored as a JSON object, where each property name is a path to the property or nested object in which the change occurred, and where each value contains the data (in array format) about the change in this property or nested object. Possible value formats: ["add"] - Nested object has been added; ["add", "<value>"] - The property of the added object equals <value>; ["update"] - Nested object has been updated; ["update", "<new value>", "<old value>"] - The property of the updated object was changed from <old value> to <new value>; ["delete"] - Nested object has been deleted.

auditlog.get

Description

`integer/array auditlog.get(object parameters)`

The method allows you to retrieve audit log records according to the given parameters.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
auditids	ID/array	Return only audit log with the given IDs.
userids	ID/array	Return only audit log that were created by the given users.
time_from	timestamp	Returns only audit log entries that have been created after or at the given time.
time_till	timestamp	Returns only audit log entries that have been created before or at the given time.
sortfield	string/array	Sort the result by the given properties. Possible values: `auditid`, `userid`, `clock`.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve audit log

Retrieve two latest audit log records.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "auditlog.get",
    "params": {
        "output": "extend",
        "sortfield": "clock",
        "sortorder": "DESC",
        "limit": 2
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",

Authentication

This class is designed to work with authentication settings.

Object references:

- Authentication

Available methods:

- authentication.get - retrieve authentication settings
- authentication.update - update authentication settings

Authentication object

The following objects are directly related to the `authentication` API.

Authentication

The authentication object has the following properties.

Property	Type	Description
authentication_type	integer	Default authentication. Possible values: 0 - *(default)* Internal; 1 - LDAP.
http_auth_enabled	integer	HTTP authentication. Possible values: 0 - *(default)* Disabled; 1 - Enabled. Property behavior: - *supported* if `$ZBX_FEATURE_FLAGS['http_auth_enabled']` is set to `true` in the frontend configuration file.
http_login_form	integer	Default login form. Possible values: 0 - *(default)* Zabbix login form; 1 - HTTP login form. Property behavior: - *supported* if `$ZBX_FEATURE_FLAGS['http_auth_enabled']` is set to `true` in the frontend configuration file.
http_strip_domains	string	Domain name to remove. Property behavior: - *supported* if `$ZBX_FEATURE_FLAGS['http_auth_enabled']` is set to `true` in the frontend configuration file.
http_case_sensitive	integer	HTTP case-sensitive login. Possible values: 0 - Off; 1 - *(default)* On. Property behavior: - *supported* if `$ZBX_FEATURE_FLAGS['http_auth_enabled']` is set to `true` in the frontend configuration file.
ldap_auth_enabled	integer	LDAP authentication. Possible values: 0 - *(default)* Disabled; 1 - Enabled.
ldap_case_sensitive	integer	LDAP case-sensitive login. Possible values: 0 - Off; 1 - *(default)* On.

Property	Type	Description
ldap_userdirectoryid	ID	ID of the default user directory for LDAP authentication. Used for user groups with `gui_access` set to LDAP or System default. Property behavior: - *required* if `ldap_auth_enabled` is set to ”Enabled”
saml_auth_enabled	integer	SAML authentication. Possible values: 0 - *(default)* Disabled; 1 - Enabled.
saml_case_sensitive	integer	SAML case-sensitive login. Possible values: 0 - Off; 1 - *(default)* On.
passwd_min_length	integer	Password minimal length requirement. Possible values range from 1 to 70. Default: 8.
passwd_check_rules	integer	Password checking rules. Possible bitmap values: 0 - Check password length; 1 - Check if password uses uppercase and lowercase Latin letters; 2 - Check if password uses digits; 4 - Check if password uses special characters; 8 - *(default)* Check if password is not in the list of commonly used passwords and does not contain derivations of word ”Zabbix” or user’s name, last name, or username. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 15 for checking all rules).
ldap_jit_status	integer	Status of LDAP provisioning. Possible values: 0 - Disabled for configured LDAP IdPs; 1 - Enabled for configured LDAP IdPs.
saml_jit_status	integer	Status of SAML provisioning. Possible values: 0 - Disabled for configured SAML IdPs; 1 - Enabled for configured SAML IdPs.
jit_provision_interval	string	Time interval between JIT provision requests for logged-in user. Accepts a number of seconds (e.g., 3600), or a value with a time suffix (e.g., `3600s`, `60m`, `1h`, `1d`, `1M`, `1y`), including support for months and years. Minimum value: 1h. Default: 1h. Available only for LDAP provisioning.
disabled_usrgrpid	ID	ID of the user group to assign the deprovisioned user to. The user group must be disabled and cannot be enabled or deleted when configured. Property behavior: - *required* if `ldap_jit_status` is set to ”Enabled for configured LDAP IdPs”, or `saml_jit_status` is set to ”Enabled for configured SAML IdPs”

Property	Type	Description
mfa_status	integer	Multi-factor authentication. Possible values: 0 - Disabled (for all configured MFA methods); 1 - Enabled (for all configured MFA methods).
mfaid	ID	Default MFA method for user groups with MFA enabled. Property behavior: - *required* if `mfa_status` is set to "Enabled"

authentication.get

Description

`object authentication.get(object parameters)`

The method allows you to retrieve authentication object according to the given parameters.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports only one parameter.

Parameter	Type	Description
output	query	This parameter is described in the reference commentary.

Return values

`(object)` Returns authentication object.

Examples

Request:

```
{
    "jsonrpc": "2.0",
    "method": "authentication.get",
    "params": {
        "output": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "authentication_type": "0",
        "http_auth_enabled": "0",
        "http_login_form": "0",
        "http_strip_domains": "",
        "http_case_sensitive": "1",
        "ldap_auth_enabled": "0",
        "ldap_case_sensitive": "1",
        "ldap_userdirectoryid": "0",
        "saml_auth_enabled": "0",
        "saml_case_sensitive": "0",
```

```
        "passwd_min_length": "8",
        "passwd_check_rules": "15",
        "jit_provision_interval": "1h",
        "saml_jit_status": "0",
        "ldap_jit_status": "0",
        "disabled_usrgrpid": "9",
        "mfa_status": "0",
        "mfaid": "0"
    },
    "id": 1
}
```

Source

CAuthentication::get() in *ui/include/classes/api/services/CAuthentication.php*.

authentication.update

Description

`object authentication.update(object authentication)`

This method allows you to update existing authentication settings.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Authentication properties to be updated.

Return values

`(array)` Returns an array with the names of updated parameters.

Examples

Request:

```
{
    "jsonrpc": "2.0",
    "method": "authentication.update",
    "params": {
        "http_auth_enabled": 1,
        "http_case_sensitive": 0,
        "http_login_form": 1
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        "http_auth_enabled",
        "http_case_sensitive",
        "http_login_form"
    ],
    "id": 1
}
```

Autoregistration

This class is designed to work with autoregistration.

Object references:

- Autoregistration

Available methods:

- autoregistration.get - retrieve autoregistration
- autoregistration.update - update autoregistration

Autoregistration object

The following objects are directly related to the `autoregistration` API.

Autoregistration

The autoregistration object has the following properties.

Property	Type	Description
tls_accept	integer	Type of allowed incoming connections for autoregistration. Possible values: 1 - allow unencrypted connections; 2 - allow TLS with PSK; 3 - allow both unencrypted and TLS with PSK connections.
tls_psk_identity	string	PSK identity; must be paired with only one PSK (across autoregistration, hosts, and proxies). Do not include sensitive information in the PSK identity, as it is sent unencrypted over the network to inform the receiver which PSK to use. Property behavior: - *write-only*
tls_psk	string	Pre-shared key (PSK); must be at least 32 hex digits. Property behavior: - *write-only*

autoregistration.get

Description

`object autoregistration.get(object parameters)`

The method allows you to retrieve autoregistration object according to the given parameters.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports only one parameter.

Parameter	Type	Description
output	query	This parameter is described in the reference commentary.

Return values

(object) Returns autoregistration object.

Examples

Request:

```
{
   "jsonrpc": "2.0",
    "method": "autoregistration.get",
    "params": {
        "output": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "tls_accept": "3"
    },
    "id": 1
}
```

Source

CAutoregistration::get() in *ui/include/classes/api/services/CAutoregistration.php*.

autoregistration.update

Description

`object autoregistration.update(object autoregistration)`

This method allows you to update existing autoregistration.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(object) Autoregistration properties to be updated.

Return values

(boolean) Returns boolean true as result on successful update.

Examples

Request:

```
{
    "jsonrpc": "2.0",
    "method": "autoregistration.update",
    "params": {
        "tls_accept": "3",
        "tls_psk_identity": "PSK 001",
        "tls_psk": "11111595725ac58dd977beef14b97461a7c1045b9a1c923453302c5473193478"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": true,
```

```
    "id": 1
}
```

Configuration

This class is designed to export and import Zabbix configuration data.

Available methods:

- configuration.export - export configuration data
- configuration.import - import configuration data
- configuration.importcompare - compare import file with current system elements

configuration.export

Description

`string configuration.export(object parameters)`

This method allows you to export configuration data as a serialized string.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the objects to be exported and the format to use.

Parameter	Type	Description
format	string	Format in which the data must be exported. Possible values: `yaml` - YAML; `xml` - XML; `json` - JSON; `raw` - unprocessed PHP array. Parameter behavior: - *required*
prettyprint	boolean	Make the output more human readable by adding indentation. Possible values: `true` - add indentation; `false` - *(default)* do not add indentation.

Parameter	Type	Description
options	object	Objects to be exported. The `options` object has the following parameters: `host_groups` - `(array)` IDs of host groups to export; `hosts` - `(array)` IDs of hosts to export; `images` - `(array)` IDs of images to export; `maps` - `(array)` IDs of maps to export; `mediaTypes` - `(array)` IDs of media types to export; `template_groups` - `(array)` IDs of template groups to export; `templates` - `(array)` IDs of templates to export; `dashboards` - `(array)` IDs of dashboards to export; `global_regexes` - `(array)` IDs of global regular expressions to export. *Admin* and *User* type users may export only those objects for which they have *read-only* or *read-write* permission, as well as images, but not media types. Parameter behavior: - *required*.

Return values

`(string)` Returns a serialized string containing the requested configuration data.

Examples

Exporting a template

Export the configuration of template "10571" as an XML string.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "configuration.export",
    "params": {
        "options": {
            "templates": [
                "10571"
            ]
        },
        "format": "xml"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": "<?xml version=\"1.0\" encoding=\"UTF-8\"?>\n<zabbix_export><version>8.0</version><template_
    "id": 1
}
```

Source

CConfiguration::export() in *ui/include/classes/api/services/CConfiguration.php*.

configuration.import

Description

`boolean configuration.import(object parameters)`

This method allows you to import configuration data from a serialized string.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the data to import and rules how the data should be handled.

Parameter	Type	Description
format	string	Format of the serialized string. Possible values: `yaml` - YAML; `xml` - XML; `json` - JSON. Parameter behavior: - *required*
source	string	Serialized string containing the configuration data. Parameter behavior: - *required*
rules	object	Rules on how new and existing objects should be imported. *Admin* type users may import only those objects for which they have *read-write* permission, as well as maps. For example, a host and its entities (items, triggers, graphs, etc.) may be imported only if the user's user group has permission to the host group that the imported host will belong to. Images and media types cannot be imported by *Admin* type users. The `rules` parameter is described in detail in the table below. Parameter behavior: - *required*
returnMissingObjects	boolean	Rules if response object should contain information about missing objects; default: `false`.

Attention:
If no rules are given, the configuration will not be updated.

The `rules` object supports the following parameters.

Parameter	Type	Description
dashboards	object	Rules on how to import dashboards. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new dashboards will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`and a particular importable dashboard is present in the system, it will be fully updated. Pages and widgets will be fully rewritten by the new ones; default: `false`.

Parameter	Type	Description
discoveryRules	object	Rules on how to import LLD rules. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new LLD rules will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing LLD rules will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, LLD rules not present in the imported data will be deleted from the database; default: `false`.
global_regexes	object	Rules on how to import global regular expressions. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new global regular expressions will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing global regular expressions will be updated, with their subexpressions fully overwritten; default: `false`.
graphs	object	Rules on how to import graphs. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new graphs will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing graphs will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, graphs not present in the imported data will be deleted from the database; default: `false`.
host_groups	object	Rules on how to import host groups. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new host groups will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing host groups will be updated; default: `false`.
hosts	object	Rules on how to import hosts. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new hosts will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing hosts will be updated; default: `false`.
httptests	object	Rules on how to import web scenarios. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new web scenarios will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing web scenarios will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, web scenarios not present in the imported data will be deleted from the database; default: `false`.
images	object	Rules on how to import images. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new images will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing images will be updated; default: `false`.

Parameter	Type	Description
items	object	Rules on how to import items. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new items will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing items will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, items not present in the imported data will be deleted from the database; default: `false`.
maps	object	Rules on how to import maps. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new maps will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing maps will be updated; default: `false`.
mediaTypes	object	Rules on how to import media types. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new media types will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing media types will be updated; default: `false`.
templateDashboards	object	Rules on how to import template dashboards. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new template dashboards will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing template dashboards will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, template dashboards not present in the imported data will be deleted from the database; default: `false`.
template_groups	object	Rules on how to import template groups. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new template groups will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing template groups will be updated; default: `false`.
templateLinkage	object	Rules on how to import template links. Supported parameters: `createMissing` - `(boolean)` if set to `true`, templates that are not linked to the host or template being imported, but are present in the imported data, will be linked; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, templates that are linked to the host or template being imported, but are not present in the imported data, will be unlinked without removing entities (items, triggers, etc.) inherited from the unlinked templates; default: `false`.
templates	object	Rules on how to import templates. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new templates will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing templates will be updated; default: `false`.

Parameter	Type	Description
triggers	object	Rules on how to import triggers. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new triggers will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing triggers will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, triggers not present in the imported data will be deleted from the database; default: `false`.
valueMaps	object	Rules on how to import host or template value maps. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new value maps will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing value maps will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, value maps not present in the imported data will be deleted from the database; default: `false`.

Return values

`(boolean)` Returns `true` if importing has been successful.

Examples

Importing a template

Import the template configuration contained in the XML string. If any items or triggers in the XML string are missing, they will be deleted from the database, and everything else will be left unchanged.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "configuration.import",
    "params": {
        "format": "xml",
        "rules": {
            "templates": {
                "createMissing": true,
                "updateExisting": true
            },
            "items": {
                "createMissing": true,
                "updateExisting": true,
                "deleteMissing": true
            },
            "triggers": {
                "createMissing": true,
                "updateExisting": true,
                "deleteMissing": true
            },
            "valueMaps": {
                "createMissing": true,
                "updateExisting": false
            }
        },
        "source": "<?xml version=\"1.0\" encoding=\"UTF-8\"?>\n<zabbix_export><version>8.0</version><templ
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": true,
    "id": 1
}
```

Source

CConfiguration::import() in *ui/include/classes/api/services/CConfiguration.php*.

configuration.importcompare

Description

`array configuration.importcompare(object parameters)`

This method allows you to compare import file with current system elements and shows what will be changed if this import file will be imported.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the possible data to import and rules how the data should be handled.

Parameter	Type	Description
format	string	Format of the serialized string. Possible values: `yaml` - YAML; `xml` - XML; `json` - JSON. Parameter behavior: - *required*
source	string	Serialized string containing the configuration data. Parameter behavior: - *required*
rules	object	Rules on how new and existing objects should be compared. *Admin* and *User* type users may compare new objects only with existing ones for which they have *read-only* or *read-write* permission. The `rules` parameter is described in detail in the table below. Parameter behavior: - *required*
returnMissingObjects	boolean	Rules if response object should contain information about missing objects; default: `false`.

Attention:
If no rules are given, there will be nothing to update and result will be empty.

Note:
Comparison will be done only for host groups and templates. Triggers and graphs will be compared only for imported templates, any other will be considered as ”new”.

The `rules` object supports the following parameters.

Parameter	Type	Description
dashboards	object	Rules on how to import dashboards. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new dashboards will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`and a particular importable dashboard is present in the system, it will be fully updated. Pages and widgets will be fully rewritten by the new ones; default: `false`.
discoveryRules	object	Rules on how to import LLD rules. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new LLD rules will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing LLD rules will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, LLD rules not present in the imported data will be deleted from the database; default: `false`.
global_regexes	object	Rules on how to import global regular expressions. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new global regular expressions will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing global regular expressions will be updated, with their subexpressions fully overwritten; default: `false`.
graphs	object	Rules on how to import graphs. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new graphs will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing graphs will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, graphs not present in the imported data will be deleted from the database; default: `false`.
host_groups	object	Rules on how to import host groups. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new host groups will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing host groups will be updated; default: `false`.
httptests	object	Rules on how to import web scenarios. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new web scenarios will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing web scenarios will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, web scenarios not present in the imported data will be deleted from the database; default: `false`.
images	object	Rules on how to import images. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new images will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing images will be updated; default: `false`. This parameter will make no difference to the output. It is allowed only for consistency with `configuration.import`.

Parameter	Type	Description
items	object	Rules on how to import items. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new items will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing items will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, items not present in the imported data will be deleted from the database; default: `false`.
maps	object	Rules on how to import maps. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new maps will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing maps will be updated; default: `false`. This parameter will make no difference to the output. It is allowed only for consistency with `configuration.import`.
mediaTypes	object	Rules on how to import media types. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new media types will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing media types will be updated; default: `false`. This parameter will make no difference to the output. It is allowed only for consistency with `configuration.import`.
templateDashboards	object	Rules on how to import template dashboards. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new template dashboards will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing template dashboards will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, template dashboards not present in the imported data will be deleted from the database; default: `false`.
template_groups	object	Rules on how to import template groups. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new template groups will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing template groups will be updated; default: `false`.
templateLinkage	object	Rules on how to import template links. Supported parameters: `createMissing` - `(boolean)` if set to `true`, templates that are not linked to the host or template being imported, but are present in the imported data, will be linked; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, templates that are linked to the host or template being imported, but are not present in the imported data, will be unlinked without removing entities (items, triggers, etc.) inherited from the unlinked templates; default: `false`.

Parameter	Type	Description
templates	object	Rules on how to import templates. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new templates will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing templates will be updated; default: `false`.
triggers	object	Rules on how to import triggers. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new triggers will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing triggers will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, triggers not present in the imported data will be deleted from the database; default: `false`.
valueMaps	object	Rules on how to import host or template value maps. Supported parameters: `createMissing` - `(boolean)` if set to `true`, new value maps will be created; default: `false`; `updateExisting` - `(boolean)` if set to `true`, existing value maps will be updated; default: `false`; `deleteMissing` - `(boolean)` if set to `true`, value maps not present in the imported data will be deleted from the database; default: `false`.

Return values

`(array)` Returns an array with changes in configuration, that will be made.

Examples

Comparing the import of a template

Compare the template contained in the XML string to the current system elements, and show what will be changed if this template will be imported.

CConfiguration::importcompare() in *ui/include/classes/api/services/CConfiguration.php*.

Connector

This class is designed to work with connectors.

Object references:

- Connector
- Tag filter

Available methods:

- connector.create - create new connectors
- connector.delete - delete connectors
- connector.get - retrieve connectors
- connector.update - update connectors

Connector object

The following objects are directly related to the `connector` API.

Connector

The connector object has the following properties.

Property	Type	Description
connectorid	ID	ID of the connector. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the connector. Property behavior: - *required* for create operations
url	string	Endpoint URL, that is, URL of the receiver. User macros are supported. Property behavior: - *required* for create operations
protocol	integer	Communication protocol. Possible values: 0 - *(default)* Zabbix Streaming Protocol v1.0.
data_type	integer	Data type. Possible values: 0 - *(default)* Item values; 1 - Events.

Property	Type	Description
item_value_type	integer	A sum of item value types to be sent. Possible values: 1 - Numeric (float); 2 - Character; 4 - Log; 8 - Numeric (unsigned); 16 - Text; 32 - Binary; 64 - JSON. Default: 31 - All item types (except binary and JSON). Property behavior: - *supported* if `data_type` is set to "Item values".
max_records	integer	Maximum number of events or items that can be sent within one message. Possible values: 0-2147483647 (max value of 32-bit signed integer). Default: 0 - Unlimited.
max_senders	integer	Number of sender processes to run for this connector. Possible values: 1-100. Default: 1.
max_attempts	integer	Number of attempts. Possible values: 1-5. Default: 1.
attempt_interval	string	The interval between retry attempts. Accepts seconds. Possible values: 0s-10s. Default: 5s. Property behavior: - *supported* if `max_attempts` is greater than 1.
timeout	string	Timeout. Time suffixes are supported (e.g., `30s`, `1m`). User macros are supported. Possible values: 1s-60s. Default: 5s.
http_proxy	string	HTTP(S) proxy connection string given as *[protocol]://[username[:password]@]proxy.example.com[:port]*. User macros are supported.
authtype	integer	HTTP authentication method. Possible values: 0 - *(default)* None; 1 - Basic; 2 - NTLM; 3 - Kerberos; 4 - Digest; 5 - Bearer.

Property	Type	Description
username	string	User name. User macros are supported. Property behavior: - *supported* if `authtype` is set to ”Basic”, ”NTLM”, ”Kerberos”, or ”Digest”
password	string	Password. User macros are supported. Property behavior: - *supported* if `authtype` is set to ”Basic”, ”NTLM”, ”Kerberos”, or ”Digest”
token	string	Bearer token. User macros are supported. Property behavior: - *required* if `authtype` is set to ”Bearer”
verify_peer	integer	Whether to validate that the host’s certificate is authentic. Possible values: 0 - Do not validate; 1 - *(default)* Validate.
verify_host	integer	Whether to validate that the host name for the connection matches the one in the host’s certificate. Possible values: 0 - Do not validate; 1 - *(default)* Validate.
ssl_cert_file	string	Public SSL Key file path. User macros are supported.
ssl_key_file	string	Private SSL Key file path. User macros are supported.
ssl_key_password	string	Password for SSL Key file. User macros are supported.
description	text	Description of the connector.
status	integer	Whether the connector is enabled. Possible values: 0 - Disabled; 1 - *(default)* Enabled.
tags_evaltype	integer	Tag evaluation method. Possible values: 0 - *(default)* And/Or; 2 - Or.

Tag filter

The tag filter allows you to export only matching item values or events. If not set, everything will be exported. The tag filter object has the following properties.

Property	Type	Description
tag	string	Tag name. Property behavior: - *required*

Property	Type	Description
operator	integer	Condition operator. Possible values: 0 - *(default)* Equals; 1 - Does not equal; 2 - Contains; 3 - Does not contain; 12 - Exists; 13 - Does not exist.
value	string	Tag value.

connector.create

Description

`object connector.create(object/array connectors)`

This method allows you to create new connector objects.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Connector objects to create.

Additionally to the standard connector properties, the method accepts the following parameters.

Parameter	Type	Description
tags	array	Connector tag filter.

Return values

`(object)` Returns an object containing the IDs of the created connectors under the `connectorids` property. The order of the returned IDs matches the order of the passed connectors.

Examples

Creating a connector

Create a connector to export trigger events with a tag filter. HTTP authentication will be performed using Bearer token.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "connector.create",
    "params": [
        {
            "name": "Export of events",
            "data_type": 1,
            "url": "{$DATA_EXPORT_URL}",
            "authtype": 5,
            "token": "{$DATA_EXPORT_BEARER_TOKEN}",
            "tags": [
                {
                    "tag": "service",
                    "operator": 0,
                    "value": "mysqld"
                }
            ]
        }
```

```
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "connectorid": [
            "3"
        ]
    },
    "id": 1
}
```

Source

CConnector::create() in *ui/include/classes/api/services/CConnector.php*.

connector.delete

Description

`object connector.delete(array connectorids)`

This method allows you to delete connector entries.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the connectors to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted connectors under the `connectorids` property.

Examples

Deleting multiple connectors

Delete two connector entries.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "connector.delete",
    "params": [
        3,
        5
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "connectorids": [
            "3",
            "5"
        ]
    },
```

```
    "id": 1
}
```

Source

CConnector::delete() in *ui/include/classes/api/services/CConnector.php*.

connector.get

Description

`integer/array connector.get(object parameters)`

The method allows you to retrieve connector objects according to the given parameters.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
connectorids	ID/array	Return only connectors with the given IDs.
selectTags	query	Return a `tags` property with connector tag filter. Supports `count`.
sortfield	string/array	Sort the result by the given properties. Possible values: `connectorid`, `name`, `data_type`, `status`.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving all connectors

Retrieve all data about all connectors and their properties.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "connector.get",
    "params": {
        "output": "extend",
        "selectTags": ["tag", "operator", "value"],
        "preservekeys": true
```

```
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "connectorid": "1",
            "name": "Export of item values",

CConnector:get() in *ui/include/classes/api/services/CConnector.php*.

connector.update

Description

`object connector.update(object/array connectors)`

This method allows you to update existing connectors.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Connector properties to be updated.

The `connectorid` property must be defined for each connector, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard connector properties, the method accepts the following parameters.

Parameter	Type	Description
tags	array	Connector tag filter to replace the current tag filter.

Return values

`(object)` Returns an object containing the IDs of the updated connectors under the `connectorids` property.

Examples

Changing HTTP authentication type

Change HTTP authentication type to Bearer for connector with ID "3".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "connector.update",
    "params": {
        "connectorid": 3,
        "authtype": 5,
        "token": "{$DATA_EXPORT_BEARER_TOKEN}"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "connectorids": [
            "3"
        ]
    },
    "id": 1
}
```

Updating tag filter

Change tag filter for connector with ID ”5”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "connector.update",
    "params": [
        {
            "connectorid": 5,
            "tags_evaltype": 2,
            "tags": [
                {
                    "tag": "service",
                    "operator": 0,
                    "value": "mysqld"
                },
                {
                    "tag": "error",
                    "operator": 12,
                    "value": ""
                }
            ]
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "connectorids": [
            "5"
        ]
    },
    "id": 1
}
```

CConnector::update() in *ui/include/classes/api/services/CConnector.php*.

Correlation

This class is designed to work with correlations.

Object references:

- Correlation
- Correlation operation
- Correlation filter

- Correlation filter condition

Available methods:

- correlation.create - create new correlations
- correlation.delete - delete correlations
- correlation.get - retrieve correlations
- correlation.update - update correlations

Correlation object

The following objects are directly related to the `correlation` API.

Correlation

The correlation object has the following properties.

Property	Type	Description
correlationid	ID	ID of the correlation. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the correlation. Property behavior: - *required* for create operations
description	string	Description of the correlation.
status	integer	Whether the correlation is enabled or disabled. Possible values: 0 - *(default)* enabled; 1 - disabled.

Correlation operation

The correlation operation object defines an operation that will be performed when a correlation is executed. It has the following properties.

Property	Type	Description
type	integer	Type of operation. Possible values: 0 - close old events; 1 - close new event. Property behavior: - *required*

Correlation filter

The correlation filter object defines a set of conditions that must be met to perform the configured correlation operations. It has the following properties.

Property	Type	Description
conditions	array	Set of filter conditions to use for filtering results. The conditions will be sorted in the order of their placement in the formula. Property behavior: - *required*

Property	Type	Description
evaltype	integer	Filter condition evaluation method. Possible values: 0 - And/Or; 1 - And; 2 - Or; 3 - Custom expression. Property behavior: - *required*
eval_formula	string	Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its `formulaid`. The value of `eval_formula` is equal to the value of `formula` for filters with a custom expression. Property behavior: - *read-only*
formula	string	User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its `formulaid`. The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted. Property behavior: - *required* if `evaltype` is set to ”custom expression”

Correlation filter condition

The correlation filter condition object defines a specific condition that must be checked before running the correlation operations.

Property	Type	Description
type	integer	Type of condition. Possible values: 0 - old event tag; 1 - new event tag; 2 - new event host group; 3 - event tag pair; 4 - old event tag value; 5 - new event tag value. Property behavior: - *required*
tag	string	Event tag (old or new). Property behavior: - *required* if `type` is set to ”old event tag”, ”new event tag”, ”old event tag value”, or ”new event tag value”
groupid	ID	ID of the host group. Property behavior: - *required* if `type` is set to ”new event host group”
oldtag	string	Old event tag. Property behavior: - *required* if `type` is set to ”event tag pair”
newtag	string	Old event tag. Property behavior: - *required* if `type` is set to ”event tag pair”

Property	Type	Description
value	string	Event tag (old or new) value. Property behavior: - *required* if `type` is set to ”old event tag value” or ”new event tag value”
formulaid	string	Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward.
operator	integer	Condition operator. Property behavior: - *required* if `type` is set to ”new event host group”, ”old event tag value”, or ”new event tag value”

Note:
To better understand how to use filters with various types of expressions, see examples on the correlation.get and correlation.create method pages.

The following operators and values are supported for each condition type.

Condition	Condition name	Supported operators	Expected value
2	Host group	=, <>	Host group ID.
4	Old event tag value	=, <>, like, not like	string
5	New event tag value	=, <>, like, not like	string

correlation.create

Description

`object correlation.create(object/array correlations)`

This method allows you to create new correlations.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Correlations to create.

Additionally to the standard correlation properties, the method accepts the following parameters.

Parameter	Type	Description
operations	array	Correlation operations to create for the correlation. Parameter behavior: - *required*
filter	object	Correlation filter object for the correlation. Parameter behavior: - *required*

Return values

`(object)` Returns an object containing the IDs of the created correlations under the `correlationids` property. The order of the returned IDs matches the order of the passed correlations.

Examples

Create a new event tag correlation

Create a correlation using evaluation method AND/OR with one condition and one operation. By default, the correlation will be enabled.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "correlation.create",
    "params": {
        "name": "new event tag correlation",
        "filter": {
            "evaltype": 0,
            "conditions": [
                {
                    "type": 1,
                    "tag": "ok"
                }
            ]
        },
        "operations": [
            {
                "type": 0
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "correlationids": [
            "1"
        ]
    },
    "id": 1
}
```

Using a custom expression filter

Create a correlation that will use a custom filter condition. The formula IDs ”A” or ”B” have been chosen arbitrarily. Condition type will be ”Host group” with operator ”<>”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "correlation.create",
    "params": {
        "name": "new host group correlation",
        "description": "a custom description",
        "status": 0,
        "filter": {
            "evaltype": 3,
            "formula": "A or B",
            "conditions": [
                {
                    "type": 2,
                    "operator": 1,
                    "formulaid": "A"
                },
                {
```

```
                    "type": 2,
                    "operator": 1,
                    "formulaid": "B"
                }
            ]
        },
        "operations": [
            {
                "type": 1
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "correlationids": [
            "2"
        ]
    },
    "id": 1
}
```

correlation.delete

Description

`object correlation.delete(array correlationids)`

This method allows you to delete correlations.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the correlations to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted correlations under the `correlationids` property.

Example

Delete multiple correlations

Delete two correlations.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "correlation.delete",
    "params": [
        "1",
```

```
        "2"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "correlationids": [
            "1",
            "2"
        ]
    },
    "id": 1
}
```

Source

CCorrelation::delete() in *ui/include/classes/api/services/CCorrelation.php*.

correlation.get

Description

`integer/array correlation.get(object parameters)`

The method allows you to retrieve correlations according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
correlationids	ID/array	Return only correlations with the given IDs.
selectFilter	query	Return a `filter` property with the correlation conditions.
selectOperations	query	Return an `operations` property with the correlation operations.
sortfield	string/array	Sort the result by the given properties. Possible values: `correlationid`, `name`, `status`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;

- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve correlations

Retrieve all configured correlations together with correlation conditions and operations. The filter uses the "and/or" evaluation type, so the `formula` property is empty and `eval_formula` is generated automatically.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "correlation.get",
    "params": {
        "output": "extend",
        "selectOperations": "extend",
        "selectFilter": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "correlationid": "1",
            "name": "Correlation 1",
            "description": "",
            "status": "0",
            "filter": {
                "evaltype": "0",
                "formula": "",
                "conditions": [
                    {
                        "type": "3",
                        "oldtag": "error",
                        "newtag": "ok",
                        "formulaid": "A"
                    }
                ],
                "eval_formula": "A"
            },
            "operations": [
                {
                    "type": "0"
                }
            ]
        }
    ],
    "id": 1
}
```

Source

CCorrelation::get() in *ui/include/classes/api/services/CCorrelation.php*.

correlation.update

Description

`object correlation.update(object/array correlations)`

This method allows you to update existing correlations.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Correlation properties to be updated.

The `correlationid` property must be defined for each correlation, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard correlation properties, the method accepts the following parameters.

Parameter	Type	Description
filter	object	Correlation filter object to replace the current filter.
operations	array	Correlation operations to replace existing operations.

Return values

`(object)` Returns an object containing the IDs of the updated correlations under the `correlationids` property.

Examples

Disable correlation

Request:

```
{
    "jsonrpc": "2.0",
    "method": "correlation.update",
    "params": {
        "correlationid": "1",
        "status": "1"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "correlationids": [
            "1"
        ]
    },
    "id": 1
}
```

Replace conditions, but keep the evaluation method

Request:

```
{
    "jsonrpc": "2.0",
    "method": "correlation.update",
    "params": {
        "correlationid": "1",
        "filter": {
            "conditions": [
                {
                    "type": 3,
                    "oldtag": "error",
                    "newtag": "ok"
```

```
                }
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "correlationids": [
            "1"
        ]
    },
    "id": 1
}
```

Dashboard

This class is designed to work with dashboards.

Object references:

- Dashboard
- Dashboard page
    - Dashboard widget
        - Dashboard widget field
- Dashboard user group
- Dashboard user

Available methods:

- dashboard.create - create new dashboards
- dashboard.delete - delete dashboards
- dashboard.get - retrieve dashboards
- dashboard.update - update dashboards

Dashboard object

The following objects are directly related to the `dashboard` API.

Dashboard

The dashboard object has the following properties.

Property	Type	Description
dashboardid	ID	ID of the dashboard. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the dashboard. Property behavior: - *required* for create operations

Property	Type	Description
userid	ID	ID of the user that is the owner of the dashboard.
private	integer	Type of dashboard sharing. Possible values: 0 - public dashboard; 1 - *(default)* private dashboard.
display_period	integer	Default slideshow interval (in seconds). Possible values: 10, 30, 60, 120, 600, 1800, 3600. Default: 30.
auto_start	integer	Auto start slideshow. Possible values: 0 - do not auto start slideshow; 1 - *(default)* auto start slideshow.

Dashboard page

The dashboard page object has the following properties.

Property	Type	Description
dashboard_pageid	ID	ID of the dashboard page. Property behavior: - *read-only*
name	string	Dashboard page name. Default: empty string.
display_period	integer	Dashboard slideshow interval (in seconds). Possible values: 0, 10, 30, 60, 120, 600, 1800, 3600. Default: 0 (will use the default slideshow interval).
widgets	array	Array of the dashboard widget objects.

Dashboard widget

The dashboard widget object has the following properties.

Property	Type	Description
widgetid	ID	ID of the dashboard widget. Property behavior: - *read-only*

Property	Type	Description
type	string	Type of the dashboard widget. Possible values: actionlog - Action log; clock - Clock; discovery - Discovery status; favgraphs - Favorite graphs; favmaps - Favorite maps; gauge - Gauge; geomap - Geomap; graph - Graph (classic); graphprototype - Graph prototype; honeycomb - Honeycomb; hostavail - Host availability; hostcard - Host card; hostnavigator - Host navigator; itemcard - Item card; itemhistory - Item history; itemnavigator - Item navigator; item - Item value; map - Map; navtree - Map Navigation Tree; piechart - Pie chart; problemhosts - Problem hosts; problems - Problems; problemsbysv - Problems by severity; scatterplot - Scatter plot; slareport - SLA report; svggraph - Graph; systeminfo - System information; tophosts - Top hosts; topitems - Top items; toptriggers - Top triggers; trigover - Trigger overview; url - URL; web - Web monitoring. Property behavior: - *required*
name	string	Custom widget name.
x	integer	A horizontal position from the left side of the dashboard. Possible values range from 0 to 71.
y	integer	A vertical position from the top of the dashboard. Possible values range from 0 to 63.
width	integer	The widget width. Possible values range from 1 to 72.
height	integer	The widget height. Possible values range from 1 to 64.
view_mode	integer	The widget view mode. Possible values: 0 - *(default)* default widget view; 1 - with hidden header;
fields	array	Array of the dashboard widget field objects. Property behavior: - see individual widgets in Dashboard widget fields

Dashboard widget field

The dashboard widget field object has the following properties.

Property	Type	Description
type	integer	Type of the widget field. Possible values: 0 - Integer; 1 - String; 2 - Host group; 3 - Host; 4 - Item; 5 - Item prototype; 6 - Graph; 7 - Graph prototype; 8 - Map; 9 - Service; 10 - SLA; 11 - User; 12 - Action; 13 - Media type. Property behavior: - *required*
name	string	Widget field name. Possible values: see Dashboard widget fields. Property behavior: - *required*
value	mixed	Widget field value depending on the type. Possible values: see Dashboard widget fields. Property behavior: - *required*

Dashboard user group

List of dashboard permissions based on user groups. It has the following properties.

Property	Type	Description
usrgrpid	ID	ID of the user group. Property behavior: - *required*
permission	integer	Type of permission level. Possible values: 2 - read only; 3 - read-write. Property behavior: - *required*

Dashboard user

List of dashboard permissions based on users. It has the following properties.

Property	Type	Description
userid	ID	ID of the user. Property behavior: - *required*
permission	integer	Type of permission level. Possible values: 2 - read only; 3 - read-write. Property behavior: - *required*

dashboard.create

Description

`object dashboard.create(object/array dashboards)`

This method allows you to create new dashboards.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Dashboards to create.

Additionally to the standard dashboard properties, the method accepts the following parameters.

Parameter	Type	Description
pages	array	Dashboard pages to be created for the dashboard. Dashboard pages will be ordered in the same order as specified. Parameter behavior: - *required*
users	array	Dashboard user shares to be created on the dashboard.
userGroups	array	Dashboard user group shares to be created on the dashboard.

Return values

`(object)` Returns an object containing the IDs of the created dashboards under the `dashboardids` property. The order of the returned IDs matches the order of the passed dashboards.

Examples

Creating a dashboard

Create a dashboard named ”My dashboard” with one Problems widget with tags and using two types of sharing (user group and user) on a single dashboard page.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
```

```
                "widgets": [
                    {
                        "type": "problems",
                        "x": 0,
                        "y": 0,
                        "width": 36,
                        "height": 5,
                        "view_mode": 0,
                        "fields": [
                            {

dashboard.delete

Description

`object dashboard.delete(array dashboardids)`

This method allows you to delete dashboards.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the dashboards to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted dashboards under the `dashboardids` property.

Examples

Deleting multiple dashboards

Delete two dashboards.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.delete",
    "params": [
        "2",
        "3"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "2",
            "3"
        ]
    },
    "id": 1
}
```

Source

CDashboard::delete() in *ui/include/classes/api/services/CDashboard.php*.

dashboard.get

Description

`integer/array dashboard.get(object parameters)`

The method allows you to retrieve dashboards according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
dashboardids	ID/array	Return only dashboards with the given IDs.
selectPages	query	Return a `pages` property with dashboard pages, correctly ordered.
selectUsers	query	Return a `users` property with users that the dashboard is shared with.
selectUserGroups	query	Return a `userGroups` property with user groups that the dashboard is shared with.
sortfield	string/array	Sort the result by the given properties. Possible values: `dashboardid`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving a dashboard by ID

Retrieve all data about dashboards "1" and "2".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.get",
    "params": {
        "output": "extend",
        "selectPages": "extend",
        "selectUsers": "extend",
        "selectUserGroups": "extend",
        "dashboardids": [
            "1",
            "2"
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "dashboardid": "1",
            "name": "Dashboard",

dashboard.update

Description

`object dashboard.update(object/array dashboards)`

This method allows you to update existing dashboards.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Dashboard properties to be updated.

The `dashboardid` property must be defined for each dashboard, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard dashboard properties, the method accepts the following parameters.

Parameter	Type	Description
pages	array	Dashboard pages to replace the existing dashboard pages. Dashboard pages are updated by the `dashboard_pageid` property. New dashboard pages will be created for objects without `dashboard_pageid` property and the existing dashboard pages will be deleted if not reused. Dashboard pages will be ordered in the same order as specified. Only the specified properties of the dashboard pages will be updated.
users	array	Dashboard user shares to replace the existing elements.
userGroups	array	Dashboard user group shares to replace the existing elements.

Return values

`(object)` Returns an object containing the IDs of the updated dashboards under the `dashboardids` property.

Examples

Renaming a dashboard

Rename a dashboard to "SQL server status".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.update",
    "params": {
        "dashboardid": "2",
        "name": "SQL server status"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "2"
        ]
    },
    "id": 1
}
```

Updating dashboard pages

Rename the first dashboard page, replace widgets on the second dashboard page and add a new page as the third one. Delete all other dashboard pages.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.update",
    "params": {
        "dashboardid": "2",
        "pages": [
            {
                "dashboard_pageid": 1,
                "name": "Renamed Page"
            },
            {
                "dashboard_pageid": 2,
                "widgets": [
                    {
                        "type": "clock",
                        "x": 0,
                        "y": 0,
                        "width": 12,
                        "height": 3
                    }
                ]
            },
            {
                "display_period": 60
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "2"
        ]
    },
    "id": 1
}
```

Change dashboard owner

Available only for admins and super admins.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.update",
    "params": {
        "dashboardid": "2",
        "userid": "1"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "2"
        ]
```

```
    },
    "id": 1
}
```

Dashboard widget fields

This page contains navigation links for dashboard widget parameters and possible property values for the respective dashboard widget field objects.

To see the parameters and property values for each widget, please use the sidebar to navigate to the corresponding widget page.

1 Action log

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Action log* widget in `dashboard.create` and `dashboard.update` methods.

> **Attention:**
> Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Action log* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Action log* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Recipients	11	userids.0	User ID. Note: To configure multiple users, create a dashboard widget field object for each user with an incremented number in the property name.
Actions	12	actionids.0	Action ID. Note: To configure multiple actions, create a dashboard widget field object for each action with an incremented number in the property name.
Media types	13	mediatypeids.0	Media type ID. Note: To configure multiple media types, create a dashboard widget field object for each media type with an incremented number in the property name.

Parameter	type	name	value
Status	0	statuses.0	0 - In progress; 1 - Sent/Executed; 2 - Failed. Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.
Search string	1	message	Any string value.
Time period	1	time_period._referenceDASHBOARD._timeperiod	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters.
From	1	time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.to` is set
To	1	time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.from` is set
Sort entries by	0	sort_triggers	3 - Time (ascending); 4 - *(default)* Time (descending); 5 - Type (ascending); 6 - Type (descending); 7 - Status (ascending); 8 - Status (descending); 11 - Recipient (ascending); 12 - Recipient (descending).
Show lines	0	show_lines	Possible values range from 1 to 100. Default: 25.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Action log* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring an *Action log* widget

Configure an *Action log* widget that displays 10 entries of action operation details, sorted by time (in ascending order). In addition, display details only for those action operations that attempted to send an email to user "1", but were unsuccessful.

Request:

2 Clock

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Clock* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Clock* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Clock* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - *(default)* 15 minutes.
Time type	0	time_type	0 - *(default)* Local time; 1 - Server time; 2 - Host time.
Clock type	0	clock_type	0 - *(default)* Analog; 1 - Digital.

The following parameters are supported if *Time type* is set to ”Host time”.

Parameter	type	name	value
Item	4	itemid.0	Item ID. Parameter behavior: - *required*

The following parameters are supported if *Clock type* is set to ”Digital”.

Parameter	type	name	value
Show	0	show.0	1 - Date; 2 - *(default)* Time; 3 - Time zone. Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.

Advanced configuration

The following advanced configuration parameters are supported if *Clock type* is set to ”Digital”.

Parameter	type	name	value
Background color	1	bg_color	Hexadecimal color code (e.g., `FF0000`). Default: "" (empty).

Date

The following advanced configuration parameters are supported if *Clock type* is set to ”Digital”, and *Show* is set to ”Date”.

Parameter	type	name	value
Bold	0	date_bold	0 - *(default)* Disabled; 1 - Enabled.
Color	1	date_color	Hexadecimal color code (e.g., `FF0000`). Default: "" (empty).

Time

The following advanced configuration parameters are supported if *Clock type* is set to ”Digital”, and *Show* is set to ”Time”.

Parameter	type	name	value
Bold	0	time_bold	0 - *(default)* Disabled; 1 - Enabled.
Color	1	time_color	Hexadecimal color code (e.g., `FF0000`). Default: "" (empty).
Seconds	0	time_sec	0 - Disabled; 1 - *(default)* Enabled.
Format	0	time_format	0 - *(default)* 24-hour; 1 - 12-hour.

Time zone

The following advanced configuration parameters are supported if *Clock type* is set to ”Digital”, and *Show* is set to ”Time zone”.

Parameter	type	name	value
Bold	0	tzone_bold	0 - *(default)* Disabled; 1 - Enabled.
Color	1	tzone_color	Hexadecimal color code (e.g., `FF0000`). Default: "" (empty).
Time zone	1	tzone_timezone	Valid timezone string (e.g., `Europe/Riga`, `system`, `UTC`, etc.). For the full list of supported time zones please refer to PHP documentation. Default: `local`. Parameter behavior: - *supported* if *Time type* is set to ”Local time” or ”Server time”
Format	0	tzone_format	0 - *(default)* Short; 1 - Full. Parameter behavior: - *supported* if *Time type* is set to ”Local time” or ”Server time”

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Clock* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Clock* widget

Configure a *Clock* widget that displays local date, time and time zone in a customized digital clock.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,

3 Discovery status

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Discovery status* widget in `dashboard.create` and `dashboard.update` methods.

Parameters

The following parameters are supported for the *Discovery status* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Discovery status* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring *Discovery status* widget

Configure a *Discovery status* widget with the refresh interval set to 15 minutes.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [
                    {
                        "type": "discovery",
                        "name": "Discovery status",
                        "x": 0,
                        "y": 0,

4 Favorite graphs

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Favorite graphs* widget in `dashboard.create` and `dashboard.update` methods.

Parameters

The following parameters are supported for the *Favorite graphs* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - *(default)* 15 minutes.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Favorite graphs* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Favorite graphs* widget

Configure a *Favorite graphs* widget with the refresh interval set to 10 minutes.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [

5 Favorite maps

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Favorite maps* widget in `dashboard.create` and `dashboard.update` methods.

Parameters

The following parameters are supported for the *Favorite maps* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - *(default)* 15 minutes.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Favorite maps* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Favorite maps* widget

Configure a *Favorite maps* widget with the refresh interval set to 10 minutes.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [
                    {
                        "type": "favmaps",
                        "name": "Favorite maps",
                        "x": 0,
                        "y": 0,
                        "width": 12,
                        "height": 3,

6 Gauge

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Gauge* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Gauge* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Gauge* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Item	4	itemid.0	Item ID. Parameter behavior: - *required* if *Item (Widget)* is not set
Item (Widget)	1	itemid._reference	Instead of Item ID: `ABCDE._itemid` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for items. Parameter behavior: - *required* if *Item* is not set
Min	1	min	Any numeric value. Suffixes (e.g., "1d", "2w", "4K", "8G") are supported. Default: "0".
Max	1	max	Any numeric value. Suffixes (e.g., "1d", "2w", "4K", "8G") are supported. Default: "100".
Value arc	1	value_arc_color	Hexadecimal color code (e.g., `FF0000`). Default: "" (empty).

Parameter	type	name	value
Arc background	1	empty_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).
Background	1	bg_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).
Show	0	show.0	1 - Description; 2 - Value; 3 - Needle; 4 - Scale; 5 - Value arc. Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name. Default: 1, 2, 4, 5. Values "Needle" and "Scale" are not supported if both: - no dashboard widget field object for *Show* with the value "Value arc" is set; - *Show arc* advanced configuration parameter is set to "Disabled". Advanced configuration parameters for *Show* options are not supported if no dashboard widget field objects with the respective values are set.
Override host	1	override_hostid._reference	ABCDE._hostid - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for hosts; DASHBOARD._hostid - set the dashboard host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.

Advanced configuration

The following advanced configuration parameters are supported for the *Gauge* widget.

Note:
The number in the *Thresholds* property name (e.g., thresholds.0.color) references the threshold place in a list, sorted in ascending order. However, if thresholds are configured in a different order, the values will be sorted in ascending order after updating widget configuration in Zabbix frontend (e.g., "thresholds.0.threshold":"5" → "thresholds.0.threshold":"1"; "thresholds.1.threshold":"1" → "thresholds.1.threshold": "5").

Parameter	type	name	value
Angle	0	angle	Possible values: 180 *(default)* or 270.
Description			
Description	1	description	Any string value, including macros. Supported macros: {HOST.*}, {ITEM.*}, {INVENTORY.*}, user macros. Default: {ITEM.NAME}.
Size	0	desc_size	Possible values range from 1 to 100. Default: 15.
Vertical position	0	desc_v_pos	0 - Top; 1 - *(default)* Bottom.
Bold	0	desc_bold	0 - *(default)* Disabled; 1 - Enabled.

Parameter	type	name	value
Color	1	desc_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).
Value			
Decimal places	0	decimal_places	Possible values range from 1 to 10. Default: 2.
Size	0	value_size	Possible values range from 1 to 100. Default: 25.
Bold	0	value_bold	0 - *(default)* Disabled; 1 - Enabled.
Color	1	value_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).
Units			
Units (checkbox)	0	units_show	0 - Disabled; 1 - *(default)* Enabled.
Units (value)	1	units	Any string value. Parameter behavior: - *supported* if *Units* (checkbox) is set to ”Enabled”
Size	0	units_size	Possible values range from 1 to 100. Default: 25. Parameter behavior: - *supported* if *Units* (checkbox) is set to ”Enabled”
Bold	0	units_bold	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Units* (checkbox) is set to ”Enabled”
Position	0	units_pos	0 - Before value; 1 - Above value; 2 - *(default)* After value; 3 - Below value. Parameter behavior: - *supported* if *Units* (checkbox) is set to ”Enabled” This parameter is ignored if set to one of the following time-related units: unixtime, uptime, s.
Color	1	units_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).
Value arc			
Arc size	0	value_arc_size	Possible values range from 1 to 100. Default: 20.
Needle			
Color	1	needle_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty). Parameter behavior: - *supported* if a dashboard widget field object for *Show* with the value ”Value arc” is set, or *Show arc* is set to ”Enabled”
Scale			

Parameter	type	name	value
Show units	0	scale_show_units	0 - Disabled; 1 - *(default)* Enabled. Parameter behavior: - *supported* if *Units* (checkbox) is set to ”Enabled” and either a dashboard widget field object for *Show* with the value ”Value arc” is set, or *Show arc* is set to ”Enabled”
Size	0	scale_size	Possible values range from 1 to 100. Default: 15. Parameter behavior: - *supported* if a dashboard widget field object for *Show* with the value ”Value arc” is set, or *Show arc* is set to ”Enabled”
Decimal places	0	scale_decimal_places	Possible values range from 1 to 10. Default: 0. Parameter behavior: - *supported* if a dashboard widget field object for *Show* with the value ”Value arc” is set, or *Show arc* is set to ”Enabled”
Thresholds			
Color	1	thresholds.0.color	Hexadecimal color code (e.g., FF0000).
Threshold	1	thresholds.0.threshold	Any numeric value. Suffixes (e.g., ”1d”, ”2w”, ”4K”, ”8G”) are supported.
Show labels	0	th_show_labels	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Thresholds* are set and either a dashboard widget field object for *Show* with the value ”Value arc” is set or *Show arc* is set to ”Enabled”
Show arc	0	th_show_arc	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Thresholds* are set
Arc size	0	th_arc_size	Possible values range from 1 to 100. Default: 5. Parameter behavior: - *supported* if *Show arc* is set to ”Enabled”

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Gauge* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Gauge* widget

Configure a *Gauge* widget that displays the item value for the item ”44474” (Interface enp0s3: Bits sent). In addition, visually fine-tune the widget with multiple advanced options, including thresholds.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
```

```
        "pages": [
            {
                "widgets": [
                    {
                        "type": "gauge",
                        "name": "Gauge",
                        "x": 0,
                        "y": 0,
                        "width": 18,
                        "height": 5,

7 Geomap

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Geomap* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Geomap* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Geomap* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.
Hosts	3	hostids.0	Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard.
Hosts (Widget/Dashboard)	1	hostids._reference	Instead of Host ID: `DASHBOARD.hostids` - set the dashboard host selector as the data source for hosts; `ABCDE._hostids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Tags			
Evaluation type	0	evaltype	0 - *(default)* And/Or; 2 - Or. This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Tag name	1	tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Tags* This parameter is not supported if configuring the widget on a template dashboard.
Operator	0	tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Tags* This parameter is not supported if configuring the widget on a template dashboard.
Tag value	1	tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Tags* This parameter is not supported if configuring the widget on a template dashboard.
Initial view	1	default_view	Comma separated *latitude*, *longitude*, *zoom level* (*optional*, possible values range from 0 to 30). Example: `40.6892494,-74.0466891,10`.
Clustering			
Clustering mode	0	clustering_mode	0 - *(default)* Auto; 1 - Zoom level.
Clustering zoom level	0	clustering_zoom_level	Possible values range from 0 to 30. Default: 0. Parameter behavior: - *supported* if *Clustering mode* is set to "Zoom level"
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Geomap* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Geomap* widget

Configure a *Geomap* widget that displays hosts from host groups "2" and "22" based on the following tag configuration: tag with

the name ”component” contains value ”node”, and tag with the name ”location” equals value ”New York”. In addition, set the map initial view to coordinates ”40.6892494” (latitude), ”-74.0466891” (longitude) with the zoom level ”10”.

Request:

```

8 Graph

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Graph* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Graph* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Graph* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Data set

The following parameters are supported for configuring a *Data set*.

Note:
The first number in the property name (e.g., ds.0.hosts.0, ds.0.items.0) represents the particular data set, while the second number, if present, represents the configured host or item.

Parameter	type	name	value
Data set type	0	ds.0.dataset_type	0 - Item list; 1 - *(default)* Item patterns.
Items	4	ds.0.itemids.0	Item ID. When configuring the widget on a template dashboard, only items configured on the template should be set. Note: To configure multiple items, create a dashboard widget field object for each item with an incremented number in the property name. Parameter behavior: - *required* if *Data set type* is set to "Item list" and *Items (Widget)* is not set
Items (Widget)	1	ds.0.itemids.0._reference	Instead of Item ID: `ABCDE._itemid` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for items. Note: To configure multiple widgets, create a dashboard widget field object for each widget with an incremented number in the property name. Parameter behavior: - *required* if *Data set type* is set to "Item list" and *Items* is not set
Color	1	ds.0.color.0	Hexadecimal color code (e.g., `FF0000`). Parameter behavior: - *required* if *Data set type* is set to "Item list"
Host patterns	1	ds.0.hosts.0	Host name or pattern (e.g., "Zabbix*"). Parameter behavior: - *required* if *Data set type* is set to "Item patterns" This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Item patterns	1	ds.0.items.0	Item name or pattern (e.g., ”*: Number of processed *values per second”). When configuring the widget on a template dashboard, only the patterns for items configured on the template should be set. Parameter behavior: - *required* if *Data set type* is set to ”Item patterns”
Color	1	ds.0.color	Hexadecimal color code (e.g., FF0000). Parameter behavior: - *supported* if *Data set type* is set to ”Item patterns” and *Color palette* is not set
Color palette	0	ds.0.color_palette	Color palette index. Possible values range from 0 to 11. Default: 0. Parameter behavior: - *supported* if *Data set type* is set to ”Item patterns” and *Color* is not set
Draw	0	ds.0.type	0 - *(default)* Line; 1 - Points; 2 - Staircase; 3 - Bar.
Stacked	0	ds.0.stacked	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Draw* is set to ”Line”, ”Staircase”, or ”Bar”
Width	0	ds.0.width	Possible values range from 1 to 10. Default: 1. Parameter behavior: - *supported* if *Draw* is set to ”Line” or ”Staircase”
Point size	0	ds.0.pointsize	Possible values range from 1 to 10. Default: 3. Parameter behavior: - *supported* if *Draw* is set to ”Points”
Transparency	0	ds.0.transparency	Possible values range from 1 to 10. Default: 5.
Fill	0	ds.0.fill	Possible values range from 1 to 10. Default: 3. Parameter behavior: - *supported* if *Draw* is set to ”Line” or ”Staircase”
Missing data	0	ds.0.missingdatafunc	0 - *(default)* None; 1 - Connected; 2 - Treat as 0; 3 - Last known. Parameter behavior: - *supported* if *Draw* is set to ”Line” or ”Staircase”

Parameter	type	name	value
Override host	1	ds.0.override_hostid.ABCDE.1	ABCDE._hostid - set a compatible widget (with its "Reference" parameter set to "ABCDE") as the data source for hosts; DASHBOARD._hostid - set the dashboard host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Y-axis	0	ds.0.axisy	0 - *(default)* Left; 1 - Right.
Invert values	0	ds.0.invert_values	0 - (default) Disabled; 1 - Enabled.
Time shift	1	ds.0.timeshift	Valid time string (e.g., 3600, 1h, etc.). You may use time suffixes. Negative values are also allowed. Default: "" (empty).
Aggregation function	0	ds.0.aggregate_function	0 - *(default)* not used; 1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum; 6 - first; 7 - last.
Aggregation interval	1	ds.0.aggregate_interval	Valid time string (e.g., 3600, 1h, etc.). You may use time suffixes. Default: 1h.
Aggregate	0	ds.0.aggregate_grouping	0 - *(default)* Each item; 1 - Data set. Parameter behavior: - *supported* if *Aggregation function* is set to "min", "max", "avg", "count", "sum", "first", or "last"
Approximation	0	ds.0.approximation	1 - min; 2 - *(default)* avg; 4 - max; 7 - all.
Data set label	1	ds.0.data_set_label	Any string value. Default: "" (empty).
Item tags			
Evaluation type	0	ds.0.item_tags_evaltype	0 - *(default)* And/Or; 2 - Or.
Tag name	1	ds.0.item_tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*

Parameter	type	name	value
Operator	0	ds.0.item_tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*
Tag value	1	ds.0.item_tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*

Display options

The following parameters are supported for configuring *Display options*.

Parameter	type	name	value
History data selection	0	source	0 - *(default)* Auto; 1 - History; 2 - Trends.
Simple triggers	0	simple_triggers	0 - *(default)* Disabled; 1 - Enabled.
Working time	0	working_time	0 - *(default)* Disabled; 1 - Enabled.
Host names in labels	0	show_hostnames	0 - *(default)* Auto; 1 - Show; 2 - Hide. This parameter is not supported if configuring the widget on a template dashboard.
Percentile line (left)			
Status	0	percentile_left	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Y-axis* (in *Data set* configuration) is set to ”Left”
Value	0	percentile_left_value	Possible values range from 1 to 100. Parameter behavior: - *supported* if *Y-axis* (in *Data set* configuration) is set to ”Left”
Percentile line (right)			

Parameter	type	name	value
Status	0	percentile_right	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Y-axis* (in *Data set* configuration) is set to ”Right”
Value	0	percentile_right_value	Possible values range from 1 to 100. Parameter behavior: - *supported* if *Y-axis* (in *Data set* configuration) is set to ”Right”

Time period

The following parameters are supported for configuring *Time period*.

Parameter	type	name	value
Time period	1	time_period._reference	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its *Reference* parameter set to ”`ABCDE`”) as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters.
From	1	time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.to` is set
To	1	time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.from` is set

Axes

The following parameters are supported for configuring *Axes*.

Parameter	type	name	value
Left Y	0	lefty	0 - Disabled; 1 - *(default)* Enabled. Parameter behavior: - *supported* if *Y-axis* (in *Data set* configuration) is set to ”Left”
Right Y	0	righty	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Y-axis* (in *Data set* configuration) is set to ”Right”
Scale	0	lefty_scale righty_scale	0 - *(default)* Linear; 1 - Logarithmic.
Min	1	lefty_min righty_min	Any numeric value. Default: "" (empty).

Parameter	type	name	value
Max	1	lefty_max	Any numeric value. Default: "" (empty).
		righty_max	
Units (type)	0	lefty_units	0 - *(default)* Auto; 1 - Static.
		righty_units	
Units (value)	1	lefty_static_units	Any string value. Default: "" (empty).
		righty_static_units	
X-Axis	0	xaxis	0 - Disabled; 1 - *(default)* Enabled.

Legend

The following parameters are supported for configuring *Legend*.

Parameter	type	name	value
Show legend	0	legend	0 - Disabled; 1 - *(default)* Enabled.
Display min/avg/max	0	legend_statistic	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Show legend* is set to ”Enabled”
Show aggregation function	0	legend_aggregation	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Show legend* is set to ”Enabled”
Rows	0	legend_lines_mode	0 - *(default)* Fixed; 1 - Variable. Parameter behavior: - *supported* if *Show legend* is set to ”Enabled”
Number of rows/ Maximum number of rows	0	legend_lines	Possible values range from 1 to 10. Default: 1. Parameter behavior: - *supported* if *Show legend* is set to ”Enabled”
Number of columns	0	legend_columns	Possible values range from 1 to 4. Default: 4. Parameter behavior: - *supported* if *Show legend* is set to ”Enabled”, and *Display min/avg/max* is set to ”Disabled”

Problems

The following parameters are supported for configuring *Problems*.

Parameter	type	name	value
Show problems	0	show_problems	0 - *(default)* Disabled; 1 - Enabled.

Parameter	type	name	value
Selected items only	0	graph_item_problems	0 - Disabled; 1 - *(default)* Enabled.
Problem hosts	1	problemhosts.0	Host name. Note: The number in the property name references the configured host. To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Severity	0	severities.0	0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Default: empty (all enabled). Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.
Problem	1	problem_name	Problem event name (case insensitive, full name or part of it).
Problem tags			
Evaluation type	0	evaltype	0 - *(default)* And/Or; 2 - Or.
Tag name	1	tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Operator	0	tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Tag value	1	tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*

Overrides

The following parameters are supported for configuring *Overrides*.

Note:
The first number in the property name (e.g., or.0.hosts.0, or.0.items.0) represents the particular data set, while the second number, if present, represents the configured host or item.

Parameter	type	name	value
Host patterns	1	or.0.hosts.0	Host name or pattern (e.g., `Zabbix*`). This parameter is not supported if configuring the widget on a template dashboard. Parameter behavior: - *required* if configuring *Overrides*
Item patterns	1	or.0.items.0	Item name or pattern (e.g., `*: Number of processed *values per second`). When configuring the widget on a template dashboard, only the patterns for items configured on the template should be set. Parameter behavior: - *required* if configuring *Overrides*
Base color	1	or.0.color	Hexadecimal color code (e.g., `FF0000`).
Width	0	or.0.width	Possible values range from 1 to 10.
Draw	0	or.0.type	0 - Line; 1 - Points; 2 - Staircase; 3 - Bar.
Transparency	0	or.0.transparency	Possible values range from 1 to 10.
Fill	0	or.0.fill	Possible values range from 1 to 10.
Point size	0	or.0.pointsize	Possible values range from 1 to 10.
Missing data	0	or.0.missingdatafunc	0 - None; 1 - Connected; 2 - Treat as 0; 3 - Last known.
Y-axis	0	or.0.axisy	0 - Left; 1 - Right.
Invert values	0	or.0.invert_values	0 - (default) Disabled; 1 - Enabled.
Time shift	1	or.0.timeshift	Valid time string (e.g., 3600, 1h, etc.). You may use time suffixes. Negative values are allowed.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Graph* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Graph* widget

Configure a *Graph* widget in the following way:

- 2 data sets for a total of 9 items on 1 host.
- The first data set is of type "Item list" and consists of 3 items that are represented by lines with a different color, but the same width, transparency, and fill.
- The second data set is of type "Item patterns", consists of 6 items, has a configured aggregation, and is represented by a line with a custom color, width, transparency, and fill.
- The second data set also has a custom data set label.
- Data in the graph are displayed for a time period of the last 3 hours.
- Problems in the graph are displayed only for the configured items.
- Graph has two Y axes of which the right Y axis displays values only for the second data set.
- Graph legend displays configured items in 4 rows, as well as minimum, maximum and average values of the data sets.

9 Graph (classic)

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Graph (classic)* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Graph (classic)* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Graph (classic)* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Source	0	source_type	0 - *(default)* Graph; 1 - Simple graph.
Graph	6	graphid.0	Graph ID. Parameter behavior: - *required* if *Source* is set to ”Graph”
Graph (Widget)	1	graphid._reference	Instead of Graph ID: `ABCDE._graphid` - set a compatible widget (with its *Reference* parameter set to ”ABCDE”) as the data source for graphs.
Item	4	itemid.0	Parameter behavior: - *required* if *Source* is set to ”Simple graph” and *Graph* is not set Item ID. Parameter behavior: - *required* if *Source* is set to ”Simple graph” and *Item (Widget)* is not set
Item (Widget)	1	itemid._reference	Instead of Item ID: `ABCDE._itemid` - set a compatible widget (with its *Reference* parameter set to ”ABCDE”) as the data source for items.
Time period	1	time_period._reference	Parameter behavior: - *required* if *Source* is set to ”Simple graph” and *Item* is not set `DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its *Reference* parameter set to ”ABCDE”) as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters.

Parameter	type	name	value
From	1	time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.to` is set
To	1	time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.from` is set
Show legend	0	show_legend	0 - Disabled; 1 - *(default)* Enabled.
Override host	1	override_hostid._reference	`ABCDE._hostid` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for hosts; `DASHBOARD._hostid` - set the dashboard host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Graph (classic)* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Graph (classic)* widget

Configure a *Graph (classic)* widget that displays a simple graph for the item "42269".

10 Graph prototype

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Graph prototype* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Graph prototype* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Graph prototype* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Source	0	source_type	2 - *(default)* Graph prototype; 3 - Simple graph prototype.
Graph prototype	7	graphid.0	Graph prototype ID. Parameter behavior: - *required* if *Source* is set to ”Graph prototype”
Item prototype	5	itemid.0	Item prototype ID. Parameter behavior: - *required* if *Source* is set to ”Simple graph prototype”
Time period	1	time_period._reference	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its *Reference* parameter set to ”ABCDE”) as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters.
From	1	time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.to` is set
To	1	time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.from` is set
Show legend	0	show_legend	0 - Disabled; 1 - *(default)* Enabled.
Override host	1	override_hostid._reference	`ABCDE._hostid` - set a compatible widget (with its *Reference* parameter set to ”ABCDE”) as the data source for hosts; `DASHBOARD._hostid` - set the dashboard host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Columns	0	columns	Possible values range from 1 to 24. Default: 2.
Rows	0	rows	Possible values range from 1 to 16. Default: 1.

Parameter	type	name	value
Reference	1	reference	Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Graph prototype* widget. For more information on configuring a dashboard, see dashboard.create.

Configuring a *Graph prototype* widget

Configure a *Graph prototype* widget that displays a grid of 3 graphs (3 columns, 1 row) created from an item prototype (ID: "42316") by low-level discovery.

Request:

```

11 Honeycomb

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Honeycomb* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Honeycomb* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Honeycomb* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.

Parameter	type	name	value
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.
Hosts	3	hostids.0	Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard.
Hosts (Widget/Dashboard)	1	hostids._reference	Instead of Host ID: `DASHBOARD.hostids` - set the dashboard host selector as the data source for hosts; `ABCDE._hostids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Host tags			
Evaluation type	0	evaltype_host	0 - *(default)* And/Or; 2 - Or. This parameter is not supported if configuring the widget on a template dashboard.
Tag name	1	host_tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Operator	0	host_tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Tag value	1	host_tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Item patterns	1	items.0	Item name or pattern. Note: To configure multiple item patterns, create a dashboard widget field object for each item pattern with an incremented number in the property name. Parameter behavior: - *required*
Item tags			
Evaluation type	0	evaltype_item	0 - *(default)* And/Or; 2 - Or.
Tag name	1	item_tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*
Operator	0	item_tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*

Parameter	type	name	value
Tag value	1	item_tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*
Show hosts in maintenance	0	maintenance	0 - *(default)* Disabled; 1 - Enabled.
Show	0	show.0	1 - Primary label; 2 - Secondary label. Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name. Default: 1, 2.
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Advanced configuration

The following advanced configuration parameters are supported for the *Honeycomb* widget.

Note:
The number in the *Thresholds* property name (e.g., thresholds.0.color) references the threshold place in a list, sorted in ascending order. However, if thresholds are configured in a different order, the values will be sorted in ascending order after updating widget configuration in Zabbix frontend (e.g., `"thresholds.0.threshold":"5"` → `"thresholds.0.threshold":"1"`; `"thresholds.1.threshold":"1"` → `"thresholds.1.threshold": "5"`).

Parameter	type	name	value
Primary label			
Type	0	primary_label_type	0 - *(default)* Text; 1 - Value.
Text	1	primary_label	Any string value, including macros. Supported macros: `{HOST.*}`, `{ITEM.*}`, `{INVENTORY.*}`, user macros. Default: `{HOST.NAME}` Parameter behavior: - *supported* if *Type* is set to "Text"
Decimal places	0	primary_label_decimal_places	Possible values range from 0 to 6. Default: 2. Parameter behavior: - *supported* if *Type* is set to "Value"
Size (type)	0	primary_label_size_type	0 - *(default)* Auto; 1 - Custom.

Parameter	type	name	value
Size	0	primary_label_size	Possible values range from 1 to 100. Default: 20. Parameter behavior: - *supported* if *Size* (type) is set to ”Custom”
Bold	0	primary_label_bold	0 - *(default)* Disabled; 1 - Enabled.
Color	1	primary_label_color	Hexadecimal color code (e.g., FF0000). Default: based on theme of Settings object and User object: 1F2C33 for ”blue-theme”, ”blue-classic-theme”, or ”hc-light”; EEEEEE for ”dark-theme”, ”dark-classic-theme”, or ”hc-dark”; E5F1FF for ”dark-blue-theme”.
Units (checkbox)	0	primary_label_units_show	0 - Disabled; 1 - *(default)* Enabled. Parameter behavior: - *supported* if *Type* is set to ”Value”
Units (value)	1	primary_label_units	Any string value. "" (empty) Parameter behavior: - *supported* if *Type* is set to ”Value” and *Units* (checkbox) is set to ”Enabled”
Position	0	primary_label_units_pos	0 - Before value; 1 - *(default)* After value. Parameter behavior: - *supported* if *Type* is set to ”Value” and *Units* (checkbox) is set to ”Enabled” This parameter is ignored if set to one of the following time-related units: unixtime, uptime, s.
Secondary label			
Type	0	secondary_label_type	0 - Text; 1 - *(default)* Value.
Text	1	secondary_label	Any string value, including macros. Supported macros: {HOST.*}, {ITEM.*}, {INVENTORY.*}, user macros. Default: {{ITEM.LASTVALUE}.fmtnum(2)} Parameter behavior: - *supported* if *Type* is set to ”Text”
Decimal places	0	secondary_label_decimal_places	Possible values range from 0 to 6. Default: 2. Parameter behavior: - *supported* if *Type* is set to ”Value”
Size (type)	0	secondary_label_size_type	0 - *(default)* Auto; 1 - Custom.
Size	0	secondary_label_size	Possible values range from 1 to 100. Default: 30. Parameter behavior: - *supported* if *Size* (type) is set to ”Custom”
Bold	0	secondary_label_bold	0 - Disabled; 1 - *(default)* Enabled.

Parameter	type	name	value
Color	1	secondary_label_color	Hexadecimal color code (e.g., FF0000). Default: based on theme of Settings object and User object: 1F2C33 for ”blue-theme”, ”blue-classic-theme”, or ”hc-light”; EEEEEE for ”dark-theme”, ”dark-classic-theme”, or ”hc-dark”; E5F1FF for ”dark-blue-theme”.
Units (checkbox)	0	secondary_label_units_show	0 - Disabled; 1 - *(default)* Enabled. Parameter behavior: - *supported* if *Type* is set to ”Value”
Units (value)	1	secondary_label_units	Any string value. "" (empty) Parameter behavior: - *supported* if *Type* is set to ”Value” and *Units* (checkbox) is set to ”Enabled”
Position	0	secondary_label_position	0 - Before value; 1 - *(default)* After value. Parameter behavior: - *supported* if *Type* is set to ”Value” and *Units* (checkbox) is set to ”Enabled” This parameter is ignored if set to one of the following time-related units: unixtime, uptime, s.
Background color			
Background color	1	bg_color	Hexadecimal color code (e.g., FF0000). Default: based on theme of Settings object and User object: D9E7ED for ”blue-theme” and ”blue-classic-theme”; 3D5059 for ”dark-theme” and ”dark-classic-theme”; 004FA8 for ”dark-blue-theme”; AAD7E9 for ”hc-light”; 335463 for ”hc-dark”.
Thresholds			
Color interpolation	0	interpolation	0 - Disabled; 1 - *(default)* Enabled.
Color	1	thresholds.0.color	Hexadecimal color code (e.g., FF0000).
Threshold	1	thresholds.0.threshold	Any numeric value. Suffixes (e.g., ”1d”, ”2w”, ”4K”, ”8G”) are supported.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Honeycomb* widget. For more information on configuring a dashboard, see dashboard.create.

Configuring a *Honeycomb* widget

Configure a *Honeycomb* widget that displays the utilization of Zabbix server processes. In addition, change the primary label of honeycomb cells and visually fine-tune the widget with thresholds.

12 Host availability

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Host availability* widget in `dashboard.create` and `dashboard.update` methods.

Parameters

The following parameters are supported for the *Host availability* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - *(default)* 15 minutes.

Parameter	type	name	value
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.
Interface type	0	interface_type.0	0 - None; 1 - Zabbix agent (passive checks); 2 - SNMP; 3 - IPMI; 4 - JMX; 5 - Zabbix agent (active checks). Default: 1, 2, 3, 4, 5 (all enabled). Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.
Layout	0	layout	0 - *(default)* Horizontal; 1 - Vertical.
Show hosts in maintenance	0	maintenance	0 - *(default)* Disabled; 1 - Enabled.
Show only totals	0	only_totals	0 - *(default)* Disabled; 1 - Enabled.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Host availability* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Host availability* widget

Configure a *Host availability* widget that displays availability information (in a vertical layout) for hosts in host group "4" with "Zabbix agent" and "SNMP" interfaces configured.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [
                    {
```

```
                        "type": "hostavail",
                        "name": "Host availability",
                        "x": 0,
                        "y": 0,
                        "width": 18,
                        "height": 3,
                        "view_mode": 0,
                        "fields": [
                            {
                                "type": 2,
                                "name": "groupids.0",
                                "value": 4
                            },
                            {
                                "type": 0,
                                "name": "interface_type",
                                "value": 1
                            },
                            {
                                "type": 0,
                                "name": "interface_type",
                                "value": 2
                            },
                            {
                                "type": 0,

13 Host card

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Host card* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Host card* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Host card* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Host	3	hostid.0	Host ID. Parameter behavior: - *required* if *Host (Widget/Dashboard)* is not set This parameter is not supported if configuring the widget on a template dashboard.
Host (Widget/Dashboard)	1	hostid._reference	Instead of Host ID: `DASHBOARD.hostid` - set the dashboard host selector as the data source for host; `ABCDE._hostid` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for host. Parameter behavior: - *required* if *Host* is not set This parameter is not supported if configuring the widget on a template dashboard.
Show suppressed problems	0	show_suppressed	0 - *(default)* Disabled; 1 - Enabled.

Parameter	type	name	value
Show	0	sections.0	0 - Host groups; 1 - Description; 2 - Monitoring; 3 - Availability; 4 - Monitored by; 5 - Templates; 6 - Inventory; 7 - Tags. Note: The number in the property name references section order in the section list. To configure multiple sections, create a dashboard widget field object for each section with an incremented number in the property name.

The following parameters are supported if *Show* is set to ”Inventory”.

Parameter	type	name	value
Inventory fields	0	inventory.0	Inventory ID. Note: To configure multiple inventory fields, create a dashboard widget field object for each inventory field with an incremented number in the property name.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Host card* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Host card* widget

Configure a *Host card* widget that displays these sections: ”Monitoring”, ”Availability”, ”Monitored by”, ”Inventory”, and ”Tags”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [
                    {
                        "type": "hostcard",
                        "name": "Host card",
                        "x": 0,
                        "y": 0,
                        "width": 14,
                        "height": 7,

14 Host navigator

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Host navigator* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Host navigator* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Host navigator* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Host patterns	1	hosts.0	Host name or pattern. Note: To configure multiple host patterns, create a dashboard widget field object for each host pattern with an incremented number in the property name. For multiple host patterns, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the hosts matching the configured host patterns belong to. This parameter is not supported if configuring the widget on a template dashboard.
Host status	0	status	-1 - *(default)* Any; 0 - Enabled; 1 - Disabled. This parameter is not supported if configuring the widget on a template dashboard.
Host tags			
Evaluation type	0	host_tags_evaltype	0 - *(default)* And/Or; 2 - Or. This parameter is not supported if configuring the widget on a template dashboard.
Tag name	1	host_tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Operator	0	host_tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Tag value	1	host_tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Severity	0	severities.0	0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Default: empty (all enabled). Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.
Show hosts in maintenance	0	maintenance	0 - *(default)* Disabled; 1 - Enabled.
Show problems	0	show_problems	0 - All; 1 - *(default)* Unsuppressed; 2 - None.
Group by			
Attribute	0	group_by.0.attribute	0 - Host group; 1 - Tag value; 2 - Severity. Note: The number in the property name references attribute order in the grouping attribute list. Parameter behavior: - *required* if configuring *Group by*
Value	1	group_by.0.tag_name	Any string value. Note: The number in the property name references the grouping attribute set in the *Attribute* parameter. Parameter behavior: - *required* if configuring *Group by* and *Attribute* is set to "Tag value"
Host limit	0	show_lines	Possible values range from 1 to 9999. Default: 100. This parameter is not supported if configuring the widget on a template dashboard.
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Host navigator* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Host navigator* widget

Configure a *Host navigator* widget that displays hosts grouped by their host group and, then, by the "city" tag value.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": "30",
        "auto_start": "1",
        "pages": [
            {
                "widgets": [
                    {
                        "type": "hostnavigator",
                        "name": "Host navigator",
                        "x": "0",
                        "y": "0",
                        "width": "12",
                        "height": "5",
                        "view_mode": "0",
                        "fields": [
                            {
                                "type": 2,
                                "name": "groupids.0",
                                "value": 2
                            },
                            {
                                "type": 2,
                                "name": "groupids.1",
                                "value": 4
                            },
                            {
                                "type": 0,

15 Item card

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Item card* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Item card* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Item card* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Item	4	itemid.0	Item ID. Parameter behavior: - *required* if *Item (Widget)* is not set
Item (Widget)	1	itemid._reference	Instead of Item ID: `ABCDE._itemid` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for item. Parameter behavior: - *required* if *Item* is not set

Parameter	type	name	value
Show	0	sections.0	0 - Description; 1 - Error text; 2 - Metrics; 3 - Latest data; 4 - Type of information; 5 - Triggers; 6 - Host interface; 7 - Type; 8 - Host inventory; 9 - Tags. Note: The number in the property name references section order in the section list. To configure multiple sections, create a dashboard widget field object for each section with an incremented number in the property name.
Override host	1	override_hostid._reference	`ABCDE._hostid` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for hosts; `DASHBOARD._hostid` - set the dashboard host selector as the data source for hosts. Default: `""` (empty) This parameter is not supported if configuring the widget on a template dashboard.

Sparkline

The following parameters are supported if *Show* is set to "Latest data".

Parameter	type	name	value
Width	0	sparkline.width	Possible values range from 0 to 10. Default: 1.
Fill	0	sparkline.fill	Possible values range from 0 to 10. Default: 3.
Color	1	sparkline.color	Hexadecimal color code (e.g., `FF0000`). Default: `42A5F5`.
Time period	1	sparkline.time_period.reference	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its `reference` parameter equal to `ABCDE`) as the data source. Default: `""` (empty) Alternatively, you can set the time period only in the *From* and *To* parameters.
From	1	sparkline.time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Default: now-1h. Parameter behavior: - *supported* if *Time period* is not set - *required* if `sparkline.time_period.to` is set

Parameter	type	name	value
To	1	sparkline.time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Default: now. Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.to` is set
History data	0	sparkline.history	0 - *(default)* Auto; 1 - History; 2 - Trends.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Item card* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring an *Item card* widget

Configure an *Item card* widget that displays these sections: ”Description”, ”Latest data”, ”Triggers”, and ”Tags”.

Request:

```
{
    "jsonrpc": "2.0",

16 Item history

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Item history* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Item history* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Item history* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Layout	0	layout	0 - *(default)* Horizontal; 1 - Vertical.
Columns (see below)			
Show lines	0	show_lines	Possible values range from 1 to 100. Default: 25.
Override host	1	override_hostid._reference	`ABCDE._hostid` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for hosts; `DASHBOARD._hostid` - set the dashboard host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Advanced configuration (see below)			
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Columns

Columns have common parameters and additional parameters depending on the configuration of the *Item* parameter.

Note:
For all parameters related to columns, the number in the property name (e.g., columns.0.name) references a column for which the parameter is configured.

The following parameters are supported for all columns.

Parameter	type	name	value
Name	1	columns.0.name	Any string value. Parameter behavior: - *required*
Item	4	columns.0.itemid	Item ID. When configuring the widget on a template dashboard, only items configured on the template should be set. Parameter behavior: - *required*
Base color	1	columns.0.base_color	Hexadecimal color code (e.g., `FF0000`). Default: "" (empty).

The following column parameters are supported if the configured *Item* is a numeric type item.

Parameter	type	name	value
Display	0	columns.0.display	1 - *(default)* As is; 2 - Bar; 3 - Indicators.
Min	1	columns.0.min	Any numeric value. Parameter behavior: - *supported* if *Display* is set to ”Bar” or ”Indicators”
Max	1	columns.0.max	Any numeric value. Parameter behavior: - *supported* if *Display* is set to ”Bar” or ”Indicators”
Thresholds			
Color	1	columns.0.thresholds.color	Hexadecimal color code (e.g., FF0000).
Threshold	1	columns.0.thresholds.threshold	Any numeric value. Suffixes (e.g., ”1d”, ”2w”, ”4K”, ”8G”) are supported.
History data	0	columns.0.history	0 - *(default)* Auto; 1 - History; 2 - Trends.

The following column parameters are supported if the configured *Item* is a character, text, or log type item.

Parameter	type	name	value
Highlights			
Highlight	1	columns.0.highlights.color	Hexadecimal color code (e.g., FF0000).
Threshold	1	columns.0.highlights.pattern	Any regular expression.
Display	0	columns.0.display	1 - *(default)* As is; 4 - HTML; 5 - Single line.
Single line	0	columns.0.max_length	Possible values range from 1 to 500. Default: 100. Parameter behavior: - *supported* if *Display* is set to ”Single line”
Use monospace font	0	columns.0.monospace_font	0 - *(default)* Use default font; 1 - Use monospace font.
Display local time	0	columns.0.local_time	0 - *(default)* Display timestamp; 1 - Display local time. Parameter behavior: - *supported* if *Item* is set to log type item, and *Show timestamp* is set to ”Enabled”

The following column parameters are supported if the configured *Item* is a binary type item.

Parameter	type	name	value
Show thumbnail	1	columns.0.show_thumbnail	0 - *(default)* Disabled; 1 - Enabled.

Advanced configuration

The following advanced configuration parameters are supported for the *Item history* widget.

Parameter	type	name	value
New values	0	sortorder	0 - *(default)* Top; 1 - Bottom.
Show timestamp	0	show_timestamp	0 - *(default)* Disabled; 1 - Enabled.
Show column header	0	show_column_header	0 - Off; 1 - Horizontal; 2 - *(default)* Vertical.
Time period	1	time_period._reference	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters.
From	1	time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.to` is set
To	1	time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.from` is set

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Item history* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring an *Item history* widget

Configure an *Item history* widget that displays latest data for two numeric items "42269" and "42270". In addition, configure the item columns to be displayed vertically, with column names displayed horizontally; limit the display to 15 lines of data and include a separate timestamp column.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [
                    {
                        "type": "itemhistory",
                        "name": "Item history",
                        "x": "0",
                        "y": "0",
                        "width": "18",
                        "height": "6",
                        "view_mode": "0",
```

```
                    "fields": [
                        {
                            "type": "0",
                            "name": "layout",
                            "value": "1"
                        },
                        {
                            "type": "1",
                            "name": "columns.0.name",
                            "value": "CPU utilization"
                        },
                        {
                            "type": "4",
                            "name": "columns.0.itemid",
                            "value": "42269"
                        },
                        {
                            "type": "1",
                            "name": "columns.1.name",
                            "value": "Memory utilization"
                        },
                        {
                            "type": "4",

17 Item navigator

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Item navigator* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Item navigator* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Item navigator* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Hosts	3	hostids.0	Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard.
Hosts (Widget/Dashboard)	1	hostids._reference	Instead of Host ID: `DASHBOARD.hostid` - set the dashboard host selector as the data source for hosts; `ABCDE._hostid` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Host tags			
Evaluation type	0	host_tags_evaltype	0 - *(default)* And/Or; 2 - Or. This parameter is not supported if configuring the widget on a template dashboard.
Tag name	1	host_tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Operator	0	host_tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Tag value	1	host_tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Item patterns	1	items.0	Item name or pattern. Note: To configure multiple item patterns, create a dashboard widget field object for each item pattern with an incremented number in the property name.
Item tags			
Evaluation type	0	item_tags_evaltype	0 - *(default)* And/Or; 2 - Or.
Tag name	1	item_tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*
Operator	0	item_tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*
Tag value	1	item_tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*
State	0	state	-1 - *(default)* All; 0 - Normal; 1 - Not supported.
Show problems	0	show_problems	0 - All; 1 - *(default)* Unsuppressed; 2 - None.
Group by			
Attribute	0	group_by.0.attribute	0 - Host group; 1 - Host name; 2 - Host tag value; 3 - Item tag value. Note: The number in the property name references attribute order in the grouping attribute list. Parameter behavior: - *required* if configuring *Group by*
Value	1	group_by.0.tag_name	Any string value. Note: The number in the property name references the grouping attribute set in the *Attribute* parameter. Parameter behavior: - *required* if configuring *Group by* and *Attribute* is set to ”Host tag value” or ”Item tag value”

Parameter	type	name	value
Item limit	0	show_lines	Possible values range from 1 to 9999. Default: 100.
Reference	1	reference	Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Item navigator* widget. For more information on configuring a dashboard, see dashboard.create.

Configuring an *Item navigator* widget

Configure an *Item navigator* widget that displays up to 1000 items grouped by their host and, then, by the ”component” item tag value.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",

18 Item value

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Item value* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Item value* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Item value* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Item	4	itemid.0	Item ID. Parameter behavior: - *required* if *Item (Widget)* is not set
Item (Widget)	1	itemid._reference	Instead of Item ID: `ABCDE._itemid` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for items. Parameter behavior: - *required* if *Item* is not set
Show	0	show.0	1 - Description; 2 - Value; 3 - Time; 4 - Change indicator; 5 - Sparkline. Default: 1, 2, 3, 4. Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.
Override host	1	override_hostid._reference	`ABCDE._hostid` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for hosts; `DASHBOARD._hostid` - set the dashboard host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.

Advanced configuration

The following advanced configuration parameters are supported for the *Item value* widget.

Note:
The number in the *Thresholds* property name (e.g., thresholds.0.color) references the threshold place in a list, sorted in ascending order. However, if thresholds are configured in a different order, the values will be sorted in ascending order after updating widget configuration in Zabbix frontend (e.g., `"thresholds.0.threshold":"5"` → `"thresholds.0.threshold":"1"`; `"thresholds.1.threshold":"1"` → `"thresholds.1.threshold": "5"`).

Parameter	type	name	value
Background color	1	bg_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).
Thresholds			
Color	1	thresholds.0.color	Hexadecimal color code (e.g., FF0000).
Threshold	1	thresholds.0.threshold	Any string value.

Parameter	type	name	value
Aggregation function	0	aggregate_function	0 - *(default)* not used; 1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum; 6 - first; 7 - last.
Time period	1	time_period._reference	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its `reference` parameter equal to `ABCDE`) as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters. Parameter behavior: - *supported* if *Aggregation function* is set to ”min”, ”max”, ”avg”, ”count”, ”sum”, ”first”, ”last”
From	1	time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set and *Aggregation function* is set to ”min”, ”max”, ”avg”, ”count”, ”sum”, ”first”, ”last” - *required* if `time_period.to` is set
To	1	time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set and *Aggregation function* is set to ”min”, ”max”, ”avg”, ”count”, ”sum”, ”first”, ”last” - *required* if `time_period.from` is set
History data	0	history	0 - *(default)* Auto; 1 - History; 2 - Trends.

Description

The following advanced configuration parameters are supported if *Show* is set to ”Description”.

Parameter	type	name	value
Description	1	description	Any string value, including macros. Supported macros: `{HOST.*}`, `{ITEM.*}`, `{INVENTORY.*}`, User macros. Default: `{ITEM.NAME}`.
Horizontal position	0	desc_h_pos	0 - Left; 1 - *(default)* Center; 2 - Right. Two or more elements (Description, Value, Time) cannot share the same *Horizontal position* and *Vertical position*.

Parameter	type	name	value
Vertical position	0	desc_v_pos	0 - Top; 1 - Middle; 2 - *(default)* Bottom. Two or more elements (Description, Value, Time) cannot share the same *Horizontal position* and *Vertical position*.
Size	0	desc_size	Possible values range from 1 to 100. Default: 15.
Bold	0	desc_bold	0 - *(default)* Disabled; 1 - Enabled.
Color	1	desc_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).

Value

The following advanced configuration parameters are supported if *Show* is set to ”Value”.

Parameter	type	name	value
Decimal places			
Decimal places	0	decimal_places	Possible values range from 1 to 10. Default: 2.
Size	0	decimal_size	Possible values range from 1 to 100. Default: 35.
Position			
Horizontal position	0	value_h_pos	0 - Left; 1 - *(default)* Center; 2 - Right. Two or more elements (Description, Value, Time) cannot share the same *Horizontal position* and *Vertical position*.
Vertical position	0	value_v_pos	0 - Top; 1 - *(default)* Middle; 2 - Bottom. Two or more elements (Description, Value, Time) cannot share the same *Horizontal position* and *Vertical position*.
Size	0	value_size	Possible values range from 1 to 100. Default: 45.
Bold	0	value_bold	0 - Disabled; 1 - *(default)* Enabled.
Color	1	value_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).
Units			
Units (checkbox)	0	units_show	0 - Disabled; 1 - *(default)* Enabled.
Units (value)	1	units	Any string value.
Position	0	units_pos	0 - Before value; 1 - Above value; 2 - *(default)* After value; 3 - Below value.
Size	0	units_size	Possible values range from 1 to 100. Default: 35.

Parameter	type	name	value
Bold	0	units_bold	0 - Disabled; 1 - *(default)* Enabled.
Color	1	units_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).

Time

The following advanced configuration parameters are supported if *Show* is set to ”Time”.

Parameter	type	name	value
Horizontal position	0	time_h_pos	0 - Left; 1 - *(default)* Center; 2 - Right. Two or more elements (Description, Value, Time) cannot share the same *Horizontal position* and *Vertical position*.
Vertical position	0	time_v_pos	0 - *(default)* Top; 1 - Middle; 2 - Bottom. Two or more elements (Description, Value, Time) cannot share the same *Horizontal position* and *Vertical position*.
Size	0	time_size	Possible values range from 1 to 100. Default: 15.
Bold	0	time_bold	0 - *(default)* Disabled; 1 - Enabled.
Color	1	time_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).

Change indicator

The following advanced configuration parameters are supported if *Show* is set to ”Change indicator”.

Parameter	type	name	value
Change indicator ↑ color	1	up_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).
Change indicator ↓ color	1	down_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).
Change indicator ↕ color	1	updown_color	Hexadecimal color code (e.g., FF0000). Default: "" (empty).

Sparkline

The following advanced configuration parameters are supported if *Show* is set to ”Sparkline”.

Parameter	type	name	value
Width	0	sparkline.width	Possible values range from 0 to 10. Default: 1.
Fill	0	sparkline.fill	Possible values range from 0 to 10. Default: 3.

Parameter	type	name	value
Color	1	sparkline.color	Hexadecimal color code (e.g., FF0000). Default: 42A5F5.
Time period	1	sparkline.time_period.reference	DASHBOARD._timeperiod - set the dashboard time period selector as the data source; ABCDE._timeperiod - set a compatible widget (with its reference parameter equal to ABCDE) as the data source. Default: DASHBOARD._timeperiod Alternatively, you can set the time period only in the *From* and *To* parameters.
From	1	sparkline.time_period.from	Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or relative time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - *required* if sparkline.time_period.to is set
To	1	sparkline.time_period.to	Valid time string in absolute (YYYY-MM-DD hh:mm:ss) or relative time syntax (now, now/d, now/w-1w, etc.). Parameter behavior: - *required* if sparkline.time_period.from is set
History data	0	sparkline.history	0 - *(default)* Auto; 1 - History; 2 - Trends.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Item value* widget. For more information on configuring a dashboard, see dashboard.create.

Configuring an *Item value* widget

Configure an *Item value* widget that displays the item value for the item "42266" (Zabbix agent availability). In addition, visually fine-tune the widget with multiple advanced options, including a dynamic background color that changes based on the availability status of Zabbix agent.

19 Map

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Map* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Map* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Map* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - *(default)* 15 minutes.
Map	8	sysmapid.0	Map ID. Parameter behavior: - *required* if *Map (Widget)* is not set
Map (Widget)	1	sysmapid._reference	`ABCDE._mapid` - set a *Map navigation tree* widget (with its *Reference* parameter set to "ABCDE") as the data source for maps. Parameter behavior: - *required* if *Map* is not set
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Map* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Map* widget

Configure a *Map* widget that displays the map "1".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [
                    {
                        "type": "map",
                        "name": "Map",
                        "x": 0,
                        "y": 0,
                        "width": 54,
                        "height": 5,
                        "view_mode": 0,
                        "fields": [
                            {
                                "type": 8,
                                "name": "sysmapid.0",
                                "value": 1
                            }
                        ]
                    }
                ]
            }
        ],
        "userGroups": [
            {
                "usrgrpid": 7,
                "permission": 2
            }
        ],
        "users": [
            {
                "userid": 1,
                "permission": 3
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "3"
        ]
    },
    "id": 1
}
```

Configuring a linked *Map* widget

Configure a *Map* widget that is linked to a *Map navigation tree* widget.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [
                    {
                        "type": "map",
                        "name": "Map",
                        "x": 0,
                        "y": 5,
                        "width": 54,
                        "height": 5,
                        "view_mode": 0,
                        "fields": [
                            {
                                "type": 1,
                                "name": "sysmapid._reference",
                                "value": "ABCDE._mapid"
                            }
                        ]
                    },
                    {
                        "type": "navtree",
                        "name": "Map navigation tree",
                        "x": 0,

20 Map navigation tree

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Map navigation tree* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Map navigation tree* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Map navigation tree* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - *(default)* 15 minutes.
Show unavailable maps	1	show_unavailable	0 - *(default)* Disabled; 1 - Enabled.
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

The following parameters are supported for configuring map navigation tree elements.

Parameter	type	name	value
Name	1	navtree.1.name	Any string value. Note: The number in the property name sets the element number.
Linked map	8	navtree.1.sysmapid	Map ID. Note: The number in the property name references the element to which the map is linked.
Parameters for creating element hierarchy	0	navtree.1.parent	Parent element number. Note: The number in the property name references the child element. The property value references the parent element.
	0	navtree.1.order	Element position in the map navigation tree. Note: The number in the property name references the element number. The property value references the element position in the map navigation tree. Parent element position is determined within the whole map navigation tree. Child element position is determined within the parent element.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Map navigation tree* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Map navigation tree* widget

Configure a *Map navigation tree* widget that displays the following map navigation tree:

- Element A
  - Element A1
  - Element A2
- Element B
  - Element B1 (contains linked map "1" that can be displayed in a linked *Map widget*)

        - Element B2
    - Element C

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,

21 Pie chart

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Pie chart* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Pie chart* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Pie chart* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.

Data set

The following parameters are supported for configuring a *Data set*.

Note:
The first number in the property name (e.g., ds.0.hosts.0, ds.0.items.0) represents the particular data set, while the second number, if present, represents the configured host or item.

Parameter	type	name	value
Data set type	0	ds.0.dataset_type	0 - Item list; 1 - *(default)* Item patterns.
Items	4	ds.0.itemids.0	Item ID. When configuring the widget on a template dashboard, only items configured on the template should be set. Note: To configure multiple items, create a dashboard widget field object for each item with an incremented number in the property name. Parameter behavior: - *required* if *Data set type* is set to ”Item list” and *Items (Widget)* is not set
Items (Widget)	1	ds.0.itemids.0._reference	Instead of Item ID: `ABCDE._itemid` - set a compatible widget (with its *Reference* parameter set to ”ABCDE”) as the data source for items. Note: To configure multiple widgets, create a dashboard widget field object for each widget with an incremented number in the property name. Parameter behavior: - *required* if *Data set type* is set to ”Item list” and *Items* is not set
Color	1	ds.0.color.0	Hexadecimal color code (e.g., `FF0000`). Parameter behavior: - *required* if *Data set type* is set to ”Item list”
Item type	0	ds.0.type.0	0 - *(default)* Normal; 1 - Total. The value ”Total” can be set only for one item in the whole chart. Parameter behavior: - *supported* if *Data set type* is set to ”Item list”
Host patterns	1	ds.0.hosts.0	Host name or pattern (e.g., ”Zabbix*”). Parameter behavior: - *required* if *Data set type* is set to ”Item patterns” This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Item patterns	1	ds.0.items.0	Item name or pattern (e.g., ”*: Number of processed *values per second”). When configuring the widget on a template dashboard, only the patterns for items configured on the template should be set. Parameter behavior: - *required* if *Data set type* is set to ”Item patterns”
Color	1	ds.0.color	Hexadecimal color code (e.g., FF0000). Parameter behavior: - *supported* if *Data set type* is set to ”Item patterns” and *Color palette* is not set
Color palette	0	ds.0.color_palette	Color palette index. Possible values range from 0 to 11. Default: 0. Parameter behavior: - *supported* if *Data set type* is set to ”Item patterns” and *Color* is not set
Aggregation function	0	ds.0.aggregate_function	1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum; 6 - first; 7 - *(default)* last.
Data set aggregation	0	ds.0.dataset_aggregation	0 - *(default)* none; 1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum. Parameter behavior: - *supported* if *Item type* is set to ”Total”
Data set label	1	ds.0.data_set_label	Any string value. Default: "" (empty).
Item tags			
Evaluation type	0	ds.0.item_tags_evaltype	0 - *(default)* And/Or; 2 - Or.
Tag name	1	ds.0.item_tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*

Parameter	type	name	value
Operator	0	ds.0.item_tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*
Tag value	1	ds.0.item_tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*

Displaying options

The following parameters are supported for configuring *Displaying options*.

Parameter	type	name	value
History data selection	0	source	0 - *(default)* Auto; 1 - History; 2 - Trends.
Draw	0	draw_type	0 - *(default)* Pie; 1 - Doughnut.
Width	0	width	20 - 20% of the radius; 30 - 30% of the radius; 40 - 40% of the radius; 50 - *(default)* 50% of the radius. Parameter behavior: - *supported* if *Draw* is set to ”Doughnut”
Stroke width	0	stroke	Possible values range from 0 to 10. Default: 0. Parameter behavior: - *supported* if *Draw* is set to ”Doughnut”
Show total value	0	total_show	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Draw* is set to ”Doughnut”
Size	0	value_size_type	0 - *(default)* Auto; 1 - Custom. Parameter behavior: - *supported* if *Show total value* is set to ”Enabled”

Parameter	type	name	value
Size (value for custom size)	0	value_size	Possible values range from 1 to 100. Default: 20. Parameter behavior: - *supported* if *Show total value* is set to ”Enabled”
Decimal places	0	decimal_places	Possible values range from 0 to 6. Default: 2. Parameter behavior: - *supported* if *Show total value* is set to ”Enabled”
Units (checkbox)	0	units_show	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Show total value* is set to ”Enabled”
Units (value)	1	units	Any string value. Parameter behavior: - *supported* if *Units* (checkbox) is set to ”Enabled”
Bold	0	value_bold	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Show total value* is set to ”Enabled”
Color	1	value_color	Hexadecimal color code (e.g., FF0000). Parameter behavior: - *supported* if *Show total value* is set to ”Enabled”
Space between sectors	0	space	Possible values range from 0 to 10. Default: 1.
Merge sectors smaller than N% (checkbox)	0	merge	0 - *(default)* Disabled; 1 - Enabled.
Merge sectors smaller than N% (value)	0	merge_percent	Possible values range from 1 to 10. Default: 1. Parameter behavior: - *supported* if *Merge sectors smaller than N%* (checkbox) is set to ”Enabled”
Merge sectors smaller than N% (color)	1	merge_color	Hexadecimal color code (e.g., FF0000). Parameter behavior: - *supported* if *Merge sectors smaller than N%* (checkbox) is set to ”Enabled”

Time period

The following parameters are supported for configuring *Time period*.

Parameter	type	name	value
Time period	1	time_period._reference	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters.
From	1	time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.to` is set
To	1	time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.from` is set

Legend

The following parameters are supported for configuring *Legend*.

Parameter	type	name	value
Show legend	0	legend	0 - Disabled; 1 - *(default)* Enabled.
Show value	0	legend_value	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Show legend* is set to "Enabled"
Show aggregation function	0	legend_aggregation	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Show legend* is set to "Enabled"
Rows	0	legend_lines_mode	0 - *(default)* Fixed; 1 - Variable. Parameter behavior: - *supported* if *Show legend* is set to "Enabled"
Number of rows/ Maximum number of rows	0	legend_lines	Possible values range from 1 to 10. Default: 1. Parameter behavior: - *supported* if *Show legend* is set to "Enabled"
Number of columns	0	legend_columns	Possible values range from 1 to 4. Default: 4. Parameter behavior: - *supported* if *Show legend* is set to "Enabled", and *Show value* is set to "Disabled"

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Pie chart* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Pie chart* widget

Configure a *Pie chart* widget in the following way:

- 2 data sets for a total of 9 items on 1 host.
- The first data set is of type "Item list" and consists of 3 items that are all with type "Normal" and represented by a different color.
- The second data set is of type "Item patterns", consists of 6 items, has a configured aggregation for each item, and is represented by a custom color.
- The second data set also has a custom data set label.
- Data in the pie chart are displayed as a doughnut chart with a custom width and total value with units in the center.
- Data in the pie chart are displayed and aggregated for a custom time period of the last 3 hours.
- Pie chart legend displays configured items in 4 rows.

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Problem hosts* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Problem hosts* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Problem hosts* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.
Exclude host groups	2	exclude_groupids.0	Host group ID. Note: To exclude multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Hosts	3	hostids.0	Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Hosts (Widget/Dashboard)	1	hostids._reference	Instead of Host ID: `DASHBOARD.hostids` - set the dashboard host selector as the data source for hosts; `ABCDE._hostids` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Problem	1	problem	Problem event name (case insensitive, full name or part of it).
Severity	0	severities.0	0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Default: empty (all enabled). Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.
Problem tags			
Evaluation type	0	evaltype	0 - *(default)* And/Or; 2 - Or.
Tag name	1	tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Operator	0	tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Tag value	1	tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Show suppressed problems	0	show_suppressed	0 - *(default)* Disabled; 1 - Enabled.
Hide groups without problems	0	hide_empty_groups	0 - *(default)* Disabled; 1 - Enabled. This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Problem display	0	ext_ack	0 - *(default)* All; 1 - Unacknowledged only; 2 - Separated.
Reference	1	reference	Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Problem hosts* widget. For more information on configuring a dashboard, see dashboard.create.

Configuring a *Problem hosts* widget

Configure a *Problem hosts* widget that displays hosts from host groups "2" and "4" that have problems with a name that includes the string "CPU" and that have the following severities: "Warning", "Average", "High", "Disaster".

23 Problems

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Problems* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Problems* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Problems* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Show	0	show	1 - *(default)* Recent problems; 2 - History; 3 - Problems.
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.
Exclude host groups	2	exclude_groupids.0	Host group ID. Note: To exclude multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Hosts	3	hostids.0	Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard.
Hosts (Widget/Dashboard)	1	hostids._reference	Instead of Host ID: `DASHBOARD.hostids` - set the dashboard host selector as the data source for hosts; `ABCDE._hostids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Problem	1	problem	Problem event name (case insensitive, full name or part of it).
Severity	0	severities.0	0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Default: empty (all enabled). Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.
Problem tags			
Evaluation type	0	evaltype	0 - *(default)* And/Or; 2 - Or.
Tag name	1	tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Operator	0	tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Tag value	1	tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Show tags	0	show_tags	0 - *(default)* None; 1 - 1; 2 - 2; 3 - 3.
Tag name (format)	0	tag_name_format	0 - *(default)* Full; 1 - Shortened; 2 - None. Parameter behavior: - *supported* if *Show tags* is set to ”1”, ”2”, or ”3”
Tag display priority	1	tag_priority	Comma-separated list of tags. Parameter behavior: - *supported* if *Show tags* is set to ”1”, ”2”, or ”3”

Parameter	type	name	value
Show operational data	0	show_opdata	0 - *(default)* None; 1 - Separately; 2 - With problem name.
Show suppressed problems	0	show_suppressed	0 - *(default)* Disabled; 1 - Enabled.
Acknowledgement status	0	acknowledgement_status	0 - *(default)* all; 1 - Unacknowledged; 2 - Acknowledged.
By me	0	acknowledged_by_me	0 - *(default)* Disabled; 1 - Enabled.
Sort entries by	0	sort_triggers	1 - Severity (descending); 2 - Host (ascending); 3 - Time (ascending); 4 - *(default)* Time (descending); 13 - Severity (ascending); 14 - Host (descending); 15 - Problem (ascending); 16 - Problem (descending). For all values, except ”Time (descending)” and ”Time (ascending)”, the *Show timeline* parameter must be set to ”Disabled”. Values ”Host (ascending)” and ”Host (descending)” are not supported if configuring the widget on a template dashboard.
Show timeline	0	show_timeline	0 - Disabled; 1 - *(default)* Enabled. Parameter behavior: - *supported* if *Sort entries by* is set to ”Time (descending)” or ”Time (ascending)”
Highlight whole row	0	highlight_row	0 - *(default)* Disabled; 1 - Enabled. This parameter is not supported in the high-contrast themes.
Show lines	0	show_lines	Possible values range from 1 to 100. Default: 25.
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Problems* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Problems* widget

Configure a *Problems* widget that displays problems for host group ”4” that satisfy the following conditions:

- Problems that have a tag with the name ”scope” that contains values ”performance” or ”availability”, or ”capacity”.
- Problems that have the following severities: ”Warning”, ”Average”, ”High”, ”Disaster”.

In addition, configure the widget to show tags and operational data.

24 Problems by severity

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Problems by severity* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Problems by severity* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Problems by severity* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.
Exclude host groups	2	exclude_groupids.0	Host group ID. Note: To exclude multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Hosts	3	hostids.0	Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard.
Hosts (Widget/Dashboard)	1	hostids._reference	Instead of Host ID: `DASHBOARD.hostids` - set the dashboard host selector as the data source for hosts; `ABCDE._hostids` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Problem	1	problem	Problem event name (case insensitive, full name or part of it).
Severity	0	severities.0	0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Default: empty (all enabled). Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.
Problem tags			
Evaluation type	0	evaltype	0 - *(default)* And/Or; 2 - Or.
Tag name	1	tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Operator	0	tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Tag value	1	tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*

Parameter	type	name	value
Show	0	show_type	0 - *(default)* Host groups; 1 - Totals. This parameter is not supported if configuring the widget on a template dashboard, and, by default, is set to ”Totals”.
Layout	0	layout	0 - *(default)* Horizontal; 1 - Vertical. Parameter behavior: - *supported* if *Show* is set to ”Totals”
Show operational data	0	show_opdata	0 - *(default)* None; 1 - Separately; 2 - With problem name.
Show suppressed problems	0	show_suppressed	0 - *(default)* Disabled; 1 - Enabled.
Hide groups without problems	0	hide_empty_groups	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Show* is set to ”Host groups” This parameter is not supported if configuring the widget on a template dashboard.
Problem display	0	ext_ack	0 - *(default)* All; 1 - Unacknowledged only; 2 - Separated.
Show timeline	0	show_timeline	0 - Disabled; 1 - *(default)* Enabled.
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Problems by severity* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Problems by severity* widget

Configure a *Problems by severity* widget that displays problem totals for all host groups.

25 Scatter plot

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Scatter plot* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Scatter plot* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Scatter plot* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Data set

The following parameters are supported for configuring a *Data set*.

Note:
The first number in the property name (e.g., ds.0.hosts.0, ds.0.items.0) represents the particular data set, while the second number, if present, represents the configured host or item.

Parameter	type	name	value
Data set type ***Data set: Item list***	0	ds.0.dataset_type	0 - Item list; 1 - *(default)* Item patterns.
Color	1	ds.0.color.0	Hexadecimal color code (e.g., `FF0000`). Parameter behavior: - *required* if *Data set type* is set to ”Item list”
X-Axis	4	ds.0.x_axis_itemids.0	Item ID. When configuring the widget on a template dashboard, only items configured on the template should be set. Note: To configure multiple items, create a dashboard widget field object for each item with an incremented number in the property name. Parameter behavior: - *required* if *Data set type* is set to ”Item list” and *X-axis (Widget)* is not set

Parameter	type	name	value
X-Axis (Widget)	1	ds.0.x_axis_itemids.0	Item ID: `ABCDE._itemid` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for items. Note: To configure multiple widgets, create a dashboard widget field object for each widget with an incremented number in the property name. Parameter behavior: - *required* if *Data set type* is set to "Item list" and *X-Axis* is not set
Y-Axis	4	ds.0.y_axis_itemids.0	Item ID. When configuring the widget on a template dashboard, only items configured on the template should be set. Note: To configure multiple items, create a dashboard widget field object for each item with an incremented number in the property name. Parameter behavior: - *required* if *Data set type* is set to "Item list" and *Y-axis (Widget)* is not set
Y-Axis (Widget)	1	ds.0.y_axis_itemids.0	Item ID: `ABCDE._itemid` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for items. Note: To configure multiple widgets, create a dashboard widget field object for each widget with an incremented number in the property name. Parameter behavior: - *required* if *Data set type* is set to "Item list" and *Y-Axis* is not set
Override host	1	ds.0.override_hostid	`ABCDE._hostid` - set a compatible widget (with its "Reference" parameter set to "`ABCDE`") as the data source for hosts; `DASHBOARD._hostid` - set the dashboard host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Data set: Item patterns			
Color	1	ds.0.color	Hexadecimal color code (e.g., `FF0000`). Parameter behavior: - *supported* if *Data set type* is set to "Item patterns" and *Color palette* is not set
Color palette	0	ds.0.color_palette	Color palette index. Possible values range: 0-11. Default: 0. Parameter behavior: - *supported* if *Data set type* is set to "Item patterns" and *Color* is not set

Parameter	type	name	value
Host patterns	1	ds.0.hosts.0	Host name or pattern (e.g., ”Zabbix*”). Parameter behavior: - *required* if *Data set type* is set to ”Item patterns” This parameter is not supported if configuring the widget on a template dashboard.
X-Axis item patterns	1	ds.0.x_axis_items.0	Item name or pattern (e.g., ”*: Number of processed *values per second”). When configuring the widget on a template dashboard, only the patterns for items configured on the template should be set. Parameter behavior: - *required* if *Data set type* is set to ”Item patterns”
Y-Axis item patterns	1	ds.0.y_axis_items.0	Item name or pattern (e.g., ”*: Number of processed *values per second”). When configuring the widget on a template dashboard, only the patterns for items configured on the template should be set. Parameter behavior: - *required* if *Data set type* is set to ”Item patterns”
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to ”`ABCDE`”) as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.
Override host	1	ds.0.override_hostid._reference	Instead of Host ID: `ABCDE._hostid` - set a compatible widget (with its ”Reference” parameter set to ”`ABCDE`”) as the data source for hosts; `DASHBOARD._hostid` - set the dashboard host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Host tags			
Evaluation type	0	evaltype_host	0 - *(default)* And/Or; 2 - Or. This parameter is not supported if configuring the widget on a template dashboard.
Tag name	1	host_tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Operator	0	host_tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Tag value	1	host_tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Marker	0	ds.0.marker	0 - *(default)* Ellipse; 1 - Square; 2 - Triangle; 3 - Diamond; 4 - Star; 5 - Cross.
Marker size	0	ds.0.marker_size	0 - *(default)* Small (6px); 1 - Medium (9px); 2 - Large (15px).
Time shift	1	ds.0.timeshift	Valid time string (e.g., 3600, 1h, etc.). You may use time suffixes. Negative values are also allowed. Default: "" (empty).
Aggregation interval	1	ds.0.aggregate_interval	Valid time string (e.g., 3600, 1h, etc.). You may use time suffixes. Default: 15m.
Aggregation function	0	ds.0.aggregate_function	0 - not used; 1 - min; 2 - max; 3 - *(default)* avg; 4 - count; 5 - sum; 6 - first; 7 - last.

Display options

The following parameters are supported for configuring *Display options*.

Parameter	type	name	value
History data selection	0	source	0 - *(default)* Auto; 1 - History; 2 - Trends.

Parameter	type	name	value
Host names in labels	0	show_hostnames	0 - *(default)* Auto; 1 - Show; 2 - Hide. This parameter is not supported if configuring the widget on a template dashboard.

Time period

The following parameters are supported for configuring *Time period*.

Parameter	type	name	value
Time period	1	time_period._reference	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters.
From	1	time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.to` is set
To	1	time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.from` is set

Axes

The following parameters are supported for configuring *Axes*.

Parameter	type	name	value
X-Axis	0	x_axis	0 - Disabled; 1 - *(default)* Enabled.
Y-Axis	0	y_axis	0 - *(default)* Disabled; 1 - Enabled.
Min	1	x_axis_min	Any numeric value. Default: "" (empty).
		y_axis_min	
Max	1	x_axis_max	Any numeric value. Default: "" (empty).
		y_axis_max	
Units (type)	0	x_axis_units	0 - *(default)* Auto; 1 - Static.
		y_axis_units	
Units (value)	1	x_axis_static_units	Any string value. Default: "" (empty).
		y_axis_static_units	

Legend

The following parameters are supported for configuring *Legend*.

Parameter	type	name	value
Show legend	0	legend	0 - Disabled; 1 - *(default)* Enabled.
Show aggregation function	0	legend_aggregation	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Show legend* is set to ”Enabled”
Rows	0	legend_lines_mode	0 - *(default)* Fixed; 1 - Variable. Parameter behavior: - *supported* if *Show legend* is set to ”Enabled”
Number of rows/ Maximum number of rows	0	legend_lines	Possible values range: 1-10. Default: 1. Parameter behavior: - *supported* if *Show legend* is set to ”Enabled”
Number of columns	0	legend_columns	Possible values range: 1-4. Default: 4. Parameter behavior: - *supported* if *Show legend* is set to ”Enabled”

Thresholds

The following parameters are supported for configuring *Thresholds*.

Note:
The number in the *Thresholds* property name (e.g., thresholds.0.color) references the threshold place in a list, sorted in ascending order. However, if thresholds are configured in a different order, the values will be sorted in ascending order after updating widget configuration in Zabbix frontend (e.g., `"thresholds.0.threshold":"5"` → `"thresholds.0.threshold":"1"`; `"thresholds.1.threshold":"1"` → `"thresholds.1.threshold": "5"`).

Parameter	type	name	value
Color interpolation	0	interpolation	0 - *(default)* Disabled; 1 - Enabled.
Color	1	thresholds.0.color	Hexadecimal color code (e.g., FF0000).
X-Axis	1	thresholds.0.x_axis_threshold	Any numeric value. Suffixes (e.g., ”1d”, ”2w”, ”4K”, ”8G”) are supported.
Y-Axis	1	thresholds.0.y_axis_threshold	Any numeric value. Suffixes (e.g., ”1d”, ”2w”, ”4K”, ”8G”) are supported.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Scatter plot* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Scatter plot* widget

Configure a *Scatter plot* widget in the following way:

- 5 data sets of type ”Item patterns”, each with default aggregation (avg, 15m) and different markers.
- The legend displays configured items in a single row and two columns.
- Thresholds are configured to color a marker red when its value reaches 80 on any axis.

26 SLA report

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *SLA report* widget in dashboard.create and dashboard.update methods.

Attention:
Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *SLA report* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *SLA report* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - *(default)* No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
SLA	10	slaid.0	SLA ID. Parameter behavior: - *required*
Service	9	serviceid.0	Service ID.
Show periods	0	show_periods	Possible values range from 1 to 100. Default: 20.
From	1	date_from	Valid date string in format YYYY-MM-DD. Relative dates with modifiers d, w, M, y (e.g., now, now/d, now/w-1w, etc.) are supported.
To	1	date_to	Valid date string in format YYYY-MM-DD. Relative dates with modifiers d, w, M, y (e.g., now, now/d, now/w-1w, etc.) are supported.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *SLA report* widget. For more information on configuring a dashboard, see dashboard.create.

Configuring an *SLA report* widget

Configure an *SLA report* widget that displays the SLA report for SLA "4" service "2" for the period of last 30 days.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
```

```
                "widgets": [
                    {
                        "type": "slareport",
                        "name": "SLA report",
                        "x": 0,
                        "y": 0,

27 System information

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *System Information* widget in dashboard.create and dashboard.update methods.

Attention:
Widget fields properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *System information* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *System Information* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - *(default)* 15 minutes.
Show	0	info_type	0 - *(default)* System stats; 1 - High availability nodes.
Show software update check details	0	show_software_update_check_details	0 - (default) Disabled; 1 - Enabled. Parameter behavior: - *supported* if AllowSoftwareUpdateCheck in Zabbix server configuration is enabled and *Show* is set to ”System stats”

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *System information* widget. For more information on configuring a dashboard, see dashboard.create.

Configuring a *System information* widget

Configure a *System information* widget that displays system stats with a refresh interval of 10 minutes and software update check enabled.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [

28 Top hosts

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Top hosts* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Top hosts* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Top hosts* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.
Hosts	3	hostids.0	Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard.
Hosts (Widget/Dashboard)	1	hostids._reference	Instead of Host ID: `DASHBOARD.hostids` - set the dashboard host selector as the data source for hosts; `ABCDE._hostids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Host tags			
Evaluation type	0	evaltype	0 - *(default)* And/Or; 2 - Or. This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Tag name	1	tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Operator	0	tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Tag value	1	tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Show hosts in maintenance	0	maintenance	0 - *(default)* Disabled; 1 - Enabled.
Columns (see below)			
Order by	0	column	Column numeric value from the configured columns.
Order	0	order	2 - *(default)* Top N; 3 - Bottom N.
Host limit	0	show_lines	Possible values range from 1 to 1000. Default: 10. This parameter is not supported if configuring the widget on a template dashboard.

Columns

Columns have common parameters and additional parameters depending on the configuration of the parameter *Data*.

Note:
For all parameters related to columns the number in the property name (e.g., columns.0.name) references a column for which the parameter is configured.

The following parameters are supported for all columns.

Parameter	type	name	value
Name	1	columns.0.name	Any string value. Parameter behavior: - *required*
Data	0	columns.0.data	1 - Item value; 2 - Host name; 3 - Text. Parameter behavior: - *required*
Base color	1	columns.0.base_color	Hexadecimal color code (e.g., FF0000). Parameter behavior: - *required*

Item value

The following parameters are supported if *Data* is set to ”Item value”.

Note:
The first number in the *Thresholds* property name (e.g., columnsthresholds.0.color.0) references the column for which thresholds are configured, while the second number references threshold place in a list, sorted in ascending order. However, if thresholds are configured in a different order, the values will be sorted in ascending order after updating widget configuration in Zabbix frontend (e.g., `"threshold.0.threshold":"5"` → `"threshold.0.threshold":"1"`; `"threshold.1.threshold":"1"` → `"threshold.1.threshold": "5"`).

Parameter	type	name	value
Item	1	columns.0.item	Valid item name. When configuring the widget on a template dashboard, only items configured on the template should be set.
Display item value as	0	columns.0.display_value_as	0 - *(default)* Numeric; 1 - Text; 2 - Binary.
Display	0	columns.0.display	1 - *(default)* As is; 2 - Bar; 3 - Indicators; 6 - Sparkline. Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric”
Min	1	columns.0.min	Any numeric value. Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric” and *Display* is set to ”Bar” or ”Indicators”
Max	1	columns.0.max	Any numeric value. Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric” and *Display* is set to ”Bar” or ”Indicators”

Parameter	type	name	value
Decimal places	0	columns.0.decimal_places	Possible values range from 0 to 10. Default: 2. Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric”
Sparkline			
Width	0	columns.0.sparkline.width	Possible values range from 0 to 10. Default: 1. Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric” and *Display* is set to ”Sparkline”
Fill	0	columns.0.sparkline.fill	Possible values range from 0 to 10. Default: 3. Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric” and *Display* is set to ”Sparkline”
Color	1	columns.0.sparkline.color	Hexadecimal color code (e.g., `FF0000`). Default: `42A5F5`. Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric” and *Display* is set to ”Sparkline”
Time period	1	columns.0.sparkline.time_period	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its `reference` parameter equal to `ABCDE`) as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters. Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric” and *Display* is set to ”Sparkline”
From	1	columns.0.sparkline.time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric” and *Display* is set to ”Sparkline”
To	1	columns.0.sparkline.time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric” and *Display* is set to ”Sparkline” - *required* if `columns.0.sparkline.time_period.from` is set
History data	0	columns.0.sparkline.history	0 *(default)* Auto; 1 - History; 2 - Trends. Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric” and *Display* is set to ”Sparkline”

Parameter	type	name	value
Thresholds			
Color	1	columnsthresholds.0.color	Hexadecimal color code (e.g., `FF0000`). Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric”
Threshold	1	columnsthresholds.0.threshold	Any string value. Parameter behavior: - *supported* if *Display item value as* is set to ”Numeric”
Highlights			
Color	1	columns.0.highlights.color	Hexadecimal color code (e.g., `FF0000`). Parameter behavior: - *supported* if *Display item value as* is set to ”Text”
Pattern	1	columns.0.highlights.pattern	Any string value. Parameter behavior: - *supported* if *Display item value as* is set to ”Text”
Show thumbnail	0	columns.0.show_thumbnail	0 - *(default)* Disabled; 1 - Enabled. Parameter behavior: - *supported* if *Display item value as* is set to ”Binary”
Aggregation function	0	columns.0.aggregate_function	0 - *(default)* not used; 1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum; 6 - first; 7 - last.
Time period	1	columns.0.time_period.reference	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its `reference` parameter equal to `ABCDE`) as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters. Parameter behavior: - *supported* if *Aggregation function* is set to ”min”, ”max”, ”avg”, ”count”, ”sum”, ”first”, ”last”
From	1	columns.0.time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set and *Aggregation function* is set to ”min”, ”max”, ”avg”, ”count”, ”sum”, ”first”, ”last” - *required* if `columns.0.time_period.to` is set
To	1	columns.0.time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set and *Aggregation function* is set to ”min”, ”max”, ”avg”, ”count”, ”sum”, ”first”, ”last” - *required* if `columns.0.time_period.from` is set

Parameter	type	name	value
History data	0	columns.0.history	0 - *(default)* Auto; 1 - History; 2 - Trends. Parameter behavior: - *supported* if *Display item value as* is set to "Numeric"
Reference	1	reference	Any string value consisting of 5 characters (e.g., `ABCDE` or `JBPNL`). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Text

The following parameters are supported if *Data* is set to "Text".

Parameter	type	name	value
Text	1	columns.0.text	Any string value, including macros. Supported macros: `{HOST.*}`, `{INVENTORY.*}`. Parameter behavior: - *required* if *Data* is set to "Text"

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Top hosts* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Top hosts* widget

Configure a *Top hosts* widget that displays top hosts by CPU utilization in host group "4". In addition, configure the following custom columns: "Host name", "CPU utilization in %", "1m avg", "5m avg", "15m avg", "Processes".

29 Top items

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Top items* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Top items* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Top items* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Hosts	3	hostids.0	Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard.
Hosts (Widget/Dashboard)	1	hostids._reference	Instead of Host ID: `DASHBOARD.hostids` - set the dashboard host selector as the data source for hosts; `ABCDE._hostids` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Host tags			
Evaluation type	0	host_tags_evaltype	0 - *(default)* And/Or; 2 - Or. This parameter is not supported if configuring the widget on a template dashboard.
Tag name	1	host_tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Operator	0	host_tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Tag value	1	host_tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Host tags* This parameter is not supported if configuring the widget on a template dashboard.
Layout	0	layout	0 - *(default)* Horizontal; 1 - Vertical.

Parameter	type	name	value
Show problems (see below)	0	show_problems	0 - All; 1 - *(default)* Unsuppressed; 2 - None.

Advanced configuration

The following advanced configuration parameters are supported for the *Top items* widget.

Parameter	type	name	value
Host ordering			
Order by	0	host_ordering_order_by	0 - *(default)* Host name; 3 - Item value.
Item patterns	1	host_ordering_item.0	Item name or pattern (e.g., "*: Number of processed *values per second"). Note: To configure multiple item patterns, create a dashboard widget field object for each item pattern with an incremented number in the property name. When configuring the widget on a template dashboard, only the patterns for items configured on the template should be set. Parameter behavior: - *required* if *Order by* is set to "Item value"
Order	0	host_ordering_order	2 - *(default)* Top N; 3 - Bottom N.
Limit	0	host_ordering_limit	Possible values range from 1 to 100. Default: 10.
Item ordering			
Order by	0	item_ordering_order_by	1 - Host; 2 - Item name; 3 - *(default)* Item value.
Host patterns	1	item_ordering_host.0	Host name or pattern. Note: To configure multiple host patterns, create a dashboard widget field object for each host pattern with an incremented number in the property name. Parameter behavior: - *required* if *Order by* is set to "Host"
Order	0	item_ordering_order	2 - *(default)* Top N; 3 - Bottom N.
Limit	0	item_ordering_limit	Possible values range from 1 to 100. Default: 10.

Columns

Note:
The first number in the property name (e.g., columns.0.items.0, columns.0.item_tags_evaltype) represents the particular column, while the second number, if present, represents the configured entity (e.g., item pattern, tag).

Parameter	type	name	value
Item patterns	1	columns.0.items.0	Item name or pattern (e.g., "*: Number of processed *values per second"). Note: To configure multiple item patterns, create a dashboard widget field object for each item pattern with an incremented second number in the property name. When configuring the widget on a template dashboard, only the patterns for items configured on the template should be set. Parameter behavior: - *required*
Item tags			
Evaluation type	0	columns.0.item_tags_evaltype	0 - *(default)* And/Or; 2 - Or.
Tag name	1	columns.0.item_tags.0.tag	Any string value. Note: The second number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*
Operator	0	columns.0.item_tags.0.operator	**0** - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The second number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*
Tag value	1	columns.0.item_tags.0.value	Any string value. Note: The second number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Item tags*
Base color	1	columns.0.base_color	Hexadecimal color code (e.g., FF0000).
Display value as	0	columns.0.display_value_as	1 - *(default)* Numeric; 2 - Text.
Display	0	columns.0.display	1 - *(default)* As is; 2 - Bar; 3 - Indicators; 6 - Sparkline.

Parameter	type	name	value
Min	1	columns.0.min	Any numeric value. Suffixes (e.g., ”1d”, ”2w”, ”4K”, ”8G”) are supported. Parameter behavior: - *supported* if *Display value as* is set to ”Numeric” and *Display* is set to ”Bar” or ”Indicators”
Max	1	columns.0.max	Any numeric value. Suffixes (e.g., ”1d”, ”2w”, ”4K”, ”8G”) are supported. Parameter behavior: - *supported* if *Display value as* is set to ”Numeric” and *Display* is set to ”Bar” or ”Indicators”
Sparkline			
Width	0	columns.0.sparkline.width	Possible values range from 0 to 10. Default: 1. Parameter behavior: - *supported* if *Display* is set to ”Sparkline”
Fill	0	columns.0.sparkline.fill	Possible values range from 0 to 10. Default: 3. Parameter behavior: - *supported* if *Display* is set to ”Sparkline”
Color	1	columns.0.sparkline.color	Hexadecimal color code (e.g., `FF0000`). Default: `42A5F5`. Parameter behavior: - *supported* if *Display* is set to ”Sparkline”
Time period	1	columns.0.sparkline.time_period.reference	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its `reference` parameter equal to `ABCDE`) as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters. Parameter behavior: - *supported* if *Display* is set to ”Sparkline”
From	1	columns.0.sparkline.time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Display* is set to ”Sparkline” - *required* if `columns.0.sparkline.time_period.to` is set
To	1	columns.0.sparkline.time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Display* is set to ”Sparkline” - *required* if `columns.0.sparkline.time_period.from` is set
History data	0	columns.0.sparkline.history	0 - *(default)* Auto; 1 - History; 2 - Trends. Parameter behavior: - *supported* if *Display* is set to ”Sparkline”

Parameter	type	name	value
Thresholds			
Color	1	columns.0.thresholds.color	Hexadecimal color code (e.g., `FF0000`). Parameter behavior: - *supported* if *Display value as* is set to ”Numeric”
Threshold	1	columns.0.thresholds.threshold	Any numeric value. Suffixes (e.g., ”1d”, ”2w”, ”4K”, ”8G”) are supported. Parameter behavior: - *supported* if *Display value as* is set to ”Numeric”
Highlights			
Highlight	1	columns.0.highlights.color	Hexadecimal color code (e.g., `FF0000`). Parameter behavior: - *supported* if *Display value as* is set to ”Text”
Threshold	1	columns.0.highlights.pattern	Any regular expression. Parameter behavior: - *supported* if *Display value as* is set to ”Text”
Decimal places	0	columns.0.decimal_places	Possible values range from 0 to 10. Default: 2.
Advanced configuration			
Aggregation function	0	columns.0.aggregate_function	If *Display value as* is set to ”Numeric”: 0 - *(default)* not used; 1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum; 6 - first; 7 - last. If *Display value as* is set to ”Text”: 0 - *(default)* not used; 4 - count; 6 - first; 7 - last.
Time period	1	columns.0.time_period.filter	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its `reference` parameter equal to `ABCDE`) as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters. Parameter behavior: - *supported* if *Aggregation function* is set to ”min”, ”max”, ”avg”, ”count”, ”sum”, ”first”, ”last”

Parameter	type	name	value
From	1	columns.0.time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set and *Aggregation function* is set to ”min”, ”max”, ”avg”, ”count”, ”sum”, ”first”, ”last” - *required* if `columns.0.time_period.to` is set
To	1	columns.0.time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set and *Aggregation function* is set to ”min”, ”max”, ”avg”, ”count”, ”sum”, ”first”, ”last” - *required* if `columns.0.time_period.from` is set
History data	0	columns.0.history	0 - *(default)* Auto; 1 - History; 2 - Trends. Parameter behavior: - *supported* if *Display value as* is set to ”Numeric”
Aggregate	0	columns.0.aggregate_column	0 - *(default)* Each item 1 - Combined. Parameter behavior: - *supported* if *Display value as* is set to ”Numeric” and *Display* is set to ”As is”, ”Bar” or ”Indicators”.
Combined aggregation function	0	columns.0.column_aggregate_function	1 - min; 2 - max; 3 - avg; 4 - count; 5 - sum *(default)*. Parameter behavior: - *required* if configuring *Aggregate*.
Combined column name	1	columns.0.combined_column_name	Any string value. Parameter behavior: - *required* if configuring *Aggregate*.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Top items* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Top items* widget

Configure a *Top items* widget that displays data for host ”10084” and only for items for which the tag with the name ”component” contains the value ”cpu”. In addition, display the data with hosts located at the top and use a colored gauge bar for cell representation.

Request:

30 Top triggers

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Top triggers* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Top triggers* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Top triggers* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - *(default)* No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Hosts	3	hostids.0	Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Problem	1	problem	Problem event name (case insensitive, full name or part of it).
Severity	0	severities.0	Trigger severities. 0 - Not classified; 1 - Information; 2 - Warning; 3 - Average; 4 - High; 5 - Disaster. Default: empty (all enabled). Note: To configure multiple values, create a dashboard widget field object for each value with an incremented number in the property name.
Problem tags			
Evaluation type	0	evaltype	0 - *(default)* And/Or; 2 - Or.
Tag name	1	tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Operator	0	tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Tag value	1	tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Time period	1	time_period._reference	`DASHBOARD._timeperiod` - set the dashboard time period selector as the data source; `ABCDE._timeperiod` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source. Default: `DASHBOARD._timeperiod` Alternatively, you can set the time period only in the *From* and *To* parameters.
From	1	time_period.from	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.to` is set

Parameter	type	name	value
To	1	time_period.to	Valid time string in absolute (`YYYY-MM-DD hh:mm:ss`) or relative time syntax (`now`, `now/d`, `now/w-1w`, etc.). Parameter behavior: - *supported* if *Time period* is not set - *required* if `time_period.from` is set
Trigger limit	0	show_lines	Possible values range from 1 to 100. Default: 10.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Top triggers* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Top triggers* widget

Configure a *Top triggers* widget that displays the top 5 triggers for host group "4" with the count of all problems for each trigger. The widget displays only triggers that have severities "Warning", "Average", "High", or "Disaster", and problems that have a tag with the name "scope" that contains values "performance" or "availability", or "capacity".

31 Trigger overview

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Trigger overview* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Trigger overview* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Trigger Overview* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Show	0	show	1 - *(default)* Recent problems; 2 - Any; 3 - Problems.

Parameter	type	name	value
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.
Hosts	3	hostids.0	Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard.
Hosts (Widget/Dashboard)	1	hostids._reference	Instead of Host ID: `DASHBOARD.hostids` - set the dashboard host selector as the data source for hosts; `ABCDE._hostids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Problem tags			
Evaluation type	0	evaltype	0 - *(default)* And/Or; 2 - Or.
Tag name	1	tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Operator	0	tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*

Parameter	type	name	value
Tag value	1	tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Problem tags*
Show suppressed problems	0	show_suppressed	0 - *(default)* Disabled; 1 - Enabled.
Layout	0	layout	0 - *(default)* Horizontal; 1 - Vertical.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Trigger overview* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *Trigger overview* widget

Configure a *Trigger overview* widget that displays trigger states for all host groups that have triggers with a tag that has the name "scope" and contains value "availability".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [
                    {
                        "type": "trigover",

                        "width": 36,
                        "height": 5,
                        "view_mode": 0,
                        "fields": [
                            {
                                "type": 1,
                                "name": "tags.0.tag",
                                "value": "scope"
                            },
                            {
                                "type": 0,
                                "name": "tags.0.operator",
                                "value": 0
                            },
                            {
                                "type": 1,
                                "name": "tags.0.value",
                                "value": "availability"
                            }
                        ]
                    }
```

```
                ]
            }
        ],
        "userGroups": [
            {
                "usrgrpid": 7,
                "permission": 2
            }
        ],
        "users": [
            {
                "userid": 1,
                "permission": 3
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "3"
        ]
    },
    "id": 1
}
```

32 URL

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *URL* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *URL* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *URL* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - *(default)* No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.

Parameter	type	name	value
URL	1	url	Valid URL string. Parameter behavior: - *required*
Override host	1	override_hostid._reference	`ABCDE._hostid` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for hosts; `DASHBOARD._hostid` - set the dashboard host selector as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *URL* widget. For more information on configuring a dashboard, see `dashboard.create`.

Configuring a *URL* widget

Configure a *URL* widget that displays the home page of Zabbix manual.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [
                    {
                        "type": "url",
                        "name": "URL",
                        "x": 0,
                        "y": 0,
                        "width": 36,
                        "height": 5,
                        "view_mode": 0,
                        "fields": [
                            {
                                "type": 1,
                                "name": "url",
                                "value": "https://www.zabbix.com/documentation/8.0/en"
                            }
                        ]
                    }
                ]
            }
        ],
        "userGroups": [
            {
                "usrgrpid": 7,
                "permission": 2
            }
        ],
        "users": [
            {
                "userid": 1,
                "permission": 3
            }
```

```
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "3"
        ]
    },
    "id": 1
}
```

33 Web monitoring

Description

These parameters and the possible property values for the respective dashboard widget field objects allow you to configure the *Web monitoring* widget in `dashboard.create` and `dashboard.update` methods.

Attention:
Widget `fields` properties are not validated during the creation or update of a dashboard. This allows users to modify built-in widgets and create custom widgets, but also introduces the risk of creating or updating widgets incorrectly. To ensure the successful creation or update of the *Web monitoring* widget, please refer to the parameter behavior outlined in the tables below.

Parameters

The following parameters are supported for the *Web monitoring* widget.

Parameter	type	name	value
Refresh interval	0	rf_rate	0 - No refresh; 10 - 10 seconds; 30 - 30 seconds; 60 - *(default)* 1 minute; 120 - 2 minutes; 600 - 10 minutes; 900 - 15 minutes.
Host groups	2	groupids.0	Host group ID. Note: To configure multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Host groups (Widget)	1	groupids._reference	Instead of Host group ID: `ABCDE._hostgroupids` - set a compatible widget (with its *Reference* parameter set to "ABCDE") as the data source for host groups. This parameter is not supported if configuring the widget on a template dashboard.

Parameter	type	name	value
Exclude host groups	2	exclude_groupids.0	Host group ID. Note: To exclude multiple host groups, create a dashboard widget field object for each host group with an incremented number in the property name. This parameter is not supported if configuring the widget on a template dashboard.
Hosts	3	hostids.0	Host ID. Note: To configure multiple hosts, create a dashboard widget field object for each host with an incremented number in the property name. For multiple hosts, the parameter *Host groups* must either be not configured at all or configured with at least one host group that the configured hosts belong to. This parameter is not supported if configuring the widget on a template dashboard.
Hosts (Widget/Dashboard)	1	hostids._reference	Instead of Host ID: `DASHBOARD.hostids` - set the dashboard host selector as the data source for hosts; `ABCDE._hostids` - set a compatible widget (with its *Reference* parameter set to "`ABCDE`") as the data source for hosts. This parameter is not supported if configuring the widget on a template dashboard.
Scenario tags			
Evaluation type	0	evaltype	0 - *(default)* And/Or; 2 - Or.
Tag name	1	tags.0.tag	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Scenario tags*
Operator	0	tags.0.operator	0 - Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Scenario tags*
Tag value	1	tags.0.value	Any string value. Note: The number in the property name references tag order in the tag evaluation list. Parameter behavior: - *required* if configuring *Scenario tags*
Show hosts in maintenance	0	maintenance	0 - Disabled; 1 - *(default)* Enabled.

Parameter	type	name	value
Reference	1	reference	Any string value consisting of 5 characters (e.g., ABCDE or JBPNL). This value must be unique within the dashboard to which the widget belongs. Parameter behavior: - *required*

Examples

The following examples aim to only describe the configuration of the dashboard widget field objects for the *Web monitoring* widget. For more information on configuring a dashboard, see dashboard.create.

Configuring a *Web monitoring* widget

Configure a *Web monitoring* widget that displays a status summary of the active web monitoring scenarios for host group "4".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dashboard.create",
    "params": {
        "name": "My dashboard",
        "display_period": 30,
        "auto_start": 1,
        "pages": [
            {
                "widgets": [
                    {
                        "type": "web",
                        "name": "Web monitoring",
                        "x": 0,
                        "y": 0,
                        "width": 18,
                        "height": 3,
                        "view_mode": 0,
                        "fields": [
                            {
                                "type": 2,
                                "name": "groupids.0",
                                "value": 4
                            }
                        ]
                    }
                ]
            }
        ],
        "userGroups": [
            {
                "usrgrpid": 7,
                "permission": 2
            }
        ],
        "users": [
            {
                "userid": 1,
                "permission": 3
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "dashboardids": [
            "3"
        ]
    },
    "id": 1
}
```

Device

This class is designed to work with mobile devices for use with Zabbix mobile app.

Object references:

- Device

Available methods:

- device.get - retrieve devices
- device.offboard - remove (offboard) devices

Device object

The Device object represents a mobile device for use with Zabbix mobile app.

Property	Type	Description
deviceid	ID	Device ID (internal, e.g., 1, 2). Property behavior: - Read-only
userid	ID	Device user's ID. Property behavior: - Constant
uuid	string	Device universally unique identifier (UUIDv7) (external, e.g., 019f930e-0ea2-7c1f-9dcc-0fbb60c40664). Property behavior: - Read-only
name	string	Device name. Property behavior: - Read-only
status	integer	Device status. Possible values: 0 - New 1 - Active 2 - Unassigned Property behavior: - Read-only

Property	Type	Description
activated_at	timestamp	Date and time the device was added in the mobile app, or 0 if not yet added. Property behavior: - Read-only
lastaccess	timestamp	Date and time the device was last authenticated in the mobile app, or 0 if not yet authenticated. Property behavior: - Read-only

device.get

This method allows you to retrieve mobile devices for use with Zabbix mobile app.

The method is available to *User*, *Admin*, and *Super admin* users if `EnableMobileDevices` is enabled and the user has access to devices. Access to API methods can be revoked in user role configuration.

User and *Admin* users can only retrieve their own devices.

Method signature: `integer/array device.get(object parameters)`

Method source: `CDevice::get()` in `ui/include/classes/api/services/CDevice.php`

Parameters

Parameter	Type	Description
deviceids	ID/array	Return only devices with the given device IDs.
userids	ID/array	Return only devices belonging to users with the given user IDs.
roleids	ID/array	Return only devices belonging to users with the given user role IDs.
usrgrpids	ID/array	Return only devices belonging to users with the given user group IDs.
sortfield	string/array	Sort the result by the given properties. Possible values: `deviceid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

Returns either an array of objects, or the count of retrieved objects (if `countOutput` is used).

Examples

Retrieve devices

Retrieve devices belonging to users with these user IDs: 1, 2, 3.
 Note that user 2 (guest) has no devices, and device 3 has not yet been added or authenticated in Zabbix mobile app.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "device.get",
    "params": {
        "output": "extend",
```

```
        "userids": [1, 2, 3]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "deviceid": "1",
            "userid": "1",
            "uuid": "019f930e-0ea2-7c1f-9dcc-0fbb60c40664",
            "name": "Google Pixel 10",
            "status": "1",
            "activated_at": "1784533122",
            "lastaccess": "1784879933"
        },
        {
            "deviceid": "2",
            "userid": "1",
            "uuid": "019d00fb-9e87-7ad5-bb4e-978467254aff",
            "name": "Apple iPhone 15 Pro",
            "status": "1",
            "activated_at": "1784533225",
            "lastaccess": "0"
        },
        {
            "deviceid": "3",
            "userid": "3",
            "uuid": "019d00fb-9e87-7ad5-bb4e-6ed88a2297ee",
            "name": "",
            "status": "0",
            "activated_at": "0",
            "lastaccess": "0"
        }
    ],
    "id": 1
}
```

device.offboard

This method allows you to remove (offboard) mobile devices for use with Zabbix mobile app.

The method is available to *User*, *Admin*, and *Super admin* users if `EnableMobileDevices` is enabled and the user has access to devices. Access to API methods can be revoked in user role configuration.

User and *Admin* users can only remove their own devices.

Method signature: `object device.offboard(object parameters)`

Method source: `CDevice::offboard()` in `ui/include/classes/api/services/CDevice.php`

Parameters

Parameter	Type	Description
uuid	string	Device universally unique identifier (UUIDv7). Matches `deviceid`.
force	boolean	Set `true` to ignore the "Device not found" error and forcibly remove the device. Default: `false`

Return values

Returns an object containing the UUID of the removed device.

Examples

Remove device

Remove a device with the given UUID, ignoring the "Device not found" error.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "device.offboard",
    "params": {
        "uuid": "019d0106-5eef-7154-a159-bb29e35d38e5",
        "force": true
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "uuid": "019d0106-5eef-7154-a159-bb29e35d38e5"
    },
    "id": 1
}
```

Discovered host

This class is designed to work with discovered hosts.

Object references:

- Discovered host

Available methods:

- dhost.get - retrieve discovered hosts

Discovered host object

The following objects are directly related to the `dhost` API.

Discovered host

> **Note:**
> Discovered host are created by the Zabbix server and cannot be modified via the API.

The discovered host object contains information about a host discovered by a network discovery rule. It has the following properties.

Property	Type	Description
dhostid	ID	ID of the discovered host.
druleid	ID	ID of the discovery rule that detected the host.
lastdown	timestamp	Time when the discovered host last went down.
lastup	timestamp	Time when the discovered host last went up.
status	integer	Whether the discovered host is up or down. A host is up if it has at least one active discovered service. Possible values: 0 - host up; 1 - host down.

dhost.get

Description

`integer/array dhost.get(object parameters)`

The method allows you to retrieve discovered hosts according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
dhostids	ID/array	Return only discovered hosts with the given IDs.
druleids	ID/array	Return only discovered hosts that have been created by the given discovery rules.
dserviceids	ID/array	Return only discovered hosts that are running the given services.
selectDRules	query	Return a `drules` property with an array of the discovery rules that detected the host.
selectDServices	query	Return a `dservices` property with the discovered services running on the host. Supports `count`.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectDServices` - results will be sorted by `dserviceid`.
sortfield	string/array	Sort the result by the given properties. Possible values: `dhostid`, `druleid`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve discovered hosts by discovery rule

Retrieve all hosts and the discovered services they are running that have been detected by discovery rule "4".

Request:

```
{
    "jsonrpc": "2.0",
```

```
    "method": "dhost.get",
    "params": {
        "output": "extend",
        "selectDServices": "extend",
        "druleids": "4"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "dservices": [
                {
                    "dserviceid": "1",
                    "dhostid": "1",
                    "type": "4",
                    "key_": "",
                    "value": "",
                    "port": "80",
                    "status": "0",
                    "lastup": "1337697227",
                    "lastdown": "0",
                    "dcheckid": "5",
                    "ip": "192.168.1.1",
                    "dns": "station.company.lan"
                }
            ],
            "dhostid": "1",
            "druleid": "4",
            "status": "0",
            "lastup": "1337697227",
            "lastdown": "0"
        },
        {
            "dservices": [
                {
                    "dserviceid": "2",
                    "dhostid": "2",
                    "type": "4",
                    "key_": "",
                    "value": "",
                    "port": "80",
                    "status": "0",
                    "lastup": "1337697234",
                    "lastdown": "0",
                    "dcheckid": "5",
                    "ip": "192.168.1.4",
                    "dns": "john.company.lan"
                }
            ],
            "dhostid": "2",
            "druleid": "4",
            "status": "0",
            "lastup": "1337697234",
            "lastdown": "0"
        },
        {
            "dservices": [
                {
```

```
                    "dserviceid": "3",
                    "dhostid": "3",
                    "type": "4",
                    "key_": "",
                    "value": "",
                    "port": "80",
                    "status": "0",
                    "lastup": "1337697234",
                    "lastdown": "0",

Discovered service

This class is designed to work with discovered services.

Object references:

- Discovered service

Available methods:

- dservice.get - retrieve discovered services

Discovered service object

The following objects are directly related to the `dservice` API.

Discovered service

Note:
Discovered services are created by the Zabbix server and cannot be modified via the API.

The discovered service object contains information about a service discovered by a network discovery rule on a host. It has the following properties.

Property	Type	Description
dserviceid	ID	ID of the discovered service.
dcheckid	ID	ID of the discovery check used to detect the service.
dhostid	ID	ID of the discovered host running the service.
dns	string	DNS of the host running the service.
ip	string	IP address of the host running the service.
lastdown	timestamp	Time when the discovered service last went down.
lastup	timestamp	Time when the discovered service last went up.
port	integer	Service port number.
status	integer	Status of the service. Possible values: 0 - service up; 1 - service down.
value	string	Value returned by the service when performing a Zabbix agent, SNMPv1, SNMPv2 or SNMPv3 discovery check.

dservice.get

Description

`integer/array dservice.get(object parameters)`

The method allows you to retrieve discovered services according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
dserviceids	ID/array	Return only discovered services with the given IDs.
dhostids	ID/array	Return only discovered services that belong to the given discovered hosts.
dcheckids	ID/array	Return only discovered services that have been detected by the given discovery checks.
druleids	ID/array	Return only discovered services that have been detected by the given discovery rules.
selectDRules	query	Return a `drules` property with an array of the discovery rules that detected the service.
selectDHosts	query	Return a `dhosts` property with an array the discovered hosts that the service belongs to.

Parameter	Type	Description
selectHosts	query	Return a `hosts` property with the hosts with the same IP address and proxy as the service. Supports `count`.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectHosts` - result will be sorted by `hostid`.
sortfield	string/array	Sort the result by the given properties. Possible values: `dserviceid`, `dhostid`, `ip`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve services discovered on a host

Retrieve all discovered services detected on discovered host "11".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dservice.get",
    "params": {
        "output": "extend",
        "dhostids": "11"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "dserviceid": "12",
            "dhostid": "11",
            "value": "",
            "port": "80",
            "status": "1",
            "lastup": "0",
            "lastdown": "1348650607",
            "dcheckid": "5",
            "ip": "192.168.1.134",
            "dns": "john.local"
```

```
        },
        {
            "dserviceid": "13",
            "dhostid": "11",
            "value": "",
            "port": "21",
            "status": "1",
            "lastup": "0",
            "lastdown": "1348650610",
            "dcheckid": "6",
            "ip": "192.168.1.134",
            "dns": "john.local"
        }
    ],
    "id": 1
}
```

Discovery check

This class is designed to work with discovery checks.

Object references:

- Discovery check

Available methods:

- dcheck.get - retrieve discovery checks

Discovery check object

The following objects are directly related to the `dcheck` API.

Discovery check

The discovery check object defines a specific check performed by a network discovery rule. It has the following properties.

Property	Type	Description
dcheckid	ID	ID of the discovery check.
druleid	ID	ID of the discovery rule that the check belongs to.
key_	string	Item key (if `type` is set to "Zabbix agent") or SNMP OID (if `type` is set to "SNMPv1 agent", "SNMPv2 agent", or "SNMPv3 agent"). Property behavior: - *required* if `type` is set to "Zabbix agent", "SNMPv1 agent", "SNMPv2 agent", or "SNMPv3 agent"
ports	string	One or several port ranges to check, separated by commas. Default: 0. Property behavior: - *supported* if `type` is set to "SSH" (0), "LDAP" (1), "SMTP" (2), "FTP" (3), "HTTP" (4), "POP" (5), "NNTP" (6), "IMAP" (7), "TCP" (8), "Zabbix agent" (9), "SNMPv1 agent" (10), "SNMPv2 agent" (11), "SNMPv3 agent" (13), "HTTPS" (14), or "Telnet" (15)

Property	Type	Description
snmp_community	string	SNMP community. Property behavior: - *required* if `type` is set to ”SNMPv1 agent” or ”SNMPv2 agent”
snmpv3_authpassphrase	string	Authentication passphrase. Property behavior: - *supported* if `type` is set to ”SNMPv3 agent” and `snmpv3_securitylevel` is set to ”authNoPriv” or ”authPriv”
snmpv3_authprotocol	integer	Authentication protocol. Possible values: 0 - *(default)* MD5; 1 - SHA1; 2 - SHA224; 3 - SHA256; 4 - SHA384; 5 - SHA512. Property behavior: - *supported* if `type` is set to ”SNMPv3 agent” and `snmpv3_securitylevel` is set to ”authNoPriv” or ”authPriv”
snmpv3_contextname	string	SNMPv3 context name. Property behavior: - *supported* if `type` is set to ”SNMPv3 agent”
snmpv3_privpassphrase	string	Privacy passphrase. Property behavior: - *supported* if `type` is set to ”SNMPv3 agent” and `snmpv3_securitylevel` is set to ”authPriv”
snmpv3_privprotocol	integer	Privacy protocol. Possible values: 0 - *(default)* DES; 1 - AES128; 2 - AES192; 3 - AES256; 4 - AES192C; 5 - AES256C. Property behavior: - *supported* if `type` is set to ”SNMPv3 agent” and `snmpv3_securitylevel` is set to ”authPriv”
snmpv3_securitylevel	string	Security level. Possible values: 0 - noAuthNoPriv; 1 - authNoPriv; 2 - authPriv. Property behavior: - *supported* if `type` is set to ”SNMPv3 agent”
snmpv3_securityname	string	Security name. Property behavior: - *supported* if `type` is set to ”SNMPv3 agent”

Property	Type	Description
type	integer	Type of check. Possible values: 0 - SSH; 1 - LDAP; 2 - SMTP; 3 - FTP; 4 - HTTP; 5 - POP; 6 - NNTP; 7 - IMAP; 8 - TCP; 9 - Zabbix agent; 10 - SNMPv1 agent; 11 - SNMPv2 agent; 12 - ICMP ping; 13 - SNMPv3 agent; 14 - HTTPS; 15 - Telnet. Property behavior: - *required*
uniq	integer	Whether to use this check as a device uniqueness criteria. Only a single unique check can be configured for a discovery rule. Possible values: 0 - *(default)* do not use this check as a uniqueness criteria; 1 - use this check as a uniqueness criteria. Property behavior: - *supported* if `type` is set to ”Zabbix agent”, ”SNMPv1 agent”, ”SNMPv2 agent”, or ”SNMPv3 agent”
host_source	integer	Source for host name. Possible values: 1 - *(default)* DNS; 2 - IP; 3 - discovery value of this check.
name_source	integer	Source for visible name. Possible values: 0 - *(default)* not specified; 1 - DNS; 2 - IP; 3 - discovery value of this check.
allow_redirect	integer	Allow situation where the target being ICMP pinged responds from a different IP address. Possible values: 0 - *(default)* treat redirected responses as if the target host is down (fail); 1 - treat redirected responses as if the target host is up (success). Property behavior: - *supported* if `type` is set to ”ICMP ping”

dcheck.get

Description

`integer/array dcheck.get(object parameters)`

The method allows you to retrieve discovery checks according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
dcheckids	ID/array	Return only discovery checks with the given IDs.
druleids	ID/array	Return only discovery checks that belong to the given discovery rules.
dserviceids	ID/array	Return only discovery checks that have detected the given discovered services.
selectDRules	query	Return discovery rules related to the discovery checks.
sortfield	string/array	Sort the result by the given properties. Possible values: `dcheckid`, `druleid`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve discovery checks for a discovery rule

Retrieve all discovery checks used by discovery rule "6".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "dcheck.get",
    "params": {
        "output": "extend",
        "dcheckids": "6"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "dcheckid": "6",
            "druleid": "4",
```

```
            "type": "3",
            "key_": "",
            "snmp_community": "",
            "ports": "21",
            "snmpv3_securityname": "",
            "snmpv3_securitylevel": "0",
            "snmpv3_authpassphrase": "",
            "snmpv3_privpassphrase": "",
            "uniq": "0",
            "snmpv3_authprotocol": "0",
            "snmpv3_privprotocol": "0",
            "snmpv3_contextname": "",
            "host_source": "1",
            "name_source": "0",
            "allow_redirect": "0"
        }
    ],

CDCheck::get() in *ui/include/classes/api/services/CDCheck.php*.

Discovery rule

This class is designed to work with network discovery rules.

> **Note:**
> This API is meant to work with network discovery rules. For low-level discovery rules, see LLD rule API.

Object references:

- Discovery rule

Available methods:

- drule.create - create new network discovery rules
- drule.delete - delete network discovery rules
- drule.get - retrieve network discovery rules
- drule.update - update network discovery rules

Discovery rule object

The following objects are directly related to the `drule` API.

Discovery rule

The discovery rule object defines a network discovery rule. It has the following properties.

Property	Type	Description
druleid	ID	ID of the discovery rule. Property behavior: - *read-only* - *required* for update operations
iprange	string	One or several IP ranges to check, separated by commas. Refer to the network discovery configuration section for more information on supported formats of IP ranges. Property behavior: - *required* for create operations

Property	Type	Description
name	string	Name of the discovery rule. Property behavior: - *required* for create operations
delay	string	Execution interval of the discovery rule. Accepts a number of seconds (e.g., 1, 60, 300), a value with a time suffix (e.g., 30s, 1m, 2h, 1d), or a user macro. Default: 1h.
proxyid	ID	ID of the proxy used for discovery.
status	integer	Whether the discovery rule is enabled. Possible values: 0 - *(default)* enabled; 1 - disabled.
concurrency_max	integer	Maximum number of concurrent checks per discovery rule. Possible values: 0 - *(default)* unlimited number of checks; 1 - one check; 2-999 - custom number of checks.
error	string	Error text if there have been any problems when executing the discovery rule. Property behavior: - *read-only*

drule.create

Description

`object drule.create(object/array discoveryRules)`

This method allows you to create new discovery rules.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Discovery rules to create.

Additionally to the standard discovery rule properties, the method accepts the following parameters.

Parameter	Type	Description
dchecks	array	Discovery checks to create for the discovery rule. Parameter behavior: - *required*

Return values

`(object)` Returns an object containing the IDs of the created discovery rules under the `druleids` property. The order of the returned IDs matches the order of the passed discovery rules.

Examples

Create a discovery rule

Create a discovery rule to find machines running the Zabbix agent in the local network. The rule must use a single Zabbix agent check on port 10050.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "drule.create",
    "params": {
        "name": "Zabbix agent discovery",
        "iprange": "192.168.1.1-255",
        "concurrency_max": "10",
        "dchecks": [
            {
                "type": "9",
                "key_": "system.uname",
                "ports": "10050",
                "uniq": "0"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "druleids": [
            "6"
        ]
    },
    "id": 1
}
```

- Discovery check

Source

CDRule::create() in *ui/include/classes/api/services/CDRule.php*.

drule.delete

Description

`object drule.delete(array discoveryRuleIds)`

This method allows you to delete discovery rules.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the discovery rules to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted discovery rules under the `druleids` property.

Examples

Delete multiple discovery rules

Delete two discovery rules.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "drule.delete",
    "params": [
        "4",
        "6"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "druleids": [
            "4",
            "6"
        ]
    },
    "id": 1
}
```

Source

CDRule::delete() in *ui/include/classes/api/services/CDRule.php*.

drule.get

Description

`integer/array drule.get(object parameters)`

The method allows you to retrieve discovery rules according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
dhostids	ID/array	Return only discovery rules that created the given discovered hosts.
druleids	ID/array	Return only discovery rules with the given IDs.
dserviceids	ID/array	Return only discovery rules that created the given discovered services.
selectDChecks	query	Return a `dchecks` property with the discovery checks used by the discovery rule. Supports `count`.
selectDHosts	query	Return a `dhosts` property with the discovered hosts created by the discovery rule. Supports `count`.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectDChecks` - results will be sorted by `dcheckid`; `selectDHosts` - results will be sorted by `dhostsid`.
sortfield	string/array	Sort the result by the given properties. Possible values: `druleid`, `name`.

Parameter	Type	Description
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve all discovery rules

Retrieve all configured discovery rules and the discovery checks they use.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "drule.get",
    "params": {
        "output": "extend",
        "selectDChecks": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "druleid": "2",
            "proxyid": "0",
            "name": "Local network",
            "iprange": "192.168.3.1-255",
            "delay": "5s",

drule.update

Description

`object drule.update(object/array discoveryRules)`

This method allows you to update existing discovery rules.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Discovery rule properties to be updated.

The `druleid` property must be defined for each discovery rule, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard discovery rule properties, the method accepts the following parameters.

Parameter	Type	Description
dchecks	array	Discovery checks to replace existing checks.

Return values

`(object)` Returns an object containing the IDs of the updated discovery rules under the `druleids` property.

Examples

Change the IP range of a discovery rule

Change the IP range of a discovery rule to ”192.168.2.1-255”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "drule.update",
    "params": {
        "druleid": "6",
        "iprange": "192.168.2.1-255"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "druleids": [
            "6"
        ]
    },
    "id": 1
}
```

Event

This class is designed to work with events.

Object references:

- Event
- Event tag
- Media type URL

Available methods:

- event.get - retrieve events
- event.acknowledge - acknowledge events

Event object

The following objects are directly related to the `event` API.

Event

Note:
Events are created by the Zabbix server and cannot be modified via the API.

The event object has the following properties.

Property	Type	Description
eventid	ID	ID of the event.
source	integer	Type of the event. Possible values: 0 - event created by a trigger; 1 - event created by a discovery rule; 2 - event created by active agent autoregistration; 3 - internal event; 4 - event created on service status update.
object	integer	Type of object that is related to the event. Possible values if `source` is set to ”event created by a trigger”: 0 - trigger. Possible values if `source` is set to ”event created by a discovery rule”: 1 - discovered host; 2 - discovered service. Possible values if `source` is set to ”event created by active agent autoregistration”: 3 - auto-registered host. Possible values if `source` is set to ”internal event”: 0 - trigger; 4 - item; 5 - LLD rule. Possible values if `source` is set to ”event created on service status update”: 6 - service.
objectid	ID	ID of the related object.

Property	Type	Description
acknowledged	integer	Whether the event has been acknowledged.
clock	timestamp	Time when the event was created.
ns	integer	Nanoseconds when the event was created.
name	string	Resolved event name.
value	integer	State of the related object. Possible values if `source` is set to ”event created by a trigger” or ”event created on service status update”: 0 - OK; 1 - problem. Possible values if `source` is set to ”event created by a discovery rule”: 0 - host or service up; 1 - host or service down; 2 - host or service discovered; 3 - host or service lost. Possible values if `source` is set to ”internal event”: 0 - ”normal” state; 1 - ”unknown” or ”not supported” state. Property behavior: - *supported* if `source` is set to ”event created by a trigger”, ”event created by a discovery rule”, ”internal event”, or ”event created on service status update”
severity	integer	Event current severity. Possible values: 0 - not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster.
r_eventid	ID	ID of the recovery event.
c_eventid	ID	ID of the event that was used to override (close) current event under global correlation rule. See `correlationid` to identify exact correlation rule. This parameter is only defined when the event is closed by global correlation rule.
cause_eventid	ID	ID of the cause event.
correlationid	ID	ID of the correlation rule that generated closing of the problem. This parameter is only defined when the event is closed by global correlation rule.
userid	ID	ID of the user that closed the event (if the event was closed manually).
suppressed	integer	Whether the event is suppressed. Possible values: 0 - event is in normal state; 1 - event is suppressed.
opdata	string	Operational data with expanded macros.
urls	array	Active media type URLs.

Event tag

The event tag object has the following properties.

Property	Type	Description
tag	string	Event tag name.
value	string	Event tag value.

Media type URL

The media type URL object has the following properties.

Property	Type	Description
name	string	Media type defined URL name.
url	string	Media type defined URL value.

Results will contain entries only for active media types with enabled event menu entry. Macro used in properties will be expanded, but if one of the properties contains an unexpanded macro, both properties will be excluded from results. For supported macros, see *Supported macros*.

event.acknowledge

Description

`object event.acknowledge(object/array parameters)`

This method allows you to update events. The following update actions can be performed:

- Close event. If the event is already resolved, this action will be skipped.
- Acknowledge event. If the event is already acknowledged, this action will be skipped.
- Unacknowledge event. If the event is not acknowledged, this action will be skipped.
- Add message.
- Change event severity. If the event already has the same severity, this action will be skipped.
- Suppress event. If the event is already suppressed, this action will be skipped.
- Unsuppress event. If the event is not suppressed, this action will be skipped.
- Change event rank to cause. If the event is already ranked as cause, this action will be skipped.
- Change event rank to symptom. If the event is already ranked as symptom, this action will be skipped.

Attention:
Only trigger events can be updated.
 Only problem events can be updated.
 Read/Write rights for trigger are required to close the event or to change event's severity.
 To close an event, manual close should be allowed in the trigger.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Parameters containing the IDs of the events and update operations that should be performed.

Parameter	Type	Description
eventids	ID/array	IDs of the events to acknowledge. Parameter behavior: *- required*

Parameter	Type	Description
action	integer	Event update action(s). Possible bitmap values: 1 - close problem; 2 - acknowledge event; 4 - add message; 8 - change severity; 16 - unacknowledge event; 32 - suppress event; 64 - unsuppress event; 128 - change event rank to cause; 256 - change event rank to symptom. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 6 for acknowledging an event and leaving a message, or 34 for acknowledging and suppressing an event). Parameter behavior: - *required*
cause_eventid	ID	Cause event ID. Parameter behavior: - *required* if `action` contains the ”change event rank to symptom” bit
message	string	Text of the message. Parameter behavior: - *required* if `action` contains the ”add message” bit
severity	integer	New severity for events. Possible values: 0 - not classified; 1 - information; 2 - warning; 3 - average; 4 - high; 5 - disaster. Parameter behavior: - *required* if `action` contains the ”change severity” bit
suppress_until	integer	Unix timestamp until which event must be suppressed. If set to ”0”, the suppression will be indefinite. Parameter behavior: - *required* if `action` contains the ”suppress event” bit

Return values

`(object)` Returns an object containing the IDs of the updated events under the `eventids` property.

Examples

Acknowledging an event

Acknowledge a single event and leave a message.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "event.acknowledge",
    "params": {
        "eventids": "20427",
        "action": 6,
```

```
        "message": "Problem resolved."
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "eventids": [
            "20427"
        ]
    },
    "id": 1
}
```

Changing event's severity

Change severity for multiple events and leave a message.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "event.acknowledge",
    "params": {
        "eventids": ["20427", "20428"],
        "action": 12,
        "message": "Maintenance required to fix it.",
        "severity": 4
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "eventids": [
            "20427",
            "20428"
        ]
    },
    "id": 1
}
```

Suppressing an event indefinitely

Suppress a single event without an expiration time.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "event.acknowledge",
    "params": {
        "eventids": "20427",
        "action": 32,
        "suppress_until": 0
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
```

```
    "result": {
        "eventids": [
            20427
        ]
    },
    "id": 1
}
```

Unsuppressing an event

Unsuppress a single previously suppressed event.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "event.acknowledge",
    "params": {
        "eventids": "20427",
        "action": 64
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "eventids": [
            20427
        ]
    },
    "id": 1
}
```

Acknowledge and suppress an event

Acknowledge one or more events, add a message, and suppress them in the same request.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "event.acknowledge",
    "params": {
        "eventids": [
            "20427",
            "20428"
        ],
        "action": 38,
        "message": "Suppressing during planned maintenance.",
        "suppress_until": 0
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "eventids": [
            20427,
            20428
        ]
    },
```

```
    "id": 1
}
```

Source

CEvent::acknowledge() in *ui/include/classes/api/services/CEvent.php*.

event.get

Description

`integer/array event.get(object parameters)`

The method allows you to retrieve events according to the given parameters.

Attention:
This method may return events of a deleted entity if these events have not been removed by the housekeeper yet.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
eventids	ID/array	Return only events with the given IDs.
groupids	ID/array	Return only events created by objects that belong to the given host groups.
hostids	ID/array	Return only events created by objects that belong to the given hosts.
objectids	ID/array	Return only events created by the given objects.
source	integer	Return only events with the given type. Refer to the event object page for a list of supported event types. Default: 0 - trigger events.
object	integer	Return only events created by objects of the given type. Refer to the event object page for a list of supported object types. Default: 0 - trigger.
acknowledged	boolean	If set to `true` return only acknowledged events.
action	integer	Return only events for which the given event update actions have been performed. For multiple actions, use a sum of any acceptable bitmap values as bitmask (for example, 34 for acknowledge and suppress event).
action_userids	ID/array	Return only events with the given IDs of users who performed the event update actions.
suppressed	boolean	If set to `true` return only suppressed events.
symptom	boolean	If set to `true` return only symptom events.
severities	integer/array	Return only events with the given event severities. Applies only if object is trigger.
trigger_severities	integer/array	Return only events with the given trigger severities. Applies only if object is trigger.
evaltype	integer	Tag evaluation method. Possible values: 0 - *(default)* And/Or; 2 - Or.

Parameter	Type	Description
tags	array	Return only events with the given tags. Format: `[{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all events. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
eventid_from	string	Return only events with IDs greater or equal to the given ID.
eventid_till	string	Return only events with IDs less or equal to the given ID.
time_from	timestamp	Return only events created at or after the given time.
time_till	timestamp	Return only events created at or before the given time.
problem_time_from	timestamp	Returns only events that were in the problem state from `problem_time_from` regardless of their current status. Applies only when the source is a trigger event and the object is a trigger. This parameter is mandatory if `problem_time_till` is specified.
problem_time_till	timestamp	Returns only events that were in the problem state up to `problem_time_till` regardless of their current status. Applies only when the source is a trigger event and the object is a trigger. This parameter is mandatory if `problem_time_from` is specified.
value	integer/array	Return only events with the given values.
selectAcknowledges	query	Return an `acknowledges` property with event updates. Event updates are sorted in reverse chronological order. The event update object has the following properties: `acknowledgeid` - `(ID)` acknowledgment's ID; `userid` - `(ID)` ID of the user that updated the event; `clock` - `(timestamp)` time when the event was updated; `message` - `(string)` text of the message; `action` - `(integer)` update action that was performed, see `event.acknowledge`; `old_severity` - `(integer)` event severity before this update action; `new_severity` - `(integer)` event severity after this update action; `suppress_until` - `(timestamp)` time till event will be suppressed; `taskid` - `(ID)` ID of task if current event is undergoing a rank change; `maintenanceid` - `(ID)` ID of the maintenance; `username` - `(string)` username of the user that updated the event; `name` - `(string)` name of the user that updated the event; `surname` - `(string)` surname of the user that updated the event. Supports `count`.
selectAlerts	query	Return an `alerts` property with alerts generated by the event. Alerts are sorted in reverse chronological order.
selectHosts	query	Return a `hosts` property with hosts containing the object that created the event. Supported only for events generated by triggers, items or LLD rules.
selectRelatedObject	query	Return a `relatedObject` property with the object that created the event. The type of object returned depends on the event type.
selectSuppressionData	query	Return a `suppression_data` property with the list of active maintenances and manual suppressions: `maintenanceid` - `(ID)` ID of the maintenance; `userid` - `(ID)` ID of user who suppressed the event; `suppress_until` - `(integer)` time until the event is suppressed.
selectTags	query	Return a `tags` property with event tags.

Parameter	Type	Description
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type.
sortfield	string/array	Sort the result by the given properties. Possible values: `eventid`, `objectid`, `clock`. Possible values when used together with `groupBy`: `objectid`. Possible values when used together with `countOutput` and `groupBy`: `objectid`, `rowscount`.
groupBy	string/array	Group the results by the given properties. The specified properties will be returned in the results. Possible values: `objectid`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects
- the count of retrieved objects, if the `countOutput` parameter has been used, but the `groupBy` parameter has not been used
- an array of objects with aggregation results, if the `groupBy` parameter has been used

Examples

Retrieving trigger events

Retrieve the latest events from trigger "22395".

Request:

```

```

Retrieving top triggers with problem event count

Retrieve the top 5 triggers that have severities ”Warning”, ”Average”, ”High”, or ”Disaster”, together with the number of problem events within a specified time period.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "event.get",
    "params": {
        "countOutput": true,
        "groupBy": "objectid",
        "source": 0,
        "object": 0,
        "value": 1,
        "time_from": 1672531200,
        "time_till": 1677628800,
        "trigger_severities": [2, 3, 4, 5],
        "sortfield": ["rowscount"],
        "sortorder": "DESC",
        "limit": 5
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "objectid": "232124",
            "rowscount": "27"
        },
        {
            "objectid": "29055",
            "rowscount": "23"
        },
        {
            "objectid": "253731",
            "rowscount": "18"
        },
        {
            "objectid": "254062",
            "rowscount": "11"
        },
        {
            "objectid": "23216",
            "rowscount": "7"
        }
    ],
    "id": 1
}
```

Source

CEvent::get() in *ui/include/classes/api/services/CEvent.php*.

Graph

This class is designed to work with graphs.

Object references:

- Graph

Available methods:

- graph.create - create new graphs
- graph.delete - delete graphs
- graph.get - retrieve graphs
- graph.update - update graphs

Graph object

The following objects are directly related to the `graph` API.

Graph

The graph object has the following properties.

Property	Type	Description
graphid	ID	ID of the graph. Property behavior: - *read-only* - *required* for update operations
height	integer	Height of the graph in pixels. Property behavior: - *required* for create operations
name	string	Name of the graph. Property behavior: - *required* for create operations
width	integer	Width of the graph in pixels. Property behavior: - *required* for create operations
flags	integer	Origin of the graph. Possible values: 0 - *(default)* a plain graph; 4 - a graph converted from prototype. Property behavior: - *read-only*
graphtype	integer	Graph's layout type. Possible values: 0 - *(default)* normal; 1 - stacked; 2 - pie; 3 - exploded.

Property	Type	Description
percent_left	float	Left percentile. Default: 0.
percent_right	float	Right percentile. Default: 0.
show_3d	integer	Whether to show pie and exploded graphs in 3D. Possible values: 0 - *(default)* show in 2D; 1 - show in 3D.
show_legend	integer	Whether to show the legend on the graph. Possible values: 0 - hide; 1 - *(default)* show.
show_work_period	integer	Whether to show the working time on the graph. Possible values: 0 - hide; 1 - *(default)* show.
show_triggers	integer	Whether to show the trigger line on the graph. Possible values: 0 - hide; 1 - *(default)* show.
templateid	ID	ID of the parent template graph. Property behavior: - *read-only*
yaxismax	float	The fixed maximum value for the Y axis. Default: 100.
yaxismin	float	The fixed minimum value for the Y axis. Default: 0.
ymax_itemid	ID	ID of the item that is used as the maximum value for the Y axis. If a user has no access to the specified item, the graph is rendered as if `ymax_type` is set to ”calculated”.
ymax_type	integer	Maximum value calculation method for the Y axis. Possible values: 0 - *(default)* calculated; 1 - fixed; 2 - item.
ymin_itemid	ID	ID of the item that is used as the minimum value for the Y axis. If a user has no access to the specified item, the graph is rendered as if `ymin_type` is set to ”calculated”.
ymin_type	integer	Minimum value calculation method for the Y axis. Possible values: 0 - *(default)* calculated; 1 - fixed; 2 - item.
uuid	string	Universal unique identifier, used for linking imported graphs to already existing ones. Auto-generated, if not given. Property behavior: - *supported* if the graph belongs to a template

graph.create

Description

`object graph.create(object/array graphs)`

This method allows you to create new graphs.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Graphs to create.

Additionally to the standard graph properties, the method accepts the following parameters.

Parameter	Type	Description
gitems	array	Graph items to be created for the graph. Parameter behavior: *- required*

Return values

`(object)` Returns an object containing the IDs of the created graphs under the `graphids` property. The order of the returned IDs matches the order of the passed graphs.

Examples

Creating a graph

Create a graph with two items.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "graph.create",
    "params": {
        "name": "MySQL bandwidth",
        "width": 900,
        "height": 200,
        "gitems": [
            {
                "itemid": "22828",
                "color": "00AA00"
            },
            {
                "itemid": "22829",

graph.delete

Description

`object graph.delete(array graphIds)`

This method allows you to delete graphs.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the graphs to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted graphs under the `graphids` property.

Examples

Deleting multiple graphs

Delete two graphs.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "graph.delete",
    "params": [
        "652",
        "653"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "graphids": [
            "652",
            "653"
        ]
    },
    "id": 1
}
```

CGraph::delete() in *ui/include/classes/api/services/CGraph.php*.

graph.get

Description

`integer/array graph.get(object parameters)`

The method allows you to retrieve graphs according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
graphids	ID/array	Return only graphs with the given IDs.
groupids	ID/array	Return only graphs that belong to hosts or templates in the given host groups or template groups.
templateids	ID/array	Return only graph that belong to the given templates.
hostids	ID/array	Return only graphs that belong to the given hosts.
itemids	ID/array	Return only graphs that contain the given items.
templated	boolean	If set to `true` return only graphs that belong to templates.
inherited	boolean	If set to `true` return only graphs inherited from a template.
expandName	flag	Expand macros in the graph name.
selectDiscoveryData	query	Return a `discoveryData` property with the graph discovery object data. The graph discovery object links a discovered graph to a graph prototype from which it was discovered. It has the following properties: `parent_graphid` - `(ID)` ID of the graph prototype from which the graph has been created; `status` - `(int)` graph discovery status: 0 - *(default)* graph is discovered, 1 - graph is not discovered anymore; `ts_delete` - `(timestamp)` time when a graph that is no longer discovered will be deleted.
selectDiscoveryRule	query	Return a `discoveryRule` property with the low-level discovery rule that created the graph.
selectHostGroups	query	Return a `hostgroups` property with the host groups that the graph belongs to.
selectTemplateGroups	query	Return a `templategroups` property with the template groups that the graph belongs to.
selectTemplates	query	Return a `templates` property with the templates that the graph belongs to.
selectHosts	query	Return a `hosts` property with the hosts that the graph belongs to.
selectItems	query	Return an `items` property with the items used in the graph.
selectGraphItems	query	Return a `gitems` property with the items used in the graph.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Supports additional properties: `host` - technical name of the host that the graph belongs to; `hostid` - ID of the host that the graph belongs to.
sortfield	string/array	Sort the result by the given properties. Possible values: `graphid`, `name`, `graphtype`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
limit	integer	

Parameter	Type	Description
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	
selectGraphDiscovery	query	Return a `graphDiscovery` property with the graph discovery object. The graph discovery objects links the graph to a graph prototype from which it was created. This query is **deprecated**, please use `selectDiscoveryData` instead.

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving graphs from hosts

Retrieve all graphs from host "10107" and sort them by name.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "graph.get",
    "params": {
        "output": "extend",
        "hostids": 10107,
        "sortfield": "name"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "graphid": "612",
            "name": "CPU jumps",
            "width": "900",
            "height": "200",
            "yaxismin": "0",
            "yaxismax": "100",
            "templateid": "439",
            "show_work_period": "1",
            "show_triggers": "1",
            "graphtype": "0",
            "show_legend": "1",
            "show_3d": "0",
            "percent_left": "0",
            "percent_right": "0",
            "ymin_type": "0",
            "ymax_type": "0",
            "ymin_itemid": "0",
            "ymax_itemid": "0",
            "flags": "0"
```

```
        },
        {
            "graphid": "613",
            "name": "CPU load",
            "width": "900",
            "height": "200",
            "yaxismin": "0",
            "yaxismax": "100",
            "templateid": "433",
            "show_work_period": "1",
            "show_triggers": "1",
            "graphtype": "0",
            "show_legend": "1",
            "show_3d": "0",
            "percent_left": "0",
            "percent_right": "0",
            "ymin_type": "1",
            "ymax_type": "0",
            "ymin_itemid": "0",
            "ymax_itemid": "0",
            "flags": "0"
        },
        {
            "graphid": "614",
            "name": "CPU utilization",
            "width": "900",
            "height": "200",
            "yaxismin": "0",
            "yaxismax": "100",
            "templateid": "387",
            "show_work_period": "1",
            "show_triggers": "0",
            "graphtype": "1",
            "show_legend": "1",
            "show_3d": "0",
            "percent_left": "0",
            "percent_right": "0",
            "ymin_type": "1",
            "ymax_type": "1",
            "ymin_itemid": "0",
            "ymax_itemid": "0",
            "flags": "0"
        },
        {
            "graphid": "645",
            "name": "Disk space usage /",
            "width": "600",
            "height": "340",
            "yaxismin": "0",
            "yaxismax": "0",
            "templateid": "0",
            "show_work_period": "0",
            "show_triggers": "0",
            "graphtype": "2",
            "show_legend": "1",
            "show_3d": "1",
            "percent_left": "0",
            "percent_right": "0",
            "ymin_type": "0",
            "ymax_type": "0",
            "ymin_itemid": "0",
            "ymax_itemid": "0",
```

```
            "flags": "4"
        }
    ],
    "id": 1
}
```

graph.update

Description

`object graph.update(object/array graphs)`

This method allows you to update existing graphs.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Graph properties to be updated.

The `graphid` property must be defined for each graph, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard graph properties the method accepts the following parameters.

Parameter	Type	Description
gitems	array	Graph items to replace existing graph items. If a graph item has the `gitemid` property defined it will be updated; otherwise, a new graph item will be created.

Return values

`(object)` Returns an object containing the IDs of the updated graphs under the `graphids` property.

Examples

Setting the maximum for the Y scale

Set the maximum of the Y scale to a fixed value of 100.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "graph.update",
    "params": {
        "graphid": "439",
        "ymax_type": 1,
        "yaxismax": 100
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "graphids": [
            "439"
        ]
    },
    "id": 1
}
```

Graph item

This class is designed to work with graph items.

Object references:

- Graph item

Available methods:

- graphitem.get - retrieve graph items

Graph item object

The following objects are directly related to the `graphitem` API.

Graph item

Note:
Graph items can only be modified via the `graph` API.

The graph item object has the following properties.

Property	Type	Description
gitemid	ID	ID of the graph item. Property behavior: - *read-only*
color	string	Graph item's draw color as a hexadecimal color code. Property behavior: - *required* for create operations
itemid	ID	ID of the item. Property behavior: - *required* for create operations
calc_fnc	integer	Value of the item that will be displayed. Possible values: 1 - minimum value; 2 - *(default)* average value; 4 - maximum value; 7 - all values; 9 - last value, used only by pie and exploded graphs.

Property	Type	Description
drawtype	integer	Draw style of the graph item. Possible values: 0 - *(default)* line; 1 - filled region; 2 - bold line; 3 - dot; 4 - dashed line; 5 - gradient line.
graphid	ID	ID of the graph that the graph item belongs to.
sortorder	integer	Position of the item in the graph. Default: starts with "0" and increases by one with each entry.
type	integer	Type of graph item. Possible values: 0 - *(default)* simple; 2 - graph sum, used only by pie and exploded graphs.
yaxisside	integer	Side of the graph where the graph item's Y scale will be drawn. Possible values: 0 - *(default)* left side; 1 - right side.

graphitem.get

Description

`integer/array graphitem.get(object parameters)`

The method allows you to retrieve graph items according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
graphids	ID/array	Return only graph items that belong to the given graphs.
itemids	ID/array	Return only graph items with the given item IDs.
type	integer	Return only graph items with the given type. Refer to the graph item object page for a list of supported graph item types.
selectGraphs	query	Return a `graphs` property with an array of graphs that the item belongs to.
sortfield	string/array	Sort the result by the given properties. Possible values: `gitemid`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
limit	integer	
output	query	
preservekeys	boolean	
sortorder	string/array	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving graph items from a graph

Retrieve all graph items used in a graph with additional information about the item and the host.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "graphitem.get",
    "params": {
        "output": "extend",
        "graphids": "387"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "gitemid": "1242",
            "graphid": "387",
            "itemid": "22665",
            "drawtype": "1",
            "sortorder": "1",
            "color": "FF5555",
            "yaxisside": "0",
            "calc_fnc": "2",
            "type": "0"
        },
        {
            "gitemid": "1243",
            "graphid": "387",
            "itemid": "22668",
            "drawtype": "1",
            "sortorder": "2",
            "color": "55FF55",
            "yaxisside": "0",
            "calc_fnc": "2",
            "type": "0"
        },
        {
            "gitemid": "1244",
            "graphid": "387",
            "itemid": "22671",
            "drawtype": "1",
            "sortorder": "3",
            "color": "009999",
            "yaxisside": "0",
            "calc_fnc": "2",
            "type": "0"
        }
    ],
    "id": 1
}
```

Graph prototype

This class is designed to work with graph prototypes.

Object references:

- Graph prototype

Available methods:

- graphprototype.create - create new graph prototypes
- graphprototype.delete - delete graph prototypes
- graphprototype.get - retrieve graph prototypes
- graphprototype.update - update graph prototypes

Graph prototype object

The following objects are directly related to the `graphprototype` API.

Graph prototype

The graph prototype object has the following properties.

Property	Type	Description
graphid	ID	ID of the graph prototype. Property behavior: - *read-only* - *required* for update operations
height	integer	Height of the graph prototype in pixels. Property behavior: - *required* for create operations
name	string	Name of the graph prototype. Property behavior: - *required* for create operations
width	integer	Width of the graph prototype in pixels. Property behavior: - *required* for create operations
flags	integer	Origin of the graph prototype. Possible values: 2 - a graph prototype; 6 - a discovered graph prototype Property behavior: - *read-only*
graphtype	integer	Graph prototypes's layout type. Possible values: 0 - *(default)* normal; 1 - stacked; 2 - pie; 3 - exploded.
percent_left	float	Left percentile. Default: 0.

Property	Type	Description
percent_right	float	Right percentile. Default: 0.
show_3d	integer	Whether to show discovered pie and exploded graphs in 3D. Possible values: 0 - *(default)* show in 2D; 1 - show in 3D.
show_legend	integer	Whether to show the legend on the discovered graph. Possible values: 0 - hide; 1 - *(default)* show.
show_work_period	integer	Whether to show the working time on the discovered graph. Possible values: 0 - hide; 1 - *(default)* show.
templateid	ID	ID of the parent template graph prototype. Property behavior: - *read-only*
yaxismax	float	The fixed maximum value for the Y axis.
yaxismin	float	The fixed minimum value for the Y axis.
ymax_itemid	ID	ID of the item that is used as the maximum value for the Y axis. If a user has no access to the specified item, the graph is rendered as if `ymax_type` is set to ”calculated”.
ymax_type	integer	Maximum value calculation method for the Y axis. Possible values: 0 - *(default)* calculated; 1 - fixed; 2 - item.
ymin_itemid	ID	ID of the item that is used as the minimum value for the Y axis. If a user has no access to the specified item, the graph is rendered as if `ymin_type` is set to ”calculated”.
ymin_type	integer	Minimum value calculation method for the Y axis. Possible values: 0 - *(default)* calculated; 1 - fixed; 2 - item.
discover	integer	Graph prototype discovery status. Possible values: 0 - *(default)* new graphs will be discovered; 1 - new graphs will not be discovered and existing graphs will be marked as lost.
uuid	string	Universal unique identifier, used for linking imported graph prototypes to already existing ones. Auto-generated, if not given. Property behavior: - *supported* if the graph prototype belongs to a template

graphprototype.create

Description

`object graphprototype.create(object/array graphPrototypes)`

This method allows you to create new graph prototypes.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Graph prototypes to create.

Additionally to the standard graph prototype properties, the method accepts the following parameters.

Parameter	Type	Description
gitems	array	Graph items to be created for the graph prototypes. Graph items can reference both items and item prototypes, but at least one item prototype must be present. Parameter behavior: - *required*

Return values

`(object)` Returns an object containing the IDs of the created graph prototypes under the `graphids` property. The order of the returned IDs matches the order of the passed graph prototypes.

Examples

Creating a graph prototype

Create a graph prototype with two items.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "graphprototype.create",
    "params": {
        "name": "Disk space usage {#FSNAME}",
        "width": 900,
        "height": 200,
        "gitems": [
            {
                "itemid": "22828",
                "color": "00AA00"
            },
            {
                "itemid": "22829",
                "color": "3333FF"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "graphids": [
            "652"
        ]
    },
    "id": 1
}
```

CGraphPrototype::create() in *ui/include/classes/api/services/CGraphPrototype.php*.

graphprototype.delete

Description

`object graphprototype.delete(array graphPrototypeIds)`

This method allows you to delete graph prototypes.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the graph prototypes to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted graph prototypes under the `graphids` property.

Examples

Deleting multiple graph prototypes

Delete two graph prototypes.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "graphprototype.delete",
    "params": [
        "652",
        "653"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "graphids": [
            "652",
            "653"
        ]
    },
    "id": 1
}
```

CGraphPrototype::delete() in *ui/include/classes/api/services/CGraphPrototype.php*.

graphprototype.get

Description

`integer/array graphprototype.get(object parameters)`

The method allows you to retrieve graph prototypes according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
discoveryids	ID/array	Return only graph prototypes that belong to the given discovery rules.
graphids	ID/array	Return only graph prototypes with the given IDs.
groupids	ID/array	Return only graph prototypes that belong to hosts or templates in the given host groups or template groups.
hostids	ID/array	Return only graph prototypes that belong to the given hosts.
inherited	boolean	If set to `true` return only graph prototypes inherited from a template.
itemids	ID/array	Return only graph prototypes that contain the given item prototypes.
templated	boolean	If set to `true` return only graph prototypes that belong to templates.
templateids	ID/array	Return only graph prototypes that belong to the given templates.
selectDiscoveryData	query	Return a `discoveryData` property with the graph prototype discovery object data. The graph prototype discovery object links a discovered graph prototype to a graph prototype from which it was discovered. It has the following properties: `parent_graphid` - `(ID)` ID of the graph prototype from which the graph has been created; `status` - `(int)` graph discovery status: 0 - *(default)* graph prototype is discovered, 1 - graph prototype is not discovered anymore; `ts_delete` - `(timestamp)` time when a graph prototype that is no longer discovered will be deleted.
selectDiscoveryRule	query	Return a `discoveryRule` property with the LLD rule that the graph prototype belongs to.
selectDiscoveryRulePrototype	query	Return a `discoveryRulePrototype` property with the parent LLD rule prototype that the graph prototype belongs to.
selectGraphItems	query	Return a `gitems` property with the graph items used in the graph prototype.
selectHostGroups	query	Return a `hostgroups` property with the host groups that the graph prototype belongs to.
selectHosts	query	Return a `hosts` property with the hosts that the graph prototype belongs to.
selectItems	query	Return an `items` property with the items and item prototypes used in the graph prototype.
selectTemplateGroups	query	Return a `templategroups` property with the template groups that the graph prototype belongs to.
selectTemplates	query	Return a `templates` property with the templates that the graph prototype belongs to.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Supports additional properties: `host` - technical name of the host that the graph prototype belongs to; `hostid` - ID of the host that the graph prototype belongs to.
sortfield	string/array	Sort the result by the given properties. Possible values: `graphid`, `name`, `graphtype`, `discovered`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	

Parameter	Type	Description
excludeSearch	boolean	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving graph prototypes from an LLD rule

Retrieve all graph prototypes from an LLD rule.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "graphprototype.get",
    "params": {
        "output": "extend",
        "discoveryids": "27426"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "graphid": "1017",
            "name": "Disk space usage {#FSNAME}",
            "width": "600",
            "height": "340",
            "yaxismin": "0.0000",
            "yaxismax": "0.0000",
            "templateid": "442",
            "show_work_period": "0",
            "show_triggers": "0",
            "graphtype": "2",
            "show_legend": "1",
            "show_3d": "1",
            "percent_left": "0.0000",
            "percent_right": "0.0000",
            "ymin_type": "0",
            "ymax_type": "0",
            "ymin_itemid": "0",
            "ymax_itemid": "0",
            "flags": "2"
            "discover": "0"
        }
    ],
    "id": 1
}
```

CGraphPrototype::get() in *ui/include/classes/api/services/CGraphPrototype.php*.

graphprototype.update

Description

`object graphprototype.update(object/array graphPrototypes)`

This method allows you to update existing graph prototypes.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Graph prototype properties to be updated.

The `graphid` property must be defined for each graph prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard graph prototype properties, the method accepts the following parameters.

Parameter	Type	Description
gitems	array	Graph items to replace existing graph items. If a graph item has the `gitemid` property defined it will be updated; otherwise, a new graph item will be created.

Return values

`(object)` Returns an object containing the IDs of the updated graph prototypes under the `graphids` property.

Examples

Changing the size of a graph prototype

Change the size of a graph prototype to 1100 to 400 pixels.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "graphprototype.update",
    "params": {
        "graphid": "439",
        "width": 1100,
        "height": 400
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
```

```
        "graphids": [
            "439"
        ]
    },
    "id": 1
}
```

CGraphPrototype::update() in *ui/include/classes/api/services/CGraphPrototype.php*.

High availability node

This class is designed to work with server nodes that are part of a high availability cluster or a standalone server instance.

Object references:

- High availability node

Available methods:

- hanode.get - retrieve nodes

High availability node object

The following object is related to operating a High availability cluster of Zabbix servers.

High availability node

Note:
Nodes are created by the Zabbix server and cannot be modified via the API.

The High availability node object has the following properties.

Property	Type	Description
ha_nodeid	ID	ID of the node.
name	string	Name assigned to the node, using the HANodeName configuration entry of `zabbix_server.conf`. Empty for a server running in standalone mode.
address	string	IP or DNS name where the node connects from.
port	integer	Port on which the node is running.
lastaccess	integer	Heartbeat time, that is, time of last update from the node. UTC timestamp.
status	integer	State of the node. Possible values: 0 - standby; 1 - stopped manually; 2 - unavailable; 3 - active.

hanode.get

Description

`integer/array hanode.get(object parameters)`

The method allows you to retrieve a list of High availability cluster nodes according to the given parameters.

Note:
This method is only available to *Super admin* user types. See User roles for more information.

Parameters

(object) Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
ha_nodeids	ID/array	Return only nodes with the given node IDs.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Supports properties: name, address, status.
sortfield	string/array	Sort the result by the given properties. Possible values: name, lastaccess, status.
countOutput	flag	These parameters are described in the reference commentary.
limit	integer	
output	query	
preservekeys	boolean	
sortorder	string/array	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Get a list of nodes ordered by status

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hanode.get",
    "params": {
        "preservekeys": true,
        "sortfield": "status",
        "sortorder": "DESC"
    },
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": {
    "ckuo7i1nw000h0sajj3l3hh8u": {
      "ha_nodeid": "ckuo7i1nw000h0sajj3l3hh8u",
      "name": "node-active",
      "address": "192.168.1.13",
      "port": "10051",
      "lastaccess": "1635335704",
      "status": "3"
    },
    "ckuo7i1nw000e0sajwfttc1mp": {
      "ha_nodeid": "ckuo7i1nw000e0sajwfttc1mp",
      "name": "node6",
      "address": "192.168.1.10",
      "port": "10053",
      "lastaccess": "1635332902",
      "status": "2"
    },
```

```
    "ckuo7i1nv000c0sajz85xcrtt": {
      "ha_nodeid": "ckuo7i1nv000c0sajz85xcrtt",
      "name": "node4",
      "address": "192.168.1.8",
      "port": "10052",
      "lastaccess": "1635334214",
      "status": "1"
    },
    "ckuo7i1nv000a0saj1fcdkeu4": {
      "ha_nodeid": "ckuo7i1nv000a0saj1fcdkeu4",
      "name": "node2",
      "address": "192.168.1.6",
      "port": "10051",
      "lastaccess": "1635335705",
      "status": "0"
    }
  },
  "id": 1
}
```

Get a list of specific nodes by their IDs

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hanode.get",
    "params": {
        "ha_nodeids": ["ckuo7i1nw000e0sajwfttc1mp", "ckuo7i1nv000c0sajz85xcrtt"]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "ha_nodeid": "ckuo7i1nv000c0sajz85xcrtt",
            "name": "node4",
            "address": "192.168.1.8",
            "port": "10052",
            "lastaccess": "1635334214",
            "status": "1"
        },
        {
            "ha_nodeid": "ckuo7i1nw000e0sajwfttc1mp",
            "name": "node6",
            "address": "192.168.1.10",
            "port": "10053",
            "lastaccess": "1635332902",
            "status": "2"
        }
    ],
    "id": 1
}
```

Get a list of stopped nodes

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hanode.get",
    "params": {
```

```
        "output": ["ha_nodeid", "address", "port"],
        "filter": {
            "status": 1
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "ha_nodeid": "ckuo7i1nw000g0sajjsjre7e3",
            "address": "192.168.1.12",
            "port": "10051"
        },
        {
            "ha_nodeid": "ckuo7i1nv000c0sajz85xcrtt",
            "address": "192.168.1.8",
            "port": "10052"
        },
        {
            "ha_nodeid": "ckuo7i1nv000d0sajd95y1b6x",
            "address": "192.168.1.9",
            "port": "10053"
        }
    ],
    "id": 1
}
```

Get a count of standby nodes

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hanode.get",
    "params": {
        "countOutput": true,
        "filter": {
            "status": 0
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": "3",
    "id": 1
}
```

Check status of nodes at specific IP addresses

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hanode.get",
    "params": {
        "output": ["name", "status"],
        "filter": {
            "address": ["192.168.1.7", "192.168.1.13"]
```

```
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "name": "node3",
            "status": "0"
        },
        {
            "name": "node-active",
            "status": "3"
        }
    ],
    "id": 1
}
```

CHaNode::get() in *ui/include/classes/api/services/CHaNode.php*.

History

This class is designed to work with history data.

Object references:

- Float history
- Integer history
- String history
- Text history
- Log history

Available methods:

- history.clear - clear history data
- history.get - retrieve history data
- history.push - send history data to Zabbix server

History object

The following objects are directly related to the `history` API.

Note:
History objects differ depending on the item's type of information. They are created by Zabbix server and cannot be modified via the API.

Float history

The float history object has the following properties.

Property	Type	Description
clock	timestamp	Time when that value was received.
itemid	ID	ID of the related item.
ns	integer	Nanoseconds when the value was received.
value	float	Received value.

Integer history

The integer history object has the following properties.

Property	Type	Description
clock	timestamp	Time when that value was received.
itemid	ID	ID of the related item.
ns	integer	Nanoseconds when the value was received.
value	integer	Received value.

String history

The string history object has the following properties.

Property	Type	Description
clock	timestamp	Time when that value was received.
itemid	ID	ID of the related item.
ns	integer	Nanoseconds when the value was received.
value	string	Received value.

Text history

The text history object has the following properties.

Property	Type	Description
id	ID	ID of the history entry.
clock	timestamp	Time when that value was received.
itemid	ID	ID of the related item.
ns	integer	Nanoseconds when the value was received.
value	text	Received value.

Log history

The log history object has the following properties.

Property	Type	Description
id	ID	ID of the history entry.
clock	timestamp	Time when that value was received.
itemid	ID	ID of the related item.
logeventid	integer	Windows event log entry ID.
ns	integer	Nanoseconds when the value was received.
severity	integer	Windows event log entry level.
source	string	Windows event log entry source.
timestamp	timestamp	Windows event log entry time.
value	text	Received value.

Binary history

The binary history object has the following properties.

Property	Type	Description
clock	timestamp	Time when that value was received.
itemid	ID	ID of the related item.
ns	integer	Nanoseconds when the value was received.
value	text	Received value.

JSON history

The JSON history object has the following properties.

Property	Type	Description
clock	timestamp	Time when that value was received.
itemid	ID	ID of the related item.
ns	integer	Nanoseconds when the value was received.
value	text	Received value.

history.clear

Description

`object history.clear(array itemids)`

This method allows you to clear item history.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of items to clear.

Return values

`(object)` Returns an object containing the IDs of the cleared items under the `itemids` property.

Examples

Clear history

Request:

```
{
    "jsonrpc": "2.0",
    "method": "history.clear",
    "params": [
        "10325",
        "13205"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "10325",
            "13205"
        ]
    },
    "id": 1
}
```

Source

CHistory::clear() in *ui/include/classes/api/services/CHistory.php*.

history.get

Description

`integer/array history.get(object parameters)`

The method allows you to retrieve history data according to the given parameters.

Attention:
This method may return historical data of a deleted entity if this data has not been removed by the housekeeper yet.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
history	integer	History object types to return. Possible values: 0 - numeric float; 1 - character; 2 - log; 3 - *(default)* numeric unsigned; 4 - text; 5 - binary; 6 - JSON.
hostids	ID/array	Return only history from the given hosts.
itemids	ID/array	Return only history from the given items.
maxValueSize	integer	Maximum number of bytes to return in the `value` property. Possible values range: 1-134217728 (1 byte to 128MiB). If set to `null`, no limit is applied. Default: 65536 (64KiB). Parameter behavior: - *supported* if `history` is set to "binary" or "JSON"
time_from	timestamp	Return only values that have been received after or at the given time.
time_till	timestamp	Return only values that have been received before or at the given time.
sortfield	string/array	Sort the result by the given properties. Possible values: `itemid`, `clock`, `ns`. Does not support sorting by `ns` if history data is stored in ClickHouse.
search	object	Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%…%"` search. Does not support searching by `value` if `history` is set to 6 (JSON).
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Retrieving item history data

Return 10 latest values received from a numeric(float) item.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "history.get",
    "params": {
        "output": "extend",
        "history": 0,
        "itemids": "23296",
        "sortfield": "clock",
        "sortorder": "DESC",
        "limit": 10
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "itemid": "23296",
            "clock": "1351090996",
            "value": "0.085",
            "ns": "563157632"
        },
        {
            "itemid": "23296",
            "clock": "1351090936",
            "value": "0.16",
            "ns": "549216402"
        },
        {
            "itemid": "23296",
            "clock": "1351090876",
            "value": "0.18",
            "ns": "537418114"
        },
        {
            "itemid": "23296",
            "clock": "1351090816",
            "value": "0.21",
            "ns": "522659528"
        },
        {
            "itemid": "23296",
            "clock": "1351090756",
            "value": "0.215",
            "ns": "507809457"
        },
        {
            "itemid": "23296",
            "clock": "1351090696",
            "value": "0.255",
            "ns": "495509699"
```

```
        },
        {
            "itemid": "23296",
            "clock": "1351090636",
            "value": "0.36",
            "ns": "477708209"
        },
        {
            "itemid": "23296",
            "clock": "1351090576",
            "value": "0.375",
            "ns": "463251343"
        },
        {
            "itemid": "23296",
            "clock": "1351090516",
            "value": "0.315",
            "ns": "447947017"
        },
        {
            "itemid": "23296",
            "clock": "1351090456",
            "value": "0.275",
            "ns": "435307141"
        }
    ],
    "id": 1
}
```

Source

CHistory::get() in *ui/include/classes/api/services/CHistory.php*.

history.push

Description

`object history.push(object/array itemHistoryData)`

This method allows sending item history data to Zabbix server.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Item history data to send.

The method supports the following parameters.

Parameter	Type	Description
itemid	ID	ID of the related item. Parameter behavior: - *required* if `host` and `key` are not set
host	string	Technical name of the host. Parameter behavior: - *required* if `itemid` is not set
key	string	Item key. Parameter behavior: - *required* if `itemid` is not set

Parameter	Type	Description
value	mixed	Item value. Parameter behavior: - *required*
clock	timestamp	Time when the value was received.
ns	integer	Nanoseconds when the value was received.

Return values

`(object)` Returns the result of the data sending operation.

Examples

Send item history data

Send item history data to Zabbix server for items ”10600”, ”10601”, and ”999999”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "history.push",
    "params": [
        {
            "itemid": 10600,
            "value": 0.5,
            "clock": 1690891294,
            "ns": 45440940
        },
        {

CHistory::push() in *ui/include/classes/api/services/CHistory.php*.

Host

This class is designed to work with hosts.

Object references:

- Host
- Host inventory
- Host tag

Available methods:

- host.create - create new hosts
- host.delete - delete hosts
- host.get - retrieve hosts
- host.massadd - add related objects to hosts
- host.massremove - remove related objects from hosts
- host.update - update hosts

Host object

The following objects are directly related to the host API.

Host

The host object has the following properties.

Property	Type	Description
hostid	ID	ID of the host. Property behavior: - *read-only* - *required* for update operations
host	string	Technical name of the host. Property behavior: - *required* for create operations
description	text	Description of the host.
flags	integer	Origin of the host. Possible values: 0 - a plain host; 4 - a host converted from prototype. Property behavior: - *read-only*

Property	Type	Description
inventory_mode	integer	Host inventory population mode. Possible values: -1 - *(default)* disabled; 0 - manual; 1 - automatic.
ipmi_authtype	integer	IPMI authentication algorithm. Possible values: -1 - *(default)* default; 0 - none; 1 - MD2; 2 - MD5 4 - straight; 5 - OEM; 6 - RMCP+.
ipmi_password	string	IPMI password.
ipmi_privilege	integer	IPMI privilege level. Possible values: 1 - callback; 2 - *(default)* user; 3 - operator; 4 - admin; 5 - OEM.
ipmi_username	string	IPMI username.
maintenance_from	timestamp	Starting time of the effective maintenance. Property behavior: - *read-only*
maintenance_status	integer	Effective maintenance status. Possible values: 0 - *(default)* no maintenance; 1 - maintenance in effect. Property behavior: - *read-only*
maintenance_type	integer	Effective maintenance type. Possible values: 0 - *(default)* maintenance with data collection; 1 - maintenance without data collection. Property behavior: - *read-only*
maintenanceid	ID	ID of the maintenance that is currently in effect on the host. Property behavior: - *read-only*
name	string	Visible name of the host. Default: `host` property value.
monitored_by	integer	Source that is used to monitor the host. Possible values: 0 - *(default)* Zabbix server; 1 - Proxy; 2 - Proxy group. Property behavior: - *required* if `select_server_for_monitoring` is set to ”Disabled”.

Property	Type	Description
proxyid	ID	ID of the proxy that is used to monitor the host. Property behavior: - *required* if `monitored_by` is set to ”Proxy”
proxy_groupid	ID	ID of the proxy group that is used to monitor the host. Property behavior: - *required* if `monitored_by` is set to ”Proxy group”
status	integer	Status and function of the host. Possible values: 0 - *(default)* enabled; 1 - disabled.
tls_connect	integer	Connections to host. Possible values: 1 - *(default)* No encryption; 2 - PSK; 4 - certificate.
tls_accept	integer	Connections from host. Possible bitmap values: 1 - *(default)* No encryption; 2 - PSK; 4 - certificate. This is a bitmask field; any sum of possible bitmap values is acceptable (for example, 6 for PSK and certificate).
tls_issuer	string	Certificate issuer.
tls_subject	string	Certificate subject.
tls_psk_identity	string	PSK identity; must be paired with only one PSK (across autoregistration, hosts, and proxies). Do not include sensitive information in the PSK identity, as it is sent unencrypted over the network to inform the receiver which PSK to use. Property behavior: - *write-only* - *required* if `tls_connect` is set to ”PSK”, or `tls_accept` contains the ”PSK” bit
tls_psk	string	Pre-shared key (PSK); must be at least 32 hex digits. Property behavior: - *write-only* - *required* if `tls_connect` is set to ”PSK”, or `tls_accept` contains the ”PSK” bit
active_available	integer	Host active interface availability status. Possible values: 0 - interface status is unknown; 1 - interface is available; 2 - interface is not available. Property behavior: - *read-only*
assigned_proxyid	ID	ID of the proxy assigned by Zabbix server, if the host is monitored by a proxy group. Property behavior: - *read-only*

Host inventory

The host inventory object has the following properties.

Note:
Each property has it's own unique ID number, which is used to associate host inventory fields with items.

ID	Property	Type	Description	Maximum length
4	alias	string	Alias.	128 characters
11	asset_tag	string	Asset tag.	64 characters
28	chassis	string	Chassis.	64 characters
23	contact	string	Contact person.	65535 characters for SQL databases
32	contract_number	string	Contract number.	64 characters
47	date_hw_decomm	string	HW decommissioning date.	64 characters
46	date_hw_expiry	string	HW maintenance expiry date.	64 characters
45	date_hw_install	string	HW installation date.	64 characters
44	date_hw_purchase	string	HW purchase date.	64 characters
34	deployment_status	string	Deployment status.	64 characters
14	hardware	string	Hardware.	255 characters
15	hardware_full	string	Detailed hardware.	65535 characters for SQL databases
39	host_netmask	string	Host subnet mask.	39 characters
38	host_networks	string	Host networks.	65535 characters for SQL databases
40	host_router	string	Host router.	39 characters
30	hw_arch	string	HW architecture.	32 characters
33	installer_name	string	Installer name.	64 characters
24	location	string	Location.	65535 characters for SQL databases
25	location_lat	string	Location latitude.	16 characters
26	location_lon	string	Location longitude.	16 characters
12	macaddress_a	string	MAC address A.	64 characters
13	macaddress_b	string	MAC address B.	64 characters
29	model	string	Model.	64 characters
3	name	string	Name.	128 characters
27	notes	string	Notes.	65535 characters for SQL databases
41	oob_ip	string	OOB IP address.	39 characters
42	oob_netmask	string	OOB host subnet mask.	39 characters
43	oob_router	string	OOB router.	39 characters
5	os	string	OS name.	128 characters
6	os_full	string	Detailed OS name.	255 characters
7	os_short	string	Short OS name.	128 characters
61	poc_1_cell	string	Primary POC mobile number.	64 characters
58	poc_1_email	string	Primary email.	128 characters
57	poc_1_name	string	Primary POC name.	128 characters
63	poc_1_notes	string	Primary POC notes.	65535 characters for SQL databases
59	poc_1_phone_a	string	Primary POC phone A.	64 characters
60	poc_1_phone_b	string	Primary POC phone B.	64 characters
62	poc_1_screen	string	Primary POC screen name.	64 characters
68	poc_2_cell	string	Secondary POC mobile number.	64 characters
65	poc_2_email	string	Secondary POC email.	128 characters
64	poc_2_name	string	Secondary POC name.	128 characters
70	poc_2_notes	string	Secondary POC notes.	65535 characters for SQL databases
66	poc_2_phone_a	string	Secondary POC phone A.	64 characters
67	poc_2_phone_b	string	Secondary POC phone B.	64 characters
69	poc_2_screen	string	Secondary POC screen name.	64 characters
8	serialno_a	string	Serial number A.	64 characters
9	serialno_b	string	Serial number B.	64 characters
48	site_address_a	string	Site address A.	128 characters
49	site_address_b	string	Site address B.	128 characters
50	site_address_c	string	Site address C.	128 characters
51	site_city	string	Site city.	128 characters
53	site_country	string	Site country.	64 characters
56	site_notes	string	Site notes.	65535 characters for SQL databases
55	site_rack	string	Site rack location.	128 characters

ID	Property	Type	Description	Maximum length
52	site_state	string	Site state.	64 characters
54	site_zip	string	Site ZIP/postal code.	64 characters
16	software	string	Software.	255 characters
18	software_app_a	string	Software application A.	64 characters
19	software_app_b	string	Software application B.	64 characters
20	software_app_c	string	Software application C.	64 characters
21	software_app_d	string	Software application D.	64 characters
22	software_app_e	string	Software application E.	64 characters
17	software_full	string	Software details.	65535 characters for SQL databases
10	tag	string	Tag.	64 characters
1	type	string	Type.	64 characters
2	type_full	string	Type details.	64 characters
35	url_a	string	URL A.	2048 characters
36	url_b	string	URL B.	2048 characters
37	url_c	string	URL C.	2048 characters
31	vendor	string	Vendor.	64 characters

Host tag

The host tag object has the following properties.

Property	Type	Description
tag	string	Host tag name. Property behavior: - *required*
value	string	Host tag value. Property behavior: - *read-only*.
automatic	integer	Type of host tag. Possible values: 0 - *(default)* manual (tag created by user); 1 - automatic (tag created by low-level discovery) Property behavior: - *read-only*
object	integer	Type of object the tag was inherited from. Possible values: 0 - template. Property behavior: - *read-only*.
objectid	ID	ID of the object the tag was inherited from. Property behavior: - *read-only*.

host.create

Description

`object host.create(object/array hosts)`

This method allows you to create new hosts.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Hosts to create.

Additionally to the standard host properties, the method accepts the following parameters.

Parameter	Type	Description
groups	object/array	Host groups to add the host to. The host groups must have only the `groupid` property defined. Parameter behavior: - *required*
interfaces	object/array	Interfaces to be created for the host.
tags	object/array	Host tags.
templates	object/array	Templates to be linked to the host. The templates must have only the `templateid` property defined.
macros	object/array	User macros to be created for the host.
inventory	object	Host inventory properties.

Return values

`(object)` Returns an object containing the IDs of the created hosts under the `hostids` property. The order of the returned IDs matches the order of the passed hosts.

Examples

Creating a host

Create a host called "Linux server" with an IP interface and tags, add it to a group, link a template to it and set the MAC addresses in the host inventory.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.create",
    "params": {
        "host": "Linux server",
        "interfaces": [
            {
                "type": 1,
                "main": 1,
                "useip": 1,
                "ip": "192.168.3.1",
                "dns": "",
                "port": "10050"
            }
        ],
        "groups": [
            {
                "groupid": "50"
            }
        ],
        "tags": [
            {
                "tag": "host-name",
                "value": "linux-server"
            }
        ],
```

```
        "templates": [
            {
                "templateid": "20045"
            }
        ],
        "macros": [
            {
                "macro": "{$USER_ID}",
                "value": "123321"
            },
            {
                "macro": "{$USER_LOCATION}",
                "value": "0:0:0",
                "description": "latitude, longitude and altitude coordinates"
            }
        ],
        "inventory_mode": 0,
        "inventory": {
            "macaddress_a": "01234",
            "macaddress_b": "56768"
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "107819"
        ]
    },
    "id": 1
}
```

Creating a host with SNMP interface

Create a host called "SNMP host" with an SNMPv3 interface with details.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.create",
    "params": {
        "host": "SNMP host",
        "interfaces": [
            {
                "type": 2,
                "main": 1,
                "useip": 1,
                "ip": "127.0.0.1",
                "dns": "",
                "port": "161",
                "details": {
                    "version": 3,
                    "bulk": 0,
                    "securityname": "mysecurityname",
                    "contextname": "",
                    "securitylevel": 1
                }
            }
        ],
```

```
        "groups": [
            {
                "groupid": "4"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10658"
        ]
    },
    "id": 1
}
```

Creating a host with PSK encryption

Create a host called "PSK host" with PSK encryption configured. Note that the host has to be pre-configured to use PSK.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.create",
    "params": {
        "host": "PSK host",
        "interfaces": [
            {
                "type": 1,
                "ip": "192.168.3.1",
                "dns": "",
                "port": "10050",
                "useip": 1,
                "main": 1
            }
        ],
        "groups": [
            {
                "groupid": "2"
            }
        ],
        "tls_accept": 2,
        "tls_connect": 2,
        "tls_psk_identity": "PSK 001",
        "tls_psk": "1f87b595725ac58dd977beef14b97461a7c1045b9a1c963065002c5473194952"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10590"
        ]
    },
    "id": 1
}
```

Creating a host monitored by a proxy

Create a host that will be monitored by proxy with ID ”1”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.create",
    "params": {
        "host": "Host monitored by proxy",
        "groups": [
            {
                "groupid": "2"
            }
        ],
        "monitored_by": 1,
        "proxyid": 1
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10591"
        ]
    },
    "id": 1
}
```

Creating a host monitored by a proxy group

Create a host that will be monitored by proxy group with ID ”1”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.create",
    "params": {
        "host": "Host monitored by proxy group",
        "groups": [
            {
                "groupid": "2"
            }
        ],
        "monitored_by": 2,
        "proxy_groupid": 1
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10592"
        ]
    },
    "id": 1
}
```

CHost::create() in *ui/include/classes/api/services/CHost.php*.

host.delete

Description

`object host.delete(array hosts)`

This method allows you to delete hosts.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of hosts to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted hosts under the `hostids` property.

Examples

Deleting multiple hosts

Delete two hosts.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.delete",
    "params": [
        "13",
        "32"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "13",
            "32"
        ]
    },
    "id": 1
}
```

CHost::delete() in *ui/include/classes/api/services/CHost.php*.

host.get

Description

`integer/array host.get(object parameters)`

The method allows you to retrieve hosts according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
groupids	ID/array	Return only hosts that belong to the given groups.
dserviceids	ID/array	Return only hosts that are related to the given discovered services.
graphids	ID/array	Return only hosts that have the given graphs.
hostids	ID/array	Return only hosts with the given host IDs.
httptestids	ID/array	Return only hosts that have the given web checks.
interfaceids	ID/array	Return only hosts that use the given interfaces.
itemids	ID/array	Return only hosts that have the given items.
maintenanceids	ID/array	Return only hosts that are affected by the given maintenances.
monitored_hosts	flag	Return only monitored hosts.
proxyids	ID/array	Return only hosts that are monitored by the given proxies.
proxy_groupids	ID/array	Return only hosts that are monitored by the given proxy groups.
templated_hosts	flag	Return both hosts and templates.
templateids	ID/array	Return only hosts that are linked to the given templates.
triggerids	ID/array	Return only hosts that have the given triggers.
with_items	flag	Return only hosts that have items. Overrides the `with_monitored_items` and `with_simple_graph_items` parameters.
with_item_prototypes	flag	Return only hosts that have item prototypes. Overrides the `with_simple_graph_item_prototypes` parameter.
with_simple_graph_item_prototypes	flag	Return only hosts that have item prototypes, which are enabled for creation and have numeric type of information.
with_graphs	flag	Return only hosts that have graphs.
with_graph_prototypes	flag	Return only hosts that have graph prototypes.
with_httptests	flag	Return only hosts that have web checks. Overrides the `with_monitored_httptests` parameter.
with_monitored_httptests	flag	Return only hosts that have enabled web checks.
with_monitored_items	flag	Return only hosts that have enabled items. Overrides the `with_simple_graph_items` parameter.
with_monitored_triggers	flag	Return only hosts that have enabled triggers. All of the items used in the trigger must also be enabled.
with_simple_graph_items	flag	Return only hosts that have items with numeric type of information.
with_triggers	flag	Return only hosts that have triggers. Overrides the `with_monitored_triggers` parameter.
withProblemsSuppressed	boolean	If set to `true` return only hosts with suppressed problems.
evaltype	integer	Tag evaluation method. Possible values: 0 - *(default)* And/Or; 2 - Or.

Parameter	Type	Description
severities	integer/array	Return hosts that have only problems with given severities. Applies only if problem object is trigger.
tags	object/array	Return only hosts with the given tags. Format: `[{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all hosts. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
inheritedTags	boolean	Return hosts that have given `tags` also in all of their linked templates. Possible values: `true` - linked templates must also have given `tags`; `false` - *(default)* linked template tags are ignored.
selectDiscoveryData	query	Return a `discoveryData` property with the host discovery object data. The host discovery object links a discovered host to a host prototype from which it was discovered. It has the following properties: `host` - `(string)` ID of the host; `parent_hostid` - `(string)` ID of the host prototype from which the host has been created; `status` - `(int)` host discovery status: 0 - *(default)* host is discovered, 1 - host is not discovered anymore; `ts_delete` - `(timestamp)` time when a host that is no longer discovered will be deleted; `ts_disable` - `(timestamp)` time when a host that is no longer discovered will be disabled; `disable_source` - `(int)` indicator of whether host was disabled by an LLD rule or manually: 0 - *(default)* disabled automatically, 1 - disabled by an LLD rule.
selectDiscoveryRule	query	Return a `discoveryRule` property with the low-level discovery rule that created the host (from host prototype in VMware monitoring).
selectDiscoveryRules	query	Return a `discoveryRules` property with host LLD rules. Supports `count`.
selectGraphs	query	Return a `graphs` property with host graphs. Supports `count`.
selectHostGroups	query	Return a `hostgroups` property with host groups data that the host belongs to.
selectHttpTests	query	Return an `httpTests` property with host web scenarios. Supports `count`.
selectInterfaces	query	Return an `interfaces` property with host interfaces. Supports `count`.
selectInventory	query	Return an `inventory` property with host inventory data.
selectItems	query	Return an `items` property with host items. Supports `count`.
selectMacros	query	Return a `macros` property with host macros.

Parameter	Type	Description
selectParentTemplates	query	Return a `parentTemplates` property with templates that the host is linked to. In addition to Template object fields, it contains `link_type` - `(integer)` the way that the template is linked to host. Possible values: 0 - *(default)* manually linked; 1 - automatically linked by LLD. Supports `count`.
selectDashboards	query	Return a `dashboards` property. Supports `count`.
selectTags	query	Return a `tags` property with host tags.
selectInheritedTags	query	Return an `inheritedTags` property with tags that are on all templates which are linked to host.
selectTriggers	query	Return a `triggers` property with host triggers. Supports `count`.
selectValueMaps	query	Return a `valuemaps` property with host value maps.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Supports additional properties: Host interface properties.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectParentTemplates` - results will be sorted by `host`; `selectInterfaces`; `selectItems` - sorted by `name`; `selectDiscoveryRules` - sorted by `name`; `selectTriggers` - sorted by `description`; `selectGraphs` - sorted by `name`; `selectDashboards` - sorted by `name`.
search	object	Return results that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%…%"` search. Supports only properties of `string` and `text` data type. Supports additional properties: Host interface properties.
searchInventory	object	Return hosts that have inventory data that match the given pattern (case-insensitive). Accepts an object, where the keys are property names, and the values are strings to search for. If no additional options are given, this will perform a `LIKE "%…%"` search. Supports only properties of `string` and `text` data type.
sortfield	string/array	Sort the result by the given properties. Possible values: `hostid`, `host`, `name`, `status`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	

Parameter	Type	Description
limit	integer	
output	query	
preservekeys	boolean	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	
selectDiscoveries	query	Return a `discoveries` property with host low-level discovery rules. Supports `count`. This query is **deprecated**, please use `selectDiscoveryRules` instead.
selectHostDiscovery	query	Return a `hostDiscovery` property with host discovery object data. This query is **deprecated**, please use `selectDiscoveryData` instead.

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving data by name

Retrieve all data about two hosts named "Zabbix server" and "Linux server".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "filter": {
            "host": [
                "Zabbix server",
                "Linux server"
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10160",
            "proxyid": "0",
            "host": "Zabbix server",
            "status": "0",
            "ipmi_authtype": "-1",
            "ipmi_privilege": "2",
            "ipmi_username": "",
            "ipmi_password": "",
            "maintenanceid": "0",
            "maintenance_status": "0",
            "maintenance_type": "0",
            "maintenance_from": "0",
```

```
            "name": "Zabbix server",
            "flags": "0",
            "description": "The Zabbix monitoring server.",
            "tls_connect": "1",
            "tls_accept": "1",
            "tls_issuer": "",
            "tls_subject": "",
            "proxy_groupid": "0",
            "monitored_by": "0",
            "inventory_mode": "1",
            "active_available": "1",
            "assigned_proxyid": "0"
        },
        {
            "hostid": "10167",
            "proxyid": "0",
            "host": "Linux server",
            "status": "0",
            "ipmi_authtype": "-1",
            "ipmi_privilege": "2",
            "ipmi_username": "",
            "ipmi_password": "",
            "maintenanceid": "0",
            "maintenance_status": "0",
            "maintenance_type": "0",
            "maintenance_from": "0",
            "name": "Linux server",
            "flags": "0",
            "description": "",
            "tls_connect": "1",
            "tls_accept": "1",
            "tls_issuer": "",
            "tls_subject": "",
            "proxy_groupid": "0",
            "monitored_by": "0",
            "inventory_mode": "1",
            "active_available": "1",
            "assigned_proxyid": "0"
        }
    ],
    "id": 1
}
```

Retrieving host groups

Retrieve host groups that the host ”Zabbix server” is a member of.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid"],
        "selectHostGroups": "extend",
        "filter": {
            "host": [
                "Zabbix server"
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10085",
            "hostgroups": [
                {
                    "groupid": "2",
                    "name": "Linux servers",
                    "flags": "0",
                    "uuid": "dc579cd7a1a34222933f24f52a68bcd8"
                },
                {
                    "groupid": "4",
                    "name": "Zabbix servers",
                    "flags": "0",
                    "uuid": "6f6799aa69e844b4b3918f779f2abf08"
                }
            ]
        }
    ],
    "id": 1
}
```

Retrieving linked templates

Retrieve the IDs and names of templates linked to host ”10084”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid"],
        "selectParentTemplates": [
            "templateid",
            "name"
        ],
        "hostids": "10084"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10084",
            "parentTemplates": [
                {
                    "name": "Linux",
                    "templateid": "10001"
                },
                {
                    "name": "Zabbix Server",
                    "templateid": "10047"
                }
            ]
        }
    ],
    "id": 1
}
```

Retrieving hosts by template

Retrieve hosts that have the ”10001” (*Linux by Zabbix agent*) template linked to them.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid", "name"],
        "templateids": "10001"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "templateid": "10001",
            "hosts": [
                {
                    "hostid": "10084",
                    "name": "Zabbix server"
                },
                {
                    "hostid": "10603",
                    "name": "Host 1"
                },
                {
                    "hostid": "10604",
                    "name": "Host 2"
                }
            ]
        }
    ],
    "id": 1
}
```

Searching by host inventory data

Retrieve hosts that contain ”Linux” in the host inventory ”OS” field.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": [
            "host"
        ],
        "selectInventory": [
            "os"
        ],
        "searchInventory": {
            "os": "Linux"
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10084",
            "host": "Zabbix server",
            "inventory": {
                "os": "Linux Ubuntu"
            }
        },
        {
            "hostid": "10107",
            "host": "Linux server",
            "inventory": {
                "os": "Linux Mint"
            }
        }
    ],
    "id": 1
}
```

Searching by host tags

Retrieve hosts that have tag ”host-name” equal to ”linux-server”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid"],
        "selectTags": "extend",
        "evaltype": 0,
        "tags": [
            {
                "tag": "host-name",
                "value": "linux-server",
                "operator": 1
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10085",
            "tags": [
                {
                    "tag": "host-name",
                    "value": "linux-server",
                    "automatic": "0"
                },
                {
                    "tag": "os",
                    "value": "rhel-7",
                    "automatic": "0"
                }
            ]
        }
```

```
    ],
    "id": 1
}
```

Retrieve hosts that have these tags not only on host level but also in their linked parent templates.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["name"],
        "tags": [
            {
                "tag": "os",
                "value": "rhel-7",
                "operator": 1
            }
        ],
        "inheritedTags": true
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10623",
            "name": "PC room 1"
        },
        {
            "hostid": "10601",
            "name": "Office"
        }
    ],
    "id": 1
}
```

Retrieve hosts excluding those with the tag ”component”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid"],
        "selectTags": "extend",
        "evaltype": 0,
        "tags": [
            {
                "tag": "component",
                "value": "",
                "operator": 5
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10084",
            "tags": [
                {
                    "tag": "class",
                    "value": "os",
                    "automatic": "0"
                },
                {
                    "tag": "target",
                    "value": "linux",
                    "automatic": "0"
                }
            ]
        },
        {
            "hostid": "10629",
            "tags": [
                {
                    "tag": "class",
                    "value": "application",
                    "automatic": "0"
                },
                {
                    "tag": "target",
                    "value": "browser",
                    "automatic": "0"
                }
            ]
        }
    ],
    "id": 1
}
```

Searching host with tags and template tags

Retrieve a host with tags and all tags that are linked to parent templates.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["name"],
        "hostids": 10502,
        "selectTags": ["tag", "value"],
        "selectInheritedTags": ["tag", "value"]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10502",
            "name": "Desktop",
            "tags": [
                {
```

```
                    "tag": "host-name",
                    "value": "linux-server"
                },
                {
                    "tag": "os",
                    "value": "rhel-7"
                }
            ],
            "inheritedTags": [
                {
                    "tag": "class",
                    "value": "os"
                },
                {
                    "tag": "target",
                    "value": "linux"
                },
                {
                    "tag": "os",
                    "value": "rhel-7"
                }
            ]
        }
    ],
    "id": 1
}
```

Searching hosts by problem severity

Retrieve hosts that have ”Disaster” problems.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["name"],
        "severities": 5
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10160",
            "name": "Zabbix server"
        }
    ],
    "id": 1
}
```

Retrieve hosts that have ”Average” and ”High” problems.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["name"],
        "severities": [3, 4]
    },
```

```
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "20170",
            "name": "Database"
        },
        {
            "hostid": "20183",
            "name": "workstation"
        }
    ],
    "id": 1
}
```

Retrieving host items

Retrieve items for the "Zabbix server" host. The request is limited to the item properties `itemid`, `name`, and `status`. Due to the large response size, only a subset of items is shown in the example.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.get",
    "params": {
        "output": ["hostid"],
        "selectItems": ["itemid","name","status"],
        "filter": {
            "host": [
                "Zabbix server"
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
  "jsonrpc": "2.0",
  "result": [
    {
      "hostid": "10084",
      "items": [
        {
          "itemid": "42227",
          "name": "Host name of Zabbix agent running",
          "status": "0"
        },
        {
          "itemid": "42237",
          "name": "Zabbix agent ping",
          "status": "0"
        },
        {
          "itemid": "42250",

CHost::get() in *ui/include/classes/api/services/CHost.php*.

host.massadd

Description

`object host.massadd(object parameters)`

This method allows you to simultaneously add multiple related objects to all the given hosts.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the IDs of the hosts to update and the objects to add to all the hosts.

The method accepts the following parameters.

Parameter	Type	Description
hosts	object/array	Hosts to be updated. The hosts must have only the `hostid` property defined. Parameter behavior: - *required*
groups	object/array	Host groups to add to the given hosts. The host groups must have only the `groupid` property defined.
interfaces	object/array	Host interfaces to be created for the given hosts.
macros	object/array	User macros to be created for the given hosts.
templates	object/array	Templates to link to the given hosts. The templates must have only the `templateid` property defined.

Return values

`(object)` Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Adding macros

Add two new macros to two hosts.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.massadd",
    "params": {
        "hosts": [
            {
                "hostid": "10160"
            },
            {
                "hostid": "10167"
            }
```

```
        ],
        "macros": [
            {
                "macro": "{$TEST1}",
                "value": "MACROTEST1"
            },
            {
                "macro": "{$TEST2}",
                "value": "MACROTEST2",
                "description": "Test description"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10160",
            "10167"
        ]
    },
    "id": 1
}
```

host.massremove

Description

`object host.massremove(object parameters)`

This method allows you to remove related objects from multiple hosts.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the IDs of the hosts to update and the objects that should be removed.

Parameter	Type	Description
hostids	ID/array	IDs of the hosts to be updated. Parameter behavior: - *required*
groupids	ID/array	IDs of the host groups to remove the given hosts from.

Parameter	Type	Description
interfaces	object/array	Host interfaces to remove from the given hosts. The host interface object must have only the `ip`, `dns` and `port` properties defined.
macros	string/array	User macros to delete from the given hosts.
templateids	ID/array	IDs of the templates to unlink from the given hosts.
templateids_clear	ID/array	IDs of the templates to unlink and clear from the given hosts.

Return values

`(object)` Returns an object containing the IDs of the updated hosts under the `hostids` property.

Examples

Unlinking templates

Unlink a template from two hosts and delete all of the templated entities.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.massremove",
    "params": {
        "hostids": ["69665", "69666"],
        "templateids_clear": "325"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "69665",
            "69666"
        ]
    },
    "id": 1
}
```

CHost::massRemove() in *ui/include/classes/api/services/CHost.php*.

host.update

Description

`object host.update(object/array hosts)`

This method allows you to update existing hosts.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(object/array) Host properties to be updated.

The hostid property must be defined for each host, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Note, however, that updating the host technical name will also update the host's visible name (if not given separately) by the host's technical name value.

Additionally to the standard host properties, the method accepts the following parameters.

Parameter	Type	Description
groups	object/array	Host groups to replace the current host groups the host belongs to. All host groups that are not listed in the request will be unlinked. The host groups must have only the groupid property defined.
interfaces	object/array	Host interfaces to replace the current host interfaces. All interfaces that are not listed in the request will be removed.
tags	object/array	Host tags to replace the current host tags. All tags that are not listed in the request will be removed.
inventory	object	Host inventory properties.
macros	object/array	User macros to replace the current user macros. All macros that are not listed in the request will be removed.
templates	object/array	Templates to replace the currently linked templates. All templates that are not listed in the request will be only unlinked. The templates must have only the templateid property defined.
templates_clear	object/array	Templates to unlink and clear from the host. The templates must have only the templateid property defined.

Return values

(object) Returns an object containing the IDs of the updated hosts under the hostids property.

Examples

Enabling a host

Enable host monitoring, that is, set its status to "0".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.update",
    "params": {
        "hostid": "10126",
        "status": 0
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10126"
        ]
    },
    "id": 1
}
```

Enabling multiple hosts

Enable monitoring of two hosts, that is, set their status to "0".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.update",
    "params": [
        {
            "hostid": "10127",
            "status": 0
        },
        {
            "hostid": "10128",
            "status": 0
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10127",
            "10128"
        ]
    },
    "id": 1
}
```

Unlinking templates

Unlink and clear two templates from host.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.update",
    "params": {
        "hostid": "10126",
        "templates_clear": [
            {
                "templateid": "10124"
            },
            {
                "templateid": "10125"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10126"
        ]
    },
    "id": 1
}
```

Updating host macros

Replace all host macros with two new ones.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.update",
    "params": {
        "hostid": "10126",
        "macros": [
            {
                "macro": "{$PASS}",
                "value": "password"
            },
            {
                "macro": "{$DISC}",
                "value": "sda",
                "description": "Updated description"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10126"
        ]
    },
    "id": 1
}
```

Updating host inventory

Change inventory mode and add location

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.update",
    "params": {
        "hostid": "10387",
        "inventory_mode": 0,
        "inventory": {
            "location": "Latvia, Riga"
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10387"
        ]
    },
    "id": 1
}
```

Updating host tags

Replace all host tags with a new one.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.update",
    "params": {
        "hostid": "10387",
        "tags": {
            "tag": "os",
            "value": "rhel-7"
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10387"
        ]
    },
    "id": 1
}
```

Updating discovered host macros

Convert discovery rule created ”automatic” macro to ”manual” and change its value to ”new-value”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.update",
    "params": {
        "hostid": "10387",
        "macros": {
            "hostmacroid": "5541",
            "value": "new-value",
            "automatic": "0"
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10387"
        ]
    },
    "id": 1
}
```

Updating host encryption

Update the host ”10590” to use PSK encryption only for connections from host to Zabbix server, and change the PSK identity and PSK key. Note that the host has to be pre-configured to use PSK.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "host.update",
```

```
    "params": {
        "hostid": "10590",
        "tls_connect": 1,
        "tls_accept": 2,
        "tls_psk_identity": "PSK 002",
        "tls_psk": "e560cb0d918d26d31b4f642181f5f570ad89a390931102e5391d08327ba434e9"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10590"
        ]
    },
    "id": 1
}
```

CHost::update() in *ui/include/classes/api/services/CHost.php*.

Host group

This class is designed to work with host groups.

Object references:

- Host group

Available methods:

- hostgroup.create - create new host groups
- hostgroup.delete - delete host groups
- hostgroup.get - retrieve host groups
- hostgroup.massadd - add related objects to host groups
- hostgroup.massremove - remove related objects from host groups
- hostgroup.propagate - propagate permissions and tag filters to host groups' subgroups
- hostgroup.update - update host groups

Host group object

The following objects are directly related to the `hostgroup` API.

Host group

The host group object has the following properties.

Property	Type	Description
groupid	ID	ID of the host group. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the host group. Property behavior: - *required* for create operations
flags	integer	Origin of the host group. Possible values: 0 - a plain host group; 4 - a discovered host group. Property behavior: - *read-only*
uuid	string	Universal unique identifier, used for linking imported host groups to already existing ones. Auto-generated, if not given.

hostgroup.create

Description

`object hostgroup.create(object/array hostGroups)`

This method allows you to create new host groups.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Host groups to create.

The method accepts host groups with the standard host group properties.

Return values

`(object)` Returns an object containing the IDs of the created host groups under the `groupids` property. The order of the returned IDs matches the order of the passed host groups.

Examples

Creating a host group

Create a host group called ”Linux servers”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostgroup.create",
    "params": {
        "name": "Linux servers"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
```

```
            "107819"
        ]
    },
    "id": 1
}
```

Source

CHostGroup::create() in *ui/include/classes/api/services/CHostGroup.php*.

hostgroup.delete

Description

`object hostgroup.delete(array hostGroupIds)`

This method allows you to delete host groups.

A host group cannot be deleted if:

- it contains hosts that belong to this group only;
- it is marked as internal;
- it is used by a host prototype;
- it is used in a global script;
- it is used in a correlation condition.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the host groups to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted host groups under the `groupids` property.

Examples

Deleting multiple host groups

Delete two host groups.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostgroup.delete",
    "params": [
        "107824",
        "107825"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "107824",
            "107825"
        ]
    },
    "id": 1
}
```

Source

CHostGroup::delete() in *ui/include/classes/api/services/CHostGroup.php*.

hostgroup.get

Description

`integer/array hostgroup.get(object parameters)`

The method allows you to retrieve host groups according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
graphids	ID/array	Return only host groups that contain hosts with the given graphs.
groupids	ID/array	Return only host groups with the given host group IDs.
hostids	ID/array	Return only host groups that contain the given hosts.
maintenanceids	ID/array	Return only host groups that are affected by the given maintenances.
triggerids	ID/array	Return only host groups that contain hosts with the given triggers.
with_graphs	boolean	Return only host groups that contain hosts with graphs.
with_graph_prototypes	boolean	Return only host groups that contain hosts with graph prototypes.
with_hosts	boolean	Return only host groups that contain hosts.
with_httptests	boolean	Return only host groups that contain hosts with web checks. Overrides the `with_monitored_httptests` parameter.
with_items	boolean	Return only host groups that contain hosts with items. Overrides the `with_monitored_items` and `with_simple_graph_items` parameters.
with_item_prototypes	boolean	Return only host groups that contain hosts with item prototypes. Overrides the `with_simple_graph_item_prototypes` parameter.
with_simple_graph_item_prototypes	boolean	Return only host groups that contain hosts with item prototypes, which are enabled for creation and have numeric type of information.
with_monitored_httptests	boolean	Return only host groups that contain hosts with enabled web checks.
with_monitored_hosts	boolean	Return only host groups that contain monitored hosts.
with_monitored_items	boolean	Return only host groups that contain hosts with enabled items. Overrides the `with_simple_graph_items` parameter.
with_monitored_triggers	boolean	Return only host groups that contain hosts with enabled triggers. All of the items used in the trigger must also be enabled.
with_simple_graph_items	boolean	Return only host groups that contain hosts with numeric items.
with_triggers	boolean	Return only host groups that contain hosts with triggers. Overrides the `with_monitored_triggers` parameter.
selectDiscoveryRules	query	Return a `discoveryRules` property with the LLD rules that discovered the host group.

Parameter	Type	Description
selectDiscoveryData	query	Return a `discoveryData` property with the host group discovery objects. Each host group discovery object is a host group prototype linked to the discovered host group and has the following properties: `parent_group_prototypeid` - `(ID)` ID of the host group prototype from which the host group was discovered; `name` - `(string)` name of the host group prototype; `ts_delete` - `(timestamp)` time when the host group that is no longer discovered will be deleted; `status` - `(int)` host group discovery status: 0 - *(default)* host group is discovered, 1 - host group is not discovered anymore.
selectHostPrototypes	query	Return a `hostPrototypes` property with host prototypes that discovered this host group.
selectHosts	query	Return a `hosts` property with the hosts that belong to the host group. Supports `count`.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectHosts` - results will be sorted by `host`.
sortfield	string/array	Sort the result by the given properties. Possible values: `groupid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	
selectGroupDiscoveries	query	Return a `groupDiscoveries` property with the host group discovery objects. Each host group discovery object is a host group prototype linked to the discovered host group. This query is **deprecated**, please use `selectDiscoveryData` instead.

Return values

`(integer/array)` Returns either:

- an array of objects
- the count of retrieved objects, if the `countOutput` parameter has been used

Examples

Retrieving data by name

Retrieve all data about two host groups named ”Zabbix servers” and ”Linux servers”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostgroup.get",
```

```
    "params": {
        "output": "extend",
        "filter": {
            "name": [
                "Zabbix servers",
                "Linux servers"
            ]
        }
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "groupid": "2",
            "name": "Linux servers",
            "flags": "0",
            "uuid": "dc579cd7a1a34222933f24f52a68bcd8"
        },
        {
            "groupid": "4",
            "name": "Zabbix servers",
            "flags": "0",
            "uuid": "6f6799aa69e844b4b3918f779f2abf08"
        }
    ],
    "id": 1
}
```

hostgroup.massadd

Description

`object hostgroup.massadd(object parameters)`

This method allows you to simultaneously add multiple related objects to all the given host groups.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the IDs of the host groups to update and the objects to add to all the host groups.

The method accepts the following parameters.

Parameter	Type	Description
groups	object/array	Host groups to be updated. The host groups must have only the `groupid` property defined. Parameter behavior: - *required*
hosts	object/array	Hosts to add to all host groups. The hosts must have only the `hostid` property defined.

Return values

`(object)` Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Adding hosts to host groups

Add two hosts to host groups with IDs 5 and 6.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostgroup.massadd",
    "params": {
        "groups": [
            {
                "groupid": "5"
            },
            {
                "groupid": "6"
            }
        ],
        "hosts": [
            {
                "hostid": "30050"
            },
            {
                "hostid": "30001"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "5",
            "6"
        ]
    },
    "id": 1
}
```

hostgroup.massremove

Description

`object hostgroup.massremove(object parameters)`

This method allows you to remove related objects from multiple host groups.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters containing the IDs of the host groups to update and the objects that should be removed.

Parameter	Type	Description
groupids	ID/array	IDs of the host groups to be updated. Parameter behavior: *- required*
hostids	ID/array	IDs of the hosts to remove from all host groups.

Return values

`(object)` Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Removing hosts from host groups

Remove two hosts from the given host groups.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostgroup.massremove",
    "params": {
        "groupids": [
            "5",
            "6"
        ],
        "hostids": [
            "30050",
            "30001"
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "5",
            "6"
        ]
    },
    "id": 1
}
```

hostgroup.propagate

Description

`object hostgroup.propagate(object parameters)`

This method allows you to apply permissions and tag filters to all subgroups of a host group.

> **Note:**
> This method is only available to *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
groups	object/array	Host groups to propagate. The host groups must have the `groupid` property defined. Parameter behavior: - *required*
permissions	boolean	Set to "true" to propagate permissions. Parameter behavior: - *required* if `tag_filters` is not set
tag_filters	boolean	Set to "true" to propagate tag filters. Parameter behavior: - *required* if `permissions` is not set

Return values

`(object)` Returns an object containing the IDs of the propagated host groups under the `groupids` property.

Examples

Propagating host group permissions and tag filters to its subgroups.

Propagate host group permissions and tag filters to its subgroups.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostgroup.propagate",
    "params": {
        "groups": [
            {
                "groupid": "6"
            }
        ],
        "permissions": true,
        "tag_filters": true
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
```

```
            "6",
        ]
    },
    "id": 1
}
```

- Host

Source

CHostGroup::propagate() in *ui/include/classes/api/services/CHostGroup.php*.

hostgroup.update

Description

`object hostgroup.update(object/array hostGroups)`

This method allows you to update existing hosts groups.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Host group properties to be updated.

The `groupid` property must be defined for each host group, all other properties are optional. Only the given properties will be updated, all others will remain unchanged.

Return values

`(object)` Returns an object containing the IDs of the updated host groups under the `groupids` property.

Examples

Renaming a host group

Rename a host group to "Linux hosts".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostgroup.update",
    "params": {
        "groupid": "7",
        "name": "Linux hosts"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "7"
        ]
    },
    "id": 1
}
```

Renaming multiple host groups

Rename two host groups to include region information in their names.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostgroup.update",
    "params": [
        {
            "groupid": "8",
            "name": "Europe/Linux hosts"
        },
        {
            "groupid": "9",
            "name": "Europe/Windows hosts"
        }
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "groupids": [
            "8",
            "9"
        ]
    },
    "id": 1
}
```

CHostGroup::update() in *ui/include/classes/api/services/CHostGroup.php*.

Host interface

This class provides access to host interfaces.

Object references:

- Host interface
  - Details

Available method:

- hostinterface.get - retrieve host interfaces

Host interfaces are created, updated, and deleted using host methods.

Host interface object

The following objects are directly related to the `hostinterface` API.

Host interface

The host interface object has the following properties.

Property	Type	Description
interfaceid	ID	ID of the interface. Property behavior: - *read-only* - *required* for update operations

Property	Type	Description
available	integer	Availability of host interface. Possible values: 0 - *(default)* unknown; 1 - available; 2 - unavailable. Property behavior: - *read-only*
hostid	ID	ID of the host that the interface belongs to. Property behavior: - *constant* - *required* for create operations
type	integer	Interface type. Possible values: 1 - Agent; 2 - SNMP; 3 - IPMI; 4 - JMX. Property behavior: - *required* for create operations
ip	string	IP address used by the interface. Can be empty if the connection is made via DNS. Property behavior: - *required* for create operations
dns	string	DNS name used by the interface. Can be empty if the connection is made via IP. Property behavior: - *required* for create operations
port	string	Port number used by the interface. Can contain user macros. Property behavior: - *required* for create operations
useip	integer	Whether the connection should be made via IP. Possible values: 0 - connect using host DNS name; 1 - connect using host IP address. Property behavior: - *required* for create operations
main	integer	Whether the interface is used as default on the host. Only one interface of some type can be set as default on a host. Possible values: 0 - not default; 1 - default. Property behavior: - *required* for create operations
details	object	Additional details object for interface. Property behavior: - *required* if `type` is set to ”SNMP”

Property	Type	Description
disable_until	timestamp	The next polling time of an unavailable host interface. Property behavior: - *read-only*
error	string	Error text if host interface is unavailable. Property behavior: - *read-only*
errors_from	timestamp	Time when host interface became unavailable. Property behavior: - *read-only*

Details

The details object has the following properties.

Property	Type	Description
version	integer	SNMP interface version. Possible values: 1 - SNMPv1; 2 - SNMPv2c; 3 - SNMPv3. Property behavior: - *required*
bulk	integer	Whether to use bulk SNMP requests. Possible values: 0 - don't use bulk requests; 1 - (default) - use bulk requests.
community	string	SNMP community. Used only by SNMPv1 and SNMPv2 interfaces. Property behavior: - *required* if `version` is set to "SNMPv1" or "SNMPv2c"
max_repetitions	integer	Max repetition value for native SNMP bulk requests (GetBulkRequest-PDUs). Used only for `discovery[]` and `walk[]` items in SNMPv2 and v3. Default: 10.
securityname	string	SNMPv3 security name. Used only by SNMPv3 interfaces.
securitylevel	integer	SNMPv3 security level. Used only by SNMPv3 interfaces. Possible values: 0 - (default) - noAuthNoPriv; 1 - authNoPriv; 2 - authPriv.
authpassphrase	string	SNMPv3 authentication passphrase. Used only by SNMPv3 interfaces.
privpassphrase	string	SNMPv3 privacy passphrase. Used only by SNMPv3 interfaces.
authprotocol	integer	SNMPv3 authentication protocol. Used only by SNMPv3 interfaces. Possible values: 0 - (default) - MD5; 1 - SHA1; 2 - SHA224; 3 - SHA256; 4 - SHA384; 5 - SHA512.

Property	Type	Description
privprotocol	integer	SNMPv3 privacy protocol. Used only by SNMPv3 interfaces. Possible values: 0 - (default) - DES; 1 - AES128; 2 - AES192; 3 - AES256; 4 - AES192C; 5 - AES256C.
contextname	string	SNMPv3 context name. Used only by SNMPv3 interfaces.

hostinterface.get

Description

`integer/array hostinterface.get(object parameters)`

The method allows you to retrieve host interfaces according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
hostids	ID/array	Return only host interfaces used by the given hosts.
interfaceids	ID/array	Return only host interfaces with the given IDs.
itemids	ID/array	Return only host interfaces used by the given items.
triggerids	ID/array	Return only host interfaces used by items in the given triggers.
selectItems	query	Return an `items` property with the items that use the interface. Supports `count`.
selectHosts	query	Return a `hosts` property with an array of hosts that use the interface.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectItems`.
sortfield	string/array	Sort the result by the given properties. Possible values: `interfaceid`, `dns`, `ip`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve host interfaces

Retrieve all data about the interfaces used by host "30057."

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostinterface.get",
    "params": {
        "output": "extend",
        "hostids": "30057"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "interfaceid": "50039",
            "hostid": "30057",
            "main": "1",
            "type": "1",
            "useip": "0",
            "ip": "",
            "dns": "localhost",
            "port": "10050",
            "available": "0",
            "error": "",
            "errors_from": "0",
            "disable_until": "0",
            "details": []
        },
        {
            "interfaceid": "55082",
            "hostid": "30057",
            "main": "1",
            "type": "2",
            "useip": "1",
            "ip": "127.0.0.1",
            "dns": "",
            "port": "161",
            "available": "0",
            "error": "",
            "errors_from": "0",
            "disable_until": "0",
            "details": {
                "version": "2",
                "bulk": "0",
                "community": "{$SNMP_COMMUNITY}",
                "max_repetitions": "10"
            }
        }
    ],
    "id": 1
}
```

Host prototype

This class is designed to work with host prototypes.

Object references:

- Host prototype
- Group link
- Group prototype
- Host prototype tag
- Custom interface
    - Custom interface details

Available methods:

- hostprototype.create - create new host prototypes
- hostprototype.delete - delete host prototypes
- hostprototype.get - retrieve host prototypes
- hostprototype.update - update host prototypes

Host prototype object

The following objects are directly related to the `hostprototype` API.

Host prototype

The host prototype object has the following properties.

Property	Type	Description
hostid	ID	ID of the host prototype. Property behavior: - *read-only* - *required* for update operations
host	string	Technical name of the host prototype. Property behavior: - *required* for create operations - *read-only* for inherited objects
name	string	Visible name of the host prototype. Default: `host` property value. Property behavior: - *read-only* for inherited objects
status	integer	Status of the host prototype. Possible values: 0 - *(default)* monitored host; 1 - unmonitored host.
flags	integer	Origin of the host prototype. Possible values: 2 - a host prototype; 6 - a discovered host prototype Property behavior: - *read-only*

Property	Type	Description
inventory_mode	integer	Host inventory population mode. Possible values: -1 - *(default)* disabled; 0 - manual; 1 - automatic.
templateid	ID	ID of the parent template host prototype. Property behavior: - *read-only*
discover	integer	Host prototype discovery status. Possible values: 0 - *(default)* new hosts will be discovered; 1 - new hosts will not be discovered and existing hosts will be marked as lost.
custom_interfaces	integer	Source of custom interfaces for hosts created by the host prototype. Possible values: 0 - *(default)* inherit interfaces from parent host; 1 - use host prototypes custom interfaces. Property behavior: - *read-only* for inherited objects
uuid	string	Universal unique identifier, used for linking imported host prototypes to already existing ones. Auto-generated, if not given. Property behavior: - *supported* if the host prototype belongs to a template

Group link

The group link object links a host prototype with a host group. It has the following properties.

Property	Type	Description
groupid	ID	ID of the host group. Property behavior: - *required*

Group prototype

The group prototype object defines a group that will be created for a discovered host. It has the following properties.

Property	Type	Description
group_prototypeid	ID	ID of the group prototype. Property behavior: - *read-only*
name	string	Name of the group prototype. Property behavior: - *required* for create operations

Host prototype tag

The host prototype tag object has the following properties.

Property	Type	Description
tag	string	Host prototype tag name. Property behavior: - *required*
value	string	Host prototype tag value. Property behavior: - *read-only*.
object	integer	Type of object the tag was inherited from. Possible values: 0 - template. Property behavior: - *read-only*.
objectid	ID	ID of the object the tag was inherited from. Property behavior: - *read-only*.

Custom interface

Custom interfaces are supported if `custom_interfaces` of Host prototype object is set to ”use host prototypes custom interfaces”. The custom interface object has the following properties.

Property	Type	Description
type	integer	Interface type. Possible values: 1 - Agent; 2 - SNMP; 3 - IPMI; 4 - JMX. Property behavior: - *required*
useip	integer	Whether the connection should be made via IP. Possible values: 0 - connect using host DNS name; 1 - connect using host IP address. Property behavior: - *required*
ip	string	IP address used by the interface. Can contain macros. Property behavior: - *required* if `useip` is set to ”connect using host IP address”
dns	string	DNS name used by the interface. Can contain macros. Property behavior: - *required* if `useip` is set to ”connect using host DNS name”
port	string	Port number used by the interface. Can contain user and LLD macros. Property behavior: - *required*

Property	Type	Description
main	integer	Whether the interface is used as default on the host. Only one interface of some type can be set as default on a host. Possible values: 0 - not default; 1 - default. Property behavior: - *required*
details	object	Additional object for custom interface details. Property behavior: - *required* if `type` is set to ”SNMP”

Custom interface details

The details object has the following properties.

Property	Type	Description
version	integer	SNMP interface version. Possible values: 1 - SNMPv1; 2 - SNMPv2c; 3 - SNMPv3. Property behavior: - *required*
bulk	integer	Whether to use bulk SNMP requests. Possible values: 0 - don’t use bulk requests; 1 - *(default)* - use bulk requests.
community	string	SNMP community. Property behavior: - *required* if `version` is set to ”SNMPv1” or ”SNMPv2c”
max_repetitions	integer	Max repetition value for native SNMP bulk requests (GetBulkRequest-PDUs). Used only for `discovery[]` and `walk[]` items in SNMPv2 and v3. Default: 10.
securityname	string	SNMPv3 security name. Property behavior: - *supported* if `version` is set to ”SNMPv3”
securitylevel	integer	SNMPv3 security level. Possible values: 0 - *(default)* - noAuthNoPriv; 1 - authNoPriv; 2 - authPriv. Property behavior: - *supported* if `version` is set to ”SNMPv3”
authpassphrase	string	SNMPv3 authentication passphrase. Property behavior: - *supported* if `version` is set to ”SNMPv3” and `securitylevel` is set to ”authNoPriv” or ”authPriv”

Property	Type	Description
privpassphrase	string	SNMPv3 privacy passphrase. Property behavior: - *supported* if `version` is set to ”SNMPv3” and `securitylevel` is set to ”authPriv”
authprotocol	integer	SNMPv3 authentication protocol. Possible values: 0 - *(default)* - MD5; 1 - SHA1; 2 - SHA224; 3 - SHA256; 4 - SHA384; 5 - SHA512. Property behavior: - *supported* if `version` is set to ”SNMPv3” and `securitylevel` is set to ”authNoPriv” or ”authPriv”
privprotocol	integer	SNMPv3 privacy protocol. Used only by SNMPv3 interfaces. Possible values: 0 - *(default)* - DES; 1 - AES128; 2 - AES192; 3 - AES256; 4 - AES192C; 5 - AES256C. Property behavior: - *supported* if `version` is set to ”SNMPv3” and `securitylevel` is set to ”authPriv”
contextname	string	SNMPv3 context name. Property behavior: - *supported* if `version` is set to ”SNMPv3”

hostprototype.create

Description

`object hostprototype.create(object/array hostPrototypes)`

This method allows you to create new host prototypes.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Host prototypes to create.

Additionally to the standard host prototype properties, the method accepts the following parameters.

Parameter	Type	Description
groupLinks	array	Group links to be created for the host prototype. Parameter behavior: - *required*

Parameter	Type	Description
ruleid	ID	ID of the LLD rule that the host prototype belongs to. Parameter behavior: - *required*
groupPrototypes	array	Group prototypes to be created for the host prototype.
macros	object/array	User macros to be created for the host prototype.
tags	object/array	Host prototype tags.
interfaces	object/array	Host prototype custom interfaces.
templates	object/array	Templates to be linked to the host prototype. The templates must have only the `templateid` property defined.

Return values

(`object`) Returns an object containing the IDs of the created host prototypes under the `hostids` property. The order of the returned IDs matches the order of the passed host prototypes.

Examples

Creating a host prototype

Create a host prototype "{#VM.NAME}" on LLD rule "23542" with a group prototype "{#HV.NAME}", tag pair "datacenter": "{#DATACENTER.NAME}" and custom SNMPv2 interface 127.0.0.1:161 with community {$SNMP_COMMUNITY}. Link it to host group "2".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostprototype.create",
    "params": {
        "host": "{#VM.NAME}",
        "ruleid": "23542",
        "custom_interfaces": "1",
        "groupLinks": [
            {
                "groupid": "2"
            }
        ],
        "groupPrototypes": [
            {
                "name": "{#HV.NAME}"
            }
        ],
        "tags": [
            {
                "tag": "datacenter",
                "value": "{#DATACENTER.NAME}"
            }
        ],
        "interfaces": [
            {
                "main": "1",
                "type": "2",
                "useip": "1",
                "ip": "127.0.0.1",
                "dns": "",
                "port": "161",
                "details": {
                    "version": "2",
                    "bulk": "1",
                    "community": "{$SNMP_COMMUNITY}"
                }
            }
```

```
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10103"
        ]
    },
    "id": 1
}
```

hostprototype.delete

Description

`object hostprototype.delete(array hostPrototypeIds)`

This method allows you to delete host prototypes.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the host prototypes to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted host prototypes under the `hostids` property.

Examples

Deleting multiple host prototypes

Delete two host prototypes.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostprototype.delete",
    "params": [
        "10103",
        "10105"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10103",
            "10105"
        ]
    },
    "id": 1
}
```

Source

CHostPrototype::delete() in *ui/include/classes/api/services/CHostPrototype.php*.

hostprototype.get

Description

`integer/array hostprototype.get(object parameters)`

The method allows you to retrieve host prototypes according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
hostids	ID/array	Return only host prototypes with the given IDs.
discoveryids	ID/array	Return only host prototypes that belong to the given LLD rules.
inherited	boolean	If set to `true` return only items inherited from a template.
selectDiscoveryData	query	Return a `discoveryData` property with the host prototype discovery object data. The host prototype discovery object links a discovered host prototype to a host prototype from which it was discovered. It has the following properties: `host` - `(string)` ID of the host; `parent_hostid` - `(string)` ID of the host prototype from which the host prototype has been created; `status` - `(int)` host prototype discovery status: 0 - *(default)* host prototype is discovered, 1 - host prototype is not discovered anymore; `ts_delete` - `(timestamp)` time when a host prototype that is no longer discovered will be deleted; `ts_disable` - `(timestamp)` time when a host prototype that is no longer discovered will be disabled; `disable_source` - `(int)` indicator of whether host prototype was disabled by an LLD rule or manually: 0 - *(default)* disabled automatically, 1 - disabled by an LLD rule.
selectDiscoveryRule	query	Return a `discoveryRule` property with the LLD rule that the host prototype belongs to.
selectDiscoveryRulePrototype	query	Return a `discoveryRulePrototype` property with the parent LLD rule prototype that the host prototype belongs to.
selectInterfaces	query	Return an `interfaces` property with host prototype custom interfaces.
selectGroupLinks	query	Return a `groupLinks` property with the group links of the host prototype.

Parameter	Type	Description
selectGroupPrototypes	query	Return a `groupPrototypes` property with the group prototypes of the host prototype.
selectInheritedTags	query	Return an `inheritedTags` property with tags that are on linked templates.
selectMacros	query	Return a `macros` property with host prototype macros.
selectParentHost	query	Return a `parentHost` property with the host that the host prototype belongs to.
selectTags	query	Return a `tags` property with host prototype tags.
selectTemplates	query	Return a `templates` property with the templates linked to the host prototype. Supports `count`.
sortfield	string/array	Sort the result by the given properties. Possible values: `hostid`, `host`, `name`, `status`, `discovered`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieving host prototypes from an LLD rule

Retrieve all host prototypes, their group links, group prototypes and tags from an LLD rule.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostprototype.get",
    "params": {
        "output": "extend",
        "selectInterfaces": "extend",
        "selectGroupLinks": "extend",
        "selectGroupPrototypes": "extend",
        "selectTags": "extend",
        "discoveryids": "23554"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "hostid": "10092",
            "host": "{#HV.UUID}",
```

CHostPrototype::get() in *ui/include/classes/api/services/CHostPrototype.php*.

hostprototype.update

Description

`object hostprototype.update(object/array hostPrototypes)`

This method allows you to update existing host prototypes.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Host prototype properties to be updated.

The `hostid` property must be defined for each host prototype, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard host prototype properties, the method accepts the following parameters.

Parameter	Type	Description
groupLinks	array	Group links to replace the current group links on the host prototype. Parameter behavior: - *read-only* for inherited objects
groupPrototypes	array	Group prototypes to replace the existing group prototypes on the host prototype. All group prototypes that are not listed in the request will be removed. Parameter behavior: - *read-only* for inherited objects
macros	object/array	User macros to replace the current user macros. All macros that are not listed in the request will be removed.
tags	object/array	Host prototype tags to replace the current tags. All tags that are not listed in the request will be removed.
interfaces	object/array	Parameter behavior: - *read-only* for inherited objects Host prototype custom interfaces to replace the current interfaces. Custom interface object should contain all its parameters. All interfaces that are not listed in the request will be removed. Parameter behavior: - *supported* if `custom_interfaces` of Host prototype object is set to "use host prototypes custom interfaces" - *read-only* for inherited objects
templates	object/array	Templates to replace the currently linked templates. The templates must have only the `templateid` property defined.

Return values

`(object)` Returns an object containing the IDs of the updated host prototypes under the `hostids` property.

Examples

Disabling a host prototype

Disable a host prototype, that is, set its status to "1".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostprototype.update",
    "params": {
        "hostid": "10092",
        "status": 1
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10092"
        ]
    },
    "id": 1
}
```

Updating host prototype tags

Replace host prototype tags with new ones.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostprototype.update",
    "params": {
        "hostid": "10092",
        "tags": [
            {
                "tag": "datacenter",
                "value": "{#DATACENTER.NAME}"
            },
            {
                "tag": "instance-type",
                "value": "{#INSTANCE_TYPE}"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10092"
        ]
    },
    "id": 1
}
```

Updating host prototype custom interfaces

Replace inherited interfaces with host prototype custom interfaces.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "hostprototype.update",
    "params": {
        "hostid": "10092",
        "custom_interfaces": "1",
        "interfaces": [
            {
                "main": "1",
                "type": "2",
                "useip": "1",
                "ip": "127.0.0.1",
                "dns": "",
                "port": "161",
                "details": {
                    "version": "2",
                    "bulk": "1",
                    "community": "{$SNMP_COMMUNITY}"
                }
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hostids": [
            "10092"
        ]
    },
    "id": 1
}
```

CHostPrototype::update() in *ui/include/classes/api/services/CHostPrototype.php*.

Housekeeping

This class is designed to work with housekeeping.

Object references:

- Housekeeping

Available methods:

- housekeeping.get - retrieve housekeeping
- housekeeping.update - update housekeeping

Housekeeping object

The following objects are directly related to the `housekeeping` API.

Housekeeping

The settings object has the following properties.

Property	Type	Description
hk_events_mode	integer	Enable internal housekeeping for events and alerts. Possible values: 0 - Disable; 1 - *(default)* Enable.
hk_events_trigger	string	Trigger data storage period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Default: 365d.
hk_events_service	string	Service data storage period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Default: 1d.
hk_events_internal	string	Internal data storage period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Default: 1d.
hk_events_discovery	string	Network discovery data storage period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Default: 1d.
hk_events_autoreg	string	Autoregistration data storage period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Default: 1d.
hk_services_mode	integer	Enable internal housekeeping for services. Possible values: 0 - Disable; 1 - *(default)* Enable.
hk_services	string	Services data storage period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Default: 365d.
hk_audit_mode	integer	Enable internal housekeeping for audit. Possible values: 0 - Disable; 1 - *(default)* Enable.
hk_audit	string	Audit data storage period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Default: 31d.
hk_sessions_mode	integer	Enable internal housekeeping for sessions. Possible values: 0 - Disable; 1 - *(default)* Enable.
hk_sessions	string	Sessions data storage period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Default: 31d.
hk_history_mode	integer	Enable internal housekeeping for history. Possible values: 0 - Disable; 1 - *(default)* Enable.

Property	Type	Description
hk_history_global	integer	Override item history period. Possible values: 0 - Do not override; 1 - *(default)* Override.
hk_history	string	History data storage period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Default: 31d.
hk_trends_mode	integer	Enable internal housekeeping for trends. Possible values: 0 - Disable; 1 - *(default)* Enable.
hk_trends_global	integer	Override item trend period. Possible values: 0 - Do not override; 1 - *(default)* Override.
hk_trends	string	Trends data storage period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Default: 365d.
db_extension	string	Configuration flag DB extension. If this flag is set to ”timescaledb” then the server changes its behavior for housekeeping and item deletion. Property behavior: - *read-only*
compression_availability	integer	Whether data compression is supported by the database (or its extension). Possible values: 0 - Unavailable; 1 - Available. Property behavior: - *read-only*
compression_status	integer	Enable TimescaleDB compression for history and trends. Possible values: 0 - *(default)* Off; 1 - On.
compress_older	string	Compress history and trends records older than specified period. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Default: 7d.

housekeeping.get

Description

`object housekeeping.get(object parameters)`

The method allows you to retrieve housekeeping object according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

(object) Parameters defining the desired output.

The method supports only one parameter.

Parameter	Type	Description
output	query	This parameter is described in the reference commentary.

Return values

(object) Returns housekeeping object.

Examples

Request:

```
{
    "jsonrpc": "2.0",
    "method": "housekeeping.get",
    "params": {
        "output": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "hk_events_mode": "1",
        "hk_events_trigger": "365d",
        "hk_events_service": "1d",
        "hk_events_internal": "1d",
        "hk_events_discovery": "1d",
        "hk_events_autoreg": "1d",
        "hk_services_mode": "1",
        "hk_services": "365d",
        "hk_audit_mode": "1",
        "hk_audit": "31d",
        "hk_sessions_mode": "1",
        "hk_sessions": "365d",
        "hk_history_mode": "1",
        "hk_history_global": "0",
        "hk_history": "31d",
        "hk_trends_mode": "1",
        "hk_trends_global": "0",
        "hk_trends": "365d",
        "db_extension": "",
        "compression_status": "0",
        "compress_older": "7d"
    },
    "id": 1
}
```

CHousekeeping ::get() in *ui/include/classes/api/services/CHousekeeping.php*.

housekeeping.update

Description

`object housekeeping.update(object housekeeping)`

This method allows you to update existing housekeeping settings.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Housekeeping properties to be updated.

Return values

`(array)` Returns an array with the names of updated parameters.

Examples

Request:

```
{
    "jsonrpc": "2.0",
    "method": "housekeeping.update",
    "params": {
        "hk_events_mode": "1",
        "hk_events_trigger": "200d",
        "hk_events_internal": "2d",
        "hk_events_discovery": "2d"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        "hk_events_mode",
        "hk_events_trigger",
        "hk_events_internal",
        "hk_events_discovery"
    ],
    "id": 1
}
```

CHousekeeping::update() in *ui/include/classes/api/services/CHousekeeping.php*.

Icon map

This class is designed to work with icon maps.

Object references:

- Icon map
- Icon mapping

Available methods:

- iconmap.create - create new icon maps
- iconmap.delete - delete icon maps
- iconmap.get - retrieve icon maps
- iconmap.update - update icon maps

Icon map object

The following objects are directly related to the `iconmap` API.

Icon map

The icon map object has the following properties.

Property	Type	Description
iconmapid	ID	ID of the icon map. Property behavior: - *read-only* - *required* for update operations
default_iconid	ID	ID of the default icon. Property behavior: - *required* for create operations
name	string	Name of the icon map. Property behavior: - *required* for create operations

Icon mapping

The icon mapping object defines a specific icon to be used for hosts with a certain inventory field value. It has the following properties.

Property	Type	Description
iconid	ID	ID of the icon used by the icon mapping. Property behavior: - *required*
expression	string	Expression to match the inventory field against. Property behavior: - *required*
inventory_link	integer	ID of the host inventory field. Refer to the host inventory object for a list of supported inventory fields. Property behavior: - *required*
sortorder	integer	Position of the icon mapping in the icon map. Property behavior: - *read-only*

iconmap.create

Description

`object iconmap.create(object/array iconMaps)`

This method allows you to create new icon maps.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Icon maps to create.

Additionally to the standard icon map properties, the method accepts the following parameters.

Parameter	Type	Description
mappings	array	Icon mappings to be created for the icon map. Parameter behavior: - *required*

Return values

(object) Returns an object containing the IDs of the created icon maps under the iconmapids property. The order of the returned IDs matches the order of the passed icon maps.

Examples

Create an icon map

Create an icon map to display hosts of different types.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "iconmap.create",
    "params": {
        "name": "Type icons",
        "default_iconid": "2",
        "mappings": [
            {
                "inventory_link": 1,
                "expression": "server",
                "iconid": "3"
            },
            {
                "inventory_link": 1,
                "expression": "switch",
                "iconid": "4"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "iconmapids": [
            "2"
        ]
    },
    "id": 1
}
```

iconmap.delete

Description

`object iconmap.delete(array iconMapIds)`

This method allows you to delete icon maps.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the icon maps to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted icon maps under the `iconmapids` property.

Examples

Delete multiple icon maps

Delete two icon maps.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "iconmap.delete",
    "params": [
        "2",
        "5"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "iconmapids": [
            "2",
            "5"
        ]
    },
    "id": 1
}
```

iconmap.get

Description

`integer/array iconmap.get(object parameters)`

The method allows you to retrieve icon maps according to the given parameters.

Note:
This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
iconmapids	ID/array	Return only icon maps with the given IDs.
sysmapids	ID/array	Return only icon maps that are used in the given maps.
selectMappings	query	Return a `mappings` property with the icon mappings used.

Parameter	Type	Description
sortfield	string/array	Sort the result by the given properties. Possible values: `iconmapid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve an icon map

Retrieve all data about icon map "3".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "iconmap.get",
    "params": {
        "iconmapids": "3",
        "output": "extend",
        "selectMappings": "extend"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "mappings": [
                {
                    "iconmappingid": "3",
                    "iconmapid": "3",
                    "iconid": "6",
                    "inventory_link": "1",
                    "expression": "server",
                    "sortorder": "0"
                },
                {
                    "iconmappingid": "4",
                    "iconmapid": "3",
                    "iconid": "10",
                    "inventory_link": "1",
                    "expression": "switch",
                    "sortorder": "1"
                }
```

```
            ],
            "iconmapid": "3",
            "name": "Host type icons",
            "default_iconid": "2"
        }
    ],
    "id": 1
}
```

iconmap.update

Description

`object iconmap.update(object/array iconMaps)`

This method allows you to update existing icon maps.

Note:
This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Icon map properties to be updated.

The `iconmapid` property must be defined for each icon map, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard icon map properties, the method accepts the following parameters.

Parameter	Type	Description
mappings	array	Icon mappings to replace the existing icon mappings.

Return values

`(object)` Returns an object containing the IDs of the updated icon maps under the `iconmapids` property.

Examples

Rename icon map

Rename an icon map to "OS icons".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "iconmap.update",
    "params": {
        "iconmapid": "1",
        "name": "OS icons"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
```

```
        "iconmapids": [
            "1"
        ]
    },
    "id": 1
}
```

Image

This class is designed to work with images.

Object references:

- Image

Available methods:

- image.create - create new images
- image.delete - delete images
- image.get - retrieve images
- image.update - update images

Image object

The following objects are directly related to the `image` API.

Image

The image object has the following properties.

Property	Type	Description
imageid	ID	ID of the image. Property behavior: - *read-only* - *required* for update operations
name	string	Name of the image. Property behavior: - *required* for create operations
imagetype	integer	Type of image. Possible values: 1 - *(default)* icon; 2 - background image. Property behavior: - *constant* - *required* for create operations
image	string	Base64 encoded image. The maximum size of the encoded image is 1 MB. Maximum size can be adjusted by changing `ZBX_MAX_IMAGE_SIZE` constant value. Supported image formats: PNG, JPEG, GIF, and WebP. Property behavior: - *required* for create operations

image.create

Description

`object image.create(object/array images)`

This method allows you to create new images.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Images to create.

The method accepts images with the standard image properties.

Return values

`(object)` Returns an object containing the IDs of the created images under the `imageids` property. The order of the returned IDs matches the order of the passed images.

Examples

Create an icon image

Create a cloud icon.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "image.create",
    "params": {
        "imagetype": 1,
        "name": "Cloud_(24)",
        "image": "iVBORw0KGgoAAAANSUhEUgAAABgAAAANCAYAAACzbK7QAAAABHNCSVQICAgIfAhkiAAAAAlwSFlzAAACmAAAApgB
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "imageids": [
            "188"
        ]
    },
    "id": 1
}
```

Create a background image

Create a small background image to be used as a pattern.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "image.create",
    "params": {
        "imagetype": 2,
        "name": "background_image",
        "image": "iVBORw0KGgoAAAANSUhEUgAAABgAAAAYCAIAAABvFaqvAAABhWlDQ1BJQ0MgcHJvZmlsZQAAKJF9kb1Lw0AYxp+m
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "imageids": [
            "189"
        ]
    },
    "id": 1
}
```

Source

CImage::create() in *ui/include/classes/api/services/CImage.php*.

image.delete

Description

`object image.delete(array imageIds)`

This method allows you to delete images.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the images to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted images under the `imageids` property.

Examples

Delete multiple images

Delete two images.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "image.delete",
    "params": [
        "188",
        "192"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "imageids": [
            "188",
            "192"
        ]
    },
    "id": 1
}
```

image.get

Description

`integer/array image.get(object parameters)`

The method allows you to retrieve images according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
imageids	ID/array	Return only images with the given IDs.
sysmapids	ID/array	Return images that are used on the given maps.
select_image	flag	Return an `image` property with the Base64 encoded image.
sortfield	string/array	Sort the result by the given properties. Possible values: `imageid`, `name`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
filter	object	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	

Return values

`(integer/array)` Returns either:

- an array of objects;
- the count of retrieved objects, if the `countOutput` parameter has been used.

Examples

Retrieve an image

Retrieve all data for image with ID "2".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "image.get",
    "params": {
        "output": "extend",
        "select_image": true,
        "imageids": "2"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "imageid": "2",
            "imagetype": "1",
            "name": "Cloud_(24)",
            "image": "iVBORw0KGgoAAAANSUhEUgAAABgAAAANCAYAAACzbK7QAAAABHNCSVQICAgIfAhkiAAAAAlwSFlzAAACmAAA
        }
    ],
    "id": 1
}
```

Source

CImage::get() in *ui/include/classes/api/services/CImage.php*.

image.update

Description

`object image.update(object/array images)`

This method allows you to update existing images.

> **Note:**
> This method is only available to *Super admin* user type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Image properties to be updated.

The `imageid` property must be defined for each image, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

The method accepts images with the standard image properties.

Return values

`(object)` Returns an object containing the IDs of the updated images under the `imageids` property.

Examples

Rename image

Rename image to ”Cloud icon”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "image.update",
    "params": {
        "imageid": "2",
        "name": "Cloud icon"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "imageids": [
            "2"
        ]
    },
```

```
    "id": 1
}
```

CImage::update() in *ui/include/classes/api/services/CImage.php*.

Item

This class is designed to work with items.

Object references:

- Item
  - HTTP header
  - HTTP query field
- Item tag
- Item preprocessing

Available methods:

- item.create - create new items
- item.delete - delete items
- item.get - retrieve items
- item.update - update items

Item object

The following objects are directly related to the `item` API.

Item

Note:
Web items cannot be directly created, updated or deleted via the Zabbix API.

The item object has the following properties.

Property	Type	Description
itemid	ID	ID of the item. Property behavior: - *read-only* - *required* for update operations

Property	Type	Description
delay	string	Update interval of the item. Accepts a number of seconds (e.g., 1, 60, 300), a value with a time suffix (e.g., 30s, 1m, 2h, 1d), or, optionally, one or more custom intervals, all separated by semicolons. Custom intervals can be a mix of flexible and scheduling intervals. Accepts user macros. If used, the value must be a single macro. Multiple macros or macros mixed with text are not supported. Flexible intervals may be written as two macros separated by a forward slash (e.g., {$FLEX_INTERVAL}/{$FLEX_PERIOD}). Example: 1h;wd1-5h9-18;{$Macro1}/1-7,00:00-24:00;0/6-7,12:00-24:00;{$Macr Property behavior: - *required* if type is set to ”Zabbix agent” (0), ”Simple check” (3), ”Zabbix internal” (5), ”External check” (10), ”Database monitor” (11), ”IPMI agent” (12), ”SSH agent” (13), ”TELNET agent” (14), ”Calculated” (15), ”JMX agent” (16), ”HTTP agent” (19), ”SNMP agent” (20), ”Script” (21), ”Browser” (22), ”Telemetry query” (24), or if type is set to ”Zabbix agent (active)” (7) and key_ does not contain ”mqtt.get”
hostid	ID	ID of the host or template that the item belongs to. Property behavior: - *constant* - *required* for create operations
interfaceid	ID	ID of the item’s host interface. Property behavior: - *required* if item belongs to host and type is set to ”Zabbix agent”, ”IPMI agent”, ”JMX agent”, ”SNMP trap”, or ”SNMP agent” - *supported* if item belongs to host and type is set to ”Simple check”, ”External check”, ”SSH agent”, ”TELNET agent”, or ”HTTP agent” - *read-only* for discovered objects
key_	string	Item key. Property behavior: - *required* for create operations - *read-only* for inherited objects or discovered objects
name	string	Name of the item. Supports user macros. Property behavior: - *required* for create operations - *read-only* for inherited objects or discovered objects
name_resolved	string	Name of the item with resolved user macros. Property behavior: - *read-only*

Property	Type	Description
type	integer	Type of the item. Possible values: 0 - Zabbix agent; 2 - Zabbix trapper; 3 - Simple check; 5 - Zabbix internal; 7 - Zabbix agent (active); 9 - Web item; 10 - External check; 11 - Database monitor; 12 - IPMI agent; 13 - SSH agent; 14 - TELNET agent; 15 - Calculated; 16 - JMX agent; 17 - SNMP trap; 18 - Dependent item; 19 - HTTP agent; 20 - SNMP agent; 21 - Script; 22 - Browser; 24 - Telemetry query. Property behavior: - *required* for create operations - *read-only* for inherited objects or discovered objects
url	string	URL string. Supports user macros, {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {HOST.PORT}, {ITEM.ID}, {ITEM.KEY}. Property behavior: - *required* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects
value_type	integer	Type of information of the item. Possible values: 0 - numeric float; 1 - character; 2 - log; 3 - numeric unsigned; 4 - text; 5 - binary; 6 - JSON. Property behavior: - *required* for create operations - *read-only* for inherited objects or discovered objects
allow_traps	integer	Allow the value to be populated similarly to the trapper item. 0 - *(default)* Do not accept incoming data; 1 - Accept incoming data. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for discovered objects

Property	Type	Description
authtype	integer	Authentication method. Possible values if `type` is set to ”SSH agent”: 0 - *(default)* password; 1 - public key. Possible values if `type` is set to ”HTTP agent”: 0 - *(default)* none; 1 - basic; 2 - NTLM; 3 - Kerberos; 4 - Digest. Property behavior: - *supported* if `type` is set to ”SSH agent” or ”HTTP agent” - *read-only* for inherited objects (if `type` is set to ”HTTP agent”) or discovered objects
description	string	Description of the item. Property behavior: - *read-only* for discovered objects
error	string	Error text if there are problems updating the item value. Property behavior: - *read-only*
flags	integer	Origin of the item. Possible values: 0 - a plain item; 4 - an item converted from prototype. Property behavior: - *read-only*
follow_redirects	integer	Follow response redirects while polling data. Possible values: 0 - Do not follow redirects; 1 - *(default)* Follow redirects. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects
headers	array	Array of headers that will be sent when performing an HTTP request. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects
history	string	A time unit of how long the history data should be stored. Also accepts user macro. Default: 31d. Property behavior: - *read-only* for discovered objects
http_proxy	string	HTTP(S) proxy connection string. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects

Property	Type	Description
inventory_link	integer	ID of the host inventory field that is populated by the item. Refer to the host inventory page for a list of supported host inventory fields and their IDs. Default: 0. Property behavior: - *supported* if `value_type` is set to ”numeric float”, ”character”, ”numeric unsigned”, or ”text” - *read-only* for discovered objects
ipmi_sensor	string	IPMI sensor. Property behavior: - *required* if `type` is set to ”IPMI agent” and `key_` is not set to ”ipmi.get” - *supported* if `type` is set to ”IPMI agent” - *read-only* for inherited objects or discovered objects
jmx_endpoint	string	JMX agent custom connection string. Default value: service:jmx:rmi:///jndi/rmi://{HOST.CONN}:{HOST.PORT}/jmxrmi Property behavior: - *supported* if `type` is set to ”JMX agent” - *read-only* for discovered objects
lastclock	timestamp	Time when the item value was last updated. By default, only values that fall within the last 24 hours are displayed. You can extend this time period by changing the value of *Max history display period* parameter in the *Administration > General* menu section. Property behavior: - *read-only*
lastns	integer	Nanoseconds when the item value was last updated. By default, only values that fall within the last 24 hours are displayed. You can extend this time period by changing the value of *Max history display period* parameter in the *Administration > General* menu section. Property behavior: - *read-only*
lastvalue	string	Last value of the item. By default, only values that fall within the last 24 hours are displayed. You can extend this time period by changing the value of *Max history display period* parameter in the *Administration > General* menu section. Property behavior: - *read-only*
logtimefmt	string	Format of the time in log entries. Property behavior: - *supported* if `value_type` is set to ”log” - *read-only* for inherited objects or discovered objects

Property	Type	Description
master_itemid	ID	ID of the master item. Property behavior: - *required* if `type` is set to ”Dependent item” - *read-only* for inherited objects or discovered objects
output_format	integer	Should the response be converted to JSON. 0 - *(default)* Store raw; 1 - Convert to JSON. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects
params	string	Additional parameters depending on the type of the item: - executed script for SSH agent and TELNET agent items; - SQL query for database monitor items; - formula for calculated items; - the script for script and browser items. Property behavior: - *required* if `type` is set to ”Database monitor”, ”SSH agent”, ”TELNET agent”, ”Calculated”, ”Script”, or ”Browser” - *read-only* for inherited objects (if `type` is set to ”Script” or ”Browser”) or discovered objects
parameters	object/array	Additional parameters if `type` is set to ”Script” or ”Browser”. Array of objects with `name` and `value` properties, where `name` must be unique. Property behavior: - *supported* if `type` is set to ”Script” or ”Browser” - *read-only* for inherited objects or discovered objects
password	string	Password for authentication. Property behavior: - *required* if `type` is set to ”JMX agent” and `username` is set - *supported* if `type` is set to ”Simple check”, ”SSH agent”, ”TELNET agent”, ”Database monitor”, or ”HTTP agent” - *read-only* for inherited objects (if `type` is set to ”HTTP agent”) or discovered objects
post_type	integer	Type of post data body stored in `posts` property. Possible values: 0 - *(default)* Raw data; 2 - JSON data; 3 - XML data. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects
posts	string	HTTP(S) request body data. Property behavior: - *required* if `type` is set to ”HTTP agent” and `post_type` is set to ”JSON data” or ”XML data” - *supported* if `type` is set to ”HTTP agent” and `post_type` is set to ”Raw data” - *read-only* for inherited objects or discovered objects

Property	Type	Description
prevvalue	string	Previous value of the item. By default, only values that fall within the last 24 hours are displayed. You can extend this time period by changing the value of *Max history display period* parameter in the *Administration > General* menu section. Property behavior: - *read-only*
privatekey	string	Name of the private key file. Property behavior: - *required* if `type` is set to ”SSH agent” and `authtype` is set to ”public key” - *read-only* for discovered objects
publickey	string	Name of the public key file. Property behavior: - *required* if `type` is set to ”SSH agent” and `authtype` is set to ”public key” - *read-only* for discovered objects
query_fields	array	Array of query fields that will be sent when performing an HTTP request. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects
request_method	integer	Type of request method. Possible values: 0 - *(default)* GET; 1 - POST; 2 - PUT; 3 - HEAD. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects
retrieve_mode	integer	What part of response should be stored. Possible values if `request_method` is set to ”GET”, ”POST”, or ”PUT”: 0 - *(default)* Body; 1 - Headers; 2 - Both body and headers will be stored. Possible values if `request_method` is set to ”HEAD”: 1 - Headers. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects
snmp_oid	string	SNMP OID. Property behavior: - *required* if `type` is set to ”SNMP agent” - *read-only* for inherited objects or discovered objects
ssl_cert_file	string	Public SSL Key file path. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects

Property	Type	Description
ssl_key_file	string	Private SSL Key file path. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects
ssl_key_password	string	Password for SSL Key file. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects
state	integer	State of the item. Possible values: 0 - *(default)* normal; 1 - not supported. Property behavior: - *read-only*
status	integer	Status of the item. Possible values: 0 - *(default)* enabled item; 1 - disabled item.
status_codes	string	Ranges of required HTTP status codes, separated by commas. Also supports user macros as part of comma separated list. Example: 200,200-`{$M}`,`{$M}`,200-400 Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects
templateid	ID	ID of the parent template item. *Hint*: Use the `hostid` property to specify the template that the item belongs to. Property behavior: - *read-only*
timeout	string	Item data polling request timeout. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 300`s`, 1`m`). Also accepts user macros. Possible values range: 1-600s. Default: ”” - use proxy/global settings. Property behavior: - *supported* if `type` is set to ”Zabbix agent” (0), ”Simple check” (3) and `key_` does not start with ”`vmware.`” and ”`icmpping`”, ”Zabbix agent (active)” (7), ”External check” (10), ”Database monitor” (11), ”SSH agent” (13), ”TELNET agent” (14), ”HTTP agent” (19), ”SNMP agent” (20) and `snmp_oid` starts with ”`walk[`” or ”`get[`”, ”Script” (21), ”Browser” (22) - *read-only* for inherited and discovered objects, - if the default value is applied and the item belongs to a host monitored by an inaccessible proxy or proxy group, the global timeout is used.

Property	Type	Description
trapper_hosts	string	Allowed hosts. Property behavior: - *readonly* for discovered objects - *supported* if `type` is set to ”Zabbix trapper”, or if `type` is set to ”HTTP agent” and `allow_traps` is set to ”Allow incoming data”. If the property is omitted, it is automatically set to the `{$TRAPPER.ALLOWED_HOSTS}` user macro (default value). By default, `{$TRAPPER.ALLOWED_HOSTS}` is `127.0.0.1,::1`. If the property is set to an empty string, incoming connections will be denied from all hosts.
trends	string	A time unit of how long the trends data should be stored. Also accepts user macro. Default: 365d. Property behavior: - *supported* if `value_type` is set to ”numeric float” or ”numeric unsigned” - *read-only* for discovered objects
units	string	Value units. Property behavior: - *supported* if `value_type` is set to ”numeric float” or ”numeric unsigned” - *read-only* for inherited objects or discovered objects
username	string	Username for authentication. Property behavior: - *required* if `type` is set to ”SSH agent”, ”TELNET agent”, or if `type` is set to ”JMX agent” and `password` is set - *supported* if `type` is set to ”Simple check”, ”Database monitor”, or ”HTTP agent” - *read-only* for inherited objects (if `type` is set to ”HTTP agent”) or discovered objects
uuid	string	Universal unique identifier, used for linking imported item to already existing ones. Auto-generated, if not given. Property behavior: - *supported* if the item belongs to a template
valuemapid	ID	ID of the associated value map. Property behavior: - *supported* if `value_type` is set to ”numeric float”, ”character”, or ”numeric unsigned” - *read-only* for inherited objects or discovered objects
verify_host	integer	Whether to validate that the host name for the connection matches the one in the host’s certificate. Possible values: 0 - *(default)* Do not validate; 1 - Validate. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects or discovered objects

Property	Type	Description
verify_peer	integer	Whether to validate that the host's certificate is authentic. Possible values: 0 - *(default)* Do not validate; 1 - Validate. Property behavior: - *supported* if `type` is set to "HTTP agent" - *read-only* for inherited objects or discovered objects
query	object	Telemetry query configuration. Defines what the item queries from the telemetry data source, how it filters the data, and how it aggregates the result. Property behavior: - *required* if `type` is set to "Telemetry query" - *read-only* for inherited objects or discovered objects
time_shift	string	How far back (before the current time) ends the time range that the item queries. Accepts a number of seconds (e.g., 1, 60, 300) or a value with a time suffix (e.g., `30s`, `1m`, `2h`, `1d`). Also accepts user macros. Possible values range: 0-86400s. Default: 15s. Property behavior: - *supported* if `type` is set to "Telemetry query"
lookback_limit	string	How far back (before the current time) the item queries for data when there is no previous query to continue from (e.g., on the item's first run), or when the previous query is older than `delay` (e.g., because Zabbix server was down). Accepts a number of seconds (e.g., 1, 60, 300) or a value with a time suffix (e.g., `30s`, `1m`, `2h`, `1d`). Also accepts user macros. Possible values range: 1-259200s. Default: 10m. Property behavior: - *supported* if `type` is set to "Telemetry query"
granularity	string	The length of a piece that the query's full time range is split into. Accepts a number of seconds (e.g., 1, 60, 300) or a value with a time suffix (e.g., `30s`, `1m`, `2h`, `1d`). Also accepts user macros. Possible values range: 1-86400s. Default: 15s. Property behavior: - *supported* if `type` is set to "Telemetry query"

HTTP header

The header object has the following properties:

Property	Type	Description
name	string	HTTP header name. Property behavior: - *required*
value	string	Header value. Property behavior: - *required*

HTTP query field

The query field object defines a name and value that is used to specify a URL parameter. It has the following properties:

Property	Type	Description
name	string	Name of the parameter. Property behavior: - *required*
value	string	Parameter value. Property behavior: - *required*

Telemetry query

The telemetry query object has the following properties.

Property	Type	Description
signal_type	integer	Signal type that the item queries. Possible values: 0 - Traces; 1 - Metrics; 2 - Logs. Property behavior: - *required*
metric_point_type	integer	Metric point type that the item queries. Possible values: 0 - Sum; 1 - Gauge; 2 - Histogram; 3 - Exponential histogram. Property behavior: - *required* if `signal_type` is set to ”Metrics”
columns	array	Array of telemetry data columns that the item queries. Can be empty. Property behavior: - *required*
aggregated_columns	array	Array of telemetry data aggregated columns that the item queries, and how it calculates a value from column records. Property behavior: - *required*
filter	object	Telemetry query filter for column records in the query. Property behavior: - *required*

Telemetry data columns

The telemetry data columns object has the following properties.

Property	Type	Description
column	string	Name of the telemetry data column that the item queries. See supported telemetry data columns. For multiple single-value columns, each `column` value must be unique. For multiple columns that hold key-value pairs, each `column` and `attribute_key` pair must be unique.
attribute_key	string	Name of the key that the item queries, within the column that holds key-value pairs. For multiple columns that hold key-value pairs, each `column` and `attribute_key` pair must be unique. Property behavior: - *required* if `column` is set to a column that holds key-value pairs

Telemetry data aggregated columns

The telemetry data aggregated columns object has the following properties.

Property	Type	Description
column	string	Name of the telemetry data column that the item queries. See supported telemetry data columns. For multiple columns, each `column` value must be unique. This property is not supported if `function` is set to ”Count”. Property behavior: - *required* if `function` is set to ”Min”, ”Max”, ”Average”, ”Sum”, or ”Percentile”
function	integer	Function that the item applies to the column records. Possible values: 1 - Min; 2 - Max; 3 - Average; 4 - Count; 5 - Sum; 8 - Percentile. Property behavior: - *required*
parameters	array	Percentile that the item calculates from the column records. Possible value: a number from 0 to 100, given as a string. Property behavior: - *required* if `function` is set to ”Percentile”
alias	string	Unique name for the calculated value, used to identify it in the item value. Each `alias` value must be unique. Property behavior: - *required*

Telemetry data filter

The telemetry data filter object has the following properties.

Property	Type	Description
conditions	array	Telemetry data filter conditions a record in a telemetry data column must meet. Property behavior: - *required*
evaltype	integer	Filter condition evaluation method. Possible values: 0 - And/Or; 1 - And; 2 - Or; 3 - Custom expression. Property behavior: - *required*
eval_formula	string	Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its `formulaid`. The value of `eval_formula` is equal to the value of `formula` for filters with a custom expression. Property behavior: - *read-only*
formula	string	User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its `formulaid`. The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted. Property behavior: - *required* if `evaltype` is set to ”Custom expression”

Telemetry data filter conditions

The telemetry data filter conditions object has the following properties.

Property	Type	Description
column	string	Name of the telemetry data column that the filter condition applies to. See supported telemetry data columns. Property behavior: - *required*
attribute_key	string	Name of the key that the condition applies to, within the column that holds key-value pairs. Property behavior: - *required* if `column` is set to a column that holds key-value pairs

Property	Type	Description
operator	integer	Filter condition operator. Possible values for single-value columns: 0 - Equals; 1 - Does not equal; 2 - Contains; 3 - Does not contain. Possible values for columns that hold key-value pairs: 0 - Equals; 1 - Does not equal; 12 - Exists. Property behavior: - *required*
value	string	Value to compare with. Property behavior: - *required* if `operator` is set to ”Equals”, ”Does not equal”, ”Contains” or ”Does not contain”
formulaid	string	Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. Property behavior: - *required* if `evaltype` of Telemetry query filter object is set to ”Custom expression”

Item tag

The item tag object has the following properties.

Property	Type	Description
tag	string	Item tag name. Property behavior: - *required*
value	string	Item tag value. Property behavior: - *read-only*.
object	integer	Type of object the tag was inherited from. Possible values: 0 - template; 1 - host. Property behavior: - *read-only*.
objectid	ID	ID of the object the tag was inherited from. Property behavior: - *read-only*.

Item preprocessing

The item preprocessing object has the following properties.

Property	Type	Description
type	integer	The preprocessing option type. Possible values: 1 - Custom multiplier; 2 - Right trim; 3 - Left trim; 4 - Trim; 5 - Regular expression; 6 - Boolean to decimal; 7 - Octal to decimal; 8 - Hexadecimal to decimal; 9 - Simple change; 10 - Change per second; 11 - XML XPath; 12 - JSONPath; 13 - In range; 14 - Matches regular expression; 15 - Does not match regular expression; 16 - Check for error in JSON; 17 - Check for error in XML; 18 - Check for error using regular expression; 19 - Discard unchanged; 20 - Discard unchanged with heartbeat; 21 - JavaScript; 22 - Prometheus pattern; 23 - Prometheus to JSON; 24 - CSV to JSON; 25 - Replace; 26 - Check unsupported; 27 - XML to JSON; 28 - SNMP walk value; 29 - SNMP walk to JSON; 30 - SNMP get value. Property behavior: - *required*
params	string	Additional parameters used by preprocessing option. Multiple parameters are separated by the newline (\n) character. If `type` is set to ”Check unsupported”, the parameters follow a `<scope>[\n<pattern>]` syntax, where *pattern* is a regular expression, and *scope* is one of: -1 - match any error; 0 - check if error message matches *pattern*; 1 - check if error message does not match *pattern*. Property behavior: - *required* if `type` is set to ”Custom multiplier” (1), ”Right trim” (2), ”Left trim” (3), ”Trim” (4), ”Regular expression” (5), ”XML XPath” (11), ”JSONPath” (12), ”In range” (13), ”Matches regular expression” (14), ”Does not match regular expression” (15), ”Check for error in JSON” (16), ”Check for error in XML” (17), ”Check for error using regular expression” (18), ”Discard unchanged with heartbeat” (20), ”JavaScript” (21), ”Prometheus pattern” (22), ”Prometheus to JSON” (23), ”CSV to JSON” (24), ”Replace” (25), Check unsupported (26), ”SNMP walk value” (28), ”SNMP walk to JSON” (29), or ”SNMP get value” (30)

Property	Type	Description
error_handler	integer	Action type used in case of preprocessing step failure. Possible values: 0 - Error message is set by Zabbix server; 1 - Discard value; 2 - Set custom value; 3 - Set custom error message. Possible values if `type` is set to ”Check unsupported”: 1 - Discard value; 2 - Set custom value; 3 - Set custom error message. Property behavior: - *required* if `type` is set to ”Custom multiplier” (1), ”Regular expression” (5), ”Boolean to decimal” (6), ”Octal to decimal” (7), ”Hexadecimal to decimal” (8), ”Simple change” (9), ”Change per second” (10), ”XML XPath” (11), ”JSONPath” (12), ”In range” (13), ”Matches regular expression” (14), ”Does not match regular expression” (15), ”Check for error in JSON” (16), ”Check for error in XML” (17), ”Check for error using regular expression” (18), ”Prometheus pattern” (22), ”Prometheus to JSON” (23), ”CSV to JSON” (24), ”Check unsupported” (26), ”XML to JSON” (27), ”SNMP walk value” (28), ”SNMP walk to JSON” (29), or ”SNMP get value” (30)
error_handler_params	string	Error handler parameters. Property behavior: - *required* if `error_handler` is set to ”Set custom value” or ”Set custom error message”

The following parameters and error handlers are supported for each preprocessing type.

Preprocessing type	Name	Parameter 1	Parameter 2	Parameter 3	Supported error handlers
1	Custom multiplier	number^1, 6^			0, 1, 2, 3
2	Right trim	list of characters[2]			
3	Left trim	list of characters[2]			
4	Trim	list of characters[2]			
5	Regular expression	pattern[3]	output[2]		0, 1, 2, 3
6	Boolean to decimal				0, 1, 2, 3
7	Octal to decimal				0, 1, 2, 3
8	Hexadecimal to decimal				0, 1, 2, 3

Preprocessing type	Name	Parameter 1	Parameter 2	Parameter 3	Supported error handlers
9	Simple change				0, 1, 2, 3
10	Change per second				0, 1, 2, 3
11	XML XPath	path[4]			0, 1, 2, 3
12	JSONPath	path[4]			0, 1, 2, 3
13	In range	min^1, 6^	max^1, 6^		0, 1, 2, 3
14	Matches regular expression	pattern[3]			0, 1, 2, 3
15	Does not match regular expression	pattern[3]			0, 1, 2, 3
16	Check for error in JSON	path[4]			0, 1, 2, 3
17	Check for error in XML	path[4]			0, 1, 2, 3
18	Check for error using regular expression	pattern[3]	output[2]		0, 1, 2, 3
19	Discard unchanged				
20	Discard unchanged with heartbeat	seconds^5, 6^			
21	JavaScript	script[2]			
22	Prometheus pattern	pattern^6, 7^	`value`, `label`, `function`	output^8, 9^	0, 1, 2, 3
23	Prometheus to JSON	pattern^6, 7^			0, 1, 2, 3

Preprocessing type	Name	Parameter 1	Parameter 2	Parameter 3	Supported error handlers
24	CSV to JSON	character[2]	character[2]	0,1	0, 1, 2, 3
25	Replace	search string[2]	replacement[2]		
26	Check unsupported	scope[1]	pattern^3, 6^		1, 2, 3
27	XML to JSON				0, 1, 2, 3
28	SNMP walk value	OID[2]	Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS		0, 1, 2, 3
29	SNMP walk to JSON[10]	Field name[2]	OID prefix[2]	Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS	0, 1, 2, 3
30	SNMP get value	Format: 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS			0, 1, 2, 3

[1] floating-point number (integers are converted to float values implicitly)
 [2] string
 [3] regular expression
 [4] JSONPath or XML XPath
 [5] positive integer (with support of time suffixes, e.g., 30s, 1m, 2h, 1d)
 [6] user macro
 [7] Prometheus pattern following the syntax: `<metric name>{<label name>="<label value>", ...} == <value>`. Each Prometheus pattern component (metric, label name, label value and metric value) can be user macro.
 [8] Prometheus output following the syntax: `<label name>` (can be a user macro) if `label` is selected as the second parameter.
 [9] One of the aggregation functions: `sum`, `min`, `max`, `avg`, `count` if `function` is selected as the second parameter.
 [10] Supports multiple "Field name,OID prefix,Format records" records delimited by a new line character.

item.create

Description

`object item.create(object/array items)`

This method allows you to create new items.

> **Note:**
> Web items cannot be created via the Zabbix API.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Items to create.

Additionally to the standard item properties, the method accepts the following parameters.

Parameter	Type	Description
preprocessing	array	Item preprocessing options.
tags	array	Item tags.

Return values

(object) Returns an object containing the IDs of the created items under the itemids property. The order of the returned IDs matches the order of the passed items.

Examples

Creating an item

Create a numeric Zabbix agent item with 2 item tags to monitor free disk space on host with ID "30074".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.create",
    "params": {
        "name": "Free disk space on /home/joe/",
        "key_": "vfs.fs.size[/home/joe/,free]",
        "hostid": "30074",
        "type": 0,
        "value_type": 3,
        "interfaceid": "30084",
        "tags": [
            {
                "tag": "component",
                "value": "storage"
            },
            {
                "tag": "equipment",
                "value": "workstation"
            }
        ],
        "delay": "30s"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "24758"
        ]
    },
    "id": 1
}
```

Creating a host inventory item

Create a Zabbix agent item to populate the host's "OS" inventory field.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.create",
    "params": {
        "name": "uname",
```

```
        "key_": "system.uname",
        "hostid": "30021",
        "type": 0,
        "interfaceid": "30007",
        "value_type": 1,
        "delay": "10s",
        "inventory_link": 5
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "24759"
        ]
    },
    "id": 1
}
```

Creating an item with preprocessing

Create an item using custom multiplier.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.create",
    "params": {
        "name": "Device uptime",
        "key_": "sysUpTime",
        "hostid": "10084",
        "type": 20,
        "snmp_oid": "SNMPv2-MIB::sysUpTime.0",
        "value_type": 1,
        "delay": "60s",
        "interfaceid": "83",
        "preprocessing": [
            {
                "type": 1,
                "params": "0.01",
                "error_handler": 1,
                "error_handler_params": ""
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "44210"
        ]
    },
    "id": 1
}
```

Creating dependent item

Create a dependent item for the master item with ID 24759. Only dependencies on the same host are allowed, therefore master and the dependent item should have the same hostid.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.create",
    "params": {
      "hostid": "30074",
      "name": "Dependent test item",
      "key_": "dependent.item",
      "type": 18,
      "master_itemid": "24759",
      "value_type": 2
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "44211"
        ]
    },
    "id": 1
}
```

Create HTTP agent item

Create POST request method item with JSON response preprocessing.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.create",
    "params": {
        "url":"http://127.0.0.1/http.php",
        "query_fields": [
            {
                "name": "mode",
                "value": "json"
            },
            {
                "name": "min",
                "value": "10"
            },
            {
                "name": "max",
                "value": "100"
            }
        ],
        "interfaceid": "1",
        "type": 19,
        "hostid": "10254",
        "delay": "5s",
        "key_": "json",
        "name": "HTTP agent example JSON",
        "value_type": 0,
        "output_format": 1,
        "preprocessing": [
            {
                "type": 12,
```

```
                "params": "$.random",
                "error_handler": 0,
                "error_handler_params": ""
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "23865"
        ]
    },
    "id": 1
}
```

Create script item

Create a simple data collection using a script item.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.create",
    "params": {
        "name": "Script example",
        "key_": "custom.script.item",
        "hostid": "12345",
        "type": 21,
        "value_type": 4,
        "params": "var request = new HttpRequest();\nreturn request.post(\"https://postman-echo.com/post\"
        "parameters": [
            {
                "name": "host",
                "value": "{HOST.CONN}"
            }
        ],
        "timeout": "6s",
        "delay": "30s"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "23865"
        ]
    },
    "id": 1
}
```

Source

CItem::create() in *ui/include/classes/api/services/CItem.php*.

item.delete

Description

`object item.delete(array itemIds)`

This method allows you to delete items.

> **Note:**
> Web items cannot be deleted via the Zabbix API.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the items to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted items under the `itemids` property.

Examples

Deleting multiple items

Delete two items.
 Dependent items and item prototypes are removed automatically if master item is deleted.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.delete",
    "params": [
        "22982",
        "22986"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "22982",
            "22986"
        ]
    },
    "id": 1
}
```

Source

CItem::delete() in *ui/include/classes/api/services/CItem.php*.

item.get

Description

`integer/array item.get(object parameters)`

The method allows you to retrieve items according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
itemids	ID/array	Return only items with the given IDs.
groupids	ID/array	Return only items that belong to the hosts from the given groups.
templateids	ID/array	Return only items that belong to the given templates.
hostids	ID/array	Return only items that belong to the given hosts.
proxyids	ID/array	Return only items that are monitored by the given proxies.
interfaceids	ID/array	Return only items that use the given host interfaces.
graphids	ID/array	Return only items that are used in the given graphs.
triggerids	ID/array	Return only items that are used in the given triggers.
webitems	flag	Include web items in the result.
inherited	boolean	If set to `true` return only items inherited from a template.
inheritedTags	boolean	Return items that have given `tags` also in host/template/linked templates. Possible values: `true` - template/host/linked templates must also have given tags; `false` - *(default)* tags from template/host/linked templates are ignored.
templated	boolean	If set to `true` return only items that belong to templates.
monitored	boolean	If set to `true` return only enabled items that belong to monitored hosts.
group	string	Return only items that belong to a group with the given name.
host	string	Return only items that belong to a host with the given name.
evaltype	integer	Tag evaluation method. Possible values: 0 - *(default)* And/Or; 2 - Or.
tags	array	Return only items with the given tags. Format: `[{"tag": "<tag>", "value": "<value>", "operator": "<operator>"}, ...]`. An empty array returns all items. Possible operator values: 0 - *(default)* Contains; 1 - Equals; 2 - Does not contain; 3 - Does not equal; 4 - Exists; 5 - Does not exist.
with_triggers	boolean	If set to `true` return only items that are used in triggers.
selectHosts	query	Return a `hosts` property with an array of hosts that the item belongs to.
selectInterfaces	query	Return an `interfaces` property with an array of host interfaces used by the item.
selectTriggers	query	Return a `triggers` property with the triggers that the item is used in. Supports `count`.
selectGraphs	query	Return a `graphs` property with the graphs that contain the item. Supports `count`.

Parameter	Type	Description
selectDiscoveryData	query	Return a `discoveryData` property with the item discovery object data. The item discovery object links a discovered item to an item prototype from which it was discovered. It has the following properties: `parent_itemid` - `(string)` ID of the item prototype from which the item has been created; `key_` - `(string)` key of the item prototype; `status` - `(int)` item discovery status: 0 - *(default)* item is discovered, 1 - item is not discovered anymore; `ts_delete` - `(timestamp)` time when an item that is no longer discovered will be deleted; `ts_disable` - `(timestamp)` time when an item that is no longer discovered will be disabled; `disable_source` - `(int)` indicator of whether item was disabled by an LLD rule or manually: 0 - *(default)* disabled automatically, 1 - disabled by an LLD rule.
selectDiscoveryRule	query	Return a `discoveryRule` property with the LLD rule that created the item.
selectInheritedTags	query	Return an `inheritedTags` property with tags that are on template/host/linked templates.
selectPreprocessing	query	Return a `preprocessing` property with item preprocessing options.
selectTags	query	Return the item tags in `tags` property.
selectValueMap	query	Return a `valuemap` property with item value map.
filter	object	Return only those results that exactly match the given filter. Accepts an object, where the keys are property names, and the values are either a single value or an array of values to match against. Does not support properties of `text` data type. Supports additional properties: `host` - technical name of the host that the item belongs to.
limitSelects	integer	Limits the number of records returned by subselects. Applies to the following subselects: `selectGraphs` - results will be sorted by `name`; `selectTriggers` - results will be sorted by `description`.
sortfield	string/array	Sort the result by the given properties. Possible values: `itemid`, `name`, `key_`, `delay`, `history`, `trends`, `type`, `status`.
countOutput	boolean	These parameters are described in the reference commentary.
editable	boolean	
excludeSearch	boolean	
limit	integer	
output	query	
preservekeys	boolean	
search	object	
searchByAny	boolean	
searchWildcardsEnabled	boolean	
sortorder	string/array	
startSearch	boolean	
selectItemDiscovery	query	Return an `itemDiscovery` property with the item discovery object. The item discovery object links the item to an item prototype from which it was created. This query is **deprecated**, please use `selectDiscoveryData` instead.

Return values

(integer/array) Returns either:

- an array of objects;
- the count of retrieved objects, if the countOutput parameter has been used.

Examples

Finding items by key

Retrieve all items used in triggers for specific host ID that have word ”system.cpu” in the item key and sort results by name.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.get",
    "params": {
        "output": "extend",
        "hostids": "10084",
        "with_triggers": true,
        "search": {
            "key_": "system.cpu"
        },
        "sortfield": "name"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "itemid": "42269",

Finding dependent items by key

Retrieve all dependent items from host with ID ”10116” that have the word ”apache” in the key.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.get",
    "params": {
        "output": "extend",
        "hostids": "10116",
        "search": {
            "key_": "apache"
        },
        "filter": {
            "type": 18
        }
    },
    "id": 1
```

```
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": [
        {
            "itemid": "25550",
            "type": "18",
            "snmp_oid": "",

Retrieving items with preprocessing rules

Retrieve all items and their preprocessing rules for specific host ID.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.get",
    "params": {
        "output": ["itemid", "name", "key_"],
        "selectPreprocessing": "extend",
        "hostids": "10254"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemid": "23865",
        "name": "HTTP agent example JSON",
        "key_": "json",
        "preprocessing": [
            {
                "type": "12",

Source

CItem::get() in *ui/include/classes/api/services/CItem.php*.

item.update

Description

`object item.update(object/array items)`

This method allows you to update existing items.

Note:
Web items cannot be updated via the Zabbix API.

Note:
This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Item properties to be updated.

The `itemid` property must be defined for each item, all other properties are optional. Only the passed properties will be updated, all others will remain unchanged.

Additionally to the standard item properties, the method accepts the following parameters.

Parameter	Type	Description
preprocessing	array	Item preprocessing options to replace the current preprocessing options. Parameter behavior: - *read-only* for inherited objects or discovered objects
tags	array	Item tags. Parameter behavior: - *read-only* for discovered objects

Return values

(object) Returns an object containing the IDs of the updated items under the itemids property.

Examples

Enabling an item

Enable an item, that is, set its status to "0".

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.update",
    "params": {
        "itemid": "10092",
        "status": 0
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "10092"
        ]
    },
    "id": 1
}
```

Update dependent item

Update Dependent item name and Master item ID. Only dependencies on same host are allowed, therefore Master and Dependent item should have same hostid.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.update",
    "params": {
        "name": "Dependent item updated name",
        "master_itemid": "25562",
        "itemid": "189019"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "189019"
        ]
    },
    "id": 1
}
```

Update HTTP agent item

Enable item value trapping.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.update",
    "params": {
        "itemid": "23856",
        "allow_traps": 1
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "23856"
        ]
    },
    "id": 1
}
```

Updating an item with preprocessing

Update an item with item preprocessing rule ”In range”.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.update",
    "params": {
        "itemid": "23856",
        "preprocessing": [
            {
                "type": 13,
                "params": "\n100",
                "error_handler": 1,
                "error_handler_params": ""
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "23856"
        ]
    },
    "id": 1
}
```

Updating a script item

Update a script item with a different script and remove unnecessary parameters that were used by previous script.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "item.update",
    "params": {
        "itemid": "23865",
```

```
        "parameters": [],
        "params": "Zabbix.log(3, 'Log test');\nreturn 1;"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "23865"
        ]
    },
    "id": 1
}
```

Source

CItem::update() in *ui/include/classes/api/services/CItem.php*.

Item prototype

This class is designed to work with item prototypes.

Object references:

- Item prototype
  - HTTP header
  - HTTP query field
- Item prototype tag
- Item prototype preprocessing

Available methods:

- itemprototype.create - create new item prototypes
- itemprototype.delete - delete item prototypes
- itemprototype.get - retrieve item prototypes
- itemprototype.update - update item prototypes

Item prototype object

The following objects are directly related to the `itemprototype` API.

Item prototype

The item prototype object has the following properties.

Property	Type	Description
itemid	ID	ID of the item prototype. Property behavior: - *read-only* - *required* for update operations

Property	Type	Description
delay	string	Update interval of the item prototype. Accepts a number of seconds (e.g., 1, 60, 300), a value with a time suffix (e.g., 30s, 1m, 2h, 1d), or, optionally, one or more custom intervals, all separated by semicolons. Custom intervals can be a mix of flexible and scheduling intervals. Accepts user macros and LLD macros. If used, the value must be a single macro. Multiple macros or macros mixed with text are not supported. Flexible intervals may be written as two macros separated by a forward slash (e.g., {$FLEX_INTERVAL}/{$FLEX_PERIOD}). Example: 1h;wd1-5h9-18;{$Macro1}/1-7,00:00-24:00;0/6-7,12:00-24:00;{$Macr Property behavior: - *required* if type is set to "Zabbix agent" (0), "Simple check" (3), "Zabbix internal" (5), "External check" (10), "Database monitor" (11), "IPMI agent" (12), "SSH agent" (13), "TELNET agent" (14), "Calculated" (15), "JMX agent" (16), "HTTP agent" (19), "SNMP agent" (20), "Script" (21), "Browser" (22), "Telemetry query" (24), or if type is set to "Zabbix agent (active)" (7) and key_ does not contain "mqtt.get"
hostid	ID	ID of the host that the item prototype belongs to. Property behavior: - *constant* - *required* for create operations
interfaceid	ID	ID of the item prototype's host interface. Property behavior: - *required* if item prototype belongs to host and type is set to "Zabbix agent", "IPMI agent", "JMX agent", "SNMP trap", or "SNMP agent" - *supported* if item prototype belongs to host and type is set to "Simple check", "External check", "SSH agent", "TELNET agent", or "HTTP agent"
key_	string	Item prototype key. Property behavior: - *required* for create operations - *read-only* for inherited objects
name	string	Name of the item prototype. Supports user macros. Property behavior: - *required* for create operations - *read-only* for inherited objects

Property	Type	Description
type	integer	Type of the item prototype. Possible values: 0 - Zabbix agent; 2 - Zabbix trapper; 3 - Simple check; 5 - Zabbix internal; 7 - Zabbix agent (active); 10 - External check; 11 - Database monitor; 12 - IPMI agent; 13 - SSH agent; 14 - TELNET agent; 15 - Calculated; 16 - JMX agent; 17 - SNMP trap; 18 - Dependent item; 19 - HTTP agent; 20 - SNMP agent; 21 - Script; 22 - Browser; 24 - Telemetry query. Property behavior: - *required* for create operations - *read-only* for inherited objects
url	string	URL string. Supports LLD macros, user macros, {HOST.IP}, {HOST.CONN}, {HOST.DNS}, {HOST.HOST}, {HOST.NAME}, {HOST.PORT}, {ITEM.ID}, {ITEM.KEY}. Property behavior: - *required* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
value_type	integer	Type of information of the item prototype. Possible values: 0 - numeric float; 1 - character; 2 - log; 3 - numeric unsigned; 4 - text; 5 - binary; 6 - JSON. Property behavior: - *required* for create operations - *read-only* for inherited objects
allow_traps	integer	Allow the value to be populated similarly to the trapper item. 0 - *(default)* Do not accept incoming data; 1 - Accept incoming data. Property behavior: - *supported* if `type` is set to ”HTTP agent”

Property	Type	Description
authtype	integer	Authentication method. Possible values if `type` is set to ”SSH agent”: 0 - *(default)* password; 1 - public key. Possible values if `type` is set to ”HTTP agent”: 0 - *(default)* none; 1 - basic; 2 - NTLM; 3 - Kerberos; 4 - Digest. Property behavior: - *supported* if `type` is set to ”SSH agent” or ”HTTP agent” - *read-only* for inherited objects (if `type` is set to ”HTTP agent”)
description	string	Description of the item prototype.
flags	integer	Origin of the item prototype. Possible values: 2 - an item prototype; 6 - a discovered item prototype Property behavior: - *read-only*
follow_redirects	integer	Follow response redirects while polling data. Possible values: 0 - Do not follow redirects; 1 - *(default)* Follow redirects. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
headers	array	Array of headers that will be sent when performing an HTTP request. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
history	string	A time unit of how long the history data should be stored. Also accepts user macro and LLD macro. Default: 31d.
http_proxy	string	HTTP(S) proxy connection string. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
ipmi_sensor	string	IPMI sensor. Property behavior: - *required* if `type` is set to ”IPMI agent” and `key_` is not set to ”ipmi.get” - *supported* if `type` is set to ”IPMI agent” - *read-only* for inherited objects
jmx_endpoint	string	JMX agent custom connection string. Default: service:jmx:rmi:///jndi/rmi://{HOST.CONN}:{HOST.PORT}/jmxrmi Property behavior: - *supported* if `type` is set to ”JMX agent”

Property	Type	Description
logtimefmt	string	Format of the time in log entries. Property behavior: - *supported* if `value_type` is set to ”log” - *read-only* for inherited objects
master_itemid	ID	ID of the master item. Property behavior: - *required* if `type` is set to ”Dependent item” - *read-only* for inherited objects
output_format	integer	Should the response be converted to JSON. Possible values: 0 - *(default)* Store raw; 1 - Convert to JSON. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
params	string	Additional parameters depending on the type of the item prototype: - executed script for SSH agent and TELNET agent item prototypes; - SQL query for database monitor item prototypes; - formula for calculated item prototypes; - the script for script and browser item prototypes. Property behavior: - *required* if `type` is set to ”Database monitor”, ”SSH agent”, ”TELNET agent”, ”Calculated”, ”Script”, or ”Browser” - *read-only* for inherited objects (if `type` is set to ”Script” or ”Browser”)
parameters	object/array	Additional parameters if `type` is set to ”Script” or ”Browser”. Array of objects with `name` and `value` properties, where `name` must be unique. Property behavior: - *supported* if `type` is set to ”Script” or ”Browser” - *read-only* for inherited objects
password	string	Password for authentication. Property behavior: - *required* if `type` is set to ”JMX agent” and `username` is set - *supported* if `type` is set to ”Simple check”, ”SSH agent”, ”TELNET agent”, ”Database monitor”, or ”HTTP agent” - *read-only* for inherited objects (if `type` is set to ”HTTP agent”)
post_type	integer	Type of post data body stored in `posts` property. Possible values: 0 - *(default)* Raw data. 2 - JSON data. 3 - XML data. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
posts	string	HTTP(S) request body data. Property behavior: - *required* if `type` is set to ”HTTP agent” and `post_type` is set to ”JSON data” or ”XML data” - *supported* if `type` is set to ”HTTP agent” and `post_type` is set to ”Raw data” - *read-only* for inherited objects

Property	Type	Description
privatekey	string	Name of the private key file. Property behavior: - *required* if `type` is set to ”SSH agent” and `authtype` is set to ”public key”
publickey	string	Name of the public key file. Property behavior: - *required* if `type` is set to ”SSH agent” and `authtype` is set to ”public key”
query_fields	array	Array of query fields that will be sent when performing an HTTP request. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
request_method	integer	Type of request method. Possible values: 0 - *(default)* GET; 1 - POST; 2 - PUT; 3 - HEAD. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
retrieve_mode	integer	What part of response should be stored. Possible values if `request_method` is set to ”GET”, ”POST”, or ”PUT”: 0 - *(default)* Body; 1 - Headers; 2 - Both body and headers will be stored. Possible values if `request_method` is set to ”HEAD”: 1 - Headers. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
snmp_oid	string	SNMP OID. Property behavior: - *required* if `type` is set to ”SNMP agent” - *read-only* for inherited objects
ssl_cert_file	string	Public SSL Key file path. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
ssl_key_file	string	Private SSL Key file path. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
ssl_key_password	string	Password for SSL Key file. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects

Property	Type	Description
status	integer	Status of the item prototype. Possible values: 0 - *(default)* enabled item prototype; 1 - disabled item prototype; 3 - unsupported item prototype.
status_codes	string	Ranges of required HTTP status codes, separated by commas. Also supports user macros or LLD macros as part of comma separated list. Example: 200,200-{$M},{$M},200-400 Property behavior: - *supported* if `type` is set to "HTTP agent" - *read-only* for inherited objects
templateid	ID	ID of the parent template item prototype. Property behavior: - *read-only*
timeout	string	Item data polling request timeout. Accepts a number of seconds (e.g., 1, 60, 300), or a value with a time suffix (e.g., 30s, 1m). Also accepts user macros and LLD macros. Possible values range: 1-600s. Default: "" - use proxy/global settings. Property behavior: - *supported* if `type` is set to "Zabbix agent" (0), "Simple check" (3) and `key_` does not start with "`vmware.`" and "`icmpping`", "Zabbix agent (active)" (7), "External check" (10), "Database monitor" (11), "SSH agent" (13), "TELNET agent" (14), "HTTP agent" (19), "SNMP agent" (20) and `snmp_oid` starts with "`walk[`" or "`get[`", "Script" (21), "Browser" (22) - *read-only* for inherited objects
trapper_hosts	string	Allowed hosts. Property behavior: - *supported* if `type` is set to "Zabbix trapper", or if `type` is set to "HTTP agent" and `allow_traps` is set to "Allow incoming data". If the property is omitted, it is automatically set to the `{$TRAPPER.ALLOWED_HOSTS}` user macro (default value). By default, `{$TRAPPER.ALLOWED_HOSTS}` is `127.0.0.1,::1`. If the property is set to an empty string, incoming connections will be denied from all hosts.
trends	string	A time unit of how long the trends data should be stored. Also accepts user macro and LLD macro. Default: 365d. Property behavior: - *supported* if `value_type` is set to "numeric float" or "numeric unsigned"
units	string	Value units. Property behavior: - *supported* if `value_type` is set to "numeric float" or "numeric unsigned" - *read-only* for inherited objects

Property	Type	Description
username	string	Username for authentication. Property behavior: - *required* if `type` is set to ”SSH agent” or ”TELNET agent”, or if `type` is set to ”JMX agent” and `password` is set - *supported* if `type` is set to ”Simple check”, ”Database monitor”, or ”HTTP agent” - *read-only* for inherited objects (if `type` is set to ”HTTP agent”)
uuid	string	Universal unique identifier, used for linking imported item prototypes to already existing ones. Auto-generated, if not given. Property behavior: - *supported* if the item prototype belongs to a template
valuemapid	ID	ID of the associated value map. Property behavior: - *supported* if `value_type` is set to ”numeric float”, ”character”, or ”numeric unsigned” - *read-only* for inherited objects
verify_host	integer	Whether to validate that the host name for the connection matches the one in the host’s certificate. Possible values: 0 - *(default)* Do not validate; 1 - Validate. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
verify_peer	integer	Whether to validate that the host’s certificate is authentic. Possible values: 0 - *(default)* Do not validate; 1 - Validate. Property behavior: - *supported* if `type` is set to ”HTTP agent” - *read-only* for inherited objects
discover	integer	Item prototype discovery status. Possible values: 0 - *(default)* new items will be discovered; 1 - new items will not be discovered and existing items will be marked as lost.
query	object	Telemetry query configuration. Defines what the item queries from the telemetry data source, how it filters the data, and how it aggregates the result. Property behavior: - *required* if `type` is set to ”Telemetry query” - *read-only* for inherited objects or discovered objects

Property	Type	Description
time_shift	string	How far back (before the current time) ends the time range that the item queries. Accepts a number of seconds (e.g., 1, 60, 300) or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Also accepts user macros and LLD macros. Possible values range: 0-86400s. Default: 15s. Property behavior: - *supported* if `type` is set to "Telemetry query"
lookback_limit	string	How far back (before the current time) the item queries for data when there is no previous query to continue from (e.g., on the item's first run), or when the previous query is older than `delay` (e.g., because Zabbix server was down). Accepts a number of seconds (e.g., 1, 60, 300) or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Also accepts user macros and LLD macros. Possible values range: 1-259200s. Default: 10m. Property behavior: - *supported* if `type` is set to "Telemetry query"
granularity	string	The length of a piece that the query's full time range is split into. Accepts a number of seconds (e.g., 1, 60, 300) or a value with a time suffix (e.g., 30s, 1m, 2h, 1d). Also accepts user macros and LLD macros. Possible values range: 1-86400s. Default: 15s. Property behavior: - *supported* if `type` is set to "Telemetry query"

HTTP header

The header object has the following properties:

Property	Type	Description
name	string	HTTP header name. Property behavior: - *required*
value	string	Header value. Property behavior: - *required*

HTTP query field

The query field object defines a name and value that is used to specify a URL parameter. It has the following properties:

Property	Type	Description
name	string	Name of the parameter. Property behavior: - *required*
value	string	Parameter value. Property behavior: - *required*

Telemetry query

The telemetry query object has the following properties.

Property	Type	Description
signal_type	integer	Signal type that the item queries. Possible values: 0 - Traces; 1 - Metrics; 2 - Logs. Property behavior: - *required*
metric_point_type	integer	Metric point type that the item queries. Possible values: 0 - Sum; 1 - Gauge; 2 - Histogram; 3 - Exponential histogram. Property behavior: - *required* if `signal_type` is set to ”Metrics”
columns	array	Array of telemetry data columns that the item queries. Can be empty. Property behavior: - *required*
aggregated_columns	array	Array of telemetry data aggregated columns that the item queries, and how it calculates a value from column records. Property behavior: - *required*
filter	object	Telemetry query filter for column records in the query. Property behavior: - *required*

Telemetry data columns

The telemetry data columns object has the following properties.

Property	Type	Description
column	string	Name of the telemetry data column that the item queries. See supported telemetry data columns. For multiple single-value columns, each `column` value must be unique. For multiple columns that hold key-value pairs, each `column` and `attribute_key` pair must be unique.

Property	Type	Description
attribute_key	string	Name of the key that the item queries, within the column that holds key-value pairs. For multiple columns that hold key-value pairs, each `column` and `attribute_key` pair must be unique. Property behavior: - *required* if `column` is set to a column that holds key-value pairs

Telemetry data aggregated columns

The telemetry data aggregated columns object has the following properties.

Property	Type	Description
column	string	Name of the telemetry data column that the item queries. See supported telemetry data columns. For multiple columns, each `column` value must be unique. This property is not supported if `function` is set to ”Count”. Property behavior: - *required* if `function` is set to ”Min”, ”Max”, ”Average”, ”Sum”, or ”Percentile”
function	integer	Function that the item applies to the column records. Possible values: 1 - Min; 2 - Max; 3 - Average; 4 - Count; 5 - Sum; 8 - Percentile. Property behavior: - *required*
parameters	array	Percentile that the item calculates from the column records. Possible value: a number from 0 to 100, given as a string. Property behavior: - *required* if `function` is set to ”Percentile”
alias	string	Unique name for the calculated value, used to identify it in the item value. Each `alias` value must be unique. Property behavior: - *required*

Telemetry data filter

The telemetry data filter object has the following properties.

Property	Type	Description
conditions	array	Telemetry data filter conditions a record in a telemetry data column must meet. Property behavior: - *required*
evaltype	integer	Filter condition evaluation method. Possible values: 0 - And/Or; 1 - And; 2 - Or; 3 - Custom expression. Property behavior: - *required*
eval_formula	string	Generated expression that will be used for evaluating filter conditions. The expression contains IDs that reference specific filter conditions by its `formulaid`. The value of `eval_formula` is equal to the value of `formula` for filters with a custom expression. Property behavior: - *read-only*
formula	string	User-defined expression to be used for evaluating conditions of filters with a custom expression. The expression must contain IDs that reference specific filter conditions by its `formulaid`. The IDs used in the expression must exactly match the ones defined in the filter conditions: no condition can remain unused or omitted. Property behavior: - *required* if `evaltype` is set to ”Custom expression”

Telemetry data filter conditions

The telemetry data filter conditions object has the following properties.

Property	Type	Description
column	string	Name of the telemetry data column that the filter condition applies to. See supported telemetry data columns. Property behavior: - *required*
attribute_key	string	Name of the key that the condition applies to, within the column that holds key-value pairs. Property behavior: - *required* if `column` is set to a column that holds key-value pairs

Property	Type	Description
operator	integer	Filter condition operator. Possible values for single-value columns: 0 - Equals; 1 - Does not equal; 2 - Contains; 3 - Does not contain. Possible values for columns that hold key-value pairs: 0 - Equals; 1 - Does not equal; 12 - Exists. Property behavior: - *required*
value	string	Value to compare with. Property behavior: - *required* if `operator` is set to ”Equals”, ”Does not equal”, ”Contains” or ”Does not contain”
formulaid	string	Arbitrary unique ID that is used to reference the condition from a custom expression. Can only contain capital-case letters. The ID must be defined by the user when modifying filter conditions, but will be generated anew when requesting them afterward. Property behavior: - *required* if `evaltype` of Telemetry query filter object is set to ”Custom expression”

Item prototype tag

The item prototype tag object has the following properties.

Property	Type	Description
tag	string	Item prototype tag name. Property behavior: - *required*
value	string	Item prototype tag value. Property behavior: - *read-only*.
object	integer	Type of object the tag was inherited from. Possible values: 0 - template; 1 - host. Property behavior: - *read-only*.
objectid	ID	ID of the object the tag was inherited from. Property behavior: - *read-only*.

Item prototype preprocessing

The item prototype preprocessing object has the following properties.

Property	Type	Description
type	integer	The preprocessing option type. Possible values: 1 - Custom multiplier; 2 - Right trim; 3 - Left trim; 4 - Trim; 5 - Regular expression; 6 - Boolean to decimal; 7 - Octal to decimal; 8 - Hexadecimal to decimal; 9 - Simple change; 10 - Change per second; 11 - XML XPath; 12 - JSONPath; 13 - In range; 14 - Matches regular expression; 15 - Does not match regular expression; 16 - Check for error in JSON; 17 - Check for error in XML; 18 - Check for error using regular expression; 19 - Discard unchanged; 20 - Discard unchanged with heartbeat; 21 - JavaScript; 22 - Prometheus pattern; 23 - Prometheus to JSON; 24 - CSV to JSON; 25 - Replace; 26 - Check unsupported; 27 - XML to JSON; 28 - SNMP walk value; 29 - SNMP walk to JSON; 30 - SNMP get value. Property behavior: - *required*
params	string	Additional parameters used by preprocessing option. Multiple parameters are separated by the newline (\n) character. If `type` is set to ”Check unsupported”, the parameters follow a `<scope>[\n<pattern>]` syntax, where *pattern* is a regular expression, and *scope* is one of: -1 - match any error; 0 - check if error message matches *pattern*; 1 - check if error message does not match *pattern*. Property behavior: - *required* if `type` is set to ”Custom multiplier” (1), ”Right trim” (2), ”Left trim” (3), ”Trim” (4), ”Regular expression” (5), ”XML XPath” (11), ”JSONPath” (12), ”In range” (13), ”Matches regular expression” (14), ”Does not match regular expression” (15), ”Check for error in JSON” (16), ”Check for error in XML” (17), ”Check for error using regular expression” (18), ”Discard unchanged with heartbeat” (20), ”JavaScript” (21), ”Prometheus pattern” (22), ”Prometheus to JSON” (23), ”CSV to JSON” (24), ”Replace” (25), ”Check unsupported” (26), ”SNMP walk value” (28), ”SNMP walk to JSON” (29), or ”SNMP get value” (30)

Property	Type	Description
error_handler	integer	Action type used in case of preprocessing step failure. Possible values: 0 - Error message is set by Zabbix server; 1 - Discard value; 2 - Set custom value; 3 - Set custom error message. Possible values if `type` is set to ”Check unsupported”: 1 - Discard value; 2 - Set custom value; 3 - Set custom error message. Property behavior: - *required* if `type` is set to ”Custom multiplier” (1), ”Regular expression” (5), ”Boolean to decimal” (6), ”Octal to decimal” (7), ”Hexadecimal to decimal” (8), ”Simple change” (9), ”Change per second” (10), ”XML XPath” (11), ”JSONPath” (12), ”In range” (13), ”Matches regular expression” (14), ”Does not match regular expression” (15), ”Check for error in JSON” (16), ”Check for error in XML” (17), ”Check for error using regular expression” (18), ”Prometheus pattern” (22), ”Prometheus to JSON” (23), ”CSV to JSON” (24), ”Check unsupported” (26), ”XML to JSON” (27), ”SNMP walk value” (28), ”SNMP walk to JSON” (29), or ”SNMP get value” (30)
error_handler_params	string	Error handler parameters. Property behavior: - *required* if `error_handler` is set to ”Set custom value” or ”Set custom error message”

The following parameters and error handlers are supported for each preprocessing type.

Preprocessing type	Name	Parameter 1	Parameter 2	Parameter 3	Supported error handlers
1	Custom multiplier	number^1, 6^			0, 1, 2, 3
2	Right trim	list of characters[2]			
3	Left trim	list of characters[2]			
4	Trim	list of characters[2]			
5	Regular expression	pattern[3]	output[2]		0, 1, 2, 3
6	Boolean to decimal				0, 1, 2, 3
7	Octal to decimal				0, 1, 2, 3
8	Hexadecimal to decimal				0, 1, 2, 3

Preprocessing type	Name	Parameter 1	Parameter 2	Parameter 3	Supported error handlers
9	Simple change				0, 1, 2, 3
10	Change per second				0, 1, 2, 3
11	XML XPath	path[4]			0, 1, 2, 3
12	JSONPath	path[4]			0, 1, 2, 3
13	In range	min^1, 6^	max^1, 6^		0, 1, 2, 3
14	Matches regular expression	pattern[3]			0, 1, 2, 3
15	Does not match regular expression	pattern[3]			0, 1, 2, 3
16	Check for error in JSON	path[4]			0, 1, 2, 3
17	Check for error in XML	path[4]			0, 1, 2, 3
18	Check for error using regular expression	pattern[3]	output[2]		0, 1, 2, 3
19	Discard unchanged				
20	Discard unchanged with heartbeat	seconds^5, 6^			
21	JavaScript	script[2]			
22	Prometheus pattern	pattern^6, 7^	`value`, `label`, `function`	output^8, 9^	0, 1, 2, 3
23	Prometheus to JSON	pattern^6, 7^			0, 1, 2, 3

Preprocessing type	Name	Parameter 1	Parameter 2	Parameter 3	Supported error handlers
24	CSV to JSON	character[2]	character[2]	0,1	0, 1, 2, 3
25	Replace	search string[2]	replacement[2]		
26	Check unsupported	scope[1]	pattern^3, 6^		1, 2, 3
27	XML to JSON				0, 1, 2, 3
28	SNMP walk value	OID[2]	Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS		0, 1, 2, 3
29	SNMP walk to JSON[10]	Field name[2]	OID prefix[2]	Format: 0 - Unchanged 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS	0, 1, 2, 3
30	SNMP get value	Format: 1 - UTF-8 from Hex-STRING 2 - MAC from Hex-STRING 3 - Integer from BITS			0, 1, 2, 3

[1] integer or floating-point number
 [2] string
 [3] regular expression
 [4] JSONPath or XML XPath
 [5] positive integer (with support of time suffixes, e.g., 30s, 1m, 2h, 1d)
 [6] user macro, LLD macro
 [7] Prometheus pattern following the syntax: `<metric name>{<label name>="<label value>", ...} == <value>`. Each Prometheus pattern component (metric, label name, label value and metric value) can be user macro or LLD macro.
 [8] Prometheus output following the syntax: `<label name>` (can be a user macro or an LLD macro) if `label` is selected as the second parameter.
 [9] One of the aggregation functions: `sum`, `min`, `max`, `avg`, `count` if `function` is selected as the second parameter.
 [10] Supports multiple "Field name,OID prefix,Format records" records delimited by a new line character.

itemprototype.create

Description

`object itemprototype.create(object/array itemPrototypes)`

This method allows you to create new item prototypes.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object/array)` Item prototype to create.

Additionally to the standard item prototype properties, the method accepts the following parameters.

Parameter	Type	Description
ruleid	ID	ID of the LLD rule that the item belongs to. Parameter behavior: - *required*
preprocessing	array	Item prototype preprocessing options.
tags	array	Item prototype tags.

Return values

`(object)` Returns an object containing the IDs of the created item prototypes under the `itemids` property. The order of the returned IDs matches the order of the passed item prototypes.

Examples

Creating an item prototype

Create an item prototype to monitor free disk space on a discovered file system. Discovered items should be numeric Zabbix agent items updated every 30 seconds.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.create",
    "params": {
        "name": "Free disk space on {#FSNAME}",
        "key_": "vfs.fs.size[{#FSNAME},free]",
        "hostid": "10197",
        "ruleid": "27665",
        "type": 0,
        "value_type": 3,
        "interfaceid": "112",
        "delay": "30s"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "27666"
        ]
    },
    "id": 1
}
```

Creating an item prototype with preprocessing

Create an item using change per second and a custom multiplier as a second step.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.create",
    "params": {
        "name": "Incoming network traffic on {#IFNAME}",
        "key_": "net.if.in[{#IFNAME}]",
        "hostid": "10001",
        "ruleid": "27665",
        "type": 0,
        "value_type": 3,
        "delay": "60s",
```

```
        "units": "bps",
        "interfaceid": "1155",
        "preprocessing": [
            {
                "type": 10,
                "params": "",
                "error_handler": 0,
                "error_handler_params": ""
            },
            {
                "type": 1,
                "params": "8",
                "error_handler": 2,
                "error_handler_params": "10"
            }
        ]
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "44211"
        ]
    },
    "id": 1
}
```

Creating dependent item prototype

Create Dependent item prototype for Master item prototype with ID 44211. Only dependencies on same host (template/discovery rule) are allowed, therefore Master and Dependent item should have same hostid and ruleid.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.create",
    "params": {
      "hostid": "10001",
      "ruleid": "27665",
      "name": "Dependent test item prototype",
      "key_": "dependent.prototype",
      "type": 18,
      "master_itemid": "44211",
      "value_type": 3
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "44212"
        ]
    },
    "id": 1
}
```

Create HTTP agent item prototype

Create item prototype with URL using user macro, query fields and custom headers.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.create",
    "params": {
        "type": "19",
        "hostid": "10254",
        "ruleid": "28256",
        "interfaceid": "2",
        "name": "api item prototype example",
        "key_": "api_http_item",
        "value_type": 3,
        "url": "{$URL_PROTOTYPE}",
        "query_fields": [
            {
                "name": "min",
                "value": "10"
            },
            {
                "name": "max",
                "value" "100"
            }
        ],
        "headers": [
            {
                "name": "X-Source",
                "value": "api"
            }
        ],
        "delay": "35"
    },
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "itemids": [
            "28305"
        ]
    },
    "id": 1
}
```

Create script item prototype

Create a simple data collection using a script item prototype.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.create",
    "params": {
        "name": "Script example",
        "key_": "custom.script.itemprototype",

itemprototype.delete

Description

`object itemprototype.delete(array itemPrototypeIds)`

This method allows you to delete item prototypes.

> **Note:**
> This method is only available to *Admin* and *Super admin* user types. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(array)` IDs of the item prototypes to delete.

Return values

`(object)` Returns an object containing the IDs of the deleted item prototypes under the `prototypeids` property.

Examples

Deleting multiple item prototypes

Delete two item prototypes.
 Dependent item prototypes are removed automatically if master item or item prototype is deleted.

Request:

```
{
    "jsonrpc": "2.0",
    "method": "itemprototype.delete",
    "params": [
        "27352",
        "27356"
    ],
    "id": 1
}
```

Response:

```
{
    "jsonrpc": "2.0",
    "result": {
        "prototypeids": [
            "27352",
            "27356"
        ]
    },
    "id": 1
}
```

itemprototype.get

Description

`integer/array itemprototype.get(object parameters)`

The method allows you to retrieve item prototypes according to the given parameters.

> **Note:**
> This method is available to users of any type. Permissions to call the method can be revoked in user role settings. See User roles for more information.

Parameters

`(object)` Parameters defining the desired output.

The method supports the following parameters.

Parameter	Type	Description
discoveryids	ID/array	Return only item prototypes that belong to the given LLD rules.
graphids	ID/array	Return only item prototypes that are used in the given graph prototypes.
hostids	ID/array	Return only item prototypes that belong to the given hosts.
inherited	boolean	If set to `true` return only item prototypes inherited from a template.
itemids	ID/array	Return only item prototypes with the given IDs.
monitored	boolean	If set to `true` return only enabled item prototypes that belong to monitored hosts.
templated	boolean	If set to `true` return only item prototypes that belong to templates.
templateids	ID/array	Return only item prototypes that belong to the given templates.
triggerids	ID/array	Return only item prototypes that are used in the given trigger prototypes.

Parameter	Type	Description
selectDiscoveryData	query	Return a `discoveryData` property with the item prototype discovery object data. The item prototype discovery object links a discovered item prototype to an item prototype from which it was discovered. It has the following properties: `parent_itemid` - `(string)` ID of the item prototype from which the item prototype has been created; `key_` - `(string)` key of the item prototype; `status` - `(int)` item prototype discovery status: 0 - *(default)* item prototype is discovered, 1 - item prototype is not discovered anymore; `ts_delete` - `(timestamp)` time when an item prototype that is no longer discovered will be deleted; `ts_disable` - `(timestamp)` time when an item prototype that is no longer discovered will be disabled; `disable_source` - `(int)` indicator of whether item prototype was disabled by an LLD rule or manually: 0 - *(default)* disabled automatically, 1 - disabled by an LLD rule.
selectDiscoveryRule	query	Return a `discoveryRule` property with the low-level discovery rule that the item prototype belongs to.
